Grit and screenings incineration plant at Milwaukee, Wis. Darwin W. Townsend. *Water Works and Sewerage* 80, 317-21(1933).—Preliminary expts. indicated that for large-scale operation grit and screenings could be combined, centrifuged and incinerated. The burning unit consists of 2 furnaces having a capacity of 20 tons per 24 hrs. each. Because of high silica content grates are replaced by 105 sq. ft. of refractory surface area per ton of capacity. The drained and sloped charging floor is unobstructed and 3 charging holes are provided for each unit. Scrubbing action of the flame is exerted at every point except in the ash settling chamber. Calcs. indicate the use of 600 gals. of fuel oil for the 24-hr. run of both units. Total cost ests. for operation are \$1.75 to \$2.00 per ton. C. C. Ruchhoft

## 15—SOILS, FERTILIZERS AND AGRICULTURAL POISONS

M. S. ANDERSON AND K. D. JACOB

The significance of soil types for agriculture. S. Gericke. *Phosphorsäure* 3, 581-8(1933).—The chem. characteristics of the horizons of different soil types are discussed with particular reference to the distribution of P.

K. D. Jacob

Colloid chemistry in agriculture. S. Gericke. *Phosphorsäure* 3, 723-5(1933).—A brief discussion of the relation of colloids to the structure and properties of soils.

K. D. Jacob

Soil reactions and forest types in the Duke Forest. T. S. Coile. *Ecology* 14, 323-33(1933).—The detn. of H-ion concn. on 500 soil samples from the Duke Forest in N. Car. shows that litter of low H-ion concn., such as red gum, yellow poplar, red maple, river birch, sycamore and dog wood, decomposes more rapidly and the decompn. ducts incorporate more rapidly into the mineral soil

than does litter of high H-ion concn. such as loblolly pine, shortleaf pine and the oaks. The soil reactions under 7 forest types in the Duke Forest, as detd. colorimetrically, do not differ enough to be a limiting factor in the distribution of the forest types. Fourteen references.

John O. Hardesty

Laboratory methods of soil investigation compared with field experiments. W. Wöhlbier and Schulze. Z. *Pflanzenernähr., Düngung Bodenk.* 12B, 460-8(1933).—Comparison of yields of beets, potatoes and small grains grown in field expts. to det. the effect of  $\text{K}_2\text{O}$  with the indications of Dirks' (cf. C. A. 27, 3767) procedure showed agreement in less than 80% of the cases. C. J. S.

Studies in Malayan soils. J. H. Dennett and H. A. Tempny. *Malayan Agr. J.* 21, 345-61(1933).—Malayan soils are discussed and classified as to climate,

parent material and vegetation. These are the granite, quartzite, Raub, coast alluvium, Petang, Dolorite and highland soils. Low org. matter content as well as the lack of a store of plant food characterizes these tropical soils.  $\text{CaO}$  varies from 0.04 to 0.13%;  $\text{K}_2\text{O}$  from 0.05 to 0.80%; and  $\text{P}_2\text{O}_5$  from 0.02 to 1.00%. The available plant food is not more than 0.1 of the above figures. Only occasionally is the soil acidity definitely harmful. In such cases the  $p_{\text{H}}$  is 3.5 or less, caused by free  $\text{H}_2\text{SO}_4$ . The ratio of N to C is about 11.0. The N content of inland soils is 0.1-0.2% and of coastal plain soils 0.15-0.40%.

Irvin C. Brown

The black soils in the vicinity of Sofia. Ivan T. Stranski. *Z. Pflanzenernähr., Düngung Bodenk.* 32A, 221-33 (1933).—The origin and characteristics of certain swampy soils are discussed. These badly drained black soils are rich in fertility but have unfavorable phys. properties. They are, in general, responsive to liming and  $\text{P}_2\text{O}_5$  fertilization. Twenty-seven references. C. J. S.

Base-exchange equilibria in clays. C. E. Marshall and R. S. Gupta. *J. Soc. Chem. Ind.* 52, 433-43T (1933).—Analytical and electrometric data are presented from a base-exchange investigation in which Putnam clay (beidellite) and bentonite (montmorillonite) were used. The reactions studied were between Na-clay and  $\text{KCl}$ ,  $\text{CaCl}_2$  and  $\text{AgNO}_3$ , also H-clay with  $\text{AgNO}_3$  and  $\text{Ti}_2\text{SO}_4$ . It was found that when a sufficiently wide range of concn is chosen none of the base-exchange equations which have been proposed is satisfactory. The substitution of activities for concns. in the simple mass-action equations does not suffice to make them valid. A. M. Brant

Evaporation of water from the soil. Max T. Lorey. *Z. Pflanzenernähr., Düngung Bodenk.* 32A, 267-78 (1933).—The relative evapns. of  $\text{H}_2\text{O}$  from  $1\frac{1}{2}$  mm. and finer quartz sand and from free  $\text{H}_2\text{O}$  surface were studied. C. J. S.

The relation of hygroscopic water to the exchange capacity. S. N. Alekhin. *Chemisation Socialistic Agr.* 1932, No 11-12, 29-38.—A. points out that there is a definite parallelism between the variation in the values of the hygroscopic moisture, in terms of millicquivalents, of different soils and their variation in values of exchange capacity. By dividing the millicquivalents of moisture by the millicquivalents of exchange capacity a definite figure is obtained which is characteristic for the zonal soil type. After obtaining the characteristic value ( $K$ ) for any soil type it is possible by dividing the millicquivalents of hygroscopic moisture per 100 g. of soil by the const. to obtain the exchange capacity of the soil. A. cites data showing that this method of obtaining the exchange capacity of the soil is in close agreement with actual detns. J. S. Joffe

The validity of Vageler's sorption equation for estimating the relative solubilities of nutrients in the soil. P. Kottgen. *Z. Pflanzenernähr., Düngung Bodenk.* 32A, 320-36 (1933).—Vageler's (cf. C. A. 26, 3865) math. treatment of the ease of replacement of absorbed ions is criticized on the ground that however applicable it may be to salt-free permutites, it is not necessarily valid for the soil's absorptive complex. Further, the cation used,  $\text{NH}_4$ , occurs naturally in soils in important amts. On theoretical grounds,  $\text{H}^+$  should be the best replacing cation for soil studies. Application of V's procedure to humid soils indicated no consistency in the amt. of sorbed base, although values for arid soils were in better agreement. It is no more useful than the older leaching methods, and its limitations are such that good indications are not to be expected with poor soils. C. J. Schollenberger

Quantitative laws in the study of the absorption properties of soils. E. N. Gapon. *Chemisation Socialistic Agr.* 1932, No 11-12, 18-28.—G. develops a formula by which he detns. the exchange capacity of soils by getting 2 exptl. points, using definite concns. of electrolytes on 2 samples of soil, on a straight line which represents graphically the isotherm equation. Taking the exptl. data of Gedroiz he shows how the calcns. by the formula correspond to the actual detns. J. S. Joffe

The permeability of the soil. F. Zunker. *Kultur-techniker* 35, 835 (1932); *Fortschr. Landw.* 8, 133.—The

relation between the permeability of a soil and its particle size and hygroscopicity is developed for a clay soil. Particle-size and hygroscopicity detns. may, under certain conditions, lead to different evaluations of the permeability of a given soil. For medium and heavy soils, a more reliable figure for permeability can be obtained from the mean of the results of particle-size, hygroscopicity and heat-of-wetting detns. K. D. Jacob

Cohesion forces in soils with unchanged structure V. G. Buluichev and G. I. Pokrovskii. *J. Tech. Phys.* (U. S. S. R.) 3, 525-31 (1933).—Cohesion forces in soils depend on the way in which the water content and the relative shapes of the soil particles affect the capillary forces. P. H. Rathmann

The effect of raw phosphate on the soils in Ukraine P. F. Tobochko. *Chemisation Socialistic Agr.* 1932, No 11-12, 43-52.—T. presents exptl. data on the effect of raw phosphates on the various subtypes of chernozem as compared with acid phosphate. He shows that outside of the deep chernozem raw phosphates may serve as a favorable substitute for acid phosphate. J. S. Joffe

Bacteriophage and the fatigue of soils planted in alfalfa A. Demolon and A. Dunez. *Compt. rend.* 197, 1344-6 (1933).—Bacteriophage was found in the nodules, roots and stems of alfalfa over 1 yr. old but not in the leaves. It was also found in soil in which alfalfa over 1 yr. old was grown. In the soils planted in young alfalfa no bacteriophage was found. Its presence in the soil is markedly persistent. This causes soil fatigue and by the end of the second year the soil is unfit for the development of legume. This condition persists until the accumulated bacteriophage disappears. Expts. indicate that bacteriophage will pass from the soil into the plants. J. R. Adams

Experimental investigations on the importance of physical soil constants for various forms of natural and newly developed pasture practice. W. Schunemann. *Z. Pflanzenernähr., Düngung Bodenk.* 32A, 278-301 (1933). C. J. Schollenberger

Correcting the unproductiveness of acid and alkaline muck soils for the growing of vegetable crops G. M. Tait and J. E. Knott. N. Y. (Cornell) Agr. Exptl. Sta., *Bull.* 572, 3-19 (1933).—Muck soils showing a  $p_{\text{H}}$  reaction of 4.0 may require an addn. of 8 tons to the acre of ground limestone. If the reaction is between  $p_{\text{H}}$  6 and 7, marl from the drainage ditches should not be spread on the surface or the soil will become too alk. In alk. muck soils, if the subsoil is acid, deep plowing or the addn. of  $\frac{1}{2}$ -1 ton of S per acre will correct the alk. Flowers of S were as effective as inoculated S composts. The optimum soil reaction for vegetables on acid and alk. muck soil is not the same. For practical purposes, mucks showing reactions of  $p_{\text{H}}$  5-7 are normally satisfactory for crop production. C. R. Feller

Carbon dioxide from the soil and plant assimilation V. Subrahmanyam and G. S. Siddappa. *Nature* 132, 1001-2 (1933).—Barley was grown on soil contg. org. matter and treated, in sep. pots, with  $\text{Fe}_2\text{O}_3$ ,  $\text{KMnO}_4$  and  $\text{H}_2\text{O}_2$ . There was about 32% more dry matter in the treated than in the untreated pots. The authors' interpretation is that the young plants get most of their  $\text{CO}_2$  from the soil, since the oxidizing agents would increase the available  $\text{CO}_2$ . J. J. Williams

The influence of the lime status of the soil upon the ability of a plant to assimilate phosphoric acid and potash W. Leach. *Z. Pflanzenernähr., Düngung Bodenk.* 32A, 20-32 (1933).—The effect of changes in  $p_{\text{H}}$  and content of active  $\text{CaO}$  due to physiologically acid and alk. fertilization and heavy liming upon (I) the citric acid soly. of soil  $\text{P}_2\text{O}_5$  and  $\text{K}_2\text{O}$  and (II) indications of the Neubauer rye-seedling method was investigated. The nature of the fertilization, whether acid or basic, had no effect upon  $\text{P}_2\text{O}_5$ . Liming reduced the availability of  $\text{CaH}_2\text{P}_2\text{O}_7$  according to II but not according to I. This throws doubt upon the reliability of II as an index of  $\text{P}_2\text{O}_5$  supply, since field results show that liming does not decrease the action of  $\text{P}_2\text{O}_5$ . Added to soil in the lab. at the rate of 150 kg./ha.,  $\text{P}_2\text{O}_5$  was recovered quantitatively by I, but only 74% by II, still less

when limed. Physiologically basic fertilization increased the availability of  $K_2O$ , an effect furthered by liming, indicated by both I and II. C. J. Schollenberger

The question of magnesia in agriculture. Ch. Brioux. *J. agr. prat.* 97, 339-40, 357-8(1933).—After a brief review of the subject a description is given of some pot tests which indicate that  $MgO$  might be used advantageously as a fertilizer ingredient, particularly in the cultivation of certain flowers. However, the results obtained in field tests are so irregular that it would appear premature to recommend the unrestricted use of  $MgO$  fertilizers.

J. R. Adams

Potassium in calcareous soils. I. Solubility and availability. W. T. McGeorge. *Ariz. Agr. Expt. Sta., Tech. Bull.* 50, 1-19(1933).—Ariz. soils contain large reserves of K but there is a wide variation in the amt. of replaceable or less firmly bound K. Even in the poorest soils there is no evidence of an immediate need for K. The soly. in water is very low in some soils but the adsorbed K responds so readily to the solvent action of  $CO_2$  that the low soly. in water does not handicap the absorption by the crop provided root respiration is normal. The Neubauer test shows that plants will absorb large amts. of K from these soils during the early stages of growth. In fact, the indications are that luxury consumption will take place in many of them. In general, available K in soils decreases with soil depth, as does also the soly. of K in water. The subsoils have a strong fixing power for K and thus, by fixation of K leached from the surface soils, the supply of available K in the subsoil increases with cultivation. II. Some properties of replaceable potassium. *Ibid.* 20-42; cf. C. A. 23, 1980.—Replaceable K is abundantly present in Ariz. calcareous soils. Exchange K is readily replaced from calcareous soils by 0.1 N solns. of  $NH_4$  salts but not by Ca salts, while in non-calcareous soils the 2 salts are equally effective. Ca salts depress the hydrolysis of K zeolite and increase fixation of K in calcareous soils, but not in non-calcareous soils. Calcareous material in soils depresses the soly. of soil K below the theoretical value detd. by Magistad (C. A. 23, 1980) and show high Neubauer values for K. Neubauer values for calcareous and non-calcareous soils contg. equiv. amts. of replaceable K are higher in the former. However, the soly. of replaceable K is higher in the latter. Neutral Ca salts show an active initial liberation of K from calcareous soils. Holding calcareous soils for an extended period in a puddled condition does not change the replaceability of K. Loss of replaceable K by leaching with pure  $H_2O$  is small for calcareous soils. Heating calcareous soils increased replaceable K up to  $760^\circ$  in a sandy loam, while there was little change in a silty-clay loam. Grinding calcareous soils in a ball mill increased the replaceability of K approx. 3-fold. Grinding a peat soil had no effect on replaceability of K. Grinding increases the exchange capacity of the inorg. exchange complex, but does not alter the exchange capacity of org. colloids. Theories are presented which explain the greater availability of K in calcareous soils and support the postulation that they contain a large part of their K adsorbed by non-cryst. colloids, either in the form of synthetic zeolite-like compds. or isoelec. ppts. Twenty-seven references.

C. R. Fellers

Preliminary pot experiments to investigate the symptoms of nutrient deficiency in five varieties of cabbage on three different types of soil. F. Vogel. *Ernähr. Pflanze* 29, 457-52(1933).—Pot expts. with kale, Brussels sprouts, cauliflower, kohlrabi and winter cabbage were carried out on sandy, peat and loamy soil. Treatment consisted of complete fertilizer, without  $K_2O$ , without  $P_2O_5$ , without N, and untreated. On the peat and loamy soils 0.5 g. each of Leumasalpetar, KCl and superphosphate were given per pot. This amt. was reduced by half with sandy soil. N deficiency caused retarded growth and low yield.  $P_2O_5$  deficiency produced a pale-colored leaf, except with kale on the loamy soil.  $K_2O$  deficiency produced a pale color, the absence of the characteristic waxy layer on the surface of leaves, excessive transpiration and the consequent wilting tendency, leaf-roll and marginal discoloration. Complete fertilizer increased yields 10-fold on sandy soil,

3-7-fold on loam, and 5-13-fold on peat soil as compared with the untreated pots. John O. Hardesty

The root systems of cereal plants with uneven distribution of nutrient substances in the soil. M. A. J. Goede-waagen. *Phosphorsäure* 3, 688-711(1933).—Oat plants were grown in rectangular boxes in a soil that was originally very deficient in P. In each box a vertical section of the soil corresponding to  $1/4$  of the total vol. of the box was thoroughly mixed with a phosphate fertilizer, that was comparatively insol. in water, at the rate of 400 kg.  $P_2O_5$  per hectare; adequate amts. of the other fertilizing elements were uniformly distributed throughout the entire vol. of the soil. The position of the oat plants in the boxes was varied with respect to their distance from the portion of the soil receiving the phosphate fertilizer. The total dry wt. of the shoots decreased rapidly with increase in the distance of the plants from the phosphate-fertilized soil, the effect of the phosphate being negligible at a distance of 0.2 m.; the dry wt. of the roots changed in the same direction but to a smaller extent. The results indicate that the max. utilization of water-insol. phosphates is obtained only when the fertilizer is placed in close contact with the plant roots. K. D. Jacob

Corynebacteria as an important group of soil micro-organisms. H. L. Jensen. *Proc. Linnean Soc. N. S. Wales* 58, 181-5(1933).—Bacteria possessing the characteristics of the genus *Corynebacterium* occur as a numerically important group of microorganisms in Australian soils, accounting for 8-65% of the nos. of bacterial colonies developing on plates of dextrose-casein agar. The no. increases somewhat with decreasing soil acidity. They appear to be active in the decompn. of org. matter in soil, particularly in the later stages of the process. They are probably identical with certain organisms previously recorded as rhizobia. K. C. Becson

The bacteriological oxidation of sulfur in an Australian soil. P. M. Rountree. *Australian J. Exptl. Biol. Med. Sci.* 11, 209-18(1933).—The optimum moisture range was 60-90% of satn., and the optimum temp. range  $16-35^\circ$ . A new organism of the *Thiobacillus* group changed the  $pH$  of the soil from 8.4 to 4.5 in 12 days, under lab. conditions. C. G. King

Occurrence of *Azotobacter* in peat soils of New York. J. K. Wilson and B. D. Wilson. N. Y. (Cornell) Agr. Expt. Sta. *Memoir* 148, 3-15(1933).—Fifty-four peat soils from 6 geographical locations in N. Y. state were air-dried, ground and stored for 27 months before examg. for *Azotobacter*. The soils were acid in reaction, except 1, and ranged in reaction from 3.8 to 7.0. Four of the samples showed no *Azotobacter*. There was no close relationship between the soil reaction and the presence of these bacteria. The soil complex seems to be more important in controlling the activity of *Azotobacter* than the soil reaction. Soils that contain carbonates and are not naturally suited to the macroscopic growth of *Azotobacter* can be made suitable in this respect by adjusting the ratio of carbonate to phosphate. This is best accomplished by the addn. of sol. salts contg. P and certain basic substances, or by the addn. of HCl,  $H_2SO_4$  or  $H_3PO_4$ . A practical application of these findings is that soils may be treated with S in order to narrow the ratio of carbonate to phosphate so that the soils will be more productive. C. R. Fellers

Character of the peat deposits of New York. B. D. Wilson and E. V. Staker. N. Y. (Cornell) Agr. Expt. Sta., *Memoir* 149, 3-20(1933).—Characteristic profiles and chem. analyses of the various peat deposits are given. Five different types were encountered. The character of the underlying material detd. largely the amt. of Ca and acidity in the deposits. The layers resting on non-calcareous materials were more acid than when calcareous underlying material was present. The CaO content was 0.92-6.8%;  $MgO$ , 0.18-0.91; N, 1.04-3.37; org. C, 29.8-57.65; and  $pH$ , 4.2-6.0. The N was present largely as lignin-humus complexes. The org. matter of each of the layers contained more hemicellulose than cellulose. The amt. of each of these constituents is smaller in the org. matter of most of the layers than is the amt. of lignin humus. The relative amts. of the org. constituents of the

peat materials are not necessarily an indication of a particular kind of peat.

C. R. Fellers

The decomposition of hydrolytic peat products including ammoniated peat. I. C. Feustel and H. G. Byers. U. S. Dept. Agr., *Tech. Bull.* 389, 1-32(1933).—A study was made of the decompn. of peat when mixed with soil as measured primarily by  $\text{CO}_2$  evolution. The samples of peat were used in the raw condition and as the products of various types of chem. treatments, including extn. by solvents and reactions with water, acids and bases at ordinary and at elevated temps. under pressure. The raw peats decompd. very slowly whereas peat treated at ordinary temp. with 40% HCl or at 150° under pressure with CaO or  $\text{NH}_3$  decompd. quite rapidly, the max. rate being approx. 1/2 of the rate of sweet clover under the same conditions. Peat and other org. materials are capable of reacting with  $\text{NH}_3$  to form nitrogenous compds. of which only a small proportion is ammoniacal in nature. The increase in the combined N when various org. materials were treated with  $\text{NH}_3$  at 150° for 3 hrs. ranged from 2.37% in lignin from corn cobs to 5.78% in sphagnum moss peat. There is no relationship between the N originally present and the addnl. N taken up in the treatment. The immediate availability of the total N in treated samples of saw-grass peat is between 25 and 50% as compared with inorg. N.

W. H. Ross

The connection between the degree of decomposition and some physicochemical properties of high moor peat. Th. Arnd, W. Siemers and W. Hoffmann. *Z. Pflanzenernähr., Düngung Boden.* 32A, 257-66(1933).—Nineteen samples of peat and one of living sphagnum were examd. for extent of decompn. by the methods of (I) Komarevskii (cf. C. A. 23, 3070), (II) Odén (cf. C. A. 15, 2143) and (III) Keppeler (cf. C. A. 14, 2901). I, requiring a detn. of residual cellulose, is too tedious for practical use with many samples; II is subject to minor errors but is satisfactory. Analyses indicated that C increases and H decreases with progress of peat development. Young peat is much lower in N,  $\text{P}_2\text{O}_5$  and  $\text{K}_2\text{O}$  than living moss, but N increases with decompn.; CaO changes little but acidity increases.

C. J. Schollenberger

Sampling and testing peat litter. M. Popp. *Z. Pflanzenernähr., Düngung Boden.* 32A, 182-4(1933).—Water content and absorptive capacity for  $\text{H}_2\text{O}$  are the only tests; the latter is detd. under arbitrary conditions described.

C. J. Schollenberger

The influence of magnesium on different potato soil types. B. E. Brown, G. V. C. Houghland, O. Smith and R. L. Carolus. *Am. Potato J.* 10, 55-65(1933); *Rev. Applied Mycol.* 12, 654-5.—When  $\text{MgSO}_4$  was added to Norfolk sandy loam soil in Virginia having a  $p_{\text{H}}$  of 4.2 much less chlorosis (indicative of a well-defined growth disturbance) of potato leaves was observed than when  $\text{MgSO}_4$  was not used. Addn. of  $\text{MgSO}_4$  to soils having  $p_{\text{H}}$  5.5 showed no beneficial results, however. Mg in water of the Atlantic seaboard coastal plains section where this chlorosis is common is low and possibly the chlorosis is an indication of Mg deficiency. In most cases the diseased plants were growing on very acid soils— $p_{\text{H}}$  4.2-5.

Oden E. Sheppard

Nitrogen balance in black cotton soils in the Malwa Plateau. I. Yeshwant D. Wad and V. G. Panse. *Indian J. Agr. Sci.* 3, 820-32(1933).—A study was made of the rate of nitrification of *karanja* cake, safflower cake and  $(\text{NH}_4)_2\text{SO}_4$  in a black cotton soil maintained at the optimum moisture content (25-30%) and incubated under shade in diffused light at relative atm. humidities ranging from 60 to 100%. At the higher humidities ammoniacal N was higher and nitrate N lower than at the lower humidities. In the drier atms. there was greater accumulation of nitrates from *karanja* cake and  $(\text{NH}_4)_2\text{SO}_4$  than from safflower cake. In the wetter atms. the initial accumulation of nitrates was more rapid from *karanja* and safflower cakes than from  $(\text{NH}_4)_2\text{SO}_4$ . With all treatments nitrates decreased rapidly in the 3rd week, the greatest decrease occurring with *karanja* cake. There was no loss of N in any case. The appearance of algal growth occurred simultaneously with the decrease in nitrates; utilization of

nitrates by algae is a factor in decreasing loss of N from soils by leaching during periods of heavy rainfall.

K. D. Jacob

The influence of cropping system and fertilization on the reaction of Sassafras silt loam soil. Henry C. Harris. *J. Am. Soc. Agron.* 26, 29-34(1934).—Long-time treatments with farm manure, N,  $\text{P}_2\text{O}_5$  or  $\text{K}_2\text{O}$  fertilizers of plots located on the Delaware Agr. Expt. Farm have had no appreciable influence on the reaction of the soil. This is probably due to local conditions and the combinations used. It appears that the  $p_{\text{H}}$  value of this soil has been influenced by the cropping system grown on the soil, especially where CaO was applied.

J. R. Adams

The cycle of phosphorus in the soil. Walter Sauerlandt. *Phosphorsäure* 3, 711-22(1933).—When they were grown in sand cultures contg. a very small amt. of black soil, oat plants were unable to utilize efficiently the P of undecompd. phytin; good results were obtained, however, when the phytin was added to the cultures 2 months before the seeds were planted. Samples of soil taken from plots immediately after growth of clover were very low in sol. P, but the amts. of sol. P increased considerably, in some cases, when the samples were kept for 6-8 weeks and the moisture content was maintained at 60% of the water-holding capacity. Tests on acid soils ( $p_{\text{H}}$  4.1-6.3) maintained at a moisture content equiv. to 60% of the water-holding capacity and incubated at 20° for 5-10 weeks indicated that when P was supplied as  $\text{KH}_2\text{PO}_4$  the amt. of available P (Dirks and Scheffer method) decreased to a min. in 5 weeks and then increased slightly. Thirty-two references.

K. D. Jacob

A comparison of estimations of phosphoric acid in soil by the pot method of E. A. Mitscherlich and the rapid procedure of Dirks and Scheffer. W. Meimberg and W. Sauerlandt. *Z. Pflanzenernähr., Düngung Boden.* 12B, 489-99(1933).—A comparison of tests with 234 soils by (I) the Mitscherlich (cf. C. A. 18, 2053) and (II) Dirks-Scheffer (cf. C. A. 24, 3070) tests indicated agreement in only 59% of the cases. All soils testing 8 or over by II were indicated to be supplied adequately with  $\text{P}_2\text{O}_5$  by I. But of all the soils indicated to be stocked sufficiently with  $\text{P}_2\text{O}_5$  by I, only 44% were so indicated by II. If heavy soils alone are considered, the latter figure is 25%. If soils poor in  $\text{P}_2\text{O}_5$  are considered as a group, agreement was 90%. The indications of II are of qual. value only.

C. J. Schollenberger

The estimation of a soil's need for phosphoric acid fertilization by means of *Aspergillus niger*. H. Niklas, G. Vilsmeier and F. Kohl. *Z. Pflanzenernähr., Düngung Boden.* 32A, 50-70(1933); cf. C. A. 25, 3426.—The increase in moisture and ash-free weight of mycelium from the 5-day growth of *A. niger* in 75 ml. flasks contg. 30 ml. nutrient soln. with 1% citric acid and both 2.5 and 7.5 g. soil over growth in check flasks without soil furnishes a reliable index to the soil's supply of available  $\text{P}_2\text{O}_5$ . The weights of mycelium obtained and the soil's need for  $\text{P}_2\text{O}_5$  are related thus:

Weight over 2 controls		Need for $\text{P}_2\text{O}_5$
2.5 g. soil	7.5 g. soil	
0.16-0.40 g.	0.24-0.60 g.	Unconditional
0.40-0.54	0.60-0.86	Conditional
Over 0.54	Over 0.86	None

The indications of the *A. niger* method resemble more closely those of the citric acid extn. of König-Hasenbäumer (C. A. 24, 4574) than the growth of plant seedlings according to Neubauer-Schneider. Fifteen references.

C. J. Schollenberger

The phosphoric acid fertilization of legumes. Arnold Kornfeld. *Phosphorsäure* 3, 594-623(1933).—Thomas meal was as efficient as superphosphate in increasing the yield of legumes, particularly lucerne and soy beans. In field expts. on a neutral soil the plants soon showed the full fertilizing effect of superphosphate, whereas Thomas meal was slower in action; in contrast to Thomas meal, superphosphate showed no secondary fertilizing action. Both fertilizers shortened the vegetation period, particularly of soy beans. The effect of inoculation in retarding

the ripening of soy beans was overcome by the use of phosphate fertilizers. Phosphates had a favorable effect on the root system, and there was a correlation between the setting of root nodules and the digestible protein content of the plants. The use of phosphate fertilizers has made the growth of legumes profitable in certain Roumanian districts. Twenty-five references. K. D. Jacob

Detection of the change in potassium and phosphoric acid contents of soil during a vegetation period by the soil investigation method of Wrangall. Hans Stahl. *J. Landw.* 81, 223-48(1933).—Five soils were carefully sampled to a depth of 15 cm. In addn. a few deeper samples were taken. Exts. by pressing out the soil soln. and repeated extns. in water were made after a fixed amt. of fertilizer was added. Analyses indicated that the  $P_2O_5$  quickly absorbed is tightly held but a portion is sol. by repeated extn. with water. K is more easily extracted than  $P_2O_5$ . Irvin C. Brown

The phosphate question. VI. Estimation of phosphate requirement. O. Arrhenius. *Z. Pflanzenernähr., Düngung Bodenk.* 32A, 1-20(1933).—About 6000 soil samples from Swedish fields on which percentage increases in various crops following  $P_2O_5$  fertilization were also detd. were examined for (I) citric acid-sol.  $P_2O_5$  (cf. C. A. 23, 5534), (II) lactate-sol.  $P_2O_5$  (cf. Egner, C. A. 27, 3278) and (III) 0.01% NaCl in  $H_2O$ -sol.  $P_2O_5$ . The data are tabulated and analyzed by statistical methods. Indications from I showed high correlation with field results, II was fairly good, III of practically no value. C. J. S.

Effect of increased applications of phosphates on the yield and quality of tobacco. B. Swietochowski. *Doswiadczalnictwo Rolnicze* 6 (1930); *Phosphorsäure* 3, 767.—P fertilizers increased the yields, improved the quality and hastened the time of ripening of tobacco. N fertilizers had a deleterious effect on the quality.

K. D. Jacob  
The phosphate fertilization of potatoes. Vowinckel. *Phosphorsäure* 3, 735-9(1933).

K. D. Jacob  
The citric acid solubility of phosphates. J. D'Ans, I. Polhe and W. Schuppe. *Z. Pflanzenernähr., Düngung Bodenk.* 32A, 70-84(1933).—Soln. of  $P_2O_5$  in 2% citric acid at 18-20°, widely used as an index of availability of phosphates, is shown to be dependent upon size of sample and other factors. Under some conditions it is considerably increased by  $Ca(NO_3)_2$  or  $KNO_3$ , an effect mistakenly attributed to increase in availability from fusion with these salts, and decreased more by  $CaCO_3$  than by  $CaO$ , because of the formation of a difficultly sol. film on the particles of  $CaO$ . Small samples of tech.  $CaHPO_4$  and  $Ca_3(PO_4)_2$  are almost completely dissolved; larger samples approach a limit in soly. asymptotically. Curves for Florida and pebble phosphates are similar; samples less than 5 and 3 g., resp.,/250 ml. are more, and larger samples less, sol. than  $CaHPO_4$ , but exceed  $Ca_3(PO_4)_2$  throughout. With samples less than 4 g., the soly. of apatite exceeds that of  $Ca_3(PO_4)_2$ . Dissolved  $P_2O_5$  from Rhenania phosphate increases rapidly with sample size up to 2.5 g., then decreases sharply, and is less than that from Florida raw phosphate with 10 g. and larger samples. A similar but less pronounced decrease in soly. was shown by basic slag, but both these artificial phosphates are in general more sol. than the other materials. Study of soly. curves over the whole range is a safer basis for judgment of fertilizer value than single detns. C. J. S.

What influence has fineness of basic slag, Kossair and Toria phosphates and Kola apatite upon the fertilizing action of their phosphoric acid? C. Krügel, C. Dreyssing and H. Kurth. *Z. Pflanzenernähr., Düngung Bodenk.* 32A, 302-20(1933) cf. following abstr.—Expts. with oats in Mitscherlich pots of humus sandy loam,  $pH$  7.2, indicated basic or Thomas slag at the rate of 40-160 kg./ha. to be by far the best source of  $P_2O_5$  among those tested. Percentages of efficiency with fineness were 22.5% for 75-100-mesh, 28.0% for 100-200-mesh and 33.0% for slag passing a sieve with 200 meshes/in. The raw phosphate rocks of similar fineness and  $P_2O_5$  contents were less than 5% efficient in all tests. The apatite increased slightly in efficiency with fineness, but the other

ground phosphate rocks did not. Conclusion: Raw phosphates are unsuitable for use on nearly neutral mineral soils. Extensive review with data and 37 references.

C. J. Schollenberger  
Is superphosphate used as top dressing as valuable as when worked into the soil? C. Krügel and C. Dreyssing. *Z. Pflanzenernähr., Düngung Bodenk.* 12B, 440-60(1933).—See C. A. 28, 555<sup>4</sup>. C. J. Schollenberger

The effect of different colloidal soil materials on the efficiency of superphosphate. Philip L. Gile. U. S. Dept. Agr., *Tech. Bull.* 371, 1-49(1933).—Detns. are given of the effects of 17 surface soils and 14 subsoils on the efficiency of superphosphate. Addns. of some soils greatly reduce the efficiency of superphosphate as compared with its efficiency in pure quartz sand while other soils increase its efficiency. Thirteen of the 14 subsoils tested impart a lower efficiency than the corresponding surface soils. Soils contg. colloids with a high  $SiO_2$ -sesquioxide ratio may enhance the efficiency of superphosphates while those contg. colloids with low ratios depress efficiency. The same is also true of subsoil materials. Charcoal and peat increase somewhat the efficiency of superphosphate and phosphate rock in pure quartz sand and the efficiency of superphosphate in sand and soil mixts. The effect of a soil colloid on superphosphate seems to depend on the degree to which the colloidal material is satd. with  $P_2O_5$ , the  $SiO_2$ -sesquioxide ratio of the colloid, the effect of the colloid on the H-ion concn. of the medium and the content of org. matter. The availability of rock phosphate on the other hand seems to be governed primarily by the H-ion concn. of the medium. The efficiencies of superphosphate calcd. from the wts. of crop increases are about the same as those calcd. from the quantities of  $P_2O_5$  recovered in the crops. Fifty-four references. W. H. Ross

Causes of the action of Thomas meal. A. Wilhelmj. *Phosphorsäure* 3, 577-80(1933); cf. C. A. 27, 5809; 28, 556<sup>1</sup>.—A summary of recent investigations relating to the soly., action and mobility of the P and the importance of the Ca, Si, Mg and Mn in Thomas meal.

K. D. Jacob  
The "active lime" in Thomas meal. S. Gericke and K. H. Siemens. *Phosphorsäure* 3, 665-87(1933).—The abs. soil-neutralizing value of the lime in Thomas meal cannot be detd. directly, but the activity of the lime can be detd. indirectly by comparison with limestone and other standard liming materials. A study of the changes in  $pH$  values and hydrolytic acidities of 2 acid soils indicated that the neutralizing value of the total lime in Thomas meal is at least as high as that of the same amt. of lime in the form of marl; field expts. and chem. lab. tests gave similar results. The lime of Thomas meal and of marl dissolved more rapidly in 0.025 N HCl than in 0.025 N AcOH; in both acids, the av. initial rate of soln. of Thomas-meal lime was somewhat greater than that of marl lime and somewhat lower than that of fine-marl lime. A 10%  $NH_4Cl$  soln. dissolved approx. 10% more of the total lime from Thomas meal contg. 10-12%  $SiO_2$  than from meal contg. 5.0-6.0%  $SiO_2$ . In field expts., the percentage activity of the lime in Thomas meal and in marl decreased with increase in the total amt. applied to the soil.

K. D. Jacob  
Fertilizer experiments in the service territory of the agricultural station Laufen, Upper Bavaria. Schubeck. *Phosphorsäure* 3, 739-47(1933).

K. D. J.  
Soil analysis as a guide to fertilizer practice. H. Sappok. *Ernähr. Pflanze* 29, 441-3(1933).—The Neubauer values for some Upper Silesian soils are given. The analytical methods of Neubauer, Dirks and Niklas as a guide to individual fertilization of these soils gave good results. The results show a greater need for  $K_2O$  than for N or  $P_2O_5$ . John O. Hardesty

Open questions of the fertilizer consultant. F. Sekera. *Phosphorsäure* 3, 641-64(1933).—The accuracy and practical value of lab. methods for detg. the acidity and fertilizer requirements of soils are discussed. The  $pH$  values of several samples of soils in contact with the roots of living plants ranged from 4.9 to 6.0 as compared with  $pH$

values of 6.0-6.1 for samples of the same soils further removed from the plant roots. K. D. Jacob

An account of pot tests made during the year 1933. G. Demortier. *Bull. inst. agron. sta. recherches Gembloux* 2, 360-73(1933).—Special investigations on the application of N during growth showed that the yield of spring wheat is affected if the reserve of N in the soil is insufficient or if the second applications are made too late.  $MgCl_2$  and  $CaCl_2$  used against dust on roads do not prove very prejudicial to nearby plants. Under operating conditions these chemicals have to be applied at a rate of about 1000 kg. per hectare to begin to affect the yields while 3500-4000 kg. per hectare are highly toxic. J. R. Adams

Effect of individual elements on the growth and the active substances of some medicinal plants. Jan Macku. *Sborník Est. akad. zeměd. Prag A6*, 363(1931); *Phosphorsäure* 3, 767.—P was as effective as N in increasing the formation of sinapisole in *Sinapis alba*, but it had no effect on the wt. of the plants. The phosphate and  $NH_4$  ions had a superior effect in increasing the growth of *Lobelia inflata* and the production of lobeline; the K ion was detrimental. The best growth of *Carduus benedictus* was obtained by fertilizing the plants with Nitrophoska, but the highest yields of snicin were obtained with phosphate and N combinations; K compds. had an unfavorable effect on production of snicin. K. D. Jacob

Comparative investigations on the estimation of fertilizer needs of soils by the cataphoretic method of Reifenberg. B. Haritantis. *Z. Pflanzenernähr., Düngung Boden.* 32A, 348-57(1933).—Ten samples from 4 soil types were examd. for available  $P_2O_5$  and  $K_2O$  by Reifenberg's (cf. C. A. 26, 4068) cataphoretic method: a suspension of the sample in a large U tube was subjected to a current of 1.5-1.8 ma. for 2 hrs. and liquid was withdrawn from the resp. limbs of the tube for analysis. The indications were compared with those of 2 chem. procedures, Lemmermann's (cf. C. A. 14, 995) 1% citric acid extn. and von Sigmond's dil.  $HNO_3$  method for calcareous soils. In most cases, the relative values for samples from the same profile stood in the same order with all methods; this indicates that R.'s method has some value, but caution is necessary in interpreting its indications with soils differing in type. C. J. Schollenberger

Determination of fertilizer needs from root-soluble, citric acid- and water-soluble phosphoric acid. E. Knickmann. *Z. Pflanzenernähr., Düngung Boden.* 32A, 84-95(1933).—Examn. of several thousand soil samples, predominantly sandy, from the Lüneburg district by (I) Neubauer's (C. A. 18, 877) seedling method for root-sol.  $P_2O_5$ , (II) the Dirks-Scheffer (C. A. 24, 3070) procedure for  $H_2O$ -sol.  $P_2O_5$  and (III) an extn. with 1% citric acid designed to measure total available  $P_2O_5$  at min. expense, indicated the best correlation between I and III. In these comparisons, however, the frequency distribution is so wide that the significance of single detns. by III is in doubt. C. J. Schollenberger

American investigations on the placement of fertilizers for different crops. Gustav Rohde. *Ernähr. Pflanze* 29, 462 70(1933).—A review of investigations in the U. S. (cf. C. A. 27, 3769, 5462) which show that cotton, maize, potatoes and beans are better able to utilize fertilizer when it is properly placed in the row or in the hill than when it is broadcast. Thirteen references. J. O. H.

The autumn fertilization of winter crops. J. Kuhn. *Deut. Land. Presse* 59, 427(1932); *Phosphorsäure* 3, 756.—When winter rye, wheat and barley were fertilized in the autumn with complete fertilizers the plants showed good growth and resisted the cold better. Heavy applications of N fertilizers, particularly in the early autumn, may cause the plants to develop so rapidly as to be damaged by heavy snows. Expts. with Thomas slag indicated that a better utilization of the P of water-insol. phosphates can be obtained by autumn applications than by spring applications. K and P fertilizers are not leached from the soil and there is no danger of their loss by autumn application, whereas N may be lost from light soils. K. D. J.

Effect of nitrogen fertilization on the recovery of a York [apple] orchard from drought injury. R. D. An-

thony. *Penn. State Hort. Assoc. News* 10, No. 1, 20, 22-3 (1933).—Fertilization of apple trees, grown in a poorly watered orchard, with  $NaNO_3$  for 7 years at the rate of 5-15 lb. per tree annually did not increase the production of fruit, as compared with the check trees, during the season following the 1930 drought. As indicated by the increased terminal growth of the branches during 1932, N fertilization had a marked effect in promoting recovery of the trees from drought injury, the effect increasing with the amt. of  $NaNO_3$  applied. K. D. Jacob

The effect of nitrogenous fertilizers on the growth and yield of wheat and barley in South Australia. II. The effect of a previous crop on the response of wheat to nitrogenous fertilizers, and the effect of increasing amounts of nitrogen on barley. A. E. V. Richardson and H. C. Gurney. *Empire J. Exptl. Agr.* 1, 325-32 (1933); cf. C. A. 28, 556.—When wheat was grown in rotation with (1) bare-fallow, (2) wheat, (3) barley, (4) oats and (5) peas, without fertilizer or with 2 cwt. superphosphate and 1 cwt.  $(NH_4)_2SO_4$  per acre, the highest yields were obtained after (1) or after (5). A supplementary application of 1 cwt.  $(NH_4)_2SO_4$  per acre gave no significant increase with wheat after (1), but gave a substantial response after (2), (3) or (4). The percentage of N in barley grain was practically unaltered by application of 0-56 lb.  $(NH_4)_2SO_4$  per acre; application of more than 100 lb./acre materially increased the N content and reduced the quality of the grain for malting purposes. N fertilizers increased the no. of ear-bearing tillers per barley plant. K. D. Jacob

The influence of initial fertilization on the yield of winter wheat. H. Schmidt and W. Kleberger. *Das Superphosphat* 9, 74-8(1933).—Initial fertilization with superphosphate, basic slag or Rhenania phosphate and  $(NH_4)_2SO_4$  or  $CaCN_2$  in the fall was superior to early spring fertilization. When  $NaNO_3$  was used, the spring fertilization was more effective, but in general  $NaNO_3$  gave less returns than did the other N carriers. Superphosphate, Rhenania phosphate and basic slag gave yields in the ratio of 100:100:98, resp., when used with  $(NH_4)_2SO_4$ , 99:98:97 with  $CaCN_2$ , and 99:99:98 with  $NaNO_3$ . With a 40% K salt the crop netted a return in the ratio 57:50:44 for fall fertilization and 45:37:26 for spring fertilization. K. C. Beeson

Experiments with commercial fertilizers on cereals Gyula Surányi. *Köztelek* 41, 855, 965(1931); *Phosphorsäure* 3, 639.—Comparative expts. were carried out with superphosphate and Rhenania phosphate, as acid- and alk.-reacting fertilizers, resp. In general, Rhenania phosphate, either alone or in combination with K and N fertilizers, gave better results than superphosphate when the 2 materials were used under the same conditions. Detn. of the P requirements of the soils by the Christensen-Niklas method gave results that agreed with those of field expts. in approx. 67% of the cases. K. D. Jacob

Effect of fertilizing with commercial fertilizers on the development of clover varieties. Ö. Villax. *Köztelek* 42, 94(1932); *Phosphorsäure* 3, 766; cf. C. A. 26, 5373.—Pot expts. were carried out with lucerne, red clover and sainfoin grown in a poor Ca-contg. pit-sand, a rich Ca-contg. loam and a Ca-deficient peat soil. In all soils, P fertilizers, especially in conjunction with K fertilizers, increased the growth of the plants, the increase being very pronounced in many cases. Likewise, P and P-K fertilizers greatly increased the root development of the plants and the growth of root nodules. Addn. of N compds. to the P-K fertilizers slightly increased the growth of the plants, but usually reduced the favorable effects of P and K on the roots. K. D. Jacob

Fertilizer experiments in the flax-producing "sovkhoz" (Soviet State Farm) "Bogatuir." A. M. Sveshnikov, P. A. Korzhagin and V. S. Pavlenkov. *Chemisation Socialistic Agr.* No. 11-12, 53-65(1932).—Expts. are reported on the effects of fertilizers on flax, oats, potatoes, sunflowers and rye in a no. of podzol subtypes. It is pointed out that complete fertilizers are very effective on these crops and as to the flax the effects are also noticed on the quality of the fiber. Simultaneously with the increase

in yield and quality of fiber the fertilizer addn. increased the no. of weeds.

**Problems on the fertilizing of fruit in England.** G. A. Cowie. *Ernähr. Pflanze* 29, 379-81(1933); cf. C. A. 25, 5912.— $K_2O$  deficiency occurs in most all of the fruit-growing districts, especially on light soils, badly weathered soils and heavy damp soils. Soils with a high lime content promote chlorosis in growing fruit. A summary is given of past work on fertilizer problems respecting fruit.

John O. Hardesty

**Method of fertilizer application for canning peas.** F. L. Muslach. *J. Am. Soc. Agron.* 26, 70-4(1934).—Better yields are generally secured on silt loams under normal moisture conditions by drilling as compared with broadcasting fertilizers. On light sandy soils losses due to germination injury are more likely where fertilizers are drilled in the row. Under normal conditions in Wisconsin it is safe to drill with the seed 250-300 lb. of 20% superphosphate and approx. the same amt. of a complete fertilizer relatively low in N, such as 2-12-6 or 2-16-8. This results in increased vigor of plants, better filling of pods and a hastening of maturity.

J. R. Adams

**Experiments with yams in Trinidad, 1931-3.** R. Cecil Wood. *Empire J. Exptl. Agr.* 1, 316-24(1933).—Increased yields of yams were obtained by fertilizing with composts prep'd. from chopped corn stalks, ground limestone,  $(NH_4)_2SO_4$  and superphosphate. Undecomposed org. matter was ineffective.

K. D. Jacob

**Fertilizer and manure for corn.** C. A. Mooers. *Tenn. Agr. Expt. Sta., Bull.* 149, 3-15(1933).—Field trials show the application of  $NaNO_3$  and  $(NH_4)_2SO_4$  is most beneficial when made at the time the corn plant is from a few in. to 1 ft. high. Inorg. sources of N gave much greater crop responses and yields than org. sources of N on soils well supplied with P and K but deficient in N. All the field tests showed K was not required on any of the soils used in the field expts. On soils deficient in P, the addn. of 200 lb. of superphosphate per acre gave uniform and profitable increases in yield.

C. R. Fellers

**The fertilizing of sugar cane.** H. H. Dodds. *Empire J. Exptl. Agr.* 1, 368-80(1933).—A review. Thirty references.

K. D. Jacob

**The fertilizing of tea.** T. Eden. *Empire J. Exptl. Agr.* 1, 297-300(1933).—A review of investigations on the effects of N, P and K fertilizers on the yield and quality of tea. Twenty-one references.

K. D. Jacob

**The effect of fertilizers on the ripening of the embryo of brewing barley.** Ottokar Heinisch. *Z. Pflanzenernähr. Düngung Bodenkd.* 12B, 503-24(1933).—Field expts. in Czechoslovakia with various fertilizer combinations for barley varieties on fine sandy loam,  $pH$  8.1, indicated that varietal and seasonal differences are more important with respect to germ development than fertilization. In all tests, completely fertilized plots matured first; lack of  $P_2O_5$  had the greatest influence in delaying maturity. Extensive review with 64 references.

C. J. S.

**Investigation of a new calcium cyanamide: "Peril-Kalkstickstoff."** Ludwig Schmitt. *Deut. Landw. Presse* 60, 77(1933).—Expts. on an acid sandy soil,  $pH$  4.06, and a loam,  $pH$  6.81, showed that a granulated  $CaCN_2$ , "Peril-Kalkstickstoff," was somewhat superior to powd.  $CaCN_2$  in both cases, although the initial action of the granulated product on the acid soil was slower. This was due to the more rapid neutralization of the soil acidity by the powd.  $CaCN_2$ , although  $pH$  measurements showed that as good final neutralization was obtained with the granulated product as with the powder.

K. C. Beeson

**Comparative experiments with various nitrogen fertilizers (lime ammonium nitrate and ammonium sulfate) for stock beets.** O. Engels. *Z. Pflanzenernähr., Düngung Bodenkd.* 12B, 499-502(1933).—Lime ammonium nitrate produced by I. G. Farbenindustrie contains 20.5% N as  $NH_4NO_3$  and 35%  $CaCO_3$ , formed into small spherules and dyed green. Field expts. with yellow Eckendorfer beets indicated that it is slightly superior to  $(NH_4)_2SO_4$  as a source of N, as measured by yields of beets, tops and dry matter per acre, although the sugar content of beets grown

with this fertilizer was lower than on any other plot.

C. J. Schollenberger

**Vegetation investigation with oats to clear the question of the replaceability of potassium by rubidium.** E. Blanck, F. Giesecke and W. Henkeshoven. *J. Landw.* 81, 205-21(1933).—The utilization of essential  $K_2O$  by the plant is hindered by the poisonous effect of  $Rb_2O$ .

Irvin C. Brown

**Sand and water culture experiments with lithium and rubidium with special reference to the possibility of substituting these elements for potassium in plant nutrition.** K. Scharrer and W. Schropp. *Ernähr. Pflanze* 29, 413-25(1933).—Wheat, rye, barley and oats decrease in sensitivity to the Li ion in the order named. Exptl. results on peas, buckwheat, mustard, red clover, lucern and perennial rye grass showed that the substitution of equiv. quantities of Li for K resulted in decreased yields, and the plants died as soon as the K had been completely replaced by Li. Gradually substitution Rb for  $K_2O$  in fertilizer applied to maize and spring barley resulted in a gradual decrease of yields to zero. Thirty-one references.

John O. Hardesty

**The possibility of the substitution of rubidium and cesium for potassium in plant nutrition.** F. Alten and R. Gottwick. *Ernähr. Pflanze* 29, 393-9(1933).—A gradual substitution of Rb for K in normal complete fertilizers used on oats in pot tests decreased the yield and was harmful to grain formation. Chem. analyses of the grain and straw showed that the use of Rb instead of K caused little difference in the total amt. of cations present. Rb displaces K in the grain and decreases the N, Ca and Mg contents of the straw. The leaf of tobacco plants receiving K showed an increased content of  $K_2O$  and a corresponding decrease in the remaining cations. Plants receiving Rb showed a reduced content of K, Na and Ca and an increase in Mg. Cs and Rb in  $H_2O$  cultures of maize retarded growth and caused premature curling of the roots. The greater toxicity of Cs confirms the lyotropic series of Höber ( $Li < Na < K < Rb < Cs$ ). Twelve references.

John O. Hardesty

**The influence of increasing applications of potash on the potash content of soil and plant.** Werner Wöhlbier and W. Schramm. *Ernähr. Pflanze* 29, 437-41(1933).— $K_2O$  fertilizer, applied to acid soils which were deficient in  $K_2O$  according to Neubauer analysis, resulted in decreased starch content and yield of potatoes. Pot expts. with oats on these  $K_2O$ -deficient soils from Rostock, Mirow and Kotzou showed that all of the  $K_2O$  applied as fertilizer was utilized by the plant except where high applications were made. Analyses of the soils after the removal of the plants with the roots showed that, with the exception of those receiving high application of  $K_2O$ , the total amt. of  $K_2O$  was the same in all soils as was also the degree of soly. of the  $K_2O$ . These soils do not absorb  $K_2O$  readily. Applications of KCl were largely retained by these soils.

John O. Hardesty

**The replaceable potassium content compared with field response to potash fertilization of some Oklahoma soils.** H. F. Murphy. *J. Am. Soc. Agron.* 26, 34-7(1934).—Oklahoma soils contg. less than 60 p. p. m. of replaceable K generally respond to  $K_2O$  fertilization if other factors are favorable for plant growth. Cropped soils contained less replaceable K than virgin soils. The replaceable K content of a fertilized soil was much higher than that of the corresponding soil which had never received any fertilizer applications.

J. R. Adams

**The root system of Coffea arabica. II. The effect of some soil conditions in modifying the "normal" root system.** F. J. Nutman. *Empire J. Exptl. Agr.* 1, 285-96(1933).—A neutral or slightly acid soil is the most favorable to the root growth of coffee. In general, good root growth is not obtained in soils more acid than approx.  $pH$  5.8-6.0.

K. D. Jacob

**Effect of certain cropping systems on the yield and quality of Havana tobacco.** A. B. Beaumont, M. E. Snell and E. B. Holland. *Mass. Agr. Expt. Sta., Bull.* 297, 3-27(1933).—Continuous culture of tobacco increased

soil acidity. The use of a rotation, cover crop or manure with tobacco, stabilized soil reaction. C. R. Fellers

**How much magnesia should be applied to tobacco land?** T. R. Swanback, O. E. Street and P. J. Anderson. Conn. Agr. Expt. Sta., *Bull.* 350, 466-73 (1933).—The optimum content of Mg in tobacco is 1.5-2% of the moisture-free wt. of the cured leaf. When the percentage is less, the combustion is incomplete and a dark ash accompanied by a less desirable taste and aroma results. If the Mg is above 2.5%, the ash is whiter but is undesirable in that it flakes too much. Application of 100 lb. per acre of magnesian limestone (MgO content 30%) was the optimum. Overliming of tobacco soils result in increased black root-rot.

C. R. Fellers

**Relation of calcium to the growth of tobacco.** T. R. Swanback, O. E. Street and P. J. Anderson. Conn. Agr. Expt. Sta., *Bull.* 350, 473-8 (1933); cf. *C. A.* 27, 3740.—Three functions of Ca in the tobacco are: (1) it neutralizes oxalic and other acids produced within the plant or taken from the soil in surplus quantity; (2) as Ca pectate it is an essential constituent of the cell walls; and (3) Ca serves as a vehicle in the translocation of nitrate and probably other anions. Approx. 5% CaO in the air-dry tobacco leaf corresponds to optimal growth of the plant. The higher the Ca content of the leaf, the lower will be the content of K and Mg. Probably Na and  $\text{NH}_4$  have a somewhat depressing effect on the absorption of Ca by the tobacco plant. The availability of Ca compds. for tobacco varied considerably and was in the order of decreasing availability: nitrate, sulfate, oxide, acetate, carbonate, oxalate, monophosphate, tartrate, triphosphate and citrate. In general, approx. 4 times as much Ca as Mg is required for optimal growth. There is a possibility that an insufficient absorption of Ca by the plant may be the ultimate cause of *brown root-rot* of tobacco. Poor absorption may be due, not to low Ca in the soil, but to an improper balance of bases. The addn. of  $\text{CaSO}_4$  at the rate of 300 lb. per acre restored normal growth to tobacco. Other good sources of Ca are cottonhull ashes and  $\text{Ca}(\text{NO}_3)_2$ . Great care is necessary that excessive available Ca is not added to soil or a reaction favorable to black root-rot development occurs.

C. R. Fellers

**Sudan grass as hay, silage and pasture for dairy cattle.** J. R. Dawson, R. R. Graves and A. G. Van Horn. U. S. Dept. Agr., *Tech. Bull.* 352, 1-28 (1933).—Data are presented giving the results of 3 yrs. expts. at the Woodward, Okla., Dairy Expt. Station on the yield, chem. compn., and comparative feeding value for milk production of Sudan-grass hay cut at 4 different stages of maturity. The chem. compn. of the hay, in general, is closely related to maturity of the plants when cut and to a certain extent follows the no. of days of growth. As the no. of days of growth increase, the percentages of crude fiber and of N-free ext. also increase; but the percentages of protein and of fat decrease. The highest yield of protein per acre is obtained when the hay is cut at the first-heads-out stage. The equiv. of 33% more nutrients is secured per acre in the form of Sudan-grass hay cut at the first-heads-out stage than from Sudan grass when grazed.

W. H. Ross

**Chemical composition of herbage from Massachusetts pastures.** J. G. Archibald and Emmett Bennett. Mass. Agr. Expt. Sta., *Bull.* 300, 2-7 (1933).—Analyses on approx. 100 samples of pasture herbage from western Mass. showed that moisture, protein and P decreased from spring to autumn, while fiber and Ca increased. There is a very definite relation between moisture content of the grass and its content of protein and P. In general, the soils were low in available P and had a  $pH$  range from 5.1 to 6. Low-P content of the soil and low-quality herbage seem to be correlated factors. P-deficient soils result in crops contg. low P, and in turn a P deficiency in farm animals.

C. R. Fellers

**Disinfectants and disinfection.** F. B. Hadley and E. C. McCulloch. Wis. Agr. Expt. Sta., *Extension Circ.* 256, 3-12 (1933).—General.

C. R. Fellers

**Tests of soil disinfectants.** C. A. Jørgensen. *Tids. for Plantavl.* 39, 316-28 (1933); *Rev. Applied Mycol.* 12,

709-10.—*Pythium de Baryanum* on cauliflower was completely controlled by Carbololie (oil) 1 and 11, Germisan, Kerol, Koefod-Johnsen's soil sterilizer, phenol, formalin, and heating the soil 2-3 hrs. at 90-5°. Excellent control of *Rhizoctonia (Corticium) solani* on cucumbers was obtained by Uspulun,  $\text{HgCl}_2$  plus salt-peter, and by heating as above. Phenol, formalin, Uspulun and sterilization by heat entirely eliminated *Plasmodiophora brassicae* on swedes. Generally speaking the results show no superiority for the patent preps. as compared with pure chemicals or sterilization by heat.

O. E. S.

**Petroleum products as spray spreaders.** Hubert Martin. *J. Soc. Chem. Ind.* 52, 429-32T (1933); cf. *C. A.* 27, 5464.—Miscellaneous petroleum products were examd. as to their suitability for use as spray spreaders. They have been classified according to the method of Pilat, *et al.* (*C. A.* 27, 2287). Crude Ca  $\gamma$ -sulfonates have excellent spreading properties unaffected by mineral acids or by any insecticidal or fungicidal spray material now in practical use. Both the crude Na  $\beta$ -sulfonates and alkali naphthenates possess excellent spreading properties but are ineffective in the presence of excess CaO or  $\text{CuSO}_4$ . The Na  $\beta$ -sulfonates may be more suitable than fatty acid or resin soaps for the prepn. of miscible oils. Crude naphthenic acids, by reason of the phytocidal properties of the crude oil present, are unsuitable for the prepn. of spray spreaders. Products of the sulfonation of oxidized petroleum oils contain emulsifying agents with promising spreading properties unaffected by the addn. of  $\text{CuSO}_4$  or of insecticides or fungicides contg. CaO. Ichthammol, a pharmaceutical prep., has spreading properties unaffected by sol. Ca or Cu compds.

**Facts concerning the spray-residue problem pertinent to the fruit vegetable industries.** Alvin J. Cox. Calif. Dept. Agr., *Monthly Bull.* 22, 389-96 (1933).—In order to come within the U. S. tolerances for As and Pb, 0.01 and 0.02 grain per lb., resp., of fruit or vegetable, many Calif. crops must be subjected to HCl or other spray-removal treatment. The spray residue remaining from a Pb arsenate-oil spray is much more difficult to remove than plain Pb arsenate. The As:Pb ratio in acid-washed Calif. fruit does not exceed 1:2.5. However, soda ash or alk washes remove less Pb than As, the ratio being as wide as 1:5 or 1:7. The F tolerance is also 0.01 grain per lb. Fluorides are readily removed by washing fruits and vegetables. It is recommended that produce such as celery be examd. and certified as within the As and Pb tolerance at the shipping point.

C. R. Fellers

**The future of spray-residue removal [from apples] in Pennsylvania.** H. G. Ingerson. *Penn. State Hort. Assoc. News* 9, No. 1, 37-44, 46-9 (1932).—Heavy rains in late August and early Sept. cause no significant reduction in the amt. of As adhering to apples sprayed with Pb arsenate. The smooth-skinned varieties of apples retain less As than the rough-skinned varieties. Addn. of lime to Pb arsenate sprays facilitates removal of the As; removal is more difficult when casein spreaders are used, and is still more difficult in Pb arsenate combinations with oils or oil soaps.

K. D. Jacob

**Regulatory control of wetting agents used in agriculture.** J. Vinas. *Ann. fals.* 26, 517-28 (1933).—The value of wetting agents is due to their power to reduce surface tension. Various methods of detg. the surface tension of liquids are outlined and discussed from the standpoint of their value for evaluating wetting agents used in conjunction with agr. sprays.

A. Papineau-Couture

**Fineness and chloride content of dusting kainite and its influence upon the results in combating weeds.** C. Husemann. *Z. Pflanzenernähr., Düngung Bodenb.* 12B, 468-72 (1933).—Three lots of kainite with 63, 32 and 54%, resp., of the material as used passing a sieve with 0.2 mm. square mesh by shaking only were compared as to effectiveness against sheepsorrel and other weeds when dusted at the rate of 400 lb./acre. It was concluded that with increase in fineness according to the above test, there is a decrease in tendency to form aggregates and an increase in Cl content, with increased herbicidal effect. A high

percentage of fine material in kainite indicates low  $H_2O$  and absence of much hygroscopic impurity. C. J. S.

**The control of powdery mildew in snap beans.** H. T. Cook. *Trans. Peninsula Hort. Soc.* 22, 5, 4 pp.(1932); *Rev. Applied Mycol.* 12, 673.—Of 11 fungicides tested for their efficacy against powdery mildew of snap beans Kolodust, lime-sulfur dust and dry lime-sulfur spray gave the most satisfactory results. For practical purposes dry lime-sulfur spray should prove generally effective if applied 3 or 4 times beginning soon after the appearance of the disease. Oden F. Sheppard

**The leaf spot disease of soy beans—a potash-deficiency phenomenon.** Arnold Kornfeld. *Z. Pflanzenernähr., Düngung Bodenk.* 32A, 201-21(1933).—Soy-beans grown in the Siebenbürgen district of Roumania are subject to abnormalities such as irregular yellow to brown spots on the leaves, delayed maturity, tendency to chlorosis and fall of leaves with inferior yields and quality. Analyses of the ash of various parts of the abnormal plants indicated only 70-80% of the usual  $K_2O$  content. Pot expts. with  $K_2O$  fertilizers resulted in normal appearance and growth, and also improved the germination of seed from plants adequately fertilized, as compared with those grown on unfertilized soil and suffering from the above symptoms of  $K_2O$  starvation. C. J. Schollenberger

**Copper seed treatments for the control of damping-off of spinach.** P. P. Pirone, A. G. Newhall, W. W. Stuart, J. G. Horsfall and A. L. Harrison. N. Y. (Cornell) Agr. Expt. Sta., *Bull.* 566, 3-25(1933).—Damping-off disease, caused by *Pythium ultimum*, was effectively controlled in both field and greenhouse by treating the seed with a 1% soln. of  $CuSO_4$ . Equally effective was the method of dusting the seed with  $Cu_2O$  dust, in which 1 lb. of powder was used to 65 lb. of seed. The cost of treating 20 lb. of seed, sufficient to plant 1 acre, does not exceed 25¢. The av. yield increase in field tests of seed-treated plots over controls was approx. 2 tons per acre. C. R. Fellers

**Cottony cushion scale in Puerto Rico.** George N. Wolcott. *J. Puerto Rico Dept. Agr.* 17, 193-221(1933).—Cottony cushion scale caused by *Icerya purchasi* is becoming widely dispersed in P. R. and is very destructive to citrus and other crops. During dry weather almost perfect control is obtained by spraying with a standard emulsion of heavy engine oil, fish oil and soap of which 60 lbs. oil is the stabilizer. C. R. Fellers

**The present status of the potato-scab question.** Floess. *Phosphorsäure* 3, 726-34(1933).—Scab occurs most frequently on potatoes grown in light porous soils; it develops most readily in alk. soils, and physiologically acid fertilizers should be used on such soils. The possibility of the development of scab is not always directly related to the  $pH$  of the soil because of differences in the buffering powers of different soils. The application of a sufficient amt. of Ca-contg. material is necessary to obtain the most efficient utilization of fertilizer (particularly N) and the max. yield of potatoes on acid soils; this does not necessarily favor the incidence of scab. Green manures and stable manure act as scab preventatives, whereas feces and hog manure from fattening establishments favor its development. K. D. Jacob

**Effect of mosaic on the tonnage and the juice of sugar cane in Pusa.** III. W. McRae. *Indian J. Agr. Sci.* 3, 870-80(1933); cf. C. A. 27, 803.—As compared with healthy cane, mosaic-infected cane gave a smaller yield of juice contg. a slightly lower percentage of glucose. The effect on sucrose and juice purity was not statistically significant. K. D. Jacob

**Notes on the biology of *Certostomella ulmi* (Schwarz) Buisman, the agent of the Dutch elm disease.** M. Boudru. *Bull. inst. agron. sta. recherches Gembloux* 2, 310-43(1933).—*C. ulmi* grows with difficulty in liquid media. The most suitable growing conditions seem to correspond to  $pH$  values ranging from 3.2 to 4.4. The influence of  $pH$  values on the growth is scarcely noticeable between  $pH$  4.4 and 7.4. The behavior of *C. ulmi* according to the initial acidity of the medium seems to imply the existence of 2 biol. states, each possessing a particular isometabolic point. *C. ulmi* is plainly acidifying and does not reduce

oxidized dyes. It has, in the whole, very small nutrient needs and possesses a large power of adaptability. Solns. of  $HgCl_2$  and  $NiSO_4$  at concns. of 1/2000 showed relatively poor action as fungicides on *C. ulmi* while Janus green, aniline green and brilliant green at concns. of 1/250,000; quinosol and Et Hg chloride at 1/1,000,000; and Sunoxol and malachite green at 1/2,000,000 were remarkably effective. J. R. Adams

**Life history, bionomics and control of the white fly of cotton (*Bemisia gossypiperda* M. & L.).** M. Afzal Husain and Kidar Nath Trehan. *Indian J. Agr. Sci.* 3, 701-53(1933).—Attack of the insect on cotton seemed to be favored to a slight extent by the use of N fertilizers, the infestation being heaviest on plots receiving farmyard manure and lightest on those receiving  $NaNO_3$ . The condition of the plants and the opening of the bolls were improved by spraying with a mixt. of rosin compd. and fish-oil soap. K. D. Jacob

**Report and investigations on the beet-fly.** R. Mayné and W. van den Bruel. *Bull. inst. agron. sta. recherches Gembloux* 2, 273-307(1933).—Treatment with NaF on the first generation was successful in destroying the flies when weather conditions were favorable. Lab. tests on the efficiency of various poisons showed that the best concn. of poison in the bait with 2% sugar was 0.4% NaF or 0.2-0.3%  $NaSiF_6$ .  $BaSiF_6$  gave some good results but its action was much slower than that of NaF or  $Na_2SiF_6$ . Artificial cryolite acted much too slow and gave poor results. It was found that when solns. were used it was best to spray during the middle of the day. Climatic conditions had an important bearing on the destruction of these flies. J. R. Adams

**Fumigation experiments on Messinian fig trees.** S. Kalogerca. *Praktika (Akad. Athenon)* 7, 72-5(1932).—Comparative results are tabulated to show the varying success of  $SO_2$ ,  $CO_2$ ,  $C_2H_5Cl_2$  +  $CCl_4$  and  $CS_2$  +  $CO_2$  as fumigating agents upon fig trees. Exposures varied from 1 to 24 hrs. at temps. from 21° to 30°. Equal parts of  $CS_2$  +  $CO_2$  for 8 hrs. produced complete sterilization. Lucien Y. Dyrenforth

**Pyrethrum controls cabbage worms.** Ray Hutson. Mich. Agr. Expt. Sta., *Quart. Bull.* 16, 100-1(1933).—Carefully applied pyrethrum spray or dust gives good control of cabbage worms. The pyrethrum should be mixed with an inert carrier such as talc, bentonite or flour in the ratio of 1 to 2, and applied at the rate of 25-30 lb. of the mixt. per acre. C. R. Fellers

**Damage caused by bean worms and some important problems connected with their control.** H. K. Plank. Calif. Dept. Agr., *Monthly Bull.* 22, 365-78(1933).—Since the bean plant is very susceptible to As or S injury great care must be used in spraying this plant. Even moderate rates of application resulted in a concn. of 0.11 grain of  $As_2O_3$  per lb. on the bean straw and moderately severe injury to the growing beans. Arsenic sprays are not recommended for beans. Ba fluosilicate applied at the rate of 8 lb. per acre gave fairly good control of bean insects. C. R. Fellers

**Recent experiments in the control of two Puerto Rican ants.** Geo. N. Wolcott. *J. Puerto Rico Dept. Agr.* 17, 223-39(1933).—Hormiga brava, *Solenopsis geminata*, out-of-doors can be only imperfectly controlled by spraying citrus groves and plantings with a phenol-kerosene emulsion. TI compds. proved ineffective out-of-doors, but indoors a  $Tl_2(SO_4)_2$  sirup gave complete control. Against the hormiguilla, *Myrmelachista ambigua ramulorum*, a bait of ground meat and  $TlCl_3 \cdot H_2O$ , gave very good control. C. R. Fellers

**Inhibition of selenium injury to wheat plants by sulfur.** Annie M. Hurd-Karrer. *Science* 78, 500(1933).—The addn. of 15 p. p. m. of Se to soil causes young wheat plants to become extensively chlorotic, but the simultaneous addn. of large amts. of S or sulfate prevented the effect. With a S:Se ratio of 12 the plants were completely uninjured; with a ratio of 8 chlorosis began to appear, and with a ratio of 2 growth was largely inhibited. The absorbed Se thus probably replaces, or may be replaced by, S in org. compds. in the plants. K. V. Thimann

Detn. of nitrate in soils (Treschow, Gabrielsen) 7. Utilization of the by-products of sewage disposal [as fertilizer] (Rumsey) 14. Phosphoric acid [fertilizers] and baking quality (Lemmerzahn) 12. Colorimetric detn. of K (Alten, *et al.*) 7. Detergents [products used in manuf. of insecticides and fungicides] (Brit. pat. 398,818) 18. Bipyridyls [products useful for destroying pests] (Ger. pat. 588,041) 18.

**Fertilizer.** Willy Bissner (to I. G. Farbenind. A.-G.). U. S. 1,939,165, Dec. 12. A fertilizer suitable for storage and which can be readily scattered comprises a homogeneous salt contg. about 3 and 1 mol. proportions of  $\text{NH}_4\text{NO}_3$  and  $(\text{NH}_4)_2\text{SO}_4$ , resp. Cf. C. A. 28, 562<sup>9</sup>.

**Fertilizer.** Curtis B. Locklin. U. S. 1,939,858, Dec. 19. A satd. brine contg. a K salt is treated with small proportions of sulfates and carbonates of K and Na; the percentage of K present is detd. for the purpose of properly adjusting the proportions in the eventual product and a definite amount of assayed phosphatic material in ground form is added to the soln. and the resulting mixt. is calcined.

**Fertilizer.** Michael Ward (50% to Howard R. Morrison). U. S. 1,941,371, Dec. 26. Earth is passed through smoke to impregnate it with carbon contained in the smoke and is then placed on the ground as an enriching agent. App. is described.

**Fertilizers.** La Soc. d'études pour la fabrication et l'emploi des engrais chim. (Robert Platt, inventor). Ger. 588,140, Nov. 13, 1933 (Cl. 16.5). See Fr. 676,747 (C. A. 24, 3077).

**Fertilizer.** Emil Neufeldt. Ger. 585,725, Oct. 9, 1933. A fertilizer is obtained by pressing defecation slime dried by flue or furnace gases. App. is described.

**Fertilizer composition.** Audrey Hill. U. S. 1,939,850, Dec. 19. A mixt. comprising ground cast iron, steel and Fe ore is maintained at a temp. of about 43° and is moistened with water for 2-4 weeks and the resulting mass is mixed with about 5% of metallic Ca.

**Fertilizers from organic refuse.** Chem. Werke vorm. H. & E. Albert. Ger. 586,743, Oct. 25, 1933 (Cl. 16.14). Addn. to 573,036 (C. A. 27, 3026). The method of Ger. 573,036 is modified by effecting the treatment with  $\text{H}_2\text{PO}_4$  in the presence of a nonpoisonous oxidizing agent, e. g.,  $\text{K}_2\text{O}_2$ ,  $\text{Al}(\text{NO}_3)_3$  or  $\text{KClO}_3$ .

**Treating putrifiable organic wastes.** George H. Earp-Thomas. U. S. 1,938,647, Dec. 12. For rendering inoffensive wastes such as wet garbage, the material is inoculated with thermophile aerobic bacteria such as soil bacteria and aerated and agitated while its bacterial decompn. is effected under controlled temp. and the product is dried and may be mixed with various other fertilizer ingredients.

**Insecticide.** Bruno Rewald (to Hanscatische Mühlenwerke A.-G.). U. S. 1,938,864, Dec. 12. The Cu salt of lecithin is used (suitably together with oil, water, etc.) in insecticides suitable for spraying plants.

**Insecticide.** Henry L. Renard. U. S. 1,941,055, Dec. 26. Finely divided naphthalene and tobacco dust are used together so that the particles of naphthalene are impregnated with a portion of the nicotine content of the tobacco and the tobacco particles are impregnated to some extent with naphthalene. This compn. is suitable for use on the ground around plants.

**Insecticides** I. G. Farbenind. A.-G. Fr. 754,735, Nov. 13, 1933. Esters of carboxylic acids of a cyanohydrin are used along with a solid or liquid dispersing agent as insecticides. The esters are prepd. by causing a cyanide soln. to act on a mixt. of an unsatd. aliphatic aldehyde and an aryl halide or a substitution product thereof. Examples are given of the prepn. of the acetic ester of cyclohexanone- ( $b_{11}$  118°) and crotonaldehydecyanohydrin

( $b_{11}$  85-7°), the benzoic ester of crotonaldehyde- ( $b_{11}$  159-60°), sorbicaldehyde- ( $b_{11}$  158-9°), acrolein- ( $b_{11}$  138-40°) and  $\alpha$ -ethyl- $\beta$ -propylacrolein-cyanohydrin ( $b_{11}$  156-8°), the 2,5-dichlorobenzoyl ester, ( $b_{11}$  145-6°, m. 47°), and the naphthoic ester of crotonaldehyde-cyanohydrin ( $b_{11}$  180-2°).

**Insecticide compositions.** Imperial Chemical Industries Ltd. Fr. 754,477, Nov. 8, 1933. Compns. having properties analogous to soaps are made by causing nicotine or tobacco oil bases or their salts to react with an inorg. ester of a long-chain aliphatic alc. to give a quaternary  $\text{NH}_4$  salt or a mixt. contg. quaternary  $\text{NH}_4$  salts. Thus, a compd. may be obtained by heating nicotine-HCl with dodecyl bromide.

**Insecticidal compositions.** Heinrich Hess. Austrian 135,144, Oct. 25, 1933 (Cl. 45g.). Use is made of a mixt. of an insecticide and a chloroethylene, with or without a solvent. A suitable compn. comprises a 2% soln. of PhOH in  $\text{C}_2\text{H}_5\text{Cl}$ , or a mixt. of aq.  $\text{CH}_2\text{O}_2$ , MeOH 10 and  $\text{C}_2\text{HCl}_3$  100 parts by vol.

**Insecticide or insect repellent.** Dudley H. Grant (to Standard Oil Development Co.). U. S. 1,940,646, Dec. 19. A compn. suitable for use with water as a spray contains an insecticidal oleoresin of pyrethrum or the like and an oil-sol. alkali metal salt of sulfonic acid material derived from petroleum and may also contain soap, derris ext., etc.

**Insecticidal powder suitable for dusting on plants.** Amos E. Badertscher (to McCormick & Co.). U. S. 1,940,899, Dec. 26. A finely divided non-alk. inert material such as talc or bentonite is sprayed with a soln. of the active principle of pyrethrum in a volatile solvent such as a light petroleum distillate and the solvent is evapd. while agitating the material at a suitable evap. temp.

**Insecticide and fungicide.** August Maier. Ger. 581,926, Oct. 27, 1933 (Cl. 45f. 3.03). Use is made of a soln. of naphthalene in  $\text{CS}_2$  and oil soap for irrigating plants.

**Apparatus for mixing mineral oil or other film-forming germicide or fungicide with water and vaporizing the mixture for spraying plants.** Benjamin Clayton, Walter B. Kerrick and Henry M. Stadt. Brit. 397,837, Aug. 23, 1933.

**Fungicides.** Imperial Chemical Industries Ltd. Fr. 754,414, Nov. 7, 1933. Fungicides are made by causing an alkali salt of a salicylic arylamide, their homologs or substitution products to react with a heavy metal compd., e. g.,  $\text{HgCl}_2$ ,  $\text{Pb}(\text{NO}_3)_2$ ,  $\text{CuSO}_4$  or  $\text{ZnCl}_2$ , is caused to react with salicylanilide.

**Disinfectants for seeds.** Guy H. Buchanan and Wm. Moore (to American Cyanamid Co.). U. S. 1,939,951, Dec. 19. An org. dithiophosphate such as Ph, Zn or Pb diethyl dithiophosphate is used with various other active agents and a diluent such as talc.

**Seed disinfectant.** Morris S. Kharasch (to E. I. du Pont de Nemours & Co.). U. S. 1,938,839, Dec. 12. Disinfectants in dust form are prepd. contg. Hg compds. of the general formula  $\text{RHgX}$ , in which R is an org. hydrocarbon radical (such as Me, Et, Pr, Bu or Ph) and X is a cyanide, thiocyanate, phosphate, borate, tetraborate, nitrate, oxalate, benzoate or lactate radical.

**Horticultural spray.** Amos E. Badertscher (to McCormick & Co.). U. S. 1,938,652, Dec. 12. Pine oil and an insecticide such as a kerosene ext. of pyrethrum is used with a sufficient addn. of dipentene substantially to negative the tendency of the pine oil to burn foliage. The compn. may be used in the form of an aq. soap emulsion.

**Treating plants with copper sulfate.** Augustin I. F. R. Joué-Delmas. Fr. 754,965, Nov. 17, 1933. The pressure necessary for the functioning of the app. is obtained by dissolving  $\text{NaHCO}_3$  and K alum in the  $\text{CuSO}_4$  soln so as to obtain a liberation of  $\text{CO}_2$ .

## 16—THE FERMENTATION INDUSTRIES

C. N. FREY

Report of the laboratories of the experimental station for grain distilleries and fermentation industries. G. Staiger. *Brennerei-Ztg.* 50, 22(1933).—Analytical results (moisture, alc. yield and diastase) were detd. on 20 kiln-dried distillery malts, 4 green malts and a product sold as malt substitute. Results are tabulated and discussed. S. Józsa

Report from the laboratories of the experimental station for grain distilleries. G. Staiger and M. Glaubitz. *Brennerei-Ztg.* 50, 127(1933).—Twenty mashes of various grains were analyzed (acidity, apparent attenuation, diastase, degree of grinding, starch; alc., alc. after completed fermentation, condition of yeast and bacteria). The results are tabulated. S. Józsa

Absolute alcohol by the new gypsum process of the I. G. Farbenindustrie. Erich Opfermann. *Papier-Fabr.* 31, Tech. wiss.-Teil 533-5(1933).—Operation of a pilot plant producing 60 l./hr. of 99.8% EtOH by the process of Ger. pat. 537,612 (C. A. 26, 1296) and 573,539 (C. 1, 27, 4240) is described. R. H. Doughty

Determination of the higher alcohols (fusel oil determination). B. Bleyer, W. Diehmair and E. Frank. *Z. Untersuch. Lebensm.* 66, 389-95(1933).—Different aldehydes were investigated for their usefulness in the colorimetric detn. of higher alcs. (Komarowsky reaction) and their method of working compared with salicylaldehyde, which is almost exclusively used. The authors believe that *p*-diaminobenzaldehyde gives more exact results than salicylaldehyde. The mechanism of the Komarowsky reaction is discussed, and it is shown that the previously given explanation must be corrected. F. L. Dunlap

The identification of sorbitol in the presence of dulcin and saccharin. G. Reif. *Z. Untersuch. Lebensm.* 66, 408-12(1933).—By the action of BzH and H<sub>2</sub>SO<sub>4</sub> (1:1) on dulcin a red color, benzaldulcin, is produced. Benzaldulcin gives on acetylation a cryst. Ac compd. By the action of aq. H<sub>2</sub>SO<sub>4</sub> and acetone on benzaldulcin a yellow-red color is produced with the setting free of BzH. As dulcin gives the same reactions as sorbitol, it must, when it has been added to a wine, be removed before testing for sorbitol. For the removal of dulcin from wine, no special precautions are necessary, as it is completely adsorbed when present by the C used in the Werder sorbitol detn. Saccharin acts quite differently from dulcin toward H<sub>2</sub>SO<sub>4</sub> (1:1) and BzH in the identification of sorbitol. No benzal compd. is formed. The presence of saccharin does not destroy the sorbitol detn., because it is removed during the analysis by the acetylating process, and it gives no color with H<sub>2</sub>SO<sub>4</sub> and acetone. Saccharin is also completely adsorbed by the C from wine. F. L. D.

A study of the use of wheat in fermentation. Pei-Sung King. *Chem. Ind. (China)* 8, 51-66(1933).—Data are recorded for expts. with *Aspergillus oryzae* and *Rhizopus japonicus*, superior yields of alc. being obtained with the former. Wm. H. Adolph

Fermentation of dextrans. G. Staiger and M. Glaubitz. *Brennerei-Ztg.* 50, 135(1933); cf. *Ibid.* 1925, No. 1667; 1929, No. 1876 and C. A. 20, 61.—Sols. were prepd. from saccharose, dextrin and yeast ext. They were fermented for 3 days at 28-30°. Pombe and Logos yeast were used for the fermentation; culture M and 152 were the checks. Further expts. were carried out on a rye mash and dextrans pptd. from beer by alc. No evidence could be found to support the assumption that Pombe and Logos yeasts should contain dextrinase. Expts. with zymase prepd. according to Buchner's method did not show fermentation in the presence of dextrin. S. J.

The use of spices (drugs) in the spirit industry. C. Luckow. *Brennerei-Ztg.* 50, 65-6(1933).—The use of ginger, limousin wood (*Quercus ilex*), mint and manna is discussed. S. Józsa

Use of rye and potato flakes for the manufacture of spirits. B. Drews. *Brennerei-Ztg.* 50, 93-4(1933).—Rye might be mashed without using malt. The ground

grain is mixed with 3 parts of cold water and let stand overnight. In summer when the temp. is high the mash is held for 2 hrs. at 50°. The mash is held for 1 hr. at 60°. Should the rye contain very little diastase 4-6% green malt must be added to obtain sufficient conversion. Directions for working under pressure are given. Similar directions are given for potato flakes and its combination with rye. S. Józsa

Combined use of rye and potato flakes. F. Wendell. *Brennerei-Ztg.* 50, 2(1933).—The principal idea is to utilize the diastase of rye in mashing potato flakes. By use of 2/3 of rye and 1/3 potato flakes the use of malt can be eliminated entirely. Practical advices are given. 3 The ground rye is doughed in with cold water for overnight. The temp. should not be raised to avoid souring. Rye mashes have the tendency to froth badly during fermentation. Attempts are made to eliminate frothing by special yeast cultures. S. Józsa

Composition of sweet must of grapes and apples and their content in arsenic, copper and zinc. C. v. der Heide and K. Hennig. *Z. Untersuch. Lebensm.* 66, 321-38(1933).—Analytical values are given for sweet musts from grapes and fruit, together with the amts. of Zn, Cu and As. Many references to the literature are given. F. L. Dunlap

Estimation of the alcohol content of liquors and essences. Olli Ant-Wuorinen. *Z. Untersuch. Lebensm.* 66, 444-6(1933).—See C. A. 27, 2755. F. L. Dunlap

Low-alcohol and alcohol-free malt beverages. A. I. Stepanov. *Izvestiya Tsentral. Nauch.-Issledovatel. Inst. Pishchevoi Vkusovoi Prom.*, Separate, 1931, 42 pp.—A review of the art of making beer with low EtOH content and with no EtOH. Many literature and patent references are cited. Julian F. Smith

Tables for the determination of alcohol and extract content of wine from the specific gravity of alcohol-water mixtures and from saccharose solutions at 20°, referred to water at 4°. C. v. der Heide and H. Mändlen. *Z. Untersuch. Lebensm.* 66, 338-41(1933). F. L. Dunlap

Ebullioscopes and the alcohol contents of white wines. G. Lhermie. *Ann. fals.* 26, 546-52(1933).—The difference in the alc. content of 50 white wines, as detd. by the Malligand ebullioscope and from the d. of the distillate, resp., varied from -0.2 to +1.5% by vol. No relationship could be worked out between the difference in the results of the 2 methods and the compn. of the wine, and it is concluded that the ebullioscope is of little or no value for detg. the alc. content of such wines. A. P.-C.

Colorimetric determination of iron in red wines. J. Ribereau-Gayon. *Ann. fals.* 26, 552-4(1933).—Polemical with Dubaquié (C. A. 27, 5886). A. P.-C.

Determination of arsenic and of phosphoric acid, copper, zinc, iron and manganese in must and wine. C. v. der Heide and K. Hennig. *Z. Untersuch. Lebensm.* 66, 341-8(1933).—Simple colorimetric methods are given for the detn. of As, Cu, Fe, Mn and P<sub>2</sub>O<sub>5</sub>. The disadvantages of the older methods are pointed out. Zn detns. are made gravimetrically as ZnO. F. L. Dunlap

Acidimetry of wines. James Hossack. *Analyst* 59, 12-13(1934).—Instead of detg. "total acids" and "volatile acids" directly and "fixed acids" by difference it is more logical to det. this last value directly. To det. total acids, add 10 ml. of satd. BaCl<sub>2</sub> to 50 ml. of wine and make alk. with 50 ml. of 0.1 N NaOH free from carbonate. 9 Make up to 250 ml., mix and filter through rapid paper. To 100 ml. of the filtrate add 25 ml. of 0.1 N HCl and titrate with 0.1 N NaOH to a phenolphthalein end point. To det. fixed acids, evap. 50 ml. of the wine to dryness on the water bath and dry at 105°. Dissolve in a convenient vol. of water and proceed as before. Det. volatile acids as recommended in "Methods of Analysis, A. O. A. C." Method I. W. T. H.

When is brandy adulterated? Q. Lieven. *Brennerei-*

*Zig.* 50, 22(1933).—A general discussion referring to official German regulations. S. Józsa

Estimation of brandies with small samples on hand. J. Peltzer. *Brennerei-Zig.* 50, 14(1933).—Methods are described to carry out the fractional distn. with a 60-cc. sample. It is shown that the chem. analysis including total acidity, alc., fusel oil, total aldehyde, aliphatic aldehydes and ester might be carried out on a 60-cc. sample. S. Józsa

Water treatment (for brandies). C. Luckow. *Brennerei-Zig.* 50, 46(1933); cf. *C. A.* 27, 2756.—Various methods (lime-caustic soda, permutoite and electroösmosis) are discussed, particularly with respect to their use in the brandy industry. Electroösmosis has the advantage that the process can be controlled and water of any desired hardness can be obtained by using a larger or smaller no. of cells. S. Józsa

Turbidity in vermouth bitter. C. Luckow. *Brennerei-Zig.* 50, 59(1933).—Various ingredients were tried systematically. L. found that catechu and licorice are mainly responsible for turbidity, particularly when vermouth wine is stored at low temp. It is suggested that these 2 ingredients be extd. with 10% alc. instead of water, let stand until the ppt. is formed and filtered with a suitable filter aid. S. Józsa

Estimation of rum, arrak and cherry brandy by the abundance test. C. Luckow. *Brennerei-Zig.* 50, 86-7 (1933).—The organoleptic test on various dilns. is carried out by detg. the greatest diln. when the characteristic aroma of the brandy is still apparent. The diln. is made with water and not with alc. to overcome the anesthetic effect of the latter. Dilns. are made from 10,000 to 100,000 with rum and arrak, and 1,000-20,000 with cherry brandy. The result gives a fair figure for cutting the brandy. S. Józsa

Examination of foreign yeasts. G. Staiger and M. Glaubitz. *Brennerei-Zig.* 50, 35(1933).—Twenty-seven yeast samples were tested and examd. Outside appearance, smell and taste, fermentation test in dough, keeping test at 35°, moisture, protein and  $P_2O_5$  content were detd. Biol. assay is included in the results, which are tabulated. S. Józsa

Utilization of organic nitrogen by highly aerated yeasts (in the molasses feed method of yeast manufacture). A. G. Khomich and E. V. Doinikova. *Schriften zentral. biochem. Forschungsinst. Nahr.-Genussmittelind.* (U. S. S. R.) 3, 85-109(1933).—The proteolytic enzymes of yeast were found to be unable to hydrolyze the protein of lupine seed. Optimum conditions were, therefore, detd. for autolytic dissolving of the N compds. of germinated lupine seed. In the aerobic molasses method of making yeast there is no unfavorable effect on yield or quality when  $(NH_4)_2SO_4$  is replaced by yeast autolyzate, and there is an advantage in that a higher molasses concn. can be used. Julian F. Smith

Resistance of compressed yeast toward sulfuric acid. F. Wagner. *Brennerei-Zig.* 50, 111(1933).—Earlier knowledge on this subject is confirmed. It was found that a protein-rich compressed yeast can be treated with water contg. 40 cc.  $H_2SO_4$  per 100 cc. A small amt. of cells will be destroyed; their no., however, is so small that it is of no importance. S. Józsa

Studies on yeast maceration juice. A. C. van Wijk and F. M. Muller. *Biochem. Z.* 267, 102-18(1933).—Keeping the bottom beer yeast 24-48 hrs. at 1° yields subsequently a juice with generally better fermenting capacity. The duration of maceration is also of great influence upon the fermenting ability of the juice. Destruction of zymase by too prolonged maceration is attributed to proteolytic action. Addn. of boiled juice results in the formation of a juice with great fermentation potency, because of its antiproteolytic action. S. M.

Color test for glycerol [in wine, vinegar] (Täufel, Thaler) 7. Identification of whortleberry juice (Diemair, Lix) 12. Pure coned. grape juices of Algerian origin (Fabre, Bremond) 12. Active allergic substance in hops (Gutmann) 17.

Biological transformation of carbon monoxide to methane. Franz Fischer and Rudolf Lieske. U. S. 1,940,944, Dec. 26. See Brit. 365,544 (*C. A.* 27, 1933).

Azeotropic distillation system for recovering anhydrous methanol and ethanol from crude mixtures obtained by fermentation. Reichsmonopolverwaltung für Branntwein. (Richard Fritzweiler and Karl R. Dietrich, inventors). Ger. 585,065, Dec. 8, 1933 (Cl. 6b. 25).

Apparatus for distilling alcohol. Firma E. Merck. (Otto von Keussler, inventor). Ger. 584,052, Sept. 14, 1933 (Cl. 6b. 25). Addn. to 575,910 (*C. A.* 27, 4874).

Concentrating alcohol from aqueous solutions. Floi Ricard and Henri M. Guinot (to U. S. Industrial Alc. Co.). U. S. 1,940,699, Dec. 26. In effecting concn. by continuous distn. and rectification in exhaustion and concn. zones, combined with distn. in the presence of an entraining liquid in a third zone, vapors from the concn. zone are introduced as a whole and directly into the lower part of the third zone and suffice for the heating of this zone. The reflux necessary for the concn. in the concn. zone is supplied by reflux from the third zone, and, at a region between these zones, alc. of a concn. higher than that of the azeotropic mixt. of water and alc. is continuously withdrawn. App. is described.

Denatured alcohol. Charles Baron and Henri Hennebute. Fr. 42,890, Nov. 15, 1933. Addn. to 742,061 (*C. A.* 27, 3555). The process of Fr. 742,061 applies to crude alcs. of all kinds as well as to rectified EtOH. Cf. *C. A.* 27, 4873.

Continuous production of esters of ethyl alcohol. Otto Fuchs (to Deutsche Gold- und Silber-Scheidanstalt vorm. Roessler). U. S. 1,939,116, Dec. 12. A mash is de-spirited by distn., and the resulting vaporous mixt. is directly esterified without previous condensation by reaction with an aliphatic monocarboxylic acid such as HOAc.

Acetic acid and glucose production by fermentation of mashes of cellulosic material such as corn cobs, sawdust, etc. Philippe A. Tetrault (to Wisconsin Alumni Research Foundation). U. S. 1,939,736, Dec. 19. A sterile culture medium of dil. cellulosic mash contg. nutritive salts and at a temp. of about 90-100° is inoculated with thermophilic microorganisms naturally developed in soil and manure and the culture is incubated at 55-65°; cultures which show less vigorous fermentation are heated to destroy the less resistant microorganisms; sterile cellulosic mash is inoculated with the remaining microorganisms to obtain sub-cultures, which are incubated and heated as before to obtain vigorous cultures which are finally further incubated with agar and used for the main fermentation of cellulosic material.

Vinegar. Ernst Simon. Ger. 589,429, Dec. 7, 1933. (Cl. 6c.). A soln. of glucose or other carbohydrate is fermented with acetic bacteria, e. g., *B. ascendens*, in a nonoxidizing atm., and the product is aerated in known manner to convert it into vinegar.

Malting. Augustinus E. Jonsson. Fr. 755,163, Nov. 21, 1933. An app. is described for removing the heat developed in the germination by an indirect cooling and for removing by air the  $CO_2$  formed.

Apparatus for dispensing measured quantities of spirits, etc. Wm. Mair Rolph. Brit. 398,253, Sept. 14, 1933.

Distillation of wines. Soc. des établissements Barbet. Fr. 42,866, Nov. 15, 1933. Addn. to 702,284 (*C. A.* 25, 4084). Modifications of the app. are given.

Yeast. Otto Hummer. Austrian 135,538, Nov. 25, 1933 (Cl. 6f.). Cultivation is begun in an aerated nutrient sugar soln., and is continued until the nutrient medium is exhausted. The used medium is then replaced completely by fresh medium, and this replacement process is repeated periodically. Mediums of different compn. or concn. may be used in the successive stages, which may also be conducted under different conditions of temp. and aeration. The process is a modification of that of Austrian 119,946 (*C. A.* 25, 1329).

Yeast. I. G. Farbenind. A.-G. (Fritz Lange, inventor). Ger. 585,992, Oct. 14, 1933. The amt. of invertase in

yeast is increased by fermentation in a dil. soln. of saccharose under diminished pressure.

Yeast. Masajiro Mizutani. Ger. 586,805, Oct. 26, 1933 (Cl. 12p. 15). The starting material for prepg.

<sup>1</sup> hypoglucosamine is obtained by treating yeast with picric acid, extg. the resulting picrate with 80% (or weaker) alc., concg. the ext. and finally decomposing the picrate by addn. of  $\text{Na}_3\text{PO}_4$ .

## 17—PHARMACEUTICAL CHEMISTRY

W. O. EMERY

**Diazo reaction of adrenaline.** Gitaro Nakayama. *Japan J. Med. Sci. II, Biochem.* 2, 285-90 (1933).—In the Ehrlich diazo reaction 3,4-dihydroxyphenylalanine and pyrocatechol behaved like adrenaline with respect to color and sensitivity. Adrenalone gave a nonspecific golden brown color. 2,4-Dihydroxyphenylalanine gave a strong, very stable orange-red color. Rachel Brown 150th birthday of Sertürner. Höll. *Pharm. Post.* 3 64, 577 (1933).—A discussion of the life and personality of Friedrich Wilhelm Sertürner, the discoverer of morphine. H. M. Burlage

**Simple method of designating strengths of solutions and liquid mixtures.** Ludwig Ternaigo. *Pharm. Monatsh.* 14, 229-30 (1933).—Criticizing the present methods of denoting strengths of solns. as indefinite, T. proposes the use of the letters "G" or "V" signifying the wt. or vol. of the soln. or mixt. and "g" or "v" for the quantity of the substance dissolved. The following possibilities in which alc. and water mixts. are used as examples are given: (1) "70Vv%" denotes a mixt. of 70 vol.-units of alc. in 100 vol.-units; (2) "70Vg%", a spirit contg. 70 vol.-units of alc. in 100 wt.-units; (3) "70Gg%", a spirit contg. 70 wt.-units of alc. in 100 wt.-units; and (4) "70Gv%", a mixt. of 70 wt.-units of alc. in 100 vol.-units. It is recommended if this scheme were accepted for universal use that the letters "G" and "g" be replaced by "P" and "p" (from word *Pondus* = weight). For the expression of strengths of standard solns. T. favors writing normalities as  $N/1$ ,  $N/10$ , etc. H. M. Burlage

**Evaluation of ergot with the aid of the nephelometer.** Sandor Tukats. *Pharm. Monatsh.* 14, 246-7 (1933).—The following procedure is described for the detn. of the alkaloids of this drug by the use of Mayer's reagent: (1) **Prepn. of the standard soln.**—Into a 50-cc. graduated flask introduce 1 cc. of a *Secoin* soln. (strong), (Chinoin) or *Gynergen* (Sandoz) corresponding to 1 mg. ergotamine and dil. to 48 cc. with 0.5% tartaric acid soln. Add 20 drops Mayer's reagent and make up to vol. (0.002%). This standard soln. is used in different dilns. for comparison with unknown solns. in the nephelometer. (2) **Detn. of the alkaloidal content.**—Introduce into a centrifugal tube of 30-cc. capacity 0.1 g. of finely powd. ergot and 20 cc. petr. ether, stopper with a cork, shake for  $\frac{1}{4}$  hr. in a shaking app.; then centrifuge and carefully draw off the ether layer with a suction pipet. Repeat the extn. twice with 10 cc. petr. ether. Dry the defatted drug in the tube at 30-40°. Add 20 cc. of a mixt. of 1 part  $\text{MgO}$  and 3 parts  $\text{H}_2\text{O}$ , add 10 cc.  $\text{Et}_2\text{O}$ , allow to stand for 10 min., shake  $\frac{1}{4}$  hr., centrifuge and draw off the  $\text{Et}_2\text{O}$  and introduce into a separatory funnel. Wash the mixt. in the tube with 10 cc.  $\text{Et}_2\text{O}$  and then rinse the pipet. Repeat the extn. process. Shake the  $\text{Et}_2\text{O}$  extns. with 0.5% tartaric acid soln. using portions of 20, 15 and 10 cc. In order to avoid loss of material it is advisable before the 2nd and 3rd extn. to rinse the outlet tube of the separatory funnel with a few drops of the solvent. Collect the extns. in a flask, filter through a hard filter into a 100-cc. graduated flask, wash the filter with the acid soln. and add sufficient acid soln. to the flask to a vol. of 95 cc. Add 20 drops Mayer's reagent and make up the vol. to 100 cc. A light milky turbidity is produced, distribute by shaking and allow to stand for 1-2 min. and compare with the standard soln. in a nephelometer. Results compare well with those obtained by the German Pharm. method. (3) **Detn. of the alkaloid in ergot preps.**—Dilute 1 cc. of the prepn. with 5 cc.  $\text{H}_2\text{O}$ , make alk. with 0.5 cc. heavy  $\text{MgO}$  suspension, ext. 3 times with 10-cc. portions of  $\text{Et}_2\text{O}$  and

shake the combined  $\text{Et}_2\text{O}$  exts. 3 times with 10-cc. portions of 0.5% tartaric acid soln; evap. the solvent from the aq. exts., introduce into a 50-cc. graduated flask and add Mayer's reagent, make up to vol. with 0.5% tartaric acid soln. and compare with the standard soln. (1). Results compare well with those obtained by biol. methods. H. M. Burlage

**Historical names of definite drug groups.** Arthur Krajanski and Bohuslav Lavicka. *Pharm. Monatsh.* 14, 248-53 (1933).—Historical discussion. H. M. Burlage

**Raw materials of cosmetics.** Karl Pfaff. *Riechstoff-Ind.* 8, 193-4 (1933); cf. C. A. 28, 853<sup>a</sup>.—The conclusion of a series of articles dealing with the ingredients of cosmetics including ceresin, paraffin, petrolatum and liquid petrolatum. Formulas are included. H. M. Burlage

**Coriander oil and its utilization. I. Preparation of linalyl acetate.** (A new method for the acetylation of linalool.) Vatsche Isagulyantz and E. Smolyaninova. *Riechstoff-Ind.* 8, 194-7 (1933).—The following method converts almost quantitatively the linalool in coriander oil into the acetate with little side reaction in the cold: Into an Al app. provided with a stirrer and a worm condenser introduce 120 kg. linalool (fraction obtained from the oil with a content of about 70% linalool), 90 kg.  $\text{Ac}_2\text{O}$  (at least 90%) and 0.6 kg. of a catalyzing mixt. (90 pts.  $\text{Ac}_2\text{O}$  + 10 pts. orthophosphoric acid). The temp. gradually rises to 38-40° and should be maintained with the aid of cold water in the worm condenser. After stirring the mixt. for 2 hrs. allow to stand for 12 hrs. at room temp. Neutralize by running the mixt. into a washing app. contg. 20-30 l.  $\text{H}_2\text{O}$  to sep. the major portion of the  $\text{AcOH}$  and a part of the  $\text{Ac}_2\text{O}$  in the form of 20-30 %  $\text{AcOH}$ , which is sepd. and treated with 10% soda soln. (90 pts.  $\text{Ac}_2\text{O}$  + 10 pts. orthophosphoric acid). The temp. gradually rises to 38-40° and should be maintained with the aid of cold water in the worm condenser. After stirring the mixt. for 2 hrs. allow to stand for 12 hrs. at room temp. Neutralize by running the mixt. into a washing app. contg. 20-30 l.  $\text{H}_2\text{O}$  to sep. the major portion of the  $\text{AcOH}$  and a part of the  $\text{Ac}_2\text{O}$  in the form of 20-30 %  $\text{AcOH}$ , which is sepd. and treated with 10% soda soln. Wash the crude linalyl acetate with a satd. soln. of  $\text{NaCl}$  until neutral. Transfer the acetate to a receiver and dry with anhyd.  $\text{Na}_2\text{SO}_4$  and distil in a vacuum app. At 60-90° (15 mm.) terpenes are sepd.; at 90° a fraction contg. 20% linalyl acetate is obtained; at 95-115° a fraction consisting of 85-92% of the compd. and some geranyl acetate is collected. The latter fraction may be distd. to sep. the 2 compds. H. M. Burlage

**The behavior of the principal fluidextracts of medicinal plants under the Wood light.** A. Soldi. *Ann. chim. applicata* 23, 455-62.—Results are tabulated of the examn. of 210 fluid exts. of medicinal plants. No relation between fluorescence and active principles could be noted. A. W. Contieri

**Proteins and nonprotein nitrogenous substances in the extract from medicinal herbs.** G. Barbera. *Ann. chim. applicata* 23, 462-70 (1933).—The upper parts of medicinal herbs contain a high percentage of nonprotein nitrogenous substances, essentially amino acids and amides. These represent about 50% of the total nitrogenous constituents of the herbs. The proteins pptd. by  $\text{EtOH}$  are mostly sol. in  $\text{KOH}$ ; they are conjugated proteins similar to those isolated from the sperm of tuna fish, by Alpani. A. W. Contieri

**Methods for examination of recent drugs, compiled by the group of hospital and commune pharmacists.** Anon. *Pharm. Weekblad* 70, 1330-6 (1933).—Phys. properties and tests for identity and purity are given for Ca acetyl-salicylate,  $\text{BzOCH}_2\text{Ph}$ ,  $\text{NH}_4\text{CO}_2\text{Et}$ , Na citrate,  $\text{HCO}_2\text{Na}$  and diacetylmorphine- $\text{HCl}$ . A. W. Döx

**An international method for determination of the morphine content of opium.** L. van Itallie. *Pharm. Weekblad* 71, 4-9 (1934).—The method of morphine detn. recommended by the Hygienic Commission of the League of

Nations is described in detail. It is based on the British Pharm. method, with slight modifications, and has already been adopted in the new Swiss and Danish Pharms.

A. W. Dox

The action of calomel on alkaloid salts and its value for toxicological investigation. J. J. L. Zwikker. *Pharm. Weekblad* 71, 22-9(1934).—The gray color reaction obtained by adding  $Hg_2Cl_2$  to the concd. soln. of an alkaloid HCl salt is not an actual reduction but a decompn. according to the equation:  $Hg_2Cl_2 \rightleftharpoons Hg + HgCl_2$ . If the alkaloid-HCl is sufficiently sol. it forms a complex with the  $HgCl_2$ , thus removing it from the system and shifting the equil. of the above equation to the right. The complex is decompd. by diln. and the reaction is then reversed. The color reaction is specific only in so far as it distinguishes readily sol. from difficultly sol. HCl salts of alkaloids. Its value in toxicology and analytical chemistry has been greatly overstd.

A. W. Dox

Investigations of tobacco smoke. III. E. Waser and Marta Stähli. *Z. Untersuch. Lebensm.* 66, 354-62(1933); cf. *C. A.* 27, 4025, 4025.—When cigaret tobacco contains 1% or more of nicotine, the nicotine content of the cigaret smoke increases proportionately with the nicotine content of the tobacco. The basic substances accompanying the nicotine have no influence on the detn. of the nicotine in the smoke. In the ordinary concns. in which they are found in the usual smoke investigations, they are pptd. by neither silicotungstic nor picric acids. Various substances are discussed, which have been used for the removal of nicotine from smoke.

F. L. Dunlap

Nicotine determination in tobacco and in nicotine-containing parasitocides. Wilhelm Mohr. *Z. Untersuch. Lebensm.* 66, 362-5(1933).—A method is described for detg. nicotine in tobacco and nicotine-contg. substances, which depends on its pptn. and detn. as nicotine picrate.

F. L. Dunlap

The determination of nicotine in tobacco smoke. II. B. Pfyl. *Z. Untersuch. Lebensm.* 66, 501-10(1933); cf. *C. A.* 22, 1214.—It is shown that smokers of cigarettes and cigars average 2 puffs per min. with an av. smoking time of 2 sec. and a vol. production of 40-50 cc. A method is given for the detn. of the combustibility. An equipment is described for reproducing the natural process of smoking. III. *Ibid.* 510-24.—A crit. discussion of factors concerned with obtaining comparable nicotine values—absorption of nicotine, prepn. of the absorption soln., moisture content of the tobacco, detn. of the amt. of tobacco smoked, statement of analytical values. A new and simplified method is given for the detn. of nicotine in tobacco smoke.

F. L. Dunlap

The standardization of thyroid preparations. Gundis Rotter and Erich Soos. *Arch. exptl. Path. Pharmacol.* 173, 614-21(1933).—The Harrington-Randall method of titrating thyroid prepn. makes possible an accurate differentiation between thyroxine and diiodotyrosine.

Harry Eagle

A new convenient method for the standardization of posterior pituitary extracts. Konrad Schübel and Walter Gehlen. *Arch. exptl. Path. Pharmacol.* 173, 633-41(1933).—The quantity of ext. required to stimulate the puerperal uterus of cats upon intramuscular and intravenous injection is used as the criterion of potency.

Harry Eagle

Chemical examination of commercial liver preparations for circulatory-active substances. Adolf Heinsen. *Klin. Wochschr.* 12, 1722-4(1933).—Campolon and Hepatrat do not contain either adenosine nucleotide or nucleoside; these are demonstrable in Hepatopson and Degewop.

Harry Eagle

A new, water-soluble digitalis preparation. Erich Hesse, Wilhelm Altner and Johanna Becher. *Klin. Wochschr.* 12, 1862-4(1933).—After preliminary extn. with benzene the leaves are extd. with 95% EtOH. The alc. ext. is purified by shaking with benzene, and then concd. with  $CHCl_3$  and pptd. with petr. ether in the usual manner. The glucosides so obtained are believed to correspond to those present in the leaves. Approx. 13% of

the prepn. injected intravenously into cats is bound by the heart.

Harry Eagle

Local anesthetics. Heinrich Münkner. *Apoth. Ztg.* 48, 1493-6, 1512-16(1933).—An address.

W. O. E.

Instability of alkaloids in aqueous solution, especially on sterilization. VII. Cocaine. R. Dietzel and O. Steeger. *Arch. Pharm.* 271, 521-37(1933); cf. *C. A.* 27, 4875.—By means of graphs and other exptl. data it is shown that for all the more common cocaine salts of which the acid dissocn. consts. are known, the decompn. of the cocaine may be detd. by a single quant. light absorption measurement and calcd. from a single corresponding  $pH$  observation. Especially does this apply to each and every  $pH$ , temp. between 0 and 100° and sterilization interval. If, as is commonly the case, the question of only moderate decompn. is involved, the very slight influence of the  $BzOH$  may be disregarded, a single  $pH$  measurement will suffice. Should the process of decompn. involve a question of improperly cleaned glass, accurate results could hardly be expected without previous control expts., since the alkali given off by various kinds of glass show such wide differences that the order of magnitude in changes of the  $pH$  concn. cannot be stated without further data. Not only is the kind of glass an important factor, but especially the  $pH$  of the soln. in question. Based upon a previously executed control, however, the change in sapou. velocity may be calcd. from the change in the  $pH$  concn.

W. O. E.

Volatile alkaloid in the mushroom *Helvella esculenta*. D. Ayc. *Arch. Pharm.* 271, 537-9(1933).—The presence of a volatile, apparently O-free alkaloid, has been established in the mushroom *Helvella esculenta*. While its exact chem. composition is as yet undetd., it appears to be liquid, and is characterized by an unpleasant mouse urine like odor, not unlike that of coniine and otherwise similar to that of nicotine. It yields ppts. with tannin, picric acid, iodized KI, as also with the reagents of Mayer, Dragendorff, Sonnenschein and Scheibler. The amt. present in the dried mushroom is extraordinarily minute.

W. O. E.

Analysis of opium, estimation of the six principal alkaloids. B. A. Klyachkina. *Arch. Pharm.* 271, 558-68(1933). See *C. A.* 28, 575.

W. O. E.

Active allergic substance in drug and useful plants: hops. M. J. Gutmann. *Heil- u. Gewürz-Pflanzen* 15, 89-92(1933).—Of the 9 principal constituents of hops examd. it is shown that lupuloné ( $\beta$ -hop bitter acid) represents the active allergic substance. By means of the biol. test it is possible to select from a series of hops that sample possessing these allergic phenomena in least degree. Furthermore, there is the possibility that addn. of some material to the finished product (beer) may operate completely to inhibit the activity of the allergic substance.

W. O. E.

Brazilian resins as bandage material. Fred W. Freise. *Heil- u. Gewürz-Pflanzen* 15, 95-6(1933).—The resins are obtained by the natives from various species of *Protium*. The prepn. and collection are described. The fresh product m. about 125°; its d. varies between 0.9985 and 1.025, depending on the age of the tree. The resin once hardened cannot again be softened by the native users. Subjected to steam distn. under diminished pressure it yields 11-18.5% of a bright yellow oil smelling of turpentine and having a  $d_{15}$  0.8928 and  $n_D^{20}$  1.4886, which dissolves in 10-14 parts of 90% alc. the initial clear soln. finally acquiring a slight opalescence. The compn. of the oil was not studied.

W. O. E.

Development in the culture of drug and condiment plants, as also of technical plants in Russia during the past few years. A. A. Ravetskii. *Heil- u. Gewürz-Pflanzen* 15, 132-5(1933).—A statistical review.

W. O. E.

W. O. E.

Viscosity and tinctures. Richard Holdermann. *Pharm. Ztg.* 79, 10-12(1934).—An exptl. study has been made of the viscosity of a series of tinctures; an Ostwald rubbing

tube was employed for the purpose and the data thus obtained were used in evaluating the tinctures. W. O. E.

**Nicotine content of some (Hawaiian) tobaccos.** Leonora N. Bilger, Mark Westgate and Robert Loveland. *Hawaii Agr. Expt. Sta., Rept.* 1932, 12-13(1933).—Analysis was made at different stages of growth on several varieties. In 5 varieties an av. of 2.5% of the nicotine was found in the young leaves, 2.74% in the medium-old leaves and 2.86% in the old leaves. In 4 out of 5 cases the nicotine content was lowest in the young leaves, in 2 cases reached its max. in the medium-old leaves and in 2 cases decreased in the old leaves. Various nicotine compds. were prepd. for exptl. trial as insecticides. These include nicotine, the tartrates, salicylate, sulfate, amide and nicotine mercuric chloride. C. R. Fellers

**Bay-oil investigations.** H. C. Henricksen. Puerto Rico Agr. Expt. Sta., *Annual Rept.* 1932, 20-1(1933); cf. C. A. 27, 565.—The young, tender and immature leaves gave 10-12% more oil than mature leaves. Stack fermentation of the leaves caused a change in the color of the oil from green to yellow and brown. Stack-fermented leaves gave less oil and a product of poorer quality as compared with fresh leaves. Recommendations in still construction are: (1) Baffles should be placed in the still heads to lessen the vol. of solids in the still; (2) distillate receivers of about 20-gal. capacity should be used; (3) pipes should be installed to carry clear water to the receivers; and (4) the oil should be filtered through filter-cel under vacuum. The distn. of ground-up leaves was of no advantage. C. R. Fellers

**Properties of the oil of chenopodium obtained by cross-fertilization of chenopodium ambrosioides with a wild variety from Kansas.** Anthelmintic value of the oil. E. J. LeBlanc and James W. Wilson. S. Dak. Agr. Expt. Sta., *Annual Rept.* 1932, 23-4(1933).—All the oil distd. at a pressure of 25-8 lb. of steam for 20-30 min. Possibly because of the drought, the yield of both oil and ascaridole, the active principle of the oil, was below normal. Exptl. de-worming of swine with the extd. oil was successful. Good results were obtained by the use of 1.5 cc. of oil to 50 lb. live wt. of swine. C. R. Fellers

**Newly introduced medicaments and pharmaceutical specialties.** Zernik. *Deut. med. Wochschr.* 59, 96, 291-5, 453, 814, 1006-7, 1364-5, 1675-6(1933).—Summarized description of new preps. introduced in Germany with references to the clinical reports bearing on these products. Arthur Grollman

**Inhepton-Merck—a new liver extract for injection.** L. Lissard. *Deut. med. Wochschr.* 59, 1850-60(1933). Arthur Grollman

**Determination of hexamethylenetetramine in medicinal preparations.** E. Schulek and V. Gervay. *Z. anal. Chem.* 92, 406-17(1933).—After reviewing the literature, a new procedure is described which depends upon liberating HCHO by boiling with  $H_2SO_4$ . If only 4 mg. of sample is taken, heating on the water bath for 10-20 min. with 2 drops of 50%  $H_2SO_4$  and 10 cc. of soln. suffices to accomplish the decompn. without loss of aldehyde by volatilization. In the macrodetn. it is better to start with 0.4 g. of sample, make up to 100 cc. and take 10 cc. of the soln. for analysis. Add 20 cc. more of water and 10 cc. of 50%  $H_2SO_4$ . Distill off the aldehyde until fumes of  $SO_2$  form in the flask; catch the distillate in a little water. Cool, add 25-30 cc. of water to the contents of the distg. flask and again evap. to fumes. Dil. the distillate to 100 cc., mix and take 30 cc. Add 5 cc. of 2 N KCN soln. which causes the aldehyde to form  $CH_2(OK)CN$ . After 15 min., add 5 cc. of 20%  $H_3PO_4$  and introduce satd.  $Br_2$  water until the liquid retains the yellow color due to excess  $Br_2$ . Then add 1-2 cc. of 5% phenol soln. to combine with excess  $Br_2$ , wait 5 min., then add 0.5 g. of KI and after 30 min. titrate the liberated  $I_2$  with 0.1 N  $Na_2S_2O_3$ . Det. the titer of the KCN by a similar titration. From each mol. of  $N_4(CH_2)_6$ , 6 mols. of HCHO is obtained. Each mol. of aldehyde reacts with 1 KCN. By treatment with  $Br_2$ , the excess KCN is converted into HBr and BrCN and by the KI treatment each

mol. of BrCN liberates 1 mol. of  $I_2$ . Numerous results attest the accuracy of the method. W. T. H.

**Essential oil of Orthodon lanceolatum Kudo (Labiateae).** Yasuji Fujita. *J. Chem. Soc., Japan* 54, 1181-7(1933).—Distn. of full grown plants gives 0.8% oil having a characteristic cineole-like aroma and light yellow color. Consts. of the oil are:  $d_4^{20}$  0.8945,  $n_D^{20}$  1.4649,  $[\alpha]_D^{20} +9.76^\circ$ , acid value 0.0, ester value 8.7 (after acetylation 34.2). The oil consists of 57% cineole, 16% *d*-linalool, 12% limonene, 4%  $\alpha$ -caryophyllene, 2% sesquiterpene alc., 1% terpene alc. ester, trace  $\alpha$ -pinene, 7% *orthodene*,  $C_{15}H_{18}$  (I) and 2% *orthodonene* (II). Consts. of I are:  $b_m$  168-70° cor.,  $d_4^{20}$  0.8430,  $n_D^{20}$  1.4670,  $[\alpha]_D^{20} +32.6^\circ$ . The structure of I is based on the following reaction:

III m. 129-30° and IV m. 76-7°. II is a sesquiterpene and has 2 double bonds. Consts. of II are:  $b_m$  254°,  $d_4^{20}$  0.9017,  $n_D^{20}$  1.4947,  $[\alpha]_D^{20} -13.28^\circ$ ; *nitrosite* m. 152-4°. The structure of II belongs to that of eudalene type.

K. Kitsuta  
**Essential oil of Orthodon formosanum Kudo (Labiateae).** Yasuji Fujita. *J. Chem. Soc., Japan* 54, 1188-90(1933).—Steam distn. of the plant gives 0.14% oil having an orange-yellow color. Consts. are:  $d_4^{20}$  1.0309,  $n_D^{20}$  1.5105,  $[\alpha]_D^{20} -5.28^\circ$ , acid value 0.90, ester value 10.6 (after acetylation 26.4). It consists of small amts. of  $\alpha$ - and  $\gamma$ -caryophyllene and 65% dillapiol.

K. Kitsuta  
The coloring of solutions of salicylate and sodium bicarbonate and the inhibiting action of sodium thiosulfate. Oscar A. Rossi. *Rev. farm.* (Buenos Aires) 75, 303-5 (1933).—The addn. to 0.1-0.2% of  $Na_2S_2O_3$  inhibits the formation of a violet color. A. E. Meyer

**Commercial possibilities of Japanese mint in the United States as a source of natural menthol.** A. F. Sievers and M. S. Lowman. U. S. Dept. Agr. *Tech. Bull.* 378, 1-34(1933).—A study with special reference to their value as sources of menthol was made of the oils obtained from Japanese mint grown in various localities and under varying conditions. Oils produced in the North and West contain on the whole a larger percentage of total menthol than those produced in the Southeast. The opportunities for this crop in Calif. appear to be greater than in other sections of the U. S. The total and combined menthol in 8 samples of oil distd. from Japanese mint grown in this state amounted on an av. to 80.94 and 6.56%, resp. Continuous cultivation over a period of yrs. indicates that seasonal conditions cause fluctuations in the menthol content of the oils, but that there is no general tendency for the menthol content to decline gradually as a result of the prevailing conditions in any one locality.

W. H. Ross  
**Chemical investigation of Indian medicinal plants. III. Chemical examination of the leaves of Erythrina indica.** Satyendranath Chakravarti, M. L. Sitaraman and A. Venkatasubban. *J. Annamalai Univ.* 2, 238-42(1933); cf. C. A. 27, 1450.—Preps. from the bark and leaves of *Erythrina indica* have been used as anodynes, febrifuges and vermifuges. The leaves were successively extd. with petr. ether,  $Et_2O$ ,  $CHCl_3$ , abs.  $EtOH$ , 70%  $EtOH$ , cold  $H_2O$ , hot  $H_2O$  and 1% aq. HCl. The petr. ether and  $Et_2O$  exts. contained a neutral, white solid (I) m. 83° after recrystn. from alc. I was not a phytosterol or glucoside.  $Et_2O$  and abs.  $EtOH$  extd. an alkaloid (II) m. 117°. II was best isolated by percolation of the leaves for 48 hrs. with cold 1% HCl, followed by pptn. as the bismuth-iodide salt. No glucosides or tannins were present in the leaves. E. W. Scott

**Indian medicinal plants. I. Withania somnifera.** D. N. Majumdar and P. C. Guha. *J. Indian Inst. Sci.* 16A, 29-33(1933).—The Bengal variety of *Withania somnifera* contains the same constituents as the S. African variety (C. A. 5, 2850), viz.,  $KNO_3$ , tannin, coloring matters, glucose, phytosterol, hentriacontane, stearic,

palmitic, oleic, linoleic, withanic acids, ipuranol, somnirol and an alkaloid,  $C_{15}H_{25}N_2$ . The presence of 3 other alkaloids was noted. II. *Swerelia chirreta*. *Ibid.* 34-9.—The following substances were isolated from an aq. EtOH ext. of the leaves, roots and stems of *Swerelia chirreta*: a phenolic compd. ( $C_{17}H_{14}O_5$ )<sub>2</sub>, m. 179-80°, oleic, palmitic, stearic and probably cerotic acids, a *phytosterol*, m. 128-30°, *acetate*, m. 127-9°, a *hydroxy acid*,  $C_{24}H_{44}(OH)-COOH$ , m. 295°, *Ac deriv.* m. 250-1°, a phenolic compd. m. 250-7°, ophelic acid, tetrabromide, m. 114-15.5°, and a neutral compd. m. 197-8°. A bitter principle, *chiratin*, was resolved into 2 compds. m. 118-19° and 179-80°, resp., and a viscous resin. The drug contains no alkaloids. C. W. Sondern

The Pharmaceutical Pocket Book for Practitioners and Students. 12th. ed., revised by C. W. Maplethorpe. London: Pharm. Press. 344 pp. 5s. 6d. Reviewed in *Am. J. Pharmacy* 105, 605; *Pharm. J.* 131, 565 (1933).

Therapeutic preparation. Amanda Grohmann. Austrian 135,514, Nov. 25, 1933 (Cl. 30f.). An aq. ext. of epididymis is mixed with pulped testicles from which the integument has been removed, and an aq. decoction of the testicle integument is added to the mixt. at a temp. not exceeding 60°.

Therapeutic preparation. I. G. Farbenind. A.-G. (Gerhard Domagk and Otto Ripke, inventors). Ger. 589,034, Dec. 1, 1933 (Cl. 30k. 7). A prepn. for conferring immunity against tumors is prepd. by compressing broken tumor cells at a temp. not exceeding 0°, or by extg. them with water or a salt soln. at the same low temp. The product may be purified by standard processes and dried. Details are given.

Therapeutic calcium compounds. Chem. Fab. vorm. Sandoz. Ger. 588,160, Nov. 13, 1933 (Cl. 12o. 11). Nonhygroscopic double compds., useful as sedatives, are prepd. by combining  $CaBr_2$  with an equimol. amt. of the Ca salt of a polyhydroxymonocarboxylic acid obtained by oxidizing a polyaldose, e. g., Ca lactobionate or malto-bionate. Combination may be effected by cooling and crystg. mixed aq. solns. of the salts, or by grinding cryst.  $CaBr_2$  with the other salt, or by oxidizing a polyaldose with  $Ca(OBr)_2$  in the presence of  $Ca(OH)_2$ . Examples are given.

Medicinal agents. I. G. Farbenind. A.-G. (Max Bockmühl and Leonhard Stein, inventors). Ger. 585,532, Oct. 4, 1933. Aq. solns. of 1-phenyl-2,3-dialkyl-4-dialkylaminopyrazolones and 1-phenyl-2,3-dialkylpyrazolone-4-aminomethanesulfonates or their derivs. are prepd. for medicinal purposes by using urethans of lower alcs. as soln. promoters. Examples are given.

Preserving colloidal liquid medicines and foodstuffs. Boris Tsitovich. Ger. 563,011, Dec. 1, 1933 (Cl. 30k. 2). The material is rapidly frozen while in a finely subdivided state. The process may be applied to serums, toxins, pharm. exts., fruit juices, fermented beverages, milk, etc.

Compounds of caffeine, etc. Wilhelm Lohmann. Ger.

585,995, Oct. 14, 1933. See Fr. 748,765 (C. A. 27, 5483). Caffeine compounds. Hans P. Kaufmann. Ger. 586,514, Oct. 21, 1933 (Cl. 12p. 7.10). Compds. of caffeine with CaCNS or SrCNS are obtained by treating caffeine with these in the presence of water. The compds. are stable to air and are used in medicine. Examples are given.

Organic arsenic compounds. Edward Lyons and Oswald M. Gruhitz (to Parke, Davis & Co.). U. S. 1,940,760, Dec. 26. Compds. of increased toxicity toward spirochetes are obtained by causing quinquivalent org. arsenic acids to react with thio acids contg. the sulfhydryl group such as thioglycolic acid. Production of derivs. from 3-amino-4-hydroxyphenylarsonic acid, phenylglycineamide-4-arsonic acid, 3-nitro-4-hydroxyphenylarsonic acid and of the cysteine derivs. of arsanilic acid and of tryparsamide are described.

Organic bismuth compounds. I. G. Farbenind. A.-G. (Max Bockmühl and Walter Persch, inventors). Ger. 585,519, Oct. 7, 1933. The unsatd. acid  $C_8H_7O_3$ , obtained as a by-product in the formation of camphor from oil of turpentine, or crude oils contg. this acid, are treated with Bi compds. The compds. are used in the cure of syphilis.

Quaternary ammonium salts. Kali-Chemie A.-G. (Heinrich Jungmann and Kurt Rülke, inventors). Ger. 589,331, Dec. 6, 1933 (Cl. 12p. 1.01). Thiocyanates of heterocyclic analogs of betaine are prepd. by treating the heterocyclic compds. with HCNS, or by double decompn. between salts of the heterocyclic compds. and thiocyanates. Examples are given of the prepn. of the thiocyanates of pyridinebetaine, quinolinebetaine and acridinebetaine. The products have disinfectant and bactericidal properties.

Salts of bile acids. Carl A. Rojahn. Ger. 585,397, Oct. 3, 1933. Addn. to 579,147 (C. A. 27, 4631). Salts of single or mixed bile acids with  $HOC_2H_4NH_2$  or  $(HOC_2H_4)_2NH$  are prepd. by standard processes. An example is given. The products are of therapeutic value.

Perhydrocarbazole derivatives. I. G. Farbenind. A.-G. (Max Bockmühl, Walter Krohs and Gustav Ehrhart, inventors). Ger. 586,802, Oct. 26, 1933 (Cl. 12p. 2). See Brit. 377,255 (C. A. 27, 4032).

Substituted halo phenols. Emil Klarman and Louis W. Gates (to Lehn & Fink, Inc.). U. S. 1,938,911 Dec. 12. Bactericidal compds. effective against organisms of the type of *Staphylococcus aureus*, such as 3-methyl-6-(diethylmethyl)-4-chlorophenol, 4-ethyl-2-propyl-6-chlorophenol and 3-methyl-6-phenethyl-4-chlorophenol are prepd. by various methods, e. g., by reacting on a suitable halogenated phenol having one substituting hydrocarbon radical with an acyl chloride, treating the resulting ester with  $AlCl_3$  to form a ketone which may be purified and then reduced to form a second hydrocarbon substituting radical. U. S. 1,938,912 relates particularly to the production of compds. such as 2-(diethylmethyl)-3,5-dimethyl-4-chlorophenol, 2-isopropyl-3,5-dimethyl-4-chlorophenol and 2-ethyl-3-methyl-6-isopropyl-4-chlorophenol.

Keratin products. Firma Johann A. Wulfig. Ger. 578,828, Oct. 14, 1933 (Cl. 12p. 16). Compds. of keratin contg. heavy metals and SH groups are obtained by reducing keratins obtained by acid hydrolysis, with Zn, sepg. the ppt. and treating it with  $H_2S$ . The product is then treated with heavy metal salt soln. such as salts of Bi, Pb, Hg, Cu, Au or Ag. Examples are given. The products are used for dermatological treatment.

Extracting vegetable tissues. Continental Can Co., Inc. Fr. 754,608, Nov. 10, 1933. Ligneous and fibrous products are reduced to the form of solid coherent flakes of a uniform thickness so that the sol. ingredients are easily accessible to an extg. liquid. The reduction is effected by breaking the fibers, softening the particles so as to render them supple and submitting them to pressure. The extn. of cinchona bark is described.

Rectal anesthetics and analgesics. Ferdinand W. Nitary (to E. R. Squibb & Sons). U. S. 1,941,220, Dec. 26. Ether and an oil such as olive oil are used to-

gether with an interface-tension depressant such as sulfonated olive oil. Cf. C. A. 27, 4630.

**Hormone preparations.** I. G. Farbenind. A.-G. (Fritz Laquer and Hermann Weyland, inventors). Ger. 585,939, Oct. 13, 1933. Solns. of ovarian hormones in high-boiling fatty acid esters are distd. *in vacuo*, and the hormones obtained from the distillate by usual methods.

**Vitamin preparations.** Wilhelm Lesselberg. Ger. 586,959, Oct. 27, 1933 (Cl. 30h. 2). Stable preps. are obtained by heating a homogenous mixt. of albuminous material and plant sap or ext. and drying in a finely divided condition. Thus, milk, rice ext. and liver contg. vitamin are mixed and sprayed on to drying rollers.

**Hormones.** F. Hoffmann-La Roche & Co. A.-G. Ger. 588,046, Nov. 13, 1933 (Cl. 12p. 17.10). Urine contg. ovarian hormones is heated with an albumin coagulable by heat, and the ppt. is sepd. and extd. with org. solvents to recover the hormones. Examples are given.

**Hormones.** Helmuth Scheibler. Ger. 588,047, Nov. 16, 1933 (Cl. 12p. 17.10). Hormones of the anterior lobe of the pituitary body are pptd. from the urine of pregnant animals by addn. of sufficient 10% phosphomolybdic acid soln. to establish a H-ion concn. of  $pH$  3.5–4. The ppt. is dissolved in aq.  $NI_3$ , treated with  $Ba(OH)_2$  to ppt. Ba phosphomolybdate, and the hormones then recovered from the filtrate.

**Hormones.** Schering-Kahlbaum A.-G. Fr. 754,326, Nov. 6, 1933. Corpora lutea, as soon as possible after removing them from the ovaries, are mixed with substances which prevent fermentation, e. g., NaF, NaCl,  $CHCl_3$  or saltpeter, and afterward they are treated in known manner.

**Hormones.** Schering-Kahlbaum A.-G. Fr. 754,687, Nov. 10, 1933. Crystd. esters of hormones are prepd. by treating the corresponding crude hormone oils with

alkalies, eliminating the neutral fraction and submitting the alkali compds. obtained to acylation in aq. soln., after which the acyl derivs. are crystd.

**Disinfectants.** Wm. L. Estabrooke. U. S. 1,938,585, Dec. 12. Reaction products of urea or thiourea with heavy metal salts such as  $HgCl_2$  or a salt of Pb, Cd, Zn, Ag or Cu are used as disinfectants.

**Bandages.** Surgical Dressings, Inc. Brit. 397,694, Aug. 31, 1933. A surgical bandage consists of a strip of unvulcanized crude rubber which has been depolymerized so that, while nonadherent to hair or skin, it coheres when pressed upon itself and is somewhat porous and extensible. Depolymerization may be effected with "thin pale crepe" by heating to  $100^\circ$  in air 30 min., in  $H_2O$  at  $100^\circ$  1 min. or in steam 5 min.

**Impregnating bandages, etc., with iodine.** Asociacion de Productores de Yodo de Chile. Ger. 585,197, Sept. 29, 1933. See Brit. 364,273 (C. A. 27, 2252).

**Solutions for sterilizing surgical instruments, etc.** Parker, White and Heyl, Inc. Ger. 585,196, Sept. 29, 1933. See Brit. 368,123 (C. A. 27, 2763).

**Cosmetics.** Franz Nöcker. Ger. 587,352, Nov. 2, 1933. Nonaq. liquid or paste compns. for cleansing the skin contain at least 50% of benzyl alc. or an ether or ester thereof.

**Hair-dressing composition.** J. W. Rausch Sohn. Ger. 588,143, Nov. 13, 1933 (Cl. 30h. 13). A colored hair-powder is prepd. by mixing cork meal or like natural product with a soln. of pyrogallol in aq. EtOH, treating the mixt. with an ammoniacal soln. of  $AgNO_3$  and mixing the insol. pigment so obtained with powd. rice and  $H_3BO_3$ .

**Treating tobacco to avoid irritation when smoked.** Werner Pettersson. U. S. 1,941,416, Dec. 26. Tobacco is impregnated with about 0.3% of 3,6-diamino-10-methylacridinium chloride.

## 18—ACIDS, ALKALIES, SALTS AND SUNDRIES

R. M. SYMMES

The calculation of mixtures of acids by a graphic method. S. D. Beskov. *J. Chem. Ind. (Moscow)* 1933, No. 8, 69–74.—Graphs are given for calcg. the diln. of strong acids and the *prepn.* of nitration mixts. H. M. L.

How to start a sulfuric acid tower system. K. A. Polyakov and A. A. Vasil'ev. *Khimstroï* 5, 2496–501 (1933). Chas. Blanc

Selection of packing as a method for intensification of the (sulfuric acid) tower system. K. M. Malin. *Khimstroï* 5, 2501–3 (1933).—The productivity of  $H_2SO_4$  towers can be considerably increased by rational packing, resulting in greater contact surface and greater internal vol. Chas. Blanc

Colloidal problems in nitrogen\* and sulfuric acid industry. Bruno Waeser. *Kolloid-Z.* 65, 378–82 (1933).—Patent review, covering dust problems in  $CaC_2$  manuf., in grinding  $CaCN_2$  and special properties of  $CaCO_3$  produced by hydrolysis of  $CaCN_2$ . Arthur Fleischer

Reworking of the products of alkaline absorption of nitrogen oxide tailings (inversion). V. F. Gogin and M. A. Minovich. *Khimstroï* 5, 2470–3 (1933).—In the conversion of  $NH_3$  to  $HNO_3$ , the absorption of the escaping lower oxides of N with alkalies (26–8° Bé. calcined  $Na_2CO_3$ ) was carried on in Fe scrubbers at 18–20° (gases at 25°). The resulting product, on evapn., gives a mixt. contg. 19%  $NaNO_2$  and 73%  $NaNO_3$ , and as such is not suited for the dye and fertilizer industry, and must be recovered by conversion to  $NaNO_3$ . In the oxidation the best results were obtained by adding  $HNO_3$  to the liquor at 52–5° for 7–10 hrs., constantly maintained at 3–5% acidity, and stirred with rapid current of air. The app. was lined with granite or with acid-resisting tiles set in asphalt. Chas. Blanc

The soda industry of Berezniki and new sources of raw material. G. V. Petrov. *Khimstroï* 5, 2494–6 (1933).—

A discussion is given to future utilization of waste NaCl obtained in the extrn. of KCl from carnallite and sylvinit in the production of  $Na_2CO_3$ . Chas. Blanc

The absorption of carbon monoxide by solutions of copper ammonium salts. N. M. Zhavoronkov and P. M. Reshchikov. *J. Chem. Ind. (Moscow)* 1933, No. 8, 41–9.— $CuNH_4$  formate absorbs CO more readily than the lactate, but the soln. is less stable and cannot be regenerated as well. Both are superior to the chloride and acetate. At least 20 g. per l. of  $Cu^{++}$  should be present in the soln. to prevent sepn. of free Cu. The concn. of  $NH_3$  in the soln. should be 123–150 g. per l. Absorption occurs best at 0–20°, but in com. practice 15–20° is sufficient. Regeneration of the soln. should take place at 70–80° and 1 atm. or less. H. M. Leicester

Fluorine. I. Fusao Ishikawa and Toyosaku Murooka. *Science Repts. Tôhoku Imp. Univ.*, 1st Ser. 22, 1155–62 (1933).—See C. A. 25, 5518. G. G.

A comparison of various methods for purifying argon from nitrogen and hydrogen. I. M. Taraskov. *J. Tech. Phys. (U. S. S. R.)* 2, 425–41 (1932).—Heated layers of Ca dust or arc discharge with Ca electrodes are better than methods using Mg or K. P. H. Rathmann

Researches in the domain of fixed nitrogen. L. M. Fridberg. *Khimstroï* 5, 2467–70 (1933).—Various phases of the production and conversion of synthetic  $NH_3$  are discussed. Chas. Blanc

The preparation of sulfur from sulfur dioxide. VII. The reaction between sulfur dioxide and hydrogen. N. F. Yushkevich, V. A. Karzhavin, A. V. Avdeeva and T. T. Krechemov. *J. Chem. Ind. (Moscow)* 1933, No. 8, 50–8; cf. C. A. 26, 4685.—At 500–800°,  $H_2$  reacts almost completely with  $SO_2$ , but only 40–60% yields of S result. The rest of the S goes into  $H_2S$ , and can be recovered by cooling the gas mixt. to 200–50° and passing it over Fe ore or bauxite, or by passing the  $H_2S$  with  $SO_2$  into  $H_2O$

below 100°. The data of Terres, Schultze and Fortkord (C. A. 26, 2558) for equil. of the reaction between  $H_2$  and  $SO_2$  are incorrect. H. M. Leicester

A study of catalysts for the conversion of methane. V. A. Karzhavin, I. M. Boguslavskii and Z. M. Smirnova. *J. Chem. Ind. (Moscow)* 1933, No. 8, 31-40.—About 1.5-3.0 g. of Ni deposited on 100 g. of porous chamotte is an active catalyst for the conversion of  $CH_4$  by  $H_2O$  and does not lose its activity on long use.  $MgO$  may be used as an activator if the temp. of the reaction does not rise above 1000°. From 0.03 to 0.5% of sulfides in the gas causes a slight preliminary decrease in the activity of the catalyst, but after this has occurred, the activity remains unchanged. H. M. Leicester

Advances in the manufacture of synthetic masses, especially those like linoleum. A. Foulon. *Nitrocellulose* 4, 208-11(1933).—A review of recent literature.

E. M. Symmes  
Litharge-glycerol cement. H. Stäger, H. Zschokke and J. P. Bohnenblust. *Kolloid-Z.* 65, 319-33(1933); cf. C. A. 23, 3311.—The properties of a poured cement,  $P$  (a mixt. of 2 mols.  $PbO$  per mol. of glycerol was used) were compared with those of a troweled cement,  $T$ , in which a mixt. of 3 $PbO$ :1 glycerol was used. The  $PbO$  was a com. grade; the glycerol contained 13%  $H_2O$ . Photomicrographs show a similar structure, contg. unchanged  $PbO$  particles, though  $P$  is somewhat looser. Shear strength,  $S$ , between cement and steel, was independent of cement thickness from 3 to 15 mm., of the height of cement from 30 to 200 mm., and practically independent of the steel pipe diam. from 35 to 195 mm. The strength of the cement is much higher than the above  $S$ , which therefore measures the tenacity of bonding. The temp. of set from 10° to 30° has no effect on  $S$ .  $S$  depends on the nature of the surface, increasing with roughness.  $T$  has a higher tensile strength; tensile strength increases for both  $T$  and  $P$  with temp. Porosity detns. by rate of flow of  $H_2$  and  $N_2$  showed a dense structure.  $T$  shows a linear change with temp., with densest structure at 30°. Detns. of  $S$  after aging in a  $CO_2$  atm. for 8 weeks show an increase for  $T$  and a decrease for  $P$ .  $CO_2$  detns. showed no differentiation of the various cements. Microscopic studies reveal that in  $T$ , the  $CO_2$  penetrates the fine pores, forming a network of  $PbCO_3$ , while in  $P$  a strongly swollen carbonate with no inner strength forms. Aging in mineral oil at 110° had no effect on the properties. Arthur Fleischer

The casein industry at home and abroad. P. F. Brookens. *Natl. Butter and Cheese J.* 24, No. 23, 12-14(1933).

A. H. Johnson  
The determination of mineral matter of industrial casein. Jean Pien and S. Herschdoerfer. *Lait* 13, 1081-9(1933).—It was found that the ash content of com. casein as detd. by simple incineration was too high, because of fixation of org. P and the presence of unoxidized C. Incineration was therefore conducted in the presence of an added alkali (5 cc. of a soln. of  $Ca(NO_3)_2$  or  $Ca(C_2H_3O_2)_2$  with  $CaO$  content of 30 g. per l. per 5 g. sample of casein). This method allows more complete oxidation of org. matter and fixes all the org. P. From the ash thus obtained subtract the  $CaO$  added and the total  $P_2O_5$  of av. pure casein. The results obtained by this method were lower than those obtained by simple incineration and were considered to represent more accurately the true ash content of com. casein. A. H. Johnson

Phosphoric acid esters as substitutes for camphor. Schmidt. *Celluloid u. Plastische Massen* 33, No. 33; *Gummi-Ztg.* 47, 1067-8(1933).—A review of the numerous compds. so far utilized. C. C. Davis

Flotation of heavy spar. J. Hamann. *Metall u. Erz* 30, 455-7(1933).—Methods are given for sepn. by flotation of heavy spar from quartz, mica, carbonates, fluorspar and Fe and Mn oxides. H. Stoertz

Products of thermal refining of graphite and graphitized coal. V. S. Veselovskii and V. S. Levina. *Mineral. Suir'e* 8, Nos. 8-9, 25-9(1933); cf. C. A. 26, 3879.—The dispersion of thermally refined graphites and graphitized anthracite was indirectly detd. by the velocity of combustion and elec. cond. The results obtained in the

use of the products in arts and industry are discussed.

Chas. Blanc

The use of pyrites containing carbon. I. The fundamentals of burning pyrites containing carbon. K. V. Khodakov. *J. Chem. Ind. (Moscow)* 1933, No. 8, 66-7.—A diagram is given to show the relation between the percentage of  $SO_2$ , excess air and compn. of the pyrites when the latter are burned. II. The possibility of using pyrites containing carbon in the contact system. S. Buikhovskii. *Ibid.* 67-9.—If account is taken of the extra  $O_2$  required, such pyrites are suitable for burning in the contact system. H. M. Leicester

The culture of certain silicate gardens. James G. Vail. *Ind. Eng. Chem.* 26, 113-18(1934).—A review of the properties and uses of silicates. P. J. Wilson, Jr.

New flotation agents. W. Hälbich. *Metall u. Erz* 30, 431-3(1933).—In the flotation of heavy spar and dolomite,  $Utinol$  HC was used as a flotation agent. It is a mixed sulfonated alc. and fat, not hydrolyzed by  $H_2O$ , and stable to lime, acid, alkali and salt. H. Stoertz

The complete utilization of *Caesalpinia spinosa* (Mol.) Kuntze. Angelo Castiglioni. *Boll. ufficiale staz. sper. ind. pelli mat. concianti.* 11, 314-19(1933).—The seeds of *Caesalpinia spinosa* (Mol.) Kuntze can be made to furnish a gum, which offers promising possibilities of use in plastic masses, in finishing leather and in textile-finishing operations. J. W. Perry

House ants and their control. Thomas J. Headlee. N. J. Agr. Expt. Sta., *Circ.* 265, 1-4(1933).—A very effective ant poison consists of the following sirup: granulated sugar 4 lb., water 4 pints, cryst. tartaric acid 3 g., and 0.25 oz. of  $Na_2HAsO_4$  dissolved in 3 fl. oz. of water. After cooling, add the  $Na_2HAsO_4$  to the sugar sirup together with  $\frac{1}{2}$  lb. of honey and mix thoroughly. C. R. Fellers

Com. hydrogenation processes [hydrogenation of N to  $NH_3$ ] (Bosch) 13. Heating solids, liquids or gases [manuf. of H and CO] (Ger. pat. 588,213) 13.

Rahm, Louis F.: Plastic Molding: An Introduction to the Materials, Equipment and Methods Used in the Fabrication of Plastic Products. New York: McGraw-Hill Book Co., Inc. 246 pp. \$3.

Hypochlorous acid. Solvay et Cie. Fr. 754,531, Nov. 8, 1933.  $HOCl$  is made by the continuous action on a current of solns. of alkali or alk. earth hypochlorites, of a rapid and regular equiv. amt. of  $Cl$  flowing in the same or opposite direction, while the  $HOCl$  formed is continuously evacuated. Solns. of suspensions of hydroxides may be used instead of hypochlorites.

Hydrocyanic acid. Ges. für Kohlentechnik m. b. H. (Wilhelm Glud and Konrad Keller, inventors). Ger. 576,531, Nov. 18, 1933 (Cl. 12k. 11). See Fr. 752,206 (C. A. 28, 862).

Hydrocyanic acid. Wilhelm Pip. Ger. 586,861, Oct. 27, 1933 (Cl. 12k. 8).  $HCONH_2$ , mixed with steam or steam and indifferent gases, is led over catalysts at high temps. The steam, etc., is pre-heated to a temp. which, with the reaction temp., raises the catalyst to the desired heat.

Nitric acid. Nikodem Caro, Albert R. Frank, Werner Siebert, Rudolph Wendlandt and Thomas Fischer. U. S. 1,939,162, Dec. 12. In producing concd.  $HNO_3$  from gas mixts. contg. N oxides, or from liquid N tetroxide, water or aq.  $HNO_3$  and O or O-contg. gases, a large portion of the primary substance is converted at a temp. of about 100° and the reaction is completed at a diminishing temp. of from 100° to 70° (the pressure remaining between 50 and 200 atm. during the process).

Nitric acid. Hermann Frischer. Fr. 754,426, Nov. 7, 1933. Oxides of N obtained by combustion of  $NH_3$  and from other sources are freed by filtration from acid and water in the form of fog, and treated by  $H_2SO_4$  in 2 stages. In the 1st stage an acid is used of such a concn. that the gases are dried but practically no nitrososulfuric acid is

formed, and the gases are absorbed in the 2nd stage. The acid from the 2nd stage is denitrified by indirect heating so as to obtain an acid of the same concn. as that used for the concn.

**Nitric acid.** Hermann Frischer. Fr. 754,711, Nov. 13, 1933. In making  $\text{HNO}_3$  of high concn. by means of dehydrating agents such as  $\text{H}_2\text{SO}_4$  or  $\text{H}_3\text{PO}_4$ , in columns or like app., the heating is effected from the exterior with the simultaneous introduction of steam into the mixt. of acids. The process may be carried out in the presence of residual  $\text{H}_2\text{SO}_4$  contg. nitrosulfuric acid.

**Nitric acid.** Harry Pauling. Fr. 755,056, Nov. 18, 1933.  $\text{HNO}_3$  is made at a low temp. from oxides of N or a gaseous mixt. contg. them, by passing them and an absorption acid in countercurrent through heat exchangers before and after traversing a cooling basin in which the very low temp. necessary for the process reigns. An app. is described.

**Phosphoric acid.** George F. Moore (to U. S. Phosphoric Products Corp.). U. S. 1,940,689, Dec. 26. In a continuous countercurrent decantation process of mfg.  $\text{H}_3\text{PO}_4$  from phosphatic material by the use of  $\text{H}_2\text{SO}_4$ , the size of the  $\text{CaSO}_4$  crystals formed is increased by decreasing the size of particles of phosphatic material used in the process.

**Sulfuric acid.** I. G. Farbenind. A.-G. (Friedrich A. Henglein and Friedrich W. Stauff, inventors). Ger. 585,586, Oct. 23, 1933 (Cl. 12f. 25). Addn. to 573,129 (C. A. 27, 4885).  $\text{H}_2\text{SO}_4$  of any desired concn. is prepd. by immersing in water perforated vessels contg. appropriate reagents other than  $\text{SO}_2$ , e. g., oleum,  $\text{HSO}_3\text{Cl}$ ,  $\text{H}_2\text{S}_2\text{O}_7$  or  $\text{SO}_2\text{Cl}_2$ .

**Mixed acid solutions.** I. G. Farbenind. A.-G. (Friedrich A. Henglein and Friedrich W. Stauff, inventors). Ger. 585,473, Oct. 4, 1933. Mixts. of chlorides of P with salts of  $\text{HSO}_3\text{Cl}$  are packed in containers which are perforated at the place of use and thrown into water, this yielding solns. of mixed acids useful, e. g., for preserving green fodder and pickling metals.

**Ammonia synthesis.** Henry S. Loud (to Atmospheric Nitrogen Corp.). U. S. 1,938,598, Dec. 12. A gas mixt. comprising H and N together with inert constituents (such as occur in water gas made from coal) is subjected to catalytic  $\text{NH}_3$  synthesis in a cyclic gas circulatory system under pressure; a portion of the gas circulating in the system is diverted and addnl. fresh gas is supplied in suitable regulated quantity to maintain the inert content of the cyclic system at a predetd. value, and the diverted portion of the gas is subjected to catalytic  $\text{NH}_3$  synthesis and  $\text{NH}_3$  removal in a second cyclic gas circulatory system. Various features of app. arrangement are described. Cf. C. A. 28, 585<sup>2</sup>.

**Ammonia synthesis.** Arthur E. Hecker (to Mathieson Alkali Works). U. S. 1,940,860, Dec. 26. In a process involving circulating a mixt. contg. H and N cyclically over a catalyst, then through an  $\text{NH}_3$  separator, and then again over the catalyst, make-up gases originally contaminated with  $\text{CO}_2$  are supplied to the circulating gas mixt. leaving the  $\text{NH}_3$  separator and  $\text{NH}_3$  carbonate formed solely by reaction of  $\text{CO}_2$  present as an impurity in such make-up gases is sepd. from the resulting gaseous mixt., as a solid, before the remaining gas mixt. is passed over the catalyst. An arrangement of app. is described.

**Hydrated alkali salts.** I. G. Farbenind. A.-G. (Robert Griesbach and Karl Neundlinger, inventors). Ger. 586,506, Oct. 21, 1933 (Cl. 12f. 15). Hydrated alkali salts readily converted to the anhyd. form are brought to globular form by subjection to a dry pre-heated air current in a rotary drum at temps. below the m. p.

**Alkali cyanides.** Grangers Manufacturing Co. Fr. 754,970, Nov. 17, 1933. White alkali cyanides are obtained by heating them to a pt. considerably above the m. p., e. g., to about  $1200^\circ$ , and cooling relatively slowly to the m. p. A small amt. of air or other oxidizing agent may be introduced during the heating. Fr. 754,971. Solns. of alkali cyanides are dried by heating rapidly a thin layer thereof to a pt. about the b. p. of the soln.

<sup>1</sup> The layer of cyanide formed is removed rapidly from the moist air.

**Alkali phosphates from ferrophosphorus.** Victor Chemical Works. Brit. 398,437, Sept. 14, 1933. Duplicate of U. S. 1,926,747 (C. A. 27, 5903). Addnl. information is given.

**Eliminating manganates in the production of tri-alkali phosphates from ferrophosphorus.** George Klein (to Victor Chemical Works). U. S. 1,939,305, Dec. 12.

<sup>2</sup> In a process involving the heating of ferro-P contg. Mn together with an alkali hydroxide or carbonate, formation of alkali manganate is prevented by the use of a 0.5–5.0% excess of the ferro-P.

**Alkali silicates.** Wilhelm Schwarzenauer. Ger. 588,200, Nov. 14, 1933 (Cl. 12f. 38). See Fr. 681,557 (C. A. 24, 4360).

**Cellular solid alkali silicate.** John W. Battersby.

<sup>3</sup> U. S. 1,939,290, Dec. 12. For the prepn. of a cellular product which is moisture resisting and suitable for thermal and elec. insulation, a water-contg., colloidal, readily sol. alkali silicate contg. about 3.5–4.0 parts  $\text{SiO}_2$  to 1 part  $\text{Na}_2\text{O}$  is heated to  $200\text{--}500^\circ$ .

**Alkali metal sulfates.** Oskar Kaselitz. U. S. 1,939,174, Dec. 12. A double sulfate contg. an alkali metal sulfate such as  $\text{K}_2\text{SO}_4$  in combination with another sulfate such as  $\text{MgSO}_4$  which is more readily sol. in water at a temp. between the cryohydric point and the normal b. p. of its soln. is mixed at such a temp. with water in such proportions that the last-mentioned sulfate is completely dissolved and may be sepd. as a substantially satd. soln.

**Cyanides.** Edward J. Franke (to Grangers Manufacturing Co.). Brit. 398,454, Sept. 14, 1933. Alkali metal cyanides are decolorized by heating to considerably above their m. ps. and cooling relatively slowly to near, but above, their f. ps. They may then be cooled to ordinary temp. at any desired rate. During the process the C is oxidized by the cyanates and carbonates present. A small quantity of air or other oxidizing substance may be added to the fused mass.

**Fluosilicates.** Brander Farbwerke, Chemische Fabrik G. m. b. H. and Emil G. Abel. Brit. 398,403, Sept. 14, 1933. See Fr. 741,502 (C. A. 27, 2766).

**Fluosilicates.** Elektrochem. Fab. G. m. b. H. Ger. 588,875, Nov. 29, 1933 (Cl. 12f. 38.04). Addn. to 553,376 (C. A. 26, 5181). Concd.  $\text{SiF}_4$  prepd. by decomp.  $\text{Na}_2\text{SiF}_6$  in *vacuo*, is used in the process of Ger. 553,376.

**Peroxides, etc.** Oesterreichische Chemische Werke G. m. b. H. Brit. 399,040, Sept. 28, 1933. See Fr. 750,125 (C. A. 28, 863<sup>9</sup>).

**Metal carbonyls.** Leo Schlecht and Max Naumann (to I. G. Farbenind. A.-G.). U. S. 1,941,111, Dec. 26. In the production of a metal carbonyl such as that of Fe by acting with CO on a carbonyl-forming material, the supply and withdrawal of fluids take place from a plurality of zones of the reaction space. App. is described.

**Alumina.** Max Buchner. Ger. 535,952, Sept. 21, 1933 (Cl. 12m. 6).  $\text{Al}_2\text{O}_3$  is obtained by treating crude aluminiferous material with  $\text{HNO}_3$ , treating the product with a limited amt. of alkali fluoride, and forming  $\text{Al}_2\text{O}_3$  from the resulting  $\text{AlF}_3$ . Thus, a mineral contg.  $\text{Al}_2\text{O}_3$  and  $\text{SiO}_2$  is treated with  $\text{HNO}_3$  to give  $\text{Al}(\text{NO}_3)_3$  and  $\text{SiO}_2$ . The  $\text{Al}(\text{NO}_3)_3$  is treated with  $\text{NaF}$  to give  $\text{AlF}_3$ . This is treated with water or  $\text{SiO}_2$  to give  $\text{Al}_2\text{O}_3$ . Cf. C. A. 27, 4634.

**Aluminum hydroxide.** The Electric Smelting and Aluminum Co. Ger. 587,294, Nov. 1, 1933. See Brit. 382,366 (C. A. 27, 4355).

**Aluminum nitrate from silicates such as leucite.** Alberto C. Blanc. U. S. 1,940,842, Dec. 26. In order to reduce the quantity of  $\text{HNO}_3$  required for sepg. Al nitrate from the soln. resulting from the action of  $\text{HNO}_3$  on material such as leucite, the acid soln. of nitrates from which the Al nitrate is to be sepd. is concd. by evapg. it down to about 50% its original vol., to eliminate water contained in the soln. as well as a portion of the water normally required for the crystn. of the Al nitrate, and there is then added to the concd. soln. the amt. of concd.  $\text{HNO}_3$  required for the sepn. and crystn. of Al nitrate (a saving

of over half the  $\text{HNO}_3$  otherwise required being effected by reason of the concn.).

**Aluminum sulfate.** Metallges. A.-G. Ger. 589,330, Dec. 6, 1933 (Cl. 12m. 7). An alk. earth aluminate or material contg. it, e. g., alumina cement or a suitable slag, is treated at atm. or slightly raised temp. and at atm. pressure in the presence of water with  $\text{SO}_2$  and O or gases contg. them. Crude alk. earth aluminate prep'd. in known manner from bauxite, clay, etc., may be treated and gases of low  $\text{SO}_2$  content may be used. Numerous details are given, and methods of sepg. the  $\text{Al}_2(\text{SO}_4)_3$  soln. from the alk. earth sulfate also formed are described.

**Aluminum sulfostearate.** Alexander Horwitz. U. S. 1,939,169, Dec. 12. Stearic acid is sulfonated with  $\text{H}_2\text{SO}_4$  and the product is washed and then saponified with an alkali metal comp'd. and the resulting product is further treated with a soln. of  $\text{Al}_2(\text{SO}_4)_3$ .

**Ammonium thiocyanate.** Wilhelm Kraus. Ger. 564,784, Sept. 26, 1933 (Cl. 12o. 17.03).  $\text{NH}_4\text{CNS}$  or  $(\text{NH}_4)_2\text{CS}$  is prep'd. by leading  $\text{NH}_3$  into an alc. soln. of  $\text{CS}_2$  quantitatively, the resulting comp'd. being filtered off, washed with water and heated till no further  $\text{H}_2\text{S}$  is evolved. On evapg. off the water  $\text{NH}_4\text{CNS}$  remains. This is converted to  $(\text{NH}_4)_2\text{CS}$  by heating to above its m. p.

**Ammonium thiocyanate.** Ges. für Kohlentchnik m. b. H. (Wilhelm Gluid, inventor). Ger. 586,587, Oct. 23, 1933 (Cl. 12k. 11). Crude  $\text{NH}_4\text{CNS}$  obtained from coke ovens is purified by forming a sat'd. soln. in cold water, sepg. the solid impurities and evapg. and crystg. the soln. Cf. C. A. 27, 1105.

**Dibarium phosphate.** Kali-Chemie A.-G. Ger. 585,518, Oct. 4, 1933. Addn. to 582,925 (C. A. 28, 864<sup>4</sup>). The  $\text{BaHPO}_4$  pptd. during the prep'n. of  $\text{H}_2\text{O}_2$  from  $\text{BaO}_3$  and  $\text{H}_2\text{PO}_4$  is worked up by first treating with  $\text{H}_2\text{PO}_4$  to convert it to sol.  $\text{Ba}(\text{H}_2\text{PO}_4)_2$ ; insol. impurities are then removed and the soln. treated with  $\text{HCl}$  or  $\text{HNO}_3$  to give  $\text{BaCl}_2$  or  $\text{Ba}(\text{NO}_3)_2$  and  $\text{H}_2\text{PO}_4$ .

**Beryllium fluoride.** Compagnie de produits chim. et électrométallurgiques Alais, Froges et Camargue. Fr. 42,883, Nov. 15, 1933. Addn. to 742,619 (C. A. 27, 3566).  $\text{BeF}_2$  is prep'd. from  $\text{BeF}_2 \cdot \text{NaF}$  or  $\text{BeF}_2 \cdot \text{KF}$  in soln. or aq. suspension by the action of gaseous  $\text{SiF}_4$ . Cf. C. A. 28, 864<sup>7</sup>.

**Nitrogenating calcium carbide.** Bayerische Stickstoffwerke A.-G. Ger. 581,868, Aug. 4, 1933. Addn. to 572,325 (C. A. 27, 2889). App. for charging the carbide holders is described.

**Calcium cyanamide.** Akt.-Ges. für Stickstoffdünger (Ernst Winter and Herbert Polack, inventors). Ger. 585,141, Oct. 3, 1933. See Fr. 741,264 (C. A. 27, 2767).

**Calcium hypochlorite.** Joseph A. M. W. Mitchell and Francis T. Meehan (to Imperial Chemical Industries Ltd.). U. S. 1,940,557, Dec. 19. See Brit. 368,306 (C. A. 27, 2250).

**Apparatus for granulating calcium nitrate and ammonium nitrate mixtures.** Norsk Hydro-Elektrisk Kvaestofaktieselskab. Ger. 580,025, Dec. 1, 1933 (Cl. 16.6). Addn. to 579,118 (C. A. 27, 4621).

**Treating phosphate rock to form calcium nitrate, etc.** Erling Johnson (to Odda Smelteverk A/S). U. S. 1,939,351, Dec. 12. Phosphate rock is dissolved in  $\text{HNO}_3$  and  $\text{Ca}(\text{NO}_3)_2$  thus formed is sepd. by crystn.; one portion of the soln. of  $\text{H}_2\text{PO}_4$  sat'd. with  $\text{Ca}(\text{NO}_3)_2$  which is obtained as mother liquor from a prior crystn. is added in the dissolving operation with  $\text{HNO}_3$ , and a second portion of the mother liquor is supplied to the reaction product of phosphate rock and acid during the crystn. of the  $\text{Ca}(\text{NO}_3)_2$ .

**Lead oxide.** Cecil H. P. Harden. Australia 9364/32, Oct. 5, 1933. An app. is described for oxidizing Pb by air comprising a rotating oxidizing chamber having revolving paddles for pulverizing the molten Pb.

**Dehydrating magnesium chloride, etc.** Joseph Blumenfeld (to Société de produits chimiques des terres rares). U. S. 1,940,620, Dec. 19. For the partial dehydration of chlorides of Mg, of Ce and of earths of the Ce class which are subject to decompn. by heating, the chloride contg. water is subjected to a sudden heating by contact with a

surface heated to about 400–500°, and the product is then further heated in an atm. contg.  $\text{HCl}$  gas. App. is described.

**Magnesium hydroxide.** American Zinc, Lead & Smelting Co. Fr. 755,409, Nov. 24, 1933.  $\text{Mg}(\text{OH})_2$  is made by adding  $\text{NH}_3$  to a soln. of  $\text{MgSO}_4$  in water, approx. in 3 times the theoretical amt. and recovering the  $\text{Mg}(\text{OH})_2$ .

**Utilizing nitrosyl chloride.** Kali-Forschungs-Anstalt G. m. b. H. Brit. 398,187, Sept. 7, 1933. See Fr. 731,230 (C. A. 27, 814).

**Decomposition of nitrosyl chloride.** Kali-Forschungs-Anstalt G. m. b. H. (Oskar F. Kaselitz and Bruno Uebler, inventors). Ger. 526,476, Dec. 7, 1933 (Cl. 12i. 26).  $\text{NO}$  and  $\text{Cl}$  are obtained by heating  $\text{NOCl}$  to its disoccn. temp. (about 700°) and rapidly cooling the products in the presence of air. The disoccn. temp. of the  $\text{NOCl}$  may be reduced to 250–300° if a catalyst is present, e. g.,  $\text{MnO}_2$ ,  $\text{Fe}_2\text{O}_3$  or  $\text{Cr}_2\text{O}_3$ . The  $\text{NO}$  and  $\text{Cl}$  may be sepd. by liquefaction and fractional distn. Cf. C. A. 27, 814.

**Decomposition of nitrosyl chloride.** I. G. Farbenind. A.-G. (Infrid Petersen and Hans Bernhard Seeborn, inventors). Ger. 589,072, Dec. 1, 1933 (Cl. 12i. 3).  $\text{NOCl}$  and gases contg. O are led at a raised temp. not exceeding 600° over a contact mass such as silica gel.  $\text{NO}$  and  $\text{Cl}$  are obtained. The reaction may be effected in stages, and the  $\text{Cl}$  may be sepd. after each stage, e. g., by adsorption. Cf. C. A. 27, 3566.

**Potassium carbonate.** Kali-Chemie A.-G. Ger. 585,421 and 585,422, Oct. 3, 1933, 585,423, Oct. 13, 1933, 585,424, 585,425 and 585,426, Oct. 3, 1933. In the manuf. of  $\text{K}_2\text{CO}_3$  by treating  $\text{KCl}$  and  $\text{MgCO}_3 \cdot 3\text{H}_2\text{O}$  (I) with  $\text{CO}_2$  to form  $\text{MgCl}_2$  and  $\text{MgCO}_3 \cdot \text{KHCO}_3 \cdot 4\text{H}_2\text{O}$  (II), which is then decompd. with water at an elevated temp., the insol. residue (I contg.  $\text{Mg}(\text{OH})_2$ ) from the decompn. of II is treated in water with  $\text{CO}_2$  to produce a soln. of  $\text{Mg}(\text{HCO}_3)_2$  (III), which is heated to regenerate I (585,421). The decompn. of II with water is interrupted at an intermediate stage, and the insol. portion of the mixt. is sepd. and reheated with water or with a soln. of III, if desired at a lower temp. The mother liquor from the second stage may be used as the aq. medium for the first stage, with further addn. of III if desired (585,422). Fresh I, required to replace that lost as  $\text{MgCl}_2$ , is separately converted into II and, if desired, reconverted into I before it is introduced into the process. The accumulation of  $\text{MgO}$  and other impurities in the process is thus checked (585,423). I may be prep'd. in a coarse granular form by incompletely neutralizing a soln. of III with  $\text{MgO}$  or  $\text{Mg}(\text{OH})_2$  (585,424). I obtained in the process, or prep'd. for use in the process, may be purified by sedimentation in water (585,425). The decompn. of II with water is effected under conditions yielding a soln. contg. less than 75 g. per l. of  $\text{KHCO}_3$ , whereby the formation of I in a condition suitable for reuse is promoted (585,426). Cf. C. A. 27, 4887.

**Potassium carbonate.** Alfred Mentzel. Ger. 585,427, Oct. 3, 1933. Addn. to 570,471 (C. A. 27, 2539). The mixt. of  $\text{K}_2\text{SO}_4$ , C and  $\text{CaO}$  used in the process of Ger. 570,471 is finely ground and then briquetted before it is treated with N.

**Potassium nitrate.** Kali-Forschungs-Anstalt G. m. b. H. (O. F. Kaselitz and Bruno Uebler, inventors). Ger. 539,172, Sept. 19, 1933 (Cl. 12i. 26).  $\text{KCl}$  and  $\text{HNO}_3$  are made to react in accordance with the equation:  $3\text{KCl} + 4\text{HNO}_3 = 3\text{KNO}_3 + \text{NOCl} + \text{Cl}_2 + 2\text{H}_2\text{O}$ . The mixt. of  $\text{NOCl}$  and  $\text{Cl}$  is passed over Fe at atm. temp., this yielding  $\text{NO}$  and the double comp'd.  $\text{FeCl}_2 \cdot \text{NOCl}$ . The  $\text{NO}$  is worked up to  $\text{HNO}_3$  in known manner. The double comp'd. is decompd. into  $\text{NOCl}$  and  $\text{FeCl}_2$  by the action of heat or water, the  $\text{NOCl}$  being mixed with fresh  $\text{Cl-NOCl}$  mixt., and the  $\text{FeCl}_2$  being worked up in any convenient way. Cf. C. A. 27, 2539.

**Potassium nitrate.** Kali-Forschungs-Anstalt G. m. b. H. (O. F. Kaselitz and Walter Katz, inventors). Ger. 540,206, Oct. 9, 1933 (Cl. 12i. 26). Addn. to 539,172 (preceding abstr.). The mixt. of  $\text{NOCl}$  and  $\text{Cl}$  obtained in the process of Ger. 539,172 is passed over Fe or Fe-

(NO<sub>2</sub>)<sub>2</sub> at about 300°, whereby all the NOCl is decompd., and NO and FeCl<sub>3</sub> are obtained. The heat of combustion of NH<sub>3</sub> may be used to heat the mixt. to the reaction temp.

**Silica.** I. G. Farbenind. A.-G. (Fritz Stöwener and Josef König, inventors). Ger. 585,938, Oct. 18, 1933. SiO<sub>2</sub> is obtained by treating porous slag with HNO<sub>3</sub>, *e. g.*, at 40–60°.

**Extracting borax from ore.** Thomas M. Cramer (to Pacific Coast Borax Co.). U. S. 1,940,118, Dec. 19. In producing "commercial" borax from an ore contg. prismatic borax and gang material, the ore is heated under super-atm. pressure to a temp. substantially above 100° for effecting the soln. of the borax in its own water of crystn. App. is described.

**Sodium cyanide.** Gesellschaft für Kohlentechnik m. b. H. Brit. 398,732, Sept. 21, 1933. See Fr. 751,191 (C. A. 28, 1150<sup>1</sup>).

**Caustic soda.** Paul Krassa. Ger. 586,972, Oct. 28, 1933 (Cl. 12i. 13). NaOH is prepd. by the action of Fe<sub>2</sub>O<sub>3</sub> on NaNO<sub>2</sub> at high temps. in the presence of air and water vapor and amorphous SiO<sub>2</sub>. Yields of 80–90% are given.

**Trisodium phosphate hydrate-soap crystals.** The Grasselli Chemical Co. Brit. 398,888, Sept. 25, 1933. See U. S. 1,885,905 (C. A. 27, 1108).

**Thorium nitrate.** Chemische Fabrik von Heyden A.-G. (Rudolf Zellmann and Richard Müller, inventors). Ger. 580,980, Oct. 30, 1933 (Cl. 12m. 9). Th(NO<sub>3</sub>)<sub>4</sub> is prepd. by heating Th oxalate to glowing and treating the resulting ThO<sub>2</sub> with concd. HNO<sub>3</sub> at temps. above the b. p. of the latter. The first process is carried out at the lowest possible glowing temp. at which the oxide is formed, *e. g.*, 350–600°.

**Zinc oxide.** Wm. A. Handwerk and Wendel Reiser (to New Jersey Zinc Co.). U. S. 1,940,125, Dec. 19. In the manuf. of ZnO by the zinc retort volatilization process, the formation of "drop-oxide" is inhibited by interposing a layer of air between a stream of the Zn vapor and the side walls of the oxidation chamber. App. is described.

**Zinc oxide.** Metallgesellschaft A.-G. Brit. 398,752, Sept. 21, 1933. See Fr. 753,330 (C. A. 28, 1150<sup>4</sup>).

**Separating ammonia and carbon dioxide.** Nikodem Caro and Albert R. Frank. (Hugo Heimann, inventor). Ger. 588,343, Nov. 15, 1933 (Cl. 12k. 2). Mixts. consisting of or contg. NH<sub>3</sub> and CO<sub>2</sub> are washed at a temp. below 60° with a satd. soln. of CaCl<sub>2</sub>, whereby NH<sub>3</sub> is absorbed without substantial absorption of CO<sub>2</sub>. The CaCl<sub>2</sub> soln. may be used until it contains a high concn. of NH<sub>3</sub>, *e. g.*, 150 g. per l. Details and exptl. results are given.

**Carbon monoxide and hydrogen.** "S. I. R. I." Società italiana ricerche industriali. Fr. 755,493, Nov. 25, 1933. See Swiss 162,458 (C. A. 28, 588<sup>4</sup>).

**Hydrogen peroxide; barium salts.** Kali-Chemie A.-G. Brit. 398,399, Sept. 14, 1933. BaO<sub>2</sub> is caused to react with H<sub>2</sub>PO<sub>4</sub> to produce H<sub>2</sub>O<sub>2</sub> and CaHPO<sub>4</sub> and the CaHPO<sub>4</sub> is treated with volatile acids that form sol. Ba salts, *e. g.*, HCl, HNO<sub>3</sub>, to regenerate the H<sub>2</sub>PO<sub>4</sub>, which may be returned to the process. In a modification the CaHPO<sub>4</sub> is dissolved in H<sub>2</sub>PO<sub>4</sub>, the soln. freed from insol. impurities and treated with the volatile acids. After sepn. of the Ba salts, *e. g.*, by cooling, the H<sub>2</sub>PO<sub>4</sub> may be freed from the volatile acid by distn. HCl is preferably used in excess to ppt. BaCl<sub>2</sub>. After treating the BaHPO<sub>4</sub> with HNO<sub>3</sub> and sepn. the deposited Ba(NO<sub>3</sub>)<sub>2</sub>, the H<sub>2</sub>PO<sub>4</sub> may be treated with Na<sub>2</sub>CO<sub>3</sub> to ppt. the remaining Ba and the soln. may be finally neutralized with further Na<sub>2</sub>CO<sub>3</sub> to form Na<sub>2</sub>HPO<sub>4</sub>, which is sepd. by cooling. Examples are given. Cf. C. A. 28, 268<sup>8</sup>.

**Hydrogen peroxide.** Deberag, Deutsche Beratungsgesellschaft für die chemische und metallurgische Industrie G. m. b. H. Ger. 567,601, Sept. 20, 1933 (Cl. 12i. 16). App. for obtaining H<sub>2</sub>O<sub>2</sub> by direct distn. of aq. solns. of H<sub>2</sub>SO<sub>4</sub> or persulfates is described. Cf. C. A. 27, 4888.

**Hydrogen peroxide.** Deberag, Deutsche Beratungsgesellschaft für die chemische und metallurgische Industrie m. b. H. Ger. 572,112, Oct. 9, 1933, and 572,615,

Oct. 9, 1933 (Cl. 12i. 16). Addns. to 567,601 (preceding abstr.). Further details of the distn. are given.

**Hydrogen peroxide.** J. D. Riedel-E. de Haën A.-G. Ger. 567,602, Nov. 9, 1933 (Cl. 12i. 16). Addn. to 510,064 (C. A. 25, 1043). In distg. H<sub>2</sub>O<sub>2</sub> as described in Ger. 510,064, the soln. is drawn through the app. at a rate above that which gives the max. yield of H<sub>2</sub>O<sub>2</sub>, and the distn. residue is dild. and redistd.

**Sulfur dioxide.** Imperial Chemical Industries Ltd. Fr. 755,255, Nov. 22, 1933. SO<sub>2</sub> is recovered from gases, *e. g.*, gases from the roasting of S ores, by an aq. soln. contg. one or more salts of non-volatile acids, the dissociation consts. of which are between  $1 \times 10^{-3}$  and  $1 \times 10^{-4}$ , measured on a diln. of 40 l. per g. mol. and at 25°. Thus, a soln. of Na citrate, with or without NaH<sub>2</sub>PO<sub>4</sub> or NH<sub>4</sub>H<sub>2</sub>PO<sub>4</sub> or a salt of lactic or glycolic acid, may be used.

**Sulfur trioxide.** Alling P. Beardsley and Napoleon A. Laury (to Calco Chemical Co.). U. S. 1,941,426, Dec. 26. A mixt. of gases contg. SO<sub>2</sub> and O is passed through a catalytic mass which consists of porous particles of substantially pure silica impregnated with solns. contg. V and Cs. U. S. 1,941,427 relates to the use of a similar catalyst which may contain Rb instead of Cs.

**Hydrogen from methane.** Hans Harter. Ger. 585,419 and 585,420, Oct. 13, 1933 (Cl. 12i. 1). Addns. to 581,986 (C. A. 28, 1150<sup>9</sup>). Further details of the process of 581,986 for producing H by the decompn. of CH<sub>4</sub> by the aid of contact catalysts such as active C steam and O or air are given (585,419). The process may be modified so that the CH<sub>4</sub> is partly oxidized at one stage to give CH<sub>3</sub>O, the waste gases from the process being then allowed to react with CH<sub>4</sub> and steam to give H (585,420). Cf. C. A. 27, 4888.

**Krypton and xenon.** Air liquide, L' (Soc. anon. pour l'étude et l'exploitation des procédés G. Claude). Fr. 755,145, Nov. 20, 1933. The liquid, concd. in Kr and Xe, resulting from an addnl. rectification of liquid O furnished from the principal rectification of air, is partially vaporized and during this vaporization which takes place at the base of the addnl. rectification column, the feeding of liquid O to this column is suppressed. Kr and Xe are thereby extd.

**Burning phosphorus.** Hans Lehrecke (to Metallges. A.-G.). U. S. 1,940,758, Dec. 26. Molten yellow P is fed into contact with a swiftly rotating surface and the resulting spray is mixed with an O-contg. gas and the mixt. is burned. App. is described.

**Sulfur.** Raymond F. Bacon. Ger. 589,084, Dec. 2, 1933 (Cl. 12i. 17). See Brit. 375,798 (C. A. 27, 4039–40).

**Sulfur and sulfates.** I. G. Farbenind. A.-G. (Hans Bähr, inventor). Ger. 588,342, Nov. 15, 1933 (Cl. 12i. 17). Acid solns. contg. sulfites, thiosulfates or polythionates, with or without other salts, are decompd. to yield S and sulfates by forcing them under pressure through an inert liquid medium heated to 150–400°. The liquid medium may be fused S or paraffin wax or an oil. Reaction vessels of Cr-Ni steel or Al are used. Details are given, and app. is described.

**Sulfur from roaster gases.** Raymond F. Bacon. Ger. 585,067, Sept. 28, 1933. See Brit. 364,351 (C. A. 27, 2000).

**Recovering sulfur from gas-purifying compositions.** Vereinigte Stahlwerke A.-G. (Josef A. Bordo, inventor). Ger. 589,073, Dec. 1, 1933 (Cl. 12i. 17). Used gas-purifying compns. contg. S are extd. with a solvent for S, *e. g.*, CS<sub>2</sub>, and the soln. is treated with H<sub>2</sub>SO<sub>4</sub> to decomp. org. impurities. SO<sub>2</sub> formed in the H<sub>2</sub>SO<sub>4</sub> treatment is then eliminated from the soln. by means of gaseous or aq. H<sub>2</sub>S or gases contg. H<sub>2</sub>S, preferably under a slightly raised pressure, and finally the soln. is evapd. to recover S.

**Sulfur recovery from materials such as iron pyrites.** Raymond F. Bacon and Isaac Bencowitz (Bencowitz to Bacon). U. S. 1,939,033, Dec. 12. A charge comprising FeS and a Ca or Mg compd. such as MgO is subjected to the action of a gas contg. free O at an elevated temp. below the fusing point of the charge, while limiting the amt. of free O substantially to that required to form Fe

oxide with the Fe contained in the charge. The liberated S is condensed.

Fine dry sulfur freely miscible with water. Adriaan Nagelvoort (to Delaware Chemical Engineering Co.). U. S. 1,939,403, Dec. 12. Finely ground S is mixed with about 0.05-0.2% of tannin or a sulfite waste liquor prepn.

Active carbon. Holzhydrolyse A.-G. Ger. 589,255, Dec. 4, 1933 (Cl. 89i. 1.02). Lignin suitable for use as raw material for the manuf. of active C is prepd. by subjecting to acid hydrolysis small rods of wood about 5-10 mm. long in the direction of the fiber and of 0.5-3 sq. mm. cross-sectional area.

Apparatus for carbon black manufacture by electrothermal dissociation of organic liquids such as hydrocarbon oils. John J. Jakosky (to Electroblacks Inc.). U. S. 1,941,009, Dec. 26. Structural and operative details.

Lampblack. N. V. de Bataafsche Petroleum Maatschappij. Fr. 754,767, Nov. 14, 1933. The hydrocarbon to be dissocd. is passed through a layer of live flame and near to a radiating surface. An app. is described.

Annaline. Willy Larsson and Gustav Mosebach. Ger. 505,240, Oct. 11, 1933 (Cl. 55c. 2). Neutral annaline for use in the manuf. of paper is prepd. by heating gypsum with C in a blast furnace to 800-1200°, extg. the product several times with hot water and finally neutralizing with hot dil. H<sub>2</sub>SO<sub>4</sub>.

Chloramine. Clark T. Henderson. U. S. 1,940,592, Dec. 19. A soln. formed from Cl and water is brought into contact with CaCO<sub>3</sub> and the resulting product is then combined with NH<sub>3</sub>.

Cryolite. Max Buchner. Ger. 563,873, Sept. 27, 1933 (Cl. 12i. 10). Solns. or suspensions of, or solid, metal fluorides are treated with Al(NO<sub>3</sub>)<sub>3</sub> at low or high temps.

Treating kaolin earths. Emile Soyez and Marcel Cherouvrier. Fr. 42,823, Nov. 4, 1933. Addn. to 736,198 (C. A. 27, 1462). Improved construction of app. is described.

Disintegrating monazite sand. I. G. Farbenind. A.-G. (Rudolf Schulze, inventor). Ger. 585,738, Oct. 7, 1933. Monazite sand is reduced with C, the reduction being carried out with oxides or carbonates as flux, for the rare earth oxides. Three mols. of flux are present for each mol. of earth oxide, and only sufficient C is added to reduce the P<sub>2</sub>O<sub>5</sub>, leaving the rare earth oxides unreduced. The reaction is carried out in a rotary furnace at sintering temp. Preferably an elec. furnace at 1650-1750° is used, the slag being granulated and milled.

Synthetic spinel. I. G. Farbenind. A.-G. Ger. 534,474, Dec. 6, 1933 (Cl. 12m. 6). Yellow synthetic spinel is prepd. by the Verneuil process from a mixt. of Al<sub>2</sub>O<sub>3</sub> about 90% and MgO about 10% to which, as coloring material, both Mn and Fe or compds. thereof have been added in small amt. The mixt. may also contain up to about 2% of ZnO. Cf. C. A. 28, 866<sup>a</sup>.

Apparatus for manufacture of soda ash (and precipitating impurities onto a moving belt). Alexander M. MacDonald. U. S. 1,940,459, Dec. 19. Various details of construction and operation are described, for removing clay, dirt, etc.

Catalysts. N. V. de Bataafsche Petroleum Mij. Fr. 754,604, Nov. 10, 1933. Catalysts for use when treating carbonaceous materials with hydrogenating gases are made by treating a halogen compd. with a sulfurating agent. In examples, WO<sub>3</sub> is heated with an excess of CCl<sub>4</sub> and afterward with H<sub>2</sub>S; molybdenite is heated with HCl to form MoCl<sub>5</sub> and afterward with H<sub>2</sub>S and H.

Metallic catalysts. Owen G. Bennett and Joseph C. W. Frazer (to Catalyst Research Corp.). U. S. 1,940,934, Dec. 26. A supporting material is covered with an amalgam of catalytically active metal and the Hg is removed from the amalgam by vacuum distn. to leave the catalytic metal distributed on the support. Cf. C. A. 27, 2259.

nated porous catalyst. Herrick R. Arnold and (to E. I. du Pont de Nemours & Co.). 19. A porous rigid support such as vacuum to remove absorbed and then is immersed, in a

vacuum, in a soln. of a catalytic compd. such as Al nitrate to prepare a catalyst suitable for use in dehydration reactions. Several examples are given.

Gels. Silica Gel Corp. Brit. 398,517, Sept. 15, 1933. Hard, granular, porous gels, having catalytic or adsorbent properties, are prepd. by peptizing a hydrous oxide "ppt." (as opposed to a true hydrogel) with an org. acid, e. g., HCOOH, AcOH, chloroacetic, and nearly dehydrating the peptized mass, e. g., by subjecting to an air current at 105-150°. The oxide ppts. may be prepd. in an acid or alk. medium, according to the character, and may contain a mixt. of different oxides, e. g., those of Fe, Al, V, Cu, Ni, Ti, Th, Mn, Cr, Zr, Bi, Ga, Be, In, Ce, Sc, Si, Ge, Sn, Ta, Mo and W. An Al gel, thus prepd., may be used to ext. H<sub>2</sub>O vapor from gases contg. carbonaceous matter, since heating to 420-650° to burn out the C does not destroy its efficiency for further adsorption. Cf. C. A. 27, 5906.

Silica gel. Elektrochem. Fab. G. m. b. H. Ger. 587,493, Nov. 4, 1933. SiF<sub>4</sub> is led into aq. H<sub>2</sub>SiF<sub>6</sub> and the ppt. is washed, molded if desired, and dried.

Condensation products from materials such as pectous residues and formaldehyde. Adolf Haverlander (to Albert D. Stewart). U. S. 1,941,349, Dec. 26. An unreacted non-fibrous pectous residue derived from pectocellulose plant material such as wheat straw is caused to react with an aldehyde such as formaldehyde while subjecting the mixt. to agitation and heating, and the reaction is checked before infusible, insol. compds. are formed, to obtain an intermediate fusible, sol. condensation product suitable for satg. fibrous materials and becoming insol. and infusible by further heating under pressure.

Condensation products resembling albumins. Pfeining-Schumacher-Werke G. m. b. H. Ger. 589,236, Dec. 4, 1933 (Cl. 39b. 22). See Brit. 386,065 (C. A. 27, 2002).

Molding compositions. Soc. d'expansion des produits d'art glycero-plastiques (S. E. P. A. G.) (Soc. à r. l.). Fr. 754,568, Nov. 9, 1933. Casein is added to gelatin used for agglomerating molding compns., to prevent the product becoming brittle on drying and reducing shrinkage and deformation on drying.

Moldable compositions. Imperial Chemical Industries Ltd. Fr. 755,280, Nov. 22, 1933. Differently colored layers of moldable PhOH-CH<sub>2</sub>O condensation products are placed in a stratified form in a vessel so that the different layers alternate regularly or irregularly and the whole is heated to 100° or until sufficiently plastic. The plastic mass produced is extruded under pressure and, if desired, broken into fragments.

Moldable materials. Soc. pour l'ind. chim. à Bâle. Fr. 755,146, Nov. 20, 1933. Acid solns. of the condensation products of aromatic amines and aldehydes in the form of gels and contg. fillers, such as sawdust or mica, are pulverized during or after formation, the acid is liberated and the products are washed, dried and compressed to desired shapes.

Mixed polymerization products suitable for making molded articles. Arthur Voss, Ewald Dickhäuser and Werner Starck (to I. G. Farbenind. A.-G.). U. S. 1,939,422, Dec. 12. A product of the mixed polymerization of at least two different esters such as vinyl acetate and vinyl oleate is partially saponified and the saponification mixt. thus formed is reacted upon with an org. compd. such as butyraldehyde so as to form an acetal. Several examples are given.

Plastic compositions. Soc. Nobel française. Fr. 42,857, Nov. 15, 1933. Addn. to 750,350 (C. A. 28, 918<sup>a</sup>). Gramophone disks are made by impressing sheets made from the compns. described in Fr. 750,350, or from a core of inert material covered with sheets made from these compns.

Laminated fibrous material. Roy E. Coleman (to The British Thomson-Houston Co. Ltd.). Brit. 398,618, Sept. 21, 1933. Paper, with a woven cloth or fabric netting imbedded therein, is treated with an aq. soln. or suspension of a resin, dried, stacked in layers and molded under heat and pressure to produce a laminated product. Alk. solns. of (artificial) resins, e. g., shellac, copal,

alkyd resins or aq. solns. obtained in the prepn. of urea- $\text{CH}_2\text{O}$  resins, which may contain some  $\text{PhOH}$  or thiourea, may be used. The aq. colloidal suspensions of alkyd resins described in Brit. 371,627 (C. A. 27, 3639) are also suitable.

**Compositions for manufacturing of molded dust guards for journal boxes or the like.** Harry C. Fisher and Charles L. Keller (to Richardson Co.). U. S. 1,939,492, Dec. 12, 1933.

used with about 5.7 times as much bitumen having substantially no penetration at 32/200/80. A softer compn. contg. a candle-tar substance may be used for parts less subject to wear.

**Putty-like compositions.** I. G. Farbenind. A.-G. (Friedrich Frick, inventor). Ger. 585,353, Oct. 2, 1933. Aq. emulsions of condensations products prepd. from polyhydric alcs., polybasic acids and highly unsatd. higher monobasic fatty acids are mixed with fillers, etc., to form cements or putty-like compns. which may be applied as ground coatings to porous surfaces such as wood.

**Sealing composition.** Jakob Janz. Fr. 754,884, Nov. 16, 1933. A sealing compn. for use cold comprises a dispersion or concd. soln. of a cellulose deriv., particularly the acetate, in very volatile chloroparaffins, e. g.,  $\text{CH}_2\text{Cl}_2$ . Fillers, softening agents giving adhesion, such as phenyl phosphate or acetanilide, fatty substances or resins may also be added.

**Glazing, calking and pointing compositions.** Thomas C. Parr. Brit. 398,057, Sept. 7, 1933. A compn. which retains its plasticity for long periods comprises Al 1-30, oil, e. g., soy-bean, linseed, perilla, cottonseed, olive, rapeseed, corn, etc., about 30, mineral filler, e. g., china clay, Ti white, ground shale or slate, zinc white,  $\text{SiO}_2$ ,  $\text{BaSO}_4$ , etc., 1-50, fibrous material, e. g., asbestos, shredded or ground rope or rags, 1-20% and the remainder a fluid vehicle, e. g., mineral spirits. The preferred compn. is whitening 12, Mg silicate 17, asbestos 5.45, soy-bean oil 30.6, varnish 16.2, mineral spirits 9 and powd. Al 9 parts. Cf. C. A. 27, 1726.

**Casein products.** I. G. Farbenind. A.-G. (Rudolf Bauer and Gustav Manthe, inventors). Ger. 574,841, Oct. 18, 1933 (Cl. 12p. 16). Ester-like high-mol. transformation products of casein which exhibit basic properties are obtained by treating an aq. suspension of casein with  $\text{C}_2\text{H}_5\text{O}$ , its homologs or analogs till an alk. reaction is

The aq. suspension may be made weakly acid by an org. acid, the product being then pptd. by alkali. Examples are given. The products are used in the adhesive and artificial mass industries.

**Artificial horn from casein.** Internationale Galalith-Hoff & Co. (Henri Dumont, inventor). Ger. 588,388, Nov. 14, 1933 (Cl. 39b. 18). The hardening of molded casein compns. by steeping in aq.  $\text{CH}_2\text{O}$  is accelerated by the presence of water-sol. alkali, alk. earth or  $\text{NH}_4$  chlorides or other salts inert to casein. Preferably, the salts are mixed with the casein before molding. Addn. of a little acid or alkali also accelerates the process.

**Coloring artificial horn.** Internationale Galalith-Hoff & Co. (Henri Dumont, inventor). Ger. 589,354, Dec. 6, 1933 (Cl. 39b. 18). See Brit. 380, 826 (C. A. 27, 4042).

**Artificial products.** I. G. Farbenind. A.-G. Fr. 755,048, Nov. 18, 1933. Polyvinyl chloride is submitted to a complementary chlorination by the action of  $\text{Cl}_2$  in a solvent or suspension agent. A depolymerization, during or after the chlorination, may be effected by a suitable elevation of the temp. The products have improved mech. resistance for making varnishes, films, threads, etc.

**Preparing pastes from strong alkali and salt solutions.** I. G. Farbenind. A.-G. (Hans Persiel and Max Kerth, inventors). Ger. 587,365, Nov. 2, 1933. Strong alkali and salt solutions are thickened by treatment with an alkali-sol. cellulose deriv. contg. at least one acid group. Cellulose glycolic acids or hydroxyethylsulfonic acids, prepd. from soda cellulose and  $\text{ClCH}_2\text{COOH}$  or  $\text{ClC}_2\text{H}_4\text{SO}_3\text{H}$ , resp., are suitable. Examples are given.

**Adhesives.** Edward J. J. Knight. Brit. 397,374, Aug. 24, 1933. An adhesive for securing rings of "Gold Seal Cap Compound" (a compn. of rubber latex, gum karaya,

$\text{Na}_2\text{CO}_3$  and bentonite) and other gaskets used in vacuum-sealed canisters comprises soft manila 34, kaolin 33, methylated spirits 28 and castor oil 5 parts. The adhesive may be thinned by aq.  $\text{NH}_3$  and glycerol.

**Adhesive.** Albert Benteli. Fr. 755,147, Nov. 20, 1933. An adhesive contains, e. g., collodion fibers 10, camphor 1, dibutyl phthalate 2, "plastopal" 2, "artificial resin AW 2" 0.5, benzene 5,  $\text{MeOH}$  3, ethylene glycol 4,  $\text{AcOBu}$  2, dioxane 6 and  $\text{AcOEt}$  8 kg.

**Glue product.** Charles H. Campbell. U. S. 1,940,486, Dec. 19. A product which may be used as a cold-water calcimine is prepd. by mixing directly with the soln. of animal glue formed by extn. in the usual way, a finely ground mineral base such as whiting or gypsum, and spray-drying the mixt. in a nebular state in a high-temp. atm. so that the particles of mineral base do not agglomerate and are coated with thin films of glue readily sol. in cold water.

**Variegated composition tiles.** Norman Fredriksen (to Armstrong Cork Co.). U. S. 1,939,045, Dec. 12. A thermoplastic base compn. such as a mixt. of resin and cement is prepd. in a relatively warm, plastic condition, and there are added to it pieces of thermoplastic variegating compn. of relatively cooler and less plastic condition and the mass is formed under pressure while still at a sufficiently high temp. to give the desired plasticity.

**Heat transfer.** Winthrop S. Lawrence (to Kaumagraph Co.). U. S. 1,939,821, Dec. 19. A paper base carries an impressed marking comprising an infusible cellulose deriv. such as nitrocellulose and a plasticizer such as triphenyl phosphate which is fusible at the temp. of transferring and which, when molten, is a solvent of the cellulose deriv. and is stable at the temp. employed. Various formulas are given (cf. C. A. 27, 2543).

**Magnetic articles.** International Standard Electric Corp. Ger. 587,312, Nov. 2, 1933. See U. S. 1,826,711 (C. A. 26, 569).

**Cores for electromagnetic apparatus.** International Standard Electric Corp. Ger. 587,391, Nov. 3, 1933. Particles of magnetic material are united by an insulating binder comprising water glass and a filler such as talc, the water glass used being of such low basicity that the usual addn. of  $\text{CrO}_3$  or other acid to the binder can be omitted. Various details are given.

**Fabrics of artificial fibers.** Kalle & Co. A.-G. (Adolf Dulitz, inventor). Ger. 586,611, Oct. 23, 1933 (Cl. 39a. 170.03). Fabrics suitable for use as windows are formed from a mixture of drawn glass fibers and textile fibers coated with cellulose esters or ethers.

**Removing iron from clay, etc.** I. G. Farbenind. A.-G. (Frederic van Taack-Trakraen, inventor). Ger. 586,588, Oct. 23, 1933 (Cl. 12m. 6). Fe is removed from materials contg.  $\text{Fe}_2\text{O}_3$  by converting the latter into  $\text{FeCl}_3$  by treatment with  $\text{Cl}_2$  under suitable temps., and extg. the  $\text{FeCl}_3$  by water or other solvents. Examples mention the purification of bauxite and kaolin by this method. Cf. C. A. 27, 3052.

**Bipyridyls.** Deutsche Gold- und Silber-Scheideanstalt vorm. Roessler (Wilhelm Schulenburg, inventor). Ger. 588,041, Nov. 13, 1933 (Cl. 12p. 1.01). Bipyridyl mixts. are obtained by heating pyridine or its derivs. to 110-160° with an alkali metal compd. having a condensing action and not contg. N, e. g., an alkali hydride or oxide. The reaction is effected in the absence of a solvent or diluent. The products are useful for destroying pests. Examples are given.

**Fixing composition.** Armand Lévy. Fr. 754,446, Nov. 7, 1933. A compn. which does not dry or harden but sticks to any surface contains, e. g., white crepe rubber 32-6, factis 36, elemi resin 4, benzene 13, methylhexalin acid ester of adipic acid 51.6 and chalk 108.1 parts.

**Artificial diamonds.** Hans Karabacek. Ger. 589,144, Dec. 2, 1933 (Cl. 12i. 33). A metal or silicate melt satd. with C is subjected to a fluctuating high pressure in the presence of a compd. from which nascent C seps. During the periods when the pressure is rising, C seps. from the melt as a mixt. of diamond and graphite. Some of this C is redissolved during the periods when the

pressure is falling, but if the duration of these periods is sufficiently restricted, a part of the sepd. diamond remains undissolved and acts as seed for the diamond sepd. during the next period of rising pressure. In one method of procedure, a mixt. of iron shavings, blast-furnace slag, amorphous C and solid  $\text{CO}_2$  or liquid CO is heated to 900–1100° under a hydraulic pressure of 5000 atm. The pressure is then raised to 15,000 atm. in 90 secs., and allowed to fall rapidly after 10–30 secs. The process may then be repeated. App. is described. Diamonds of 5 mm. diam. and 0.25 carat wt. have been obtained.

**Friction material suitable for brake linings, etc.** Mark Shoeld. U. S. 1,941,280, Dec. 26. Felted asbestos is combined with a water-insol. bonding material such as gilsonite or hard pitch and S and the product is molded and dried, the bonding material is rendered infusible (as by heating in air) and the product is then impregnated with an org. compd. such as blown petroleum or asphalt.

**"Mineral wool."** Clarence B. White. U. S. 1,939,329, Dec. 12. A "mineral wool" which is suitable for heat insulation, etc., is made from the waste obtained in the reduction and refining of metal-bearing materials such as blast-furnace slag and has a Cu content of about 0.15–5.0% which serves to prevent brittleness.

**Compound fibrous sheets.** Hendrik J. Prins. Brit. 398,006, Sept. 7, 1933. A combination of rubber, balata, gutta-percha, etc., with mineral and vegetable waxes, e. g., paraffin, montan, is used as the uniting medium in forming compd. sheets of paper, woven fabrics, wood, etc., union being effected by heating to about the softening point and pressing the coated sheets together.

**Cooking utensil of fibrous material impregnated with sodium silicate.** Albert L. Clapp. U. S. 1,941,145, Dec. 26. Receptacles suitable for baking pies are formed of cellulosic fibrous material which is impregnated with a Na silicate soln. of about 5–20°Bé. and then dried out. Asbestos fiber or mica may be added. Cf. C. A. 27, 3077.

**Annular kiln for burning lime with fine coal.** Prager A. Fross-Büssing Werk Komm-Ges. Ger. 585,982, Oct. 14, 1933.

**Heat-evolving compositions.** Paul Tschelnitz. Austrian 135,336, Nov. 10, 1933 (Cl. 12c.). Comps. which evolve heat when moistened with water are prepd. by mixing a powd. metal with a metal sulfide and a suitable electrolyte. A typical compn. contains Fe 92, FeS or  $\text{CuS}$  3 and  $\text{CuSO}_4$  5%. The comps. may contain inert addns., e. g., inorg. colloids or wood meal, and may be used for medical or cosmetic purposes, etc.

**Waterproof compositions.** Carbide & Carbon Chemicals Corp. and Eastman Kodak Co. Fr. 755,175, Nov. 21, 1933. Materials resistant to moisture for making films, sheets, etc., are composed of an org. ester of cellulose, e. g., cellulose acetate united with an impermeabilizing compn. contg. a vinyl resin. The resin may be obtained by simultaneously polymerizing a vinyl halide and a vinyl ester with an aliphatic acid. The impermeabilizing compn. may contain wax 2–45, a gum 5–20, a plasticizing agent 0.25% and vinyl resin the rest, and this compn. is applied in one or more layers or coatings to the sheets of cellulose ester.

**Wetting agents.** Gaïtan P. Lièvre. Fr. 42,888, Nov. 15, 1933. Addn. to 751,422 (C. A. 28, 1213). The alk. neutralization solns. obtained from the residues from petroleum refineries are steam distd. to remove oils, neutralized by hot dil.  $\text{H}_2\text{SO}_4$ , steam distd. to remove volatile impurities and finally dried. The products are used as wetting agents for fibers.

**Wetting, emulsifying and other agents.** Oranienburger Chemische Fabrik A.-G. (Kurt Lindner and Arno Russe, inventors). Ger. 586,066, Oct. 21, 1933 (Cl. 12o. 23.01). Addn. to 582,790 (C. A. 28, 923). Wetting, cleaning and other agents are made by the method of 582,790 under milder conditions. Natural fats, fatty acids, etc., mixed with alcs., ketones or lactones are sulfonated in the presence of water-binding agents.

**Detergents, etc.** Imperial Chemical Industries Ltd., Alfred W. Baldwin and Hugh M. Bunbury. Brit. 398,818, Sept. 11, 1933. Detergent, dispersing, emulsifying and

1 frothing agents are obtained by sulfonating monoalkyl ethers of glycerol in which the alkyl group contains 16–18 C atoms. The starting materials are preferably obtained by the sapon. of the liver oils of elasmobranch fish. The products may be used in *impregnating and tanning* and in the manuf. of *pigments, pastes, insecticides and fungicides*. In examples (1) batyl alc. is sulfonated with pyridine- $\text{SO}_3$  in pyridine or with Na pyrosulfate in pyridine and (2) the mixt. of selachyl, batyl and chimyl alcs. obtained from the liver oil of *Centrophorus granulosus* and *Somniosus microcephalus* is similarly sulfonated. *Cleansing baths for wool*, which foam readily, are prepd. in further examples from the products by soln. in  $\text{H}_2\text{O}$ .

**Cleaning agent.** Soc. pour l'ind. chim. à Bâle. Fr. 42,825, Nov. 4, 1933. Addn. to 743,004 (C. A. 27, 3790). *o*-Dichlorobenzene is used as a cleaning agent for surfaces coated with cellulose ester varnishes.

3 **Cleaning agents.** Adrien Cassmann. Fr. 754,861, Nov. 16, 1933. A soap substitute contains  $\text{CaCO}_3$  60,  $\text{NaCl}$  40 and dehydrated  $\text{Na}_2\text{CO}_3$  40 g.

**Cleaning composition.** Herbert Walter. Fr. 754,521, Nov. 8, 1933. A cleaning compn. for walls, etc., resembling soft rubber is made by dissolving  $\text{K}_2\text{SiO}_3$  in boiling water and mixing rye flour with it. A small amt. of turpentine oil is added to prevent the mass becoming friable. Cf. C. A. 28, 271<sup>1</sup>.

4 **Cleansing compositions.** Anton Riess. Austrian 135,349, Nov. 10, 1933 (Cl. 23b.). A soln. for cleansing, disinfecting and deodorizing butchers' equipment is prepd. from a dry mixt. of an oxidizing agent, a carbonate, and sufficient alum to react with the carbonate. A typical mixt. contains  $\text{NaBO}_3$  15,  $\text{NaHCO}_3$  70 and alum 15%.

**Non-saponaceous hand-cleaning composition.** Charles G. Moore (to Glidden Co.). U. S. 1,940,558, Dec. 19, 1933. A liquid mixt. of toluene, butanol and  $\text{EtOAc}$ , together with 8–16 oz. of lanolin per gal. of the liquid, is suitable for removing lacquer residues or the like from the hands.

**Case for holding silverware to prevent tarnishing.** George E. Herring. U. S. 1,939,497, Dec. 12. Details are described of a case, surfaces of which are treated with a sulfide-neutralizing chemical, such as Pb acetate. Cf. C. A. 27, 4692.

**Metal polish.** I. G. Farbenind. A.-G. (Hermann Hagenest and Frederick W. Stauf, inventors). Ger. 586,823, Oct. 27, 1933 (Cl. 22g. 14). An acid-free liquid or paste-like metal polish contains sol. fluorides. Thus, a polish may consist of kieselguhr, talcum,  $\text{NH}_4\text{F}$ , alc.,  $\text{NH}_4$  oleate and water.

**Paint- and varnish-remover.** Lindley E. Mills and Sherman W. Putnam (to Dow Chemical Co.). U. S. 1,938,714, Dec. 12. Acetone,  $\text{C}_2\text{H}_5$  and  $\text{CCl}_4$  are used with a preponderating proportion of *o*-dichlorobenzene and propylene dichloride.

**Emulsifying agents.** Carl Stürpel. Ger. 589,015, Dec. 1, 1933 (Cl. 12o. 23.02). Mixts. of com. cholesterol with fatty acids or their glycerides are sulfonated with concd.  $\text{H}_2\text{SO}_4$ . Examples are given.

**Composition for use in the manufacture of gaskets, etc.** Harold H. Jordan (to Armstrong Cork Co.). U. S. 1,941,437, Dec. 26. A compn. which may be formed of casein, glycerol, rubber and ethanalamine is milled at an elevated temp. (suitably about 85°), a plasticized glue is added and the milling is continued; comminuted cork is added, and the mixt. is further milled and cured.

**Composition for making dental casts.** Richard Grill. Austrian 135,683, Nov. 25, 1933 (Cl. 80e.). The compn. comprises chamotte about 75, alabaster about 20 and a gypsum cement about 5%.

**Preserving brushes.** Württ. Bürsten- und Pinsel-Fabrik Kullen & Co. (Otto Mecheels, inventor). Ger. 587,362, Nov. 2, 1933. Brushes are impregnated with an aq. glue soln. contg. a softening agent, e. g., glycerol, and then treated with  $\text{CH}_3\text{O}$  and dried.

**Shoe creams, etc.** Carl Gentner chemische Fabrik-Göppingen. Fr. 755,016, Nov. 18, 1933. In shoe creams and polishes composed of waxes, turpentine, water and an emulsifying agent, a suspension in water of insol. earth colors forms the dispersion phase.

**Composition for use on duplicator sheets.** Erik R. Nielsen (to Charles H. Joy, Jr.). U. S. 1,938,927, Dec. 12. Duplicator sheets are formed with a layer of fusible, absorbent, aldehyde-protein compn. having a  $pH$  of 7.0-9.0 and which may be formed from formaldehyde, glue and glycerol.

**Lithographic printing plate.** Thomas E. Richards. U. S. 1,938,667, Dec. 12. There is applied to the bare metal of a grained Al plate, in the form of the work to be printed, an image substance such as a mixt. contg. transfer ink, turpentine, asphalt, oleic acid and "Elbagreen oil" having an affinity for ink and capable of softening when heated; the plate is then etched with acid, then heated sufficiently to develop cavities in it and the image substance is caused to soften and flow into the cavities of the Al. Cf. C. A. 27, 2105.

**Stereotypes.** Ges. E. G. Acheson Ltd. Ger. 585,431, Oct. 4, 1933. Fibrous matrices for casting stereotypes are coated with an aq. graphite dispersion which may also contain  $Na_2SiO_3$ , colloidal clay and glycerol, with or without a thickener such as gum arabic or casein.

**Shoe stiffeners.** The British United Shoe Machinery

Co. Ltd. and David B. Macdonald. Brit. 397,141, Aug. 17, 1933. A shoe-upper end stiffener, charged with a stiffening agent, is provided at a localized portion with a plasticizer or solvent to render this portion temporarily or permanently more flexible. Thus box toes, charged with celluloid and resin and (or) a resin ester, may be treated at the skived portion with tricresyl phosphate, castor oil or stearin for a permanent, or with a low-volatility solvent, e. g., diacetone alc., for a temporary, effect.

**Fire-extinguishing apparatus.** Sparklets Ltd. and George E. Heyl. Brit. 397,380, Aug. 24, 1933. A container for compressed  $CO_2$  is sealed by a wire of a low-melting alloy which is soldered into a bore of a Cu ferrule screwed into an opening in the steel body of the container. Alloys used are (1) Cd 3, Sn 4, Pb 8, Bi 5 (m. 68°); (2) Sn 3, Pb 8, Bi 9 (m. 79°); (3) Sn 3, Pb 5, Bi 8 (m. 94.5°) and (4) Cd 3, Sn 8, Pb 8, Bi 15 parts (m. 70°).

**Apparatus for generating fire-extinguishing foam.** Karl Schmidt and Clemens Wagener (to Pyrene-Minimax Corp.). U. S. 1,940,272, Dec. 19. Various structural and operative details are described. Cf. C. A. 27, 3645, 3791.

## 19—GLASS, CLAY PRODUCTS, REFRACTORIES AND ENAMELED METALS

G. E. BARTON, C. H. KERR

The dependence of the reaction velocity in glass batches on the physical condition and chemical composition of the raw materials. I. The influence of sand grain size on reaction velocity in sand-soda mixtures. M. Linde and F. H. Zschacke. *Glastech. Ber.* 11, 445-54 (1933).—Three similar mixts. of soda and sand of various grain sizes were heated under the same conditions and the effect on the reaction velocity was followed by detg. the undecompd. soda present. The velocity at a certain temp. increases with decreasing grain size. With increasing temp. the differences in velocity become smaller and at sufficiently high temp. differences disappear. As long as the batch is not sintered the insulating effect far outweighs the effect of increased surface. With larger particles the insulating effect is greater. With a sintered batch the differences in velocity are significant. The finer the grain size is, the more rapid the reaction. The last residue of soda is decompd. only slowly. Heating at 1300° for 20 min. still leaves 2% of soda. The large bubbles initially present become smaller and more numerous as the flux becomes more satd. with silica.

J. F. Hyde  
Changing fuel in glass-melting furnaces. H. Maurach. *Glastech. Ber.* 11, 437-44 (1933).—Twenty-seven references.

J. F. Hyde  
Effect of gases upon the properties of glass. VII-VIII. Effect of the heat treatment of glass upon its silver plating. 2 and 3. K. Nakanishi. *J. Soc. Chem. Ind., Japan* 36, Suppl. binding 672-3 (1933); cf. C. A. 28, 869°.—In mirror making it was found to be effective to heat glass at a temp. which is 50-100° below the softening point, for 30-60 min. under reduced pressure. The max. velocity of silver plating was supposed to exist at a condition where gases were removed to a moderate extent from the surface of the glass, but where some  $O_2$  was still present.

Karl Kammermeyer  
Physical and chemical processes in the melting of potassium oxide-lead oxide-silica glasses. M. A. Benbowdov, A. A. Appen, T. F. Korzhukhina, E. P. Chodikel and G. A. Shinke. *J. Soc. Glass Tech.* 17, 305-19 (1933).—A study was made of the processes of conversion into glass of a mixt. of the several oxides to yield a glass of the compn. 48%  $SiO_2$ , 45.5%  $PbO$  and 6.5%  $K_2O$ . The batch was heated at 100° stages up to 1200°. The reaction was followed by detn. of the loss in wt. of the batch, the compn. of the gases evolved, the  $H_2O$ - and the dil.- $HNO_3$ -sol. constituents, the compn. of the molten or sintered mass and by microscopic examn. Studies were made of  $K_2CO_3$  alone and of the binary systems  $K_2CO_3$  and  $SiO_2$ ,  $K_2CO_3$  and  $Pb_2O_3$ ,  $Pb_2O_3$  and  $SiO_2$ , as well as of the ternary system. Up to 300° there was no evidence

of reaction except the liberation of moisture, the  $K_2CO_3$  contg. about 15% originally, and the slight evolution of  $CO_2$  from the  $K_2CO_3$  and  $SiO_2$  reaction. The red lead dissolved initially at 500° at a slow rate and completely below 600°. The  $K_2CO_3$ - $SiO_2$  reaction rate increased at 500° and above, becoming very rapid at 800°. Microscopic examn. showed that even after chem. reaction was complete the product was very inhomogeneous, having varying  $ns$ . Between 1000° and 1200° the homogeneity improved because of the soln. of both the  $SiO_2$  and the  $PbO$ , the mass becoming practically isotropic at 1200°. The  $H_2O$  soly. practically ceased at 800°. The acid soly. was practically const. up to 800° and then decreased progressively with increased temps.

H. F. K.

Manganese dioxide as decolorizer and colorant of glass.

L. Springer. *Céram., verrerie, emailerie* 1933, 251 3.—Studies were made of coloration by oxides of Fe and Mn, decolorization by  $MnO_2$ , and decolorization with pure Mn compds. Results of fusions with varying proportions of coloring and decolorizing agents are described. *Ibid.* 296. —Further tests show the effect of the treatment of glass contg.  $FeO$  with varying amts. of  $MnO_2$ ,  $KMnO_4$  and saltpeper. Variable results are thought due to variations in manner of heating and in temp. *Ibid.* 351.—Coloration of glass by  $MnO_2$  depends on the conditions of reduction or oxidation in the presence of Fe, As or saltpeper. Equal amts. of  $FeO$  and  $MnO_2$  give a smoky-brown color. If the amt. of  $MnO_2$  is double that of  $FeO$  the color is yellowish brown with large amts., green with small amts. Expts. on decolorization by  $MnO_2$  show that it is necessary to use equal amts. of  $MnO_2$  and  $KMnO_4$  or comparatively larger amts. of the latter to decolorize  $FeO$ . Such large amts. do not easily produce over-coloration. Only relatively very large amts. produce an over-coloration of brown or violet. This may be due to the many more or less colorless combinations possible between Fe and Mn. In decolorization by Mn there is danger of reduction effects which may bring back the green color of Fe. Since over-coloration is relatively rare,  $MnO_2$  or better  $KMnO_4$  +  $MnO_2$  + saltpeper are to be considered among the best agents of decolorization.

Alice W. Epperson

Stones in glass and devitrification. Albert Granger. *Céram. verrerie, emailerie* 1933, 389 92.—These phenomena and various causes are discussed, including those caused by the pots and by the compn. of the glass. Compn. and optical properties of the crystals are discussed.

Alice W. Epperson

The temperature of transformation and softening of glasses. Edouard Rencker. *Compt. rend.* 197, 1049-51 (1933).—Differential expansion curves are given for 4

glasses: B<sub>2</sub>O<sub>3</sub>, Pollopos, Pyrex, and one of compn. SiO<sub>2</sub> 87%, Na<sub>2</sub>O 9%, BeO 4%. The results depend on the size of the specimen and the rate of heating. Conclusion: The temperature of transformation coincides with the softening point.

J. B. Austin  
Evolution of gas from solid glass on heating. N. A. Orlova and S. V. Ptitzin. *J. Tech. Phys.* (U. S. S. R.) 3, 596-601 (1933).—Graphs show the rate of desorption from lead and dolomite glass used for lamp bulbs. F. H. R.

Studies on chilled plate glass. Tsuruo Araki, Sōnosuke Takahashi and Shūichi Mori. *J. Soc. Chem. Ind., Japan* 36, Suppl. binding 677 (1933).—Polariscopic examn. of the glass showed systematic stress distribution. Phys. properties for chilled and untreated glass are presented.

K. Kammermeyer  
The silvering of automobile headlamp bulbs. Geo. S. Santmyers. *Metal Ind.* (N. Y.) 31, 277-9 (1933).—In most industrial establishments, individual variations in the Rochelle salt and the Brashear formula are prevalent. It has been found that better results in silvering glass are obtained from the use of an excess of NH<sub>4</sub>OH in the prepn. of the Ag soln., the elimination of the necessity for its filtration and the production of a very opaque deposit in a dil. soln. of Ag by the presumably catalytic action of I or of the double cyanide of Hg and K. W. H. Boynton

Effect of drying on the grain-size distribution of clays. Carl W. Correns and Wolfgang Schott. *Kolloid-Z.* 65, 190-203 (1933); cf. *C. A.* 27, 1122.—Drying of a Papendorf diluvial and an Oligocene clay, either at 105° or at various humidities at 30°, caused an increase in coarseness in the fractions below 5 μ. A deep-sea red clay containing 77% <1.1 μ in radius showed 69% after drying at 30° and 61.5% after drying at 105°. Clay dried at 105° and allowed to reabsorb H<sub>2</sub>O showed no further change. The original Oligocene clay, after 200-day treatment in a humid atm., became coarser and absorbed H<sub>2</sub>O, which was not given up at 105°, while the Papendorf clay became finer. The difference is due to chem. compn. Arthur Fleischer

The absorption systems of kaolins and clays with liquids in relation to the occurrence of plasticity. Erhard Gruner. *Z. anorg. allgem. Chem.* 215, 1-18 (1933).—G. has detd. the vapor pressures of systems of kaolin separately with CCl<sub>4</sub>, C<sub>6</sub>H<sub>6</sub>, CS<sub>2</sub>, SO<sub>2</sub> (Group I); H<sub>2</sub>S, Et<sub>3</sub>NH, EtNH<sub>2</sub>, Me<sub>2</sub>NH, MeNH<sub>2</sub>, Et<sub>2</sub>O, Me<sub>2</sub>CO, NH<sub>3</sub>, H<sub>2</sub>O (II). In I, not plastic, the vapor pressure remains practically const., that of the pure liquid, until no liquid remains; in II, plastic, there is a gradual decrease in vapor pressure, indicating an absorptive retention of liquid. In order that a plastic mass result the dispersing liquid must have an asymmetric dipolar mol. which must be so constituted that it can employ a neg. part, equiv. to an O, to regenerate the kaolin anhydride. The magnitude of the dipole, degree of asymmetry and chem. relationship to kaolin det. the degree of plasticity. Liquid NH<sub>3</sub> dehydrates kaolin and clays, by removing H<sub>2</sub>O from the allophane portion only. The results are in agreement with the theory of Ruff and collaborators. Curves are given. E. R. Schierz

Suitability of limes for sand-lime brick manufacture. G. E. Bessey and H. J. Eldridge. *J. Soc. Chem. Ind.* 52, 443-7T (1933).

Artificial drying of fire bricks. M. S. Kazanskii and P. P. Yagupov. *Keram. i Steklo* 9, No. 8, 5-9 (1933); cf. *C. A.* 27, 173.

Silicates of soda in the ceramic industry. Wm. Stericker. *Ceram. Age* 23, 3-4, 28 (1934).—J. G. Vail is given as author but a later note (*Ibid.* 60) explains that this is a typographical error. Herbert S. Willson

Physical-chemical principles of the present-day silicate industry. Wilhelm Fitel. *Angew. Chem.* 46, 803-10 (1933).—A general discussion with special emphasis upon Debye's theory and the application of x-ray absorption spectra.

Karl Kammermeyer  
Classification of florescence. Ellis Lovejoy. *Bull. Am. Ceram. Soc.* 13, 22-3 (1934).—Cryptoflorescence, efflorescence, inflorescence and scum are defined and further subdivided. Corrective procedures are tabulated.

Incrustations on porous pottery—cleaning without loss of

pigment. Colin G. Fink. *Tech. Studies Field of Fine Arts* 2, 59-61 (1933).—Removal of salt incrustations can be effected by electrodesmosis. A. Papineau-Couture  
Semi-porcelain table ware. V. P. Zubchaninov and Z. I. Glushanok. *Keram. i Steklo* 9, No. 8, 9-12 (1933).—A series of expts. in an intermediate field between porcelain and faience is described.

M. V. Kondoidy  
Cracking of cooking utensils. Vielhaber. *Emailwaren-Ind.* 10, 317-20 (1933).—A high-quality enamel resistant to temp. changes must contain a min. amt. of white opacifier. The opacifier should be melted and not added to the mill. The enamel layer should be thin, while the sheet iron should be thick. The 2nd coat is a ground enamel mixed with white enamel to give a lighter color. Up to 50% of white enamel may be added provided it does not contain more than 6% cryolite or Na fluosilicate and is not based on a feldspar opacification. Addns. of kaolin, or opacifiers contg. it, and the addn. of a large amt. of clay as suspending agent should be avoided. It is almost impossible to apply ground enamels contg. opacifiers.

Glass. Marianne Wellmann. *Ger.* 585,816, Oct. 11, 1933. Addn. to 537,633 (*C. A.* 26, 1408). The method of 537,633 for making Be borate glasses transparent to ultra-violet rays is modified by using alkali carbonate in place of Li<sub>2</sub>CO<sub>3</sub>. Thus, the glass contains 15-25 parts of boric acid, 1-2 parts of BeCO<sub>3</sub> and an amt. of alkalicarbonate equiv. to 3-6 parts of Li<sub>2</sub>CO<sub>3</sub>. The glass is also useful for lenses, prisms and Hg-vapor lamps.

Glass. I. G. Farbenind. A.-G. (Hans G. Grimm and Paul Huppert, inventors). *Ger.* 589,035, Dec. 1, 1933 (*Cl.* 32b. 1). Addn. to 580,295 (*C. A.* 27, 4895). SiO<sub>2</sub> normally used in making glass is replaced wholly or in part by Al<sub>2</sub>O<sub>3</sub> and P<sub>2</sub>O<sub>5</sub> in the proportion of more than 1 mol. of Al<sub>2</sub>O<sub>3</sub> per mol. of P<sub>2</sub>O<sub>5</sub>. The excess of Al<sub>2</sub>O<sub>3</sub> may be up to 18% of the wt. of the glass. The glass obtained has a lower coeff. of expansion and a higher softening temp. than that made by the process of *Ger.* 580,295. Examples are given.

Glass. René Amand. *Fr.* 755,171, Nov. 21, 1933. Construction of refractory pots is described.

Container for melting glass. Firma Oscar Gossler (Gedeon v. Pazsichky, inventor). *Ger.* 585,761, Oct. 10, 1933. Addn. to 580,502 (*C. A.* 28, 1156<sup>9</sup>).

**Automatic temperature-control apparatus for use in delivery of molten glass.** Leonard D. Soubier (to Owens-Ill. Glass Co.). U. S. reissue 19,025, Dec. 12. A reissue of original pat. No. 1,802,789 (C. A. 25, 3794).

**Apparatus for forming glass articles such as bottles or jars.** Leonard D. Soubier (to Owens-Ill. Glass Co.). U. S. 1,940,634, Dec. 19. Mech. features.

**Glass-blowing apparatus suitable for manufacture of bottles.** Robert Patterson (to Carr-Lowrey Glass Co.). U. S. 1,830,917, Dec. 19. Mech. and operative details.

**Machine for making electric lamp bulbs and similar glassware.** Carl A. Brown, Charles Wm. Craig and Frank B. Vansickle (to The British Thomson-Houston Co. Ltd.). Brit. 397,425, Aug. 24, 1933.

**Apparatus for making glass tubes having a stripe of contrasting color embedded therein.** Wm. H. Said (to Corning Glass Works). Brit. 397,444, Aug. 24, 1933. Addn. to 354,509 (C. A. 27, 2271).

**Device for drawing glass tubes.** Glaswerke Ruhr A.-G. Ger. 585,689, Oct. 6, 1933.

**Continuous apparatus for drawing glass tubes.** Corning Glass Works. Ger. 586,684, Oct. 24, 1933 (Cl. 32a. 23.02). Addn. to 576,341 (C. A. 27, 3794).

**Apparatus for heating glass tubes to form annular constrictions or swellings.** Osram G. m. b. H. Komm.-Ges. (Hans Joachim Spanner and Werner Lukas, inventors). Ger. 585,899, Oct. 12, 1933.

**Tempering glass.** Soc. anon. des manufactures des glaces et produits chimiques de St. Gobain, Chauny & Cirey. Brit. 397,395, Aug. 24, 1933. Addn. to 361,277 (C. A. 27, 1126). Jets of air for chilling hot sheet glass are produced by apertures in 2 disks, each of which is housed in an air conduit and rotated in its own plane. Cf. C. A. 27, 2270.

**Device for hardening glass plates by blowing air upon them while hot.** Compagnies réunies des glaces et verres spéciaux du nord de la France. Ger. 585,535, Oct. 5, 1933.

**Glass-pressing apparatus.** Eduard Redlhammer & Solme-Glasfabrik. Ger. 585,615, Oct. 5, 1933.

**Apparatus for polishing sheets of glass, marble slabs, etc.** Soc. anon. des manufactures des glaces et produits chimiques de St. Gobain, Chauny & Cirey. Brit. 398,407, Sept. 14, 1933.

**Glass-rolling apparatus.** John H. Fox and Wm. Owen (to Pittsburgh Plate Glass Co.). U. S. 1,939,967, Dec. 19. Structural and mech. features.

**Roller for use in an apparatus for drawing flat sheet glass.** Joseph Gaskell. Brit. 398,479, Sept. 12, 1933.

**Sheet glass.** Forges et ateliers de constructions électriques de Jeumont. Brit. 397,400, Aug. 24, 1933. In pouring molten glass from a pot into the pass between the rollers of a double-roll machine having its rollers arranged at different levels the pot is tilted about an axis inclined to the axes of the rollers, and at the same time the pot is moved parallel with the rollers to spread the glass.

**Apparatus for drawing sheet glass.** Howard L. Halbach (to N. V. Hollandsche Maatschappij voor de Vervaardiging Van Glas). Brit. 397,820, Aug. 31, 1933.

**Method of making molded articles from white glass cased with colored glass.** Sächsische Glasfabrik August Walther & Söhne A.-G. Ger. 589,094, Dec. 2, 1933 (Cl. 32b. 9). Manipulative features are described.

**Compound glass.** Imperial Chemical Industries Ltd., James S. B. Fleming and Archibald Renfrew. Brit. 398,189, Sept. 7, 1933. In mfg. compd. glass the interlayer, comprising thermoplastic resinous polymers or inter-polymers of unsatd. compds., e. g., polymerized vinyl acetate, Me acrylate, Me  $\alpha$ -methylacrylate, vinylbenzene or the products obtained by polymerizing mixts. of Me acrylate with Me or Et  $\alpha$ -methylacrylate or with vinyl cyanide, is annealed by maintaining the compd. glass for a long time, e. g., 16 hrs., at the temp. of incipient softening of the resin.

**Compound glass.** Imperial Chemical Industries Ltd. and Archibald Renfrew. Brit. 398,855, Sept. 22, 1933. Compd. glass includes a layer of a polymerized or inter-polymerized unsatd. org. compd., e. g., vinyl acetate, Me acrylate, formed from a sheet of a partially polymerized

1 sirup by evapg. the unsatd. compd. by heating below the b. p. The sirup may contain or the component sheets may be assembled under a non-volatile softener, e. g., di-Bu phthalate. The glass sheets may be first coated with an adhesive, e. g., gelatin, polyvinyl acetate.

**Compound glass.** The Triplex Safety Glass Co. Ltd. and John Wilson. Brit. 398,172, Sept. 5, 1933. Addn. to 332,551 (C. A. 25, 391). Cellulose ester plastics, e. g., celluloid, cellulose acetate, are united to sheets of glass 2 coated with gelatin, with or without an enamel or cement, by bringing the sheets together while immersed in or flooded by an inert liquid comprising homologs of cyclohexanol, e. g., methyl- or dimethyl-cyclohexanols, or derivs. thereof, e. g., methyl- or dimethyl-cyclohexanol oxalates, and then subjecting to heat and pressure. The liquid may be used hot and may comprise also cyclohexanol, glycerol, H<sub>2</sub>O, di-Me, di-Bu or di-Am phthalates, ethylene glycol 3 ether, diethylene glycol ether, cyclohexanone or its homologs, triaryl phosphates, *p*-toluenesulfonamide, benzyl alc., triacetin, PhMe, xylene, AmOH, *sec*-hexyl alc. and mineral oil. Cf. C. A. 27, 5920.

**Apparatus for forming compound glass sheets.** Bernhard Engels. U. S. 1,941,392, Dec. 26. A layer of molten glass is delivered onto an upwardly drawn sheet of glass between the molten glass bath and the drawing device.

4 **Laminating sheets of glass and reinforcing material such as celluloid or the like.** Wm. O. Lytle (to Duplate Corp.). U. S. 1,939,998, Dec. 19. Various details of app. and operation are described for uniting the materials under the action of heat and pressure.

**Nonsplintering glass.** Duplate Corp. Ger. 587,457, Nov. 3, 1933. See U. S. 1,781,084 (C. A. 25, 182).

**Molding clay thimbles for holding pottery in kilns.** Harry M. Aynsley (trading as Taylor and Co.) and Henry Shuffelbotham. Brit. 397,737, Aug. 31, 1933.

5 **Ceramic articles.** Max Hauser. Ger. 588,152, Nov. 13, 1933 (Cl. 80b. 8.21). This corresponds to Swiss 128,404 (C. A. 23, 2798), but gives addnl. details.

**Device for partly drying potter's clay, etc.** Georg Fischer. Ger. 585,578, Oct. 5, 1933.

**Rollers for comminuting clay and like plastic masses.** Otto Lefnaer. Ger. 585,496, Oct. 10, 1933.

6 **Counterflow recuperative furnace suitable for firing decalcomania decorations on pottery ware.** Frank T. Cope and Wilbur S. Bowling (to Elec. Furnace Co.). U. S. 1,938,581, Dec. 12.

**Apparatus for drying, maturing and glazing ceramic bodies such as glazed tile in a continuous manner.** Andrew Malinovsky (to Malinite Products, Inc.). U. S. 1,940,554, Dec. 19. Structural and mech. features.

7 **Glazed tile.** Charles B. Lansing and Robert H. Loudon (to National Tile Co.). U. S. 1,941,403, Dec. 26. A mold is at least partially filled with body material; glaze material in sheet form is applied to the body material, the combined materials are compressed, and the tile is then removed from the mold and fired.

**Ceramic insulating compositions.** Deutsche Ton- & Steinzeug-Werke A.-G. Ger. 588,271, Nov. 18, 1933 (Cl. 21c. 2.01). Addn. to 493,001 (C. A. 24, 2816) and 498,149 (C. A. 24, 3843). The products of Ger. 493,001 and 498,149 are improved by adding to the mass before firing a compd. of Mn, Zr, Ce, Cr, P, W or V, as well as a compd. of Ti.

**Electric insulating compositions.** Siemens-Schuckertwerke A.-G. (Willy Zehrowski, inventor). Ger. 588,272, Nov. 15, 1933 (Cl. 21c. 2.03). Use is made of artificial fibers of an inorg. Mg compd. united by a binder comprising a readily fusible glass. Thus, fibers prepd. in known 9 manner from fused hornblende, or from a fused mixt. of hornblende and CaF<sub>2</sub>, may be mixed with powd. fusible glass and molded under heat and pressure.

**Luting.** Siemens & Halske A.-G. Fr. 754,359, Nov. 6, 1933. A luting for the central electrode of spark plugs contains Al<sub>2</sub>O<sub>3</sub> 50-53, Al(OH)<sub>3</sub> 10, quartz powder 15 and glass powder or Pb 5-2 parts.

**Refractory articles.** Deutsche Gold- und Silber-Schmelzanstalt vorm. Roessler (Eugen Rishkevich, in-

ventor). Ger. 588,258, Nov. 17, 1933 (Cl. 80b. 8.13). Refractory articles are manufd. by molding and firing a compn. contg. fresh  $ZrO_2$  and calcined  $ZrO_2$  together with up to 1.5% of  $BeO$  and about the same amt. of  $MgO$ , with or without a little  $Al_2O_3$ . A part of the oxides may be formed *in situ* from hydrolysable compds., e. g.,  $BeCl_2$ ,  $ZrCl_4$ , or  $MgCl_2$ .

**Refractory products.** Gilbert E. Seil. Fr. 755,038, Nov. 18, 1933. A refractory product of chromite, in which the gang of low m. p. has been transformed into a refractory material, is made by intimately mixing the Cr ore and crystd.  $MgO$ , highly calcined, the  $MgO$  being present in amt. above 12.5% (preferably 17-25%) of the total wt. of the mixt., grinding and kneading the mixt., afterward molding and calcining the mass, preferably to about 1850°.

**Refractory material suitable for lining furnaces.** Reed W. Hyde (to Dwight & Lloyd Metallurgical Co.). U. S. 1,939,838, Dec. 12. See Fr. 740,798 (C. A. 27, 2781).

**Refractory brick.** Russell P. Heuer (to General Refractories Co.). U. S. 1,939,211, Dec. 12. Flint clay is calcined until its open pore space is reduced to 5% or less, and a mixt. contg. at least 75% of the product thus obtained is formed into brick under a pressure of over 1000 lb. per sq. in. Cf. C. A. 27, 1472.

**Refractories.** Morningside Fireclay Co. Ltd. and Robert Currans. Brit. 397,977, Sept. 7, 1933. A refractory product for the manuf. of bricks, blocks, tiles, etc., is composed of calcined fireclay without any extraneous ingredients. Raw fireclay is calcined at 1000-1200°, ground dry, reground wet, molded in the plastic condition without a binder and burnt in a kiln. The material may be dried after the wet grinding and then reground wet before molding.

**Polishing, grinding and sharpening material.** Siemens & Halske A.-G. (Reinhold Reichmann, inventor). Ger. 589,374, Dec. 6, 1933 (Cl. 80b. 11). Practically pure  $BeO$  which has been sintered at above 1700° is used for polishing, grinding and sharpening very hard materials such as hard alloys.

**Glazes.** Hans J. Harkort. Fr. 754,412, Nov. 7, 1933. In making Pb glazes for pottery, etc., the Pb is introduced

into the compn. in the form of industrial waste products contg. oxides of Pb, e. g., waste from the storage-battery industry.

**Enamel.** Ignaz Kreidl. Ger. 585,832, Oct. 11, 1933. Fe enamel or the white background of Fe enamel is prepd. by coating the Fe with a soln. or pseudo soln. of salts or compds. of Ni or Co with non-volatile acids in  $H_2PO_4$ . Preferably,  $H_2PO_4$  solns. of phosphates or borates of Ni or Co, or colloidal oxides or hydroxides of Ni or Co are used.

**Enamels.** Ignaz Kreidl. Fr. 754,524, Nov. 8, 1933. Slips, for making enamels, that are stable to storing are made by using opacifying agents, the necessary amt. of which is not above the amt. which can be absorbed by the slip. Suitable agents are org. dyes such as methylene blue and malachite green or highly polymerized hydrocarbons, such as resins, tars and asphalts. The stability can be increased by the addn. of an adsorption agent.

**Enameling iron.** Leichtmetall-Verwertungs-Ges. m. b. H. Ger. 585,409, Oct. 3, 1933. Sheet iron is coated with an aq. sludge of natural lepidolite and then fired at 1000°. Up to 30% of  $SiO_2$ ,  $Al_2O_3$ ,  $CaO$ ,  $MgO$ ,  $K_2CO_3$  or  $Na_2CO_3$  may be mixed with the lepidolite. Preliminary application of a ground enamel is unnecessary.

**Enameled iron articles.** Wm. E. Dougherty (to The O. Hommel Co.). U. S. 1,938,691, Dec. 12. For producing an opaque, white, enameled iron article, there are fired upon the article at least two successively applied coats of glass opacified with Ti oxide, glass being used contg.  $SiO_2$  with flux in sufficient amount to produce a glass m. about 925° or lower, and the Ti oxide being added in a quantity sufficient to afford in a doubly coated article a reflectance of at least 59%.

**Making hollow ware.** Joseph & Jesse Siddons Ltd. and Joseph R. Siddons. Brit. 398,289, Sept. 14, 1933. Cast Fe or steel saucepans, kettles, etc., are enameled over all or part of the exterior surface, allowed to cool, prepd. for tinning and tinned internally. The enamel is fired 15-20 min. at preferably 680-800° for a "wet" process or at 850-1000° for a dry process.

**Apparatus for firing enamel.** Karl Machwirth. Ger. 586,640, Oct. 24, 1933 (Cl. 48c. 7).

## 20—CEMENT AND OTHER BUILDING MATERIALS

J. C. WITT

**The mill in the cement industry.** Alfred Müller. *Tonind.-Ztg.* 57, 613-14 (1933).—A general discussion of mill types and construction. Karl Kammermeyer

**Classification of lime-clay-magnesia deposits and their utilization in the production of cements.** V. A. Kind and S. D. Okorokov. *Mineral. Suir'e* 8, Nos. 8-9, 5-14 (1933).—The chem. classification of the U. S. S. R. mixed deposits of  $CaCO_3$ ,  $MgCO_3$  and clay into 24 types is based on the properties of the resulting cements, and is presented by a triangular graph and tabulation. Chas. Blanc

**Cements with addition of bitumen.** Walter Dyckerhoff. *Tonind.-Ztg.* 57, 637-9, 660-2 (1933).—The manuf. of portland cements with bitumen addn. (I) is described. Addns. of 3-4% bitumen present optimum figures. The I cements show a continuous rise in strength when subjected to alternate freezing and heating treatment. They require a greater amt. of mixing water, have longer setting time, and also show a better ratio of tensile to compressive strength than ordinary portland cements. The I cements are also more elastic and have less shrinkage. Exptl. data are presented. Karl Kammermeyer

**Question of swelling and shrinking of cements.** O. Goffin and G. Musznug. *Zement* 22, 549-50 (1933).—Cements from 3 clinkers contg. 1.27-3.27% free  $CaO$  were examd. over a 90-day period of water and air curing. It was found that swelling increased with the free  $CaO$  content and the presence of more than 4% gypsum. Shrinkage increased with the fineness of the cement and with the addns. of  $CaCl_2$ . The  $SiO_2$  content had no apparent effect on either swelling or shrinkage. H. F. Kriege

**Occurrences during the setting of aluminous cements.**

Renato Salmoni with H. E. Schwiete. *Zement* 22, 523-6 (1933).—The heat evolution, swelling, strength and  $pH$  values of 2 setting cements were detd. The swelling of the cement particles, the increase in strength and the heat evolved are controlled by the  $pH$  values of the mass. The Donnan equil. is used to explain the observed occurrences. References are given. H. F. Kriege

**Measuring the heat of the setting of cement.** R. Sandri. *Zement* 22, 593-6 (1933). H. F. Kriege

**Cement problems. The sudden set of portland cement.** Kurt Würzner. *Tonind.-Ztg.* 57, 707-9 (1933).—Expts. are described which were made to det. the relations between setting time and quantity of water bound. These resulted in smooth curves indicating that "sudden set" does not take place instantaneously. The influence of alkali addn. and  $CO_2$  treatment of the cement are also shown. Karl Kammermeyer

**Analysis of portland cement.** Olaf Røer. *Tids. Kjemi Bergesen* 13, 55-6 (1933).—An outline of methods in use. H. C. M. Ingeberg

**Investigations of the clays of portland cement. I. Preparation of portland cement from tuff and limestone.** Yoshiaki Sanada. *J. Soc. Chem. Ind., Japan* 36, Suppl. binding 678-80 (1933).—Eleven raw mixts. were prepd. from limestone, tuff, sandy tuff and Cu slag. The chem. compn. of the raw materials and the proportions, hydraulic modulus and fineness of the raw mixts. are presented. Chem. compn., hydraulic modulus,  $SiO_2$  and Fe modulus, activity index and  $Fe_2O_3/Al_2O_3$  ratio are reported for the clinkers. The setting time, soundness and strength tests on these samples showed that portland cement of good

quality could be made from these raw materials. II. The thermal changes of tuff. *Ibid.* 680-1.—Combined water was nearly all lost at 750°, sol. SiO<sub>2</sub> was a max. at 740° and tuff heated at 800° was most easily ground.

Karl Kammermeyer

Average or mean value? R. Feret. *Rev. matériaux construction trav. publics* 1933, 397-400.—A statistical study of compressive-strength data obtained on a variety of cement mortars indicates that the av. value is preferable.

Karl Kammermeyer

Permanent and elastic deformations of cement mortars. S. Uchida and K. Endell. *Zement* 22, 579-82(1933).—A new method of torsion measurements is described which gave satisfactory results with specimens of cement-sand mortars of 1:0 to 1:6 mixes and ages up to 180 days.

H. F. Kriege

Sulfur-impregnated cement mortar. Georg Saenger. *Zement* 22, 537-41, 546 70(1933).—Three cements and 1 sand were made into mortar specimens of 1:3, 1:5 and 1:8 proportions, with 3 consistencies designated as earth moist, plastic and fluid for each mix. After 3 weeks' normal curing the specimens were immersed in molten S at 130-50° or 160-80° for periods of 3, 6 and 24 hrs. The previously reported large increase in compressive strength of the S-impregnated specimens over the untreated was observed. The strength difference due to cement content of the lean and rich mixes was practically overcome by the S treatment of any duration, while the difference due to consistency was materially reduced by the longer soaking periods chiefly. The penetration of the S at 170° was usually less than at 130°. The resistance of the mortars to abrasion and to corrosive solns. was increased by the S treatment. Prolonged H<sub>2</sub>O storage of the impregnated specimens produced notable declines in compressive strength which were not observed in the air-cured mortars. Hence the S treatment is not advised for concrete structures and units which are exposed to moisture and weathering.

H. F. Kriege

Hydraulic mortars. Augustin Maché. *Compt. rend.* 197, 1420-2(1933).—M. has made up mortars which include earthy material to study the effect of org. matter upon the setting and hardening properties of the concrete. A mortar made from a siliceous sand gave relative compressive strengths of 67, 145 and 238 for 2 hrs., 7 and 28 days, resp. By the introduction of 1% humus these values were reduced, resp., to 52, 106 and 155. Two % humus gave 36, 56 and 132 while 5% humus gave 19, 39 and 89, resp. This decrease in strength is attributed to the acid character of the earthy matter and not to its colloidal properties. The addn. of small quantities of free alkali decreases the compressive strength of the mortar. If, however, the mortar contains 5% earthy matter and 5% NaOH, the relative compressive strengths are 56, 120 and 182 for 2 hrs., 7 and 28 days. Similar results are obtained with a calcareous sand in the mortar. H. E. Messmore

The analysis of trass. W. Wittekindt. *Tonind.-Ztg.* 57, 732-4, 758-9, 785(1933).—See C. A. 27, 4052.

Karl Kammermeyer

Slurry drying with the Miag calcinator. Karl Gönigen. *Zement* 22, 582-5(1933).

H. F. Kriege

New phases in concrete technology. J. A. Kirejenko. *Zement* 22, 556-9, 571-2(1933).—A review is given of one Ukrainian work on the crit. age of concrete in connection with low temps., effect of high temp. and moisture on the mech. strength, heat capacities and conductivities of concretes and mortars, protection of fresh concrete against frost action and related subjects.

H. F. Kriege

Newer methods for the investigation of the general and the capillary porosities of concrete structures. Pogány. *Zement* 22, 585-8, 597-8(1933).—Certain microscopic and planimeter methods are discussed. The most practical method is stated to be the measuring of the rise of distd. H<sub>2</sub>O at 20° under 760 mm. Hg pressure in the thoroughly dried specimens.

H. F. Kriege

Changes in compressive strength of concrete with increasing age up to twenty years. Otto Graf. *Zement* 22, 526-31(1933).—Concrete protected from drying out dur-

ing 20 yrs. continued to gain slowly in compressive strength, while that stored dry declined in strength gradually.

H. F. Kriege

Relative viscosities of liquid asphaltic road materials at various test temperatures. J. T. Pauls and R. H. Lewis. *Public Roads* 14, 212-18(1934).—A survey of test methods on asphaltic road materials in connection with the simplification of state specifications indicated a considerable variation of opinion as to the temps. at which viscosity detns. should be made. From a study of this problem the following conclusions were drawn: (1) There is need for tests at a no. of temperatures to cover adequately the wide range in consistency of liquid asphaltic road materials. (2) The use of 140° and 180°F. should prove satisfactory as control temps. in Furol viscosity detns. for the more viscous liquid asphaltic road materials. (3) When practicable, the temp. designated for control should give a Furol viscosity of less than 500 sec. However, the more viscous materials of the rapid curing type should not be tested for viscosity at a temp. higher than 140°F. (4) Many so-called liquid asphaltic road materials, which are used in hot surface-treatment work, and which are designated as hot oils, 90 and 95% road oils, etc., are in fact semi-solid asphaltic materials. These grades of material probably can be controlled best for consistency by either a float test at a low temp. or by a penetration test at 77°F. under a load of 50-100 g. (5) Tests at a temp. of approx. 210°F. can be omitted readily from specifications for liquid asphaltic road materials.

L. B. Miller

Bricks made from schist-ash as the cause of masonry deterioration. Haeckermann. *Tonind.-Ztg.* 57, 604-6, 624-9(1933).—The masonry destruction was caused by the high sulfate content of the schist-ash which gave vol. increases through the formation of double salts from Ca-SO<sub>4</sub> and alkali sulfates. Exptl. data are presented.

Karl Kammermeyer

A scientific and practical study of the principal products used as floor coverings in dwellings. F. Chalamel. *Rev. matériaux construction trav. publics* 1933, 27-9B, 47-50B, 68-71B, 91-4B, 110-13B, 124-6B, 147-50B, 167-70B, 189-91B, 206-9B, 231 3B.—The study includes phys. and chem. characteristics, resistance to microbic invasion, structure, decorative possibilities, uses and upkeep. The materials are classified into those used as individual pieces (tiles, paving bricks, wood, etc.), and products used without joints (granite slabs, concrete, etc.). Burned and unburned products are discussed. Rubber and linoleum products are also mentioned. Considerable exptl. data are presented.

K. Kammermeyer

The blue staining of timber and the molding of wood pulp. Lauri Alanko. *Teknillinen Aikakauslehti* 23, 368-74(1933).—A description is given of the life characteristics of the strains of fungi responsible for the blue staining of timber, and the discoloration and decay of wet mech. and sulfite pulp. A brief account is given of the methods used for the preservation of wood and wood pulp.

S. A. Karjala

New chemical treatments for the control of sap stain and mold in southern pine and hardwood lumber. A. D. Chapman and T. C. Scheffer. *Southern Lumberman* Sep. 4 pp.(May 15, 1933); *Rev. Applied Mycol.* 12, 688-9.—Lignasan (0.25%) and Na tetrachlorophenolate (STCP) (0.3%) gave the best results on a com. scale, reducing incidence of stain to under 1%. LE-3 (an Ht Hg oleate prepn., 0.24%) and a mixt. (known as SCOPP) of STCP and Na 2-chloro-*o*-phenylphenolate (0.3% of each) ranked next in general efficacy. SCOPP gave satisfactory results with all woods except sap gum. SCOPP alone or mixed with STCP was superior in the control of sap stains of pine and mold to lignasan, LE-3 or STCP alone. SCOPP withstood washing out in pine better than LE-3 or lignasan while STCP was best for sap gum. Used at the rate of 1.5-3% as a spray for pine export timbers SCOPP gave very satisfactory results against stain and mold, 90% of the treated pieces reaching London in good condition. The corrosive action of the chem. compds. on equipment can be obviated by adding alkali to the soln., which likewise prevents the Fe tannate

discoloration that is liable to develop in treated oak timber. Oden E. Sheppard

Pressure pipes of nonmetallic materials [concrete and asbestos cement] (Weber) 14. Classifier for sepg. ground cement from gas currents (U. S. pat. 1,939,710) 1. Treatment of calcareous shale (residue used in the manuf. of cement) (Ger. pat. 587,289) 22. Glue product [used as a calcimine] (U. S. pat. 1,940,486) 18.

Bauer, B.: Das Zusammenwirken von Beton und Eisen im Eisenbetonstützenbau. Vienna: Gerold & Co. 64 pp. M. 3.

Cements. I. G. Farbenind. A.-G. Brit. 396,964, Aug. 17, 1933. Addn. to 328,538. See Ger. 573,177 (C. A. 27, 4370).

Cement. Wilhelm Schulze, Jr. Ger. 563,604, Nov. 7, 1933 (Cl. 80b. 3.05). Cement is made from ore slimes and lime with an addn. of oil shale. Oil or coal dust may be used as the fuel for burning. A 40% addn. of oil shale contg. 5% bitumen may be given.

Cement. Soc. des ciments français et des Portland de Boulogne-Sur-Mer et compagnie des Portland de Desvres. Fr. 754,728, Nov. 13, 1933. In making white cement in a rotary furnace, the clinker is removed from the furnace at the moment it has reached its highest temp. and cooled in the absence of air, *e. g.*, by water, and only to such a pt. that it dries by itself.

Cement. Soc. des ciments français et des Portland de Boulogne-Sur-Mer et compagnie des Portland de Desvres. Fr. 754,775, Nov. 14, 1933. A white cement is obtained by intimately mixing the raw materials with either  $\text{CaF}_2$  or  $\text{CaCl}_2$  or both and removing the clinker from the rotary furnace at the pt. where it reaches its max. temp., and cooling the clinker by water or steam in the absence of air.

Pozzolan cement. Società anon. italiana per la produzione calci e cementi di Segni. Brit. 398,028, Sept. 7, 1933. A hydraulic cement for use in sea water is prepd. by mixing  $\text{CaO}$  with (artificial) pozzolana and  $\text{CaSO}_4$  in such proportions that the cement has a hydraulic index of 1-2.5. The  $\text{CaO}$  should not contain more than 5% impurities and the  $\text{CaSO}_4$  should be commercially pure. In an example a cement of hydraulic index 2.1 consists of pozzolana 80,  $\text{CaO}$  15 and  $\text{CaSO}_4$  5%.

Rotary kiln for cement burning. Fellner & Ziegler A.-G. Ger. 585,799, Oct. 10, 1933.

Apparatus for mixing cement and water. Deutsche Werke Kiel A.-G. Fr. 754,443, Nov. 7, 1933.

Apparatus for drying dewatered cement slurry, etc. Albert Weimar. Ger. 589,066, Dec. 1, 1933 (Cl. 80c. 14.10).

Apparatus for evaporating cement slurry, etc. Fried. Krupp Grusonwerk A.-G. Ger. 586,715, Oct. 25, 1933 (Cl. 80c. 14.10).

Rotary drum for treating crude cement mixture with furnace gases. Arno Andreas. Ger. 588,479, Nov. 18, 1933 (Cl. 80c. 14.10).

Mortar. Soc. anon. Brevetti Agostino Pozzi. Austrian 353,692, Nov. 25, 1933 (Cl. 80c.). A substitute for ordinary lime in the prepn. of mortar is prepd. by moistening calcined siliceous lime with dil.  $\text{HCl}$ , and allowing the mixt. to stand in a closed vessel until the reaction is complete. A silicate, *e. g.*,  $\text{Al}$  hydrosilicate, may be added when lime of low  $\text{SiO}_2$  content is used. Mortar prepd. from the product has a cellular structure and hardens quickly.

Bituminous pavement Alfred S. Hirzel. U. S. 1,940,417, Dec. 19. Large particles of stone are used with a smaller proportion of smaller particles of crushed slag as aggregate in a bituminous upper or wearing course of pavements.

Bituminous paving material Robert P. Fletcher, Jr. U. S. 1,940,645, Dec. 19. Mineral aggregate is treated with a volatile temporary fluxing oil, then with an ordinary bituminous paving cement, then with a bituminous tempering material consisting of a hard powd. asphalt or

gilsonite and this mixt. is laid before its constituents have completely coalesced.

Bituminous compositions. Wm. Griffiths and Frank Poulger. Brit. 397,864, Aug. 22, 1933. A mastic asphalt is made by mixing a bituminous binder, *e. g.*, a mixt. of pitch and tar, with an inert filler consisting of spent oxide or cyanide residue having, *e. g.*, the compn.  $\text{Fe}_2\text{O}_3$  11.1,  $\text{H}_2\text{O}$  33.9,  $\text{CaO}$  20,  $\text{SO}_3$  21.3 and  $\text{Fe}(\text{CN})_2$  3.7 and  $\text{CO}_2$ , etc., 10%. A quantity, *e. g.*, 1-5%, of resin or resinous residue from wood pulp manuf. may be added. The mastic, molten or as an aq. emulsion, may be mixed with aggregate, *e. g.*, granite chips, ballast, moist earth, to form a road-making compn.

Bituminous compositions. Eli W. Harvey and Herbert P. Weatherly. Brit. 398,268, Sept. 14, 1933. A paving and roof compn. is made from bitumen, sand and limestone dust by melting the bitumen and adding the heated filling material. Mineral or petroleum bitumen may be used.

Rubber composition for roads, etc. Albert E. Bond (to Rubber Cement Products Ltd.). U. S. 1,940,528, Dec. 19. A plastic compn. which may be used for road or roof surfaces, etc., consists of a concd. aq. dispersion of natural or synthetic rubber and a quantity of Portland cement or the like at least sufficient to cause the dispersion to set or gel irreversibly.

Waterproofing and dust-preventing composition for treating roads, tennis courts, etc. Richard Kraft. Austrian 135,143, Oct. 25, 1933 (Cl. 23c.). The compn., which is heavier than water, comprises crude or waste oil mixed with about 2% of powd. asbestos and about 8% of a soln. of bitumen in solvent naphtha.

Blast-furnace slags. Arthur Killing. Fr. 754,439, Nov. 7, 1933. A compact and homogeneous slag for use in the manuf. of tar macadam, filling materials, concrete, etc., is made by treating the slag with air so as to produce an increase of temp. and fluidity as well as a degassing and adding, if necessary, after reheating, materials contg.  $\text{SiO}_2$  and (or) clay.

Artificial stone. Karl F. Höller and Stefan Schless. Ger. 583,253, Aug. 31, 1933 (Cl. 80b. 1.02). Lime slaked with an excess of water is refined by flotation and sifting and then mixed while wet with a filler, *e. g.*,  $\text{CaCO}_3$ . The mixt. is filtered, molded under pressure and hardened with  $\text{CO}_2$ . Alternatively, the wet mixt. may be finely subdivided before it is molded by rapidly evapg. the water, *e. g.*, by pouring the mixt. onto a heated plate. The mixt. may also be dried, ground, and mixed with a hardening substance, *e. g.*,  $\text{SiC}$  or quartz, before it is molded.

Artificial stone. Edmund P. Schöler. Ger. 588,494, Nov. 24, 1933 (Cl. 80b. 20.01). A mixt. of powd.  $\text{CaO}$  with powd. calcined ash from brown coal is treated with water or steam under pressure, with exclusion of air, until it is uniformly moistened. The mixt. is then pressed into molds and hardened by treatment with steam under pressure.

Light stone, etc. Bruno Neuhof. Ger. 586,795, Oct. 26, 1933 (Cl. 80b. 1.09). Light stone, plaster, heat-insulating material, etc., is prepd. by mixing mineral material such as lime, cement, clay, etc., with the waste sulfite or sulfate lye from cellulose manuf. Alkali carbonates may also be added.

Porous blocks, etc. Richard Handl and Jacobus J. Meuzelaar. Ger. 585,581, Oct. 5, 1933. Light, porous articles are made by molding cellulosic materials and cement mixed with a soln. of  $\text{Fe}_2(\text{SO}_4)_3$  and milk of lime.

Machine for molding concrete blocks, etc. Charles M. Murdoch. Brit. 397,054, Aug. 17, 1933.

Apparatus for the centrifugal molding of blocks, slabs and like constructional elements. Ralph Williams. Brit. 396,931, Aug. 17, 1933.

Endless chain apparatus for molding slabs, blocks, tiles, etc. Donald Craig (legal representative of Frederick T. Walker, deceased). Brit. 398,195, Sept. 1, 1933.

Lining metal tubes with bituminous material. Georg Reichenbecher and Ernst Grube (to Vereinigte Stahlwerke A.-G.). U. S. 1,939,521, Dec. 12. A tube of metal is heated to from 30° to 40° above the working temp. of rust-preventing material to be cast such as

bitumen and then is painted with a thin layer of the material, cooled and rotated while sufficient heated coating material is deposited centrifugally to give a lining of the desired thickness.

**Compound metal sheets.** Egbert Groove. Brit. 398,318, Sept. 14, 1933. Weatherproof building-elements, e. g., roofing, waste-pipes, gutters, are made by rolling a Pb coating onto at least 1 side of a non-perforated Zn sheet. Elements having a Pb coating on 1 side only may have a varnish covering on the opposite side.

**"Acoustic" plaster.** Harry E. Brookby (to U. S. Gypsum Co.). U. S. 1,938,803, Dec. 12, 1933. Com. retarded gypsum stucco is used with oxalic or benzoic acid (adapted to react with a carbonate to release  $\text{CO}_2$ ) and an aggregate of granulated pumice and granulated marble, to form a sound-absorbent plaster. Cf. C. A. 27, 3056.

**Plaster of Paris.** Wilbur S. Randel (to U. S. Gypsum Co.). U. S. 1,941,188, Dec. 26, 1933. For producing  $\text{CaSO}_4$  dihydrate, anhyd.  $\text{CaSO}_4$  is subjected to the combined action of water and attrition to effect hydration and the resulting slurry of dihydrate is heated under pressure to a calcining temp.

**Coloring granular mineral matter such as slate used on roofing.** Horatio L. Small (to Philip Carvey Mfg. Co.). U. S. 1,939,930, Dec. 19, 1933. Na silicate and pigmenting material such as chromic oxide are applied in a plurality of sep. fractional parts which are then dehydrated simultaneously by heating. Cf. C. A. 27, 5170.

**Flooring coverings, etc.** Felix Hoffmann and Franz Hoffmann. Brit. 396,971, Aug. 17, 1933. A floor or wall-covering compn. consists of cork from which the acids have been extd., e. g., by KOH soln., and a binding agent, e. g., cement, gypsum. The cork, which may be colored as desired, may form up to 90% by vol. of the mixt. The compn. may be applied as a continuous surface or as preformed slabs.

**Hygrometric apparatus for determining the moisture content of materials such as wood, textiles, etc.** Paul Rother and Georg Grau. Brit. 398,139, Sept. 7, 1933.

**Impregnating wood for interiors of buildings.** Herman C. Nielsen (to National Wood Products Co.). U. S. 1,939,186, Dec. 12, 1933. Wood such as that for doors or flooring, etc., is impregnated with a mixt. comprising fish oil 22, turpentine 22, mineral lubricating oil 22, mineral turpentine substitute 22, oleic acid 4,  $\text{CaCl}_2$  2 and scenting material such as oil of citronella about 2 parts, and may then be coated with a compn. which dries and hardens to a transparent coating, such as varnish or lacquer.

**Waterproofing composition for wood, etc.** Albert G. Rodwell. Fr. 754,666, Nov. 10, 1933. A gelatinous  $\text{SiO}_2$  is impregnated with a soln. of rubber latex and a soln. of an alkali silicate is added.

**Fireproofing wood.** Jean B. Ambrosini. Fr. 755,121, Nov. 20, 1933. Wood is fireproofed by the hot gas coming from the distn. of coal or by the water condensed from the gas in its passage through the conduits.

## 21—FUELS, GAS, TAR AND COKE

A. C. FIELDNER AND ALDEN H. EMERY

**Relative efficiencies of domestic fuels in relation to their costs and their advantages.** Ralph A. Sherman. *Am. Inst. Mining Met. Engrs. Contribution* 63, 8 pp. (1933).

**A study of methods for the analysis of mixtures of hydrocarbons and ethyl alcohol.** J. Herbrich. *Ann. combustibles liquides* 8, 1113-33 (1933).—Stability diagrams for gasoline-alc. mixts. for compns. of 90-10 to 84-16 are presented which permit reading temps. of sepn. into 2 phases for various  $\text{H}_2\text{O}$  concns. Numerical examples are carried out, demonstrating the additive character of crit.  $\text{H}_2\text{O}$  concns. at  $0^\circ$ . Karl Kammermeyer

**Effect of water vapor on ignition temperatures of methane-air mixtures.** G. W. Jones and Henry Seaman. *Ind. Eng. Chem.* 26, 71-2 (1934).—The differences between the ignition temps. for the dry and satd. (at room temps.) gases vary somewhat with the compn., reaching a max. of  $11^\circ$  for a mixt. contg. 4%  $\text{CH}_4$ . The effect of amts. of  $\text{H}_2\text{O}$  vapor less than 20% satn. was too slight to be detected.  $\text{H}_2\text{O}$  vapor has no appreciable effect upon the lag on ignition for  $\text{CH}_4$ -air mixts. P. J. W., Jr.

**Influence of fuels on the starting of internal-combustion engines.** Wawrzyniok. *Automobiltech. Z.* 36, 464-70, 496-9 (1933). Tests on various fuels, including gasoline and various blends, showed that the type of fuel has little influence on the starting characteristics of the engines.

A. A. Boetlingk

**Anthracites: peranthracites and true anthracites. II. True anthracites.** P. Lebeau. *Ann. combustibles liquides* 8, 903-1002 (1933); cf. C. A. 27, 5512; 28, 877. The results of the examn. of 11 anthracites of continental origin are reported and include analyses of the anthracites and of the gases produced by pyrogenation. K. K.

**Utilization of anthracite fines by distillation and recovery of the pitch.** Oller S. Martinez. *Bol. oficial minas metal. combust.* 16, 1-93 (Nov., 1932); *Chimie & industrie* 30, 556. The Pieters process, in use at the Esperance et Bonne-Fortune coal mines at Montignat, seems to be the most scientific, simplest and most economical. It uses a continuous, vertical retort, consisting of 2 rectangular chambers; heat is applied to the wider sides, and the gases are removed through ducts in the narrower sides. The material is fed downward by gravity

and requires 15-20 hrs. to reach the level of the burners where it is heated to  $800^\circ$ . Below this level it is cooled by the air used at the burners and is discharged at about  $100^\circ$ . The feeding chamber is closed by means of a hydraulic seal. A. Papineau-Couture

**A laboratory test on coals for predicting the physical properties of the resultant by-product coke.** E. Swartzman, E. J. Burrough and R. A. Strong. *Can. Dept. Mines, Mines Branch, Rept.* No. 737-2, 24 pp. (1933).—Coke buttons are made at  $600^\circ$ , the volatile matter evolved is measured and the swelling index detd. by the formula: percentage of swelling = [(vol. of button in cc. - 2)/2]  $\times$  100; and swelling index = [(percentage of swelling) / (volatile matter)]  $\times$  100. Plotting swelling index (S. I.) vs. volatile matter (V. M.) arranges the coals that produce cokes of similar phys. properties in groups, as follows: (I) S. I., 1000-1400; V. M., 10-15%; contains all high-rank blending coals of Pocahontas type; (II) S. I., 900-1400; V. M., 15-20%; blending coals only; (III) S. I., 900-1500; V. M., 20-25%; natural by-product coking coals; (IV) S. I., 650-1200; V. M., 25-29%; true gas cokes, high density, low reactivity, spongy ends, much breeze, max. swelling and max. contraction; (V) S. I., 650-350; V. M., 29-33%; high-volatile gas coals, giving coke similar to IV, but very friable, must be blended; (VI) S. I., 350-0; V. M., 28-35%; coals similar to V, must be blended; (VII) S. I., 650-350; V. M., 25-29%; medium to good cokes, but friable; (VIII) S. I., 350-0; V. M., 28-25%; gives cokes superior to VI but inferior to VII, must be blended; (IX) S. I., 650-150; V. M., 25-20%; gives fairly good domestic and metallurgical fuels, they differ from III largely in cell structure of thicker walls; phys. properties are greatly influenced by amt. of ash (percentage on 3 inch, apparent sp. gr. and bulk density increase to max. with increasing ash to 10%, then fall); (X) S. I., 150-0; V. M., 25-15%; pebbly coke; (XI) S. I., 350-100; V. M., 20-15%; (XII) S. I., 180-0; V. M., 15-10%; unsuited for by-product use; (XIII) S. I., 0-200; V. M., 5-35%; pebbly cokes or noncoking.

Alden H. Emery

**Studies in the composition of coals. The action of solvents.** J. E. Ashmore and R. V. Wheeler. *J. Chem. Soc.* 1933, 1405-8. In studying the action of solvents on coal attention is called to the possible synthesis of

extractable matter from the solvent itself, due to the powerful catalytic action of the coal. This action is most noticeable in extns. at high temps. and with mixed solvents. The oxidation of  $C_6H_6$  to  $PhOH$  at high temps. accounts for a part of the  $PhOH$  found. The condensation of xylene and  $Am$  alc., with or without simultaneous oxidation, to form a resinic material is readily promoted by coal. The O in coal appears to be highly reactive; e. g.,  $EtOH$  is oxidized to  $AcH$  when it is boiled with finely divided lignite. H. F. Johnstone

New method of sampling coal by a suction drill sampling machine. J. C. Vogel. *J. Chem. Met. Mining Soc. S. Africa* 34, 127-32(1933). Alden H. Emery

An investigation of the accuracy of routine analytical determinations on coal and coke. II. V. A. Briscoe, J. H. Jones and C. B. Marson. *Dept. Sci. Ind. Research Fuel Research, Phys. and Chem. Survey of the Natl. Coal Resources* No. 29, 38 pp.(1933).—Sixty-four detns. of the proximate and ultimate analysis of a coal and coke, of the calorific value of the coal, and of the sp. gr. and porosity of the coke were made. The probable error, and the errors pertaining to duplicates, have been calcd. By comparison with detns. on pure chem. compds. it is concluded that there is no error of lab. sampling. For the same coal analyzed by 12 different labs., the discrepancy of the results is, for all detns. except ash, greater than calcd., and greatest for volatile matter. For non-swelling coals the Dulong calcn. rarely differs from the detd. calorific values by more than 150 B. t. u. The high probable error for the porosity of coke indicates the limited utility of this detn. P. S. Roller

Macro and microscopic study of Donetz basin "reddon" coals. L. M. Mayer and L. B. Zukerman. *Coke and Chem. (U. S. S. R.)* 1932, No. 7, 38-48.—An historic review of the petrographic study of coals. The nomenclature of coals introduced by Potonie and Gotan (?) is adapted: vitrite—coal with luster; durite—opaque coal; fusite—shredded coal. The compn. of a no. of samples from different Donetz basin coals detd. by proximate and ultimate analysis and a series of microscopic photographs accompanied by extensive discussion is given. J. S.

The experimental blending of coals. R. W. Perry. *Gas World* 100, No. 2579, Coking Sect. 5-10(1934).—The 4 methods employed for making blending expts. are: (1) large-scale oven tests, (2) bag tests, (3) box tests and (4) exptl. oven tests. An exptl. oven 3 ft. long, 3 ft. high and 18 in. wide to hold a charge of 500 lb. has proved of value in research problems. Tests to det. the improvements effected in cokes by addn. of small amts. of fusain or coke breeze to the mix in this oven are outlined. The low bulk d. of the charge, a disadvantage of the exptl. oven, which results in a less dense coke than from a large oven, may be overcome by air drying the charge. P. J. Wilson, Jr.

Increasing the coking power of coal. Tadaji Shimamura and Hideo Nomura. *J. Fuel Soc. Japan* 12, 1371-82 (1933) (in English 131-6).—The coking power of coal was increased by treating it with H under pressure and heating. By this process the content of  $\gamma$ -compds. in weakly coking coal increased from less than to more than 10%. The increase of  $\gamma$ -compds. was ascribed to the conversion of some parts of  $\alpha$ - and  $\beta$ -compds. by the action of H in which the O of the original coal was reduced greatly, producing water with H. In regard to the mechanism of the action of H upon coal, the deoxidation occurs first and then the addn. of H follows, until the coal completely liquefies. F. I. Nakamura

The electrical conductivity of coal as a measure of coking properties. Kai-Ying King and Kuo Ping. *J. Chinese Chem. Soc.* 1, 208-18(1933).—60-Mesh coal is placed in a Si tube in a furnace, and the elec. cond. detd. for a column 1 mm. thick for the range 500-800°. Measurements on 4 samples show that good coking coals give a sharply increasing cond. with rise of temp., indicating the ease with which coal is graphitized. The method is proposed for predicting coking properties. W. H. A.

Spontaneous combustion in the western area of the South Wales coalfield. W. M. Thomas, T. David Jones

and J. Ivon Graham. *Proc. S. Wales Inst. Engrs.* 49, 347-58(1933); cf. *C. A.* 27, 5172.—Discussion.

The anthraquinone problem—coal and synthetic anthraquinone production. V. G. Gulinov. *Coke and Chem. (U. S. S. R.)* 1932, No. 8, 24-8.—A description of methods for synthetic anthraquinone production. Raw materials required are phthalic anhydride and anhyd.  $AlCl_3$ . It is believed that the growth of the synthetic anthraquinone industry was due to the temporary abnormally low prices of phthalic anhydride and anhyd.  $AlCl_3$  in the U. S. For this consideration and lack of these 2 raw materials in U. S. S. R. the production of anthraquinone from coal by the Cr method is recommended for the Russian industry as more economical. J. S.

Assessing the value of gas coals. R. A. Mott. *Gas J.* 205, 33-4, 88-90(1934).—M. suggests that comparisons of the gas-making properties of "pure coals" be made in addn. to those for normal com. purity to furnish a clearer picture of the relative gas-making values. A study of the relation between the rank of coals (ash, S and  $H_2O$ -free) and the gas-making power shows that British and American coals in horizontal retorts gave max. yields at 85-86% C, the Canadian coals at a somewhat lower C content. With steaming in vertical retorts or when water gas is added, it would seem that coals of 86-87% C are the best. A comparison of the importance of ash and  $H_2O$  in coal carbonized in horizontal and vertical retorts indicates that except in certain cases freedom from ash is of much greater importance than freedom from  $H_2O$ . P. J. Wilson, Jr.

Vertical retorts and their maintenance. Darrell W. Rees. *Gas World* 99, 625-7; *Gas J.* 204, 889-90(1933).—Each point in the operation of vertical retorts should receive the proper attention at regular intervals. The results of an 8-day test with a typical Welsh washed gas coal are included. P. J. Wilson, Jr.

Two C. O. L. intermittent vertical chamber plants. Anon. *Gas World* 100, 37-9; *Gas J.* 205, 91-3(1934).—The operating results are given from 48 retorts with a capacity of 5,000,000 cu. ft. per day at Brentford, and 24 with a capacity of 3,000,000 cu. ft. at Vancouver. P. J. Wilson, Jr.

Factors influencing maintenance costs of carbonizing plant. T. Campbell Finlayson. *Gas World* 100, 33-6 (1934); *Gas World* 205, 148-51. P. J. Wilson, Jr.

Evaluation of bituminous coal for gas manufacture in coke ovens. N. Hessler. *Gas u. Wasserfach* 76, 881-7, 899-905(1933).—The literature on coal swelling pressure, caking, carbonizing and petrographic tests is reviewed. Test results for proximate analysis, lab. gas yields and heating value, caking index, swelling pressure, shrinkage, coke strength (tumbler test) and petrographic analyses are given for a series of coals from Upper and Lower Silesia, Westphalia and England. Details of the carbonizing test equipment are given. The caking test of Campredon was modified by using a constant amt. of sand and varying the dry coal content by  $1/10$  g. The mixt. is coked in a crucible with an upper diam. of 40 mm. and 46 mm. high, so that the coke button has a height of about 15 mm. On cooling, the button is removed from the crucible and placed on a smooth sand surface. A 16-mm. diam. steel ball is then allowed to fall 100 mm. onto the small end of the button, and that mixt. is selected for which the button is cracked but not disintegrated. The caking index is then taken as 100— (10 times the wt. of coal). The effect of moisture content on the coke swelling power is noted. The most important characteristics of a coal for carbonization in coke ovens are a strong coke and a good gas yield. Some idea of practical oven results may be obtained by detg. the caking tendency, the swelling pressure, shrinkage and making lab. carbonization tests. The petrographic compn. of the coal also has an influence on coke formation but the gas plant is not justified in considering this factor. Coke-

oven plants at mines, however, may use such studies to make good coke blends of poor coals. Rank of coal is of more importance to the gas plant. In general, the heating value of the gas and the yield of 4300 cal. mixed gas increases with increasing volatile content. The coke strength generally decreases with increasing gas yield, but not invariably.

**Reforming oil refinery and natural gas.** J. A. Perry. *Gas Age-Record* 72, 479-83(1933).—One thousand cu. ft. of refinery gas of 1600 B. t. u. is reformed by the United Gas Improvement process to 2000 cu. ft. of 560 B. t. u. gas plus 33 lb. of coke which makes an addnl. 1000 cu. ft. of blue gas. This work is being done with a normal 11 ft. carbureted water-gas set at the rate of 8-10 million cu ft. per day. Overall conversion costs are somewhat less than those for carbureted water gas. H. L. Olin

**Mitigating internal corrosion of natural-gas lines.** A. B. Allyn. *Gas Age-Record* 72, 463-5(1933).—The internal corrosion of high-pressure natural-gas pipe lines caused by the action of  $H_2S$  and  $O_2$  in the presence of condensed moisture is a serious problem in California. Removal of the first 2 by chem. methods seems impracticable and dehumidification to prevent condensation of  $H_2O$  seems to be the only solution. The possibility of applying the common refrigeration methods is discussed. H. L. Olin

**Signs of the times—present-day processes unwieldy—importance of complete gasification—water-gas plant.** C. F. Broadhead. *Gas World* 100, 8-11; *Gas J.* 205, 94-8(1934).—A survey of the gas industry with needed developments in production, purification and distribution. B. considers a combination of a water-gas set and vertical retorts in one plant the most promising means of gas production. P. J. Wilson, Jr.

**Production of high B. t. u. gas in existing water-gas equipment.** Leon J. Willien. *Gas Age-Record* 72, 431-3(1933).—Temporary shut off of the natural gas supply is met by the production of a 945 B. t. u. gas in a standard three-shell water-gas machine. A light distillate of 32° Bc. is gasified in an atm. of steam. H. L. Olin

**Fused cobalt oxide as a water-gas catalyst.** Ernest C. White and J. F. Shultz. *Ind. Eng. Chem.* 26, 95-7(1934).—Catalysts made by the proper fusion and partial reduction with H of Co oxide effectively catalyze the water-gas reaction to equil. at temps. as low as 283° and space velocities of 1800 vols. of water gas per vol. of catalyst per hr. The addn. of suitable promoters, such as Fe up to 3% or Cu oxide, suppressed the simultaneous formation of  $CH_4$ . A Co catalyst contg. 38% Cu was particularly active as a water-gas catalyst without significant synthesis of  $CH_4$ . P. J. Wilson, Jr.

**Coal-gas purification.** New low-temperature method. Berekhoff. *Ice and Cold Storage* 36, 187-8(1933).—By cooling coal gas to 0-5° more complete removal of  $NH_3$  and naphthalene is effected. A. H. Johnson

**Experience with a gas-heating plant.** K. H. Raupp. *Gas-u. Wasserfach* 76, 869-73(1933).—A low, uniform, chimney draft is required for most efficient operation of a gas-heating plant, as indicated by practical test results. R. W. Ryan

**Modern waste heat boilers for gas works.** J. Ipfelkofer. *Gas-u. Wasserfach* 76, 849-56(1933).—Gas plants have 3 sources of waste heat, the hot coke, blow gases from water-gas generators and the flue products from the oven flues. The heat from the coke is rarely used, while the heat in flue products from ovens is used largely for preheating fuel gas and air. This article describes both fire-tube and water-tube boilers, boilers with forced circulation of the water, and boilers with provision for the supplementary use of fuels. R. W. Ryan

**The best design of Venturi tubes.** Wilhelm Beckmann. *Gas-u. Wasserfach* 76, 865-9(1933).—A short, properly designed, downstream portion or diffuser for a Venturi meter has proven to be equally as effective as the usual longer down-stream type, for measuring  $H_2O$ , and saves much room, making Venturi tubes applicable to many situations where the old form is too long. R. W. Ryan

**Practice of (gas) generating process.** G. I. Shakh-

Paroniantz. *Khimstrof* 5, 2477-84(1933).—The designs and performance of various types of generating installations for gasification of coals of varied ash and slag contents are discussed. Chas. Blanc

**The Fuel Research Institute's charcoal gas producer.** Shojiro Uchida. *J. Fuel Soc. Japan* 12, 1391-1402(1933) (in English 138-40).—The charcoal gas producer of the Fuel Research Inst. is characterized by its wall construction, its light weight and cheap price, viz., the producer wall is made of cast iron 3 mm. thick, the inner surface of which is lined with a common fire clay with a thickness of only 5 mm. Outside that wall there is an outer thin iron shell leaving about 10 mm. of air space between them. Air is passed in this space by a natural draft which serves to cool the wall and thus it is protected from high temp. inside the producer. The producer is operated with downward air draft with the addn. of a limited amt. of water. The producer was fitted to a 24 h. p. Hudson 7 seater and a comparative drive totaling about 5000 miles was made with charcoal and gasoline. During the run the inside temp. and wall temp. of the producer were noted and the gases were analyzed. In measuring the reactivity of charcoal, 92.5 cc. of  $CO_2$  per min. was passed to 0.3 g. of powd. sample heated at 900°, and the weight decrease was measured. The app. used was the Oshima-Fukuda precision thermobalance. During this test about 100 g. of charcoal was consumed every min. and the water added for gasification was about 15 cc. per min. As this motor car runs 4.87 km. with 1 l. of gasoline at an av. speed of 32 km. per hr., it may be said that when the distance alone is compared nearly the same run is obtained with 1 kg. of charcoal as with 1 l. of gasoline. F. I. Nakamura

**Influence of sodium carbonate upon the producer-gas reaction.** Clarence B. Weiss and Alfred H. White. *Ind. Eng. Chem.* 26, 83-7(1934).—The reaction  $Na_2CO_3 + 2C = 2Na + 3CO$  which proceeds to the right at temps. above 800° (cf. C. A. 25, 1970) is reversed when the reaction products are cooled slowly in the range 900-750°. The reaction was studied in a miniature gas producer consisting of a Ni tube heated in an elec. furnace. When using untreated Acheson graphite and dry air at 900° and a time of contact of 2 secs., the exit gases contained 6.8% CO; but when the graphite contained 1%  $Na_2CO_3$ , they contained 33% CO. As little as 0.1%  $Na_2CO_3$  would give these results. Similar results were obtained with steam-air mixts. The  $Na_2CO_3$  is decompd. in the lower part of the producer when the temp. is high, and is regenerated in the upper and cooler part of the producer where it deposits on the fresh graphite, and is recycled. If it were not for the loss of part of the soda with the fuel ash, a small amt. would last a long time. Foundry coke required 5%  $Na_2CO_3$  since the ash combined with the soda. The treated coke gave a richer gas at 880° than could be obtained from the untreated coke at 1090°. P. J. Wilson, Jr.

**Gas-absorption apparatus.** Robert T. Dillon. *Ind. Eng. Chem.* 26, 111(1934).—An efficient, glass gas absorber which is adaptable to macro- or microwork, and requires a small vol. of absorbing soln., consists of 2 concentric tubes sealed together near one end. The gas passes down the inner tube, up through the absorbing soln. in the outer tube, and escapes through holes at the junction of the tubes. P. J. Wilson, Jr.

**Experiments with service governors.** N. F. D. Wardle. *Gas J.* 205, 103-4(1934).—A compensated governor has the outlet pressure rising in proportion to the increase in flow. Tests with 2 such governors lead W. to the conclusion that the manufacturers have not hit on the right method of compensation. The results with a better design are shown. P. J. Wilson, Jr.

**Pyrolysis of the lower paraffins. III. Production of olefins in baffled metal tubes.** Adrien Cambron and Colin H. Bayley. *Can. J. Research* 9, 583-90(1933); cf. C. A. 27, 5172.—Results have been obtained which indicate that the conversion of the lower paraffins to olefins by thermal treatment can be satisfactorily carried out in special alloy steel tubes at 800-820°. By using

baffled tubes it has been found possible to obtain high rates of conversion at temps. considerably lower than when using open tubes. Actually the temp. has been brought within the range of usefulness of special alloy steels. Heat-resistant alloys of the 18-8 type have been found unsuitable for this purpose, because Ni appears to catalyze the formation of elementary C, but Ni-free alloys contg. over 20% of Cr have been found satisfactory. IV. The conversion of gaseous paraffins to aromatic hydrocarbons in baffled quartz tubes. *Ibid.* 591-602.—The polymerization of gaseous olefin mixts. such as are obtained by the pyrolysis of the lower paraffins has been studied by passing the gases through heated quartz tubes under conditions of streamline and of turbulent gas flow. It is shown that the observed rate of polymerization of the gaseous olefins to liquid hydrocarbons is appreciably higher at a given wall temp. under conditions of turbulent flow. By subjecting propane to 2 thermal treatments at a max. temp. of 950°, 29% by weight of the gas is converted to liquids of which 70% boils in the gasoline range, and over 30% by weight of the propane is recoverable in the gaseous by-products as olefins, the total conversion into useful products being consequently about 60%. Substantially the same results have been obtained in single-stage recycling expts. J. W. Shipley

**Recovery and treatment of ammonia from coke-oven gas.** P. S. Sokolov. *Coke and Chem.* (U. S. S. R.) 1932, No. 8, 16 20.—An outline of the technology of  $\text{NH}_3$  recovery from coke-oven gas. Computations are made on the basis of coking 1000 tons of dry coal, with 8% moisture, per day for  $\text{NH}_3$  yields, quantity of lime, water, steam consumption, etc. James Sorrel

**Sulfur recovery from hydrogen sulfide of coke-oven gas and other gases by means of activated carbon.** M. D. Kenigstul. *Coke and Chem.* (U. S. S. R.) 1932, No. 7, 32-7.—A discussion of reports of a no. of investigators in the use of activated C for S recovery from gas by absorption ( $2\text{H}_2\text{S} + \text{O}_2 = 2\text{H}_2\text{O} + 2\text{S}$ ). A distinctly different method is described for recovery (where activated C acts as a catalyst only) developed at the Ukrainian Coal Chem. Inst. Essentially it consists in: (1) absorption of  $\text{H}_2\text{S}$ ,  $\text{CO}_2$ , and partly  $\text{CS}_2$  from the gas by  $\text{KNO}_3$  soln. in scrubbers; (2) treating the absorbing liquor by means of Petit's method which results in liberation of gas with 10%  $\text{H}_2\text{S}$ ; (3) passing this gas through an activated C bed acting as a catalyst (according to the scheme proposed by Bezuglov and Kutzakov) where up to 93%  $\text{H}_2\text{S}$  is oxidized and S drops out as liquid outside of the catalyst bed, thus almost eliminating the need for regeneration. James Sorrel

**Chief shortcomings in the Linde installation for separation of coking gas and ways for its perfection.** P. K. Sakmin. *Khimirol* 5, 2485-94(1933); cf. C. A. 28, 6094.—The criticism of the Linde separator is based in part on the lab. expts. in a specially designed app. (illustrated). The tabulated comparative results show that in the Linde system there are large losses of  $\text{N}_2$  in the washing of polluted crude mixts. of  $\text{N}_2$  and  $\text{H}_2$  and of one half of  $\text{C}_2\text{H}_4$  of the purified coking gas in the  $\text{CH}_4$  fraction. The  $\text{C}_2\text{H}_4$  fraction issues as a gas and must be liquefied with considerable consumption of energy before the fractionation into  $\text{CH}_4$ ,  $\text{C}_2\text{H}_4$ ,  $\text{C}_2\text{H}_6$  and  $\text{C}_3\text{H}_8$ . The work is being continued. Chas. Blanc

**Electric purification of coke-oven gas or tar.** Ya. A. Nazarenko and V. S. Savchenko. *Coke and Chem.* (U. S. S. R.) 1932, No. 8, 11 16.—Elec. precipitators are described. James Sorrel

**Examination of the phenols of a low-temperature coal tar.** S. Caplan, J. Ross, M. G. Sevag and T. M. Switz. *Ind. Eng. Chem., Anal. Ed.* 6, 7-12(1934).—The range 220-260° was studied. It is necessary to give close attention to column design, which is described, and to fractionation. Detn. methods are replete in detail showing fractions about 220° and 234° contain mesitol and 3-methyl-5-ethylphenol, resp., also the cryst. derivs., bromides and phenylurethans of these substances. Fractions up to 260° are shown to be phenyl homologs with

alkyl groups in a *m*-position to the hydroxyl group.

Halsey E. Silliman

**Viscosity of pitch.** A. B. Manning. *Dep't. Sci. Ind. Research, Fuel Research, Tech. Paper No. 39*, 20 pp. (1933).—This investigation is designed as part of a program to correlate lab. tests of pitch with its suitability for briquet manuf. Empiric methods such as detn. of twist point, etc., are but in effect rough comparisons. The expts. show that the coeff. of viscosity being const., all coal-tar pitches are true viscous liquids; while petroleum pitches or bitumens are plastics or pseudo plastics, since the coeff. of viscosity varies with the shearing stress. Previous investigations are discussed. This present investigation covers the temp. 30-40° by the disk method, 30-80° by the rotating-cylinder viscometer, and 80-110° by the capillary tube viscometer, all app. being illustrated and described, on low-temp., horizontal-retort, vertical-retort, soft horizontal-retort and coke-oven pitches; also coal-tar pitch as against bitumen. It is noticeable that the temp. coeff. of the viscosity of bitumen is much less than that of coal-tar pitch. Halsey E. Silliman

**Progress in the gas industry: Sulfur and coke problems: Benzene-rectification plant: Working costs.** B. Thorpe. *Gas World* 99, 674-5(1933); *Gas J.* 205, 44-5(1934).—Lower S in the coal to be gasified means lower S in the town gas. An effort was made to trace the S removed from coke on drying with the waste gases from retort settings (cf. H. Singleton, C. A. 28, 8819) by boiling gently in dil., neutral  $\text{H}_2\text{O}_2$  for 12 hrs. and analyzing for S. The operating results of the continuous benzene rectifying plant at Huddersfield are described. P. J. Wilson, Jr.

**How to improve the position of the coking industry.** S. W. Saunders. *Gas World* 100, No. 2579, Coking S. 1 2-4(1934).—The importance of research to the gas industry. Several problems in benzene and tar production are outlined. P. J. Wilson, Jr.

**Heating horizontal retort settings.** H. James Risby. *Gas J.* 204, 781-4, 834 6; *Gas World* 99, 595-8, 612 4 (1933).—In order to obtain the rapid penetration of heat necessary for the production of a smaller, uniform-sized coke, R. has developed the multiple-stage, "tertiary air" combustion system for use on horizontal and inclined retort settings. The secondary air to the heating chamber is so restricted that combustion of the fuel gases entering the heating chamber is incomplete. Sufficient additional air to complete combustion is preheated in overhead recuperators and admitted to the heating flues at the upper retorts. The waste gases continue through the recuperators to the stack. A heat balance indicates that by use of this system a definite saving in fuel is possible. Temps. in the settings will be more uniform and the quality of the coke improved. P. J. Wilson, Jr.

**Bricks of coke-oven walls.** T. Kuroda. *J. Soc. Chem. Ind., Japan* 36, Suppl. binding 655-6(1933).—A silica brick taken from a coke-oven battery after 12 yrs of operation was examd. analytically in 3 sections, which were taken from each face and the center of the brick. A slight increase in total Fe was observed on the face of the coking chamber, probably coming from the coal ash. The Fe content of the flue side was reduced somewhat, probably because of the exposure to a reducing flame giving metallic Fe which diffuses into the brick. The analysis of the central section was taken as a basis. K. K.

Callen, Arthur S., and Ulmann, August, Jr.: Principles of Combustion. Scranton, Pa.: Internl. Textbook Co. 71 pp. \$1.05.

British standards for creosote Specifications for Fuel m luminaces. (B. S. S. No. 503-1933). London: Brit. Standards Inst. 2s. 2d. Reviewed in *Chem. Age* 29, 4(1933).

Motor fuel. Compagnie des procédés Gohin Poulenc and Dimitri Costin. Fr. 754,936, Nov. 17, 1933. Gases from mineral or vegetable oils are mixed with a poor gas such as producer gas and used for explosion motors.

Liquid fuels. E. I. du Pont de Nemours & Co. Fred- 3  
 crik B. Downing and Herbert W. Walker. Brit. 398, 790, Sept. 7, 1933. Hydrocarbons are stabilized and rendered resistant to the formation of gums and discoloration by adding a small amt. of an amine salt of a hydroxyaryl compd., other than hydroxydiaryls, in the absence of dyes. Thus gasoline,  $C_6H_6$ , benzine, cracked hydrocarbons or Diesel fuel is mixed with 1 or more of the compds., hydroquinone dianilide, dibutylamine  $\alpha$ -naphthol etc., the monodiethanolamine salt of catechol, the mono- $\alpha$ -toluidine salt of hydroquinone or the  $p$ -phenyl- $\alpha$ -naphthylamine salt of  $m$ -4-xyleneol. Tertiary aliphatic and aromatic amines may also be used in the prepn. of the salts which may have antidetonating properties also.

Liquid fuels. Maurice Chaffette. Fr. 755,445, Nov. 21, 1933. Homogeneous mixts. of hydrocarbons and alcohols such as MeOH or EtOH are obtained at a low temp. or with presence of small amts. of water by the introduction of an acid or a pyridine base. Thus, to a mixt. contg. MeOH 18, ordinary gasoline 54 and benzene 18 vols. is added 0.9% by vol. of "pyridine oleate," and this prevents the presence of 0.5 vol. of water without sepn.

Apparatus for vaporizing liquid fuels to produce a dry vapor Arthur H. Masters. U. S. 1,939,270, Dec. 12. Various structural and operative details are described.

Use of high-frequency oscillations in carburetion of air with liquid fuels. Mark F. Heaney (40% to Edward B. Benjamin). U. S. 1,939,302, Dec. 12. Various details of app. and operation are described by which a pool of suspended droplets of liquid fuel are treated with "ultrasonic" frequency oscillations such as may be induced by the use of an oscillator of the quartz crystal type, the crystal in turn serving in a circuit including an electron discharge tube to establish and fix the rate of the vibrations produced.

Gasifying finely divided solid and liquid fuels. Franz Heitzberg. U. S. 1,939,488, Dec. 12. Finely divided fuel is injected into an externally heated chamber which is the size of a usual coke-oven chamber, and steam is injected into the chamber in a direction opposed to the flow of fuel, the fuel is maintained in suspension and rich gas is withdrawn from the upper part of the chamber, and water gas and ash are withdrawn from the lower part of the chamber. App. is described.

Solid fuel. Alois J. Hanke. Fr. 755,452, Nov. 25, 1933. Solid fuel is improved by submitting it to the action of vapors of hydrocarbons, contg. or not contg. bitumens of mineral wax, at 100-130° according to the nature of the fuel.

Preparing fuel briquets. Ernst Rochming. Ger. 585,507, Oct. 10, 1933.

Apparatus for cooling briquets. Wellpappschalung- 9  
 Vertrieb L. Steiniger. Ger. 585,158, Oct. 3, 1933.

Thermoelectric apparatus for measuring the calorific value of fuels. Siemens & Halske A.-G. (Heinz Gruss, inventor). Ger. 585,215, Sept. 29, 1933.

Destructive hydrogenation. The Gas Light & Coke Co. Fr. 754,676, Nov. 10, 1933. A basic O-contg. salt of Ti or a reduction or transformation product of such a salt is used in the catalytic hydrogenation of carbonaceous

materials. Examples are given of the use of a basic Ti molybdate, chromate, tungstate and vanadate.

Low-temperature carbonization. Hans Magnus. Ger. 588,156, Nov. 13, 1933 (Cl. 10a. 36.01). Low-temperature carbonization products from brown coal, oil shale or like bituminous materials are treated to sep. tar and tarry oils, and the latter are then cracked to yield light liquid hydrocarbons as a sep. product by passage at about 500° through coke produced in the process.

Low-temperature carbonization. Wm. A. Caunt. Fr. 754,642, Nov. 10, 1933. The retort is in the form of a rotating cylinder slightly inclined to the horizontal.

Upright metal retort suitable for low-temperature carbonization of coal, etc. Lewis C. Karick. U. S. 1,938,596, Dec. 12.

Jigging apparatus for screening or classifying coal, ores, etc. Wm. H. Herrisford. Brit. 396,807, Aug. 14, 1933.

Briquetting coal. Wilhelm Klopffleisch. Ger. 588,425, Nov. 17, 1933 (Cl. 10b. 3.01). Coal is mixed with a low percentage of dry peat and ground hard pitch, and the mixt. is briquetted under heat and pressure.

Briquetting coal or brown coal. Wilhelm Bunberger. Ger. 588,403, Nov. 20, 1933 (Cl. 80a. 25.01). Permanent briquetting molds are prepd. by molding and sintering a mixt. contg. WC 50 60,  $Cr_2C_3$  20 30, SiC 10 15, Bc 5 10, and Al 0.5 2%.

Hydrogenating coal or tar. C. Otto & Co. G. m. b. H. Ger. 588,268, Nov. 15, 1933 (Cl. 12a. 1.05). A suspension of coal or tar in an oil of high b. p. is treated in counter-flow with H under pressure in app. comprising a large no. of parallel narrow tubes. The oil should preferably contain unsatd. compds.

Rotary-drum apparatus for the continuous distillation of coal, etc. International Bitumenoil Corp. Ger. 585,274, Oct. 3, 1933. See Brit. 323,523 (C. A. 24, 3103).

Apparatus for charging continuously operated vertical coal-distillation retorts. Heinrich Koppers A.-G. Ger. 585,403, Oct. 10, 1933.

Apparatus for distilling and coking coal. Edmund G. Weeks and Wm. A. Riley (to Babcock & Wilcox Ltd.). U. S. 1,941,130, Dec. 26. Structural and mech. features of an app. having a retort comprising a fuel-bed container with a coke discharge and coke extractor at the bottom of the container and means for automatically changing the speed of operation of the coke extractor as the level of the upper surface of solid fuel in the fuel bed container changes.

Treatment of coal-distillation gases. The Barrett Co. Ger. 588,090, Nov. 11, 1933 (Cl. 26d. 1.40). See Brit. 346,805 (C. A. 27, 1147).

Stable dispersion of coal and fuel oil. Robert A. Adam, Frederick C. V. Holmes and Arthur W. Perrins (to Cunard Steam Ship Co., Ltd.). U. S. 1,939,587, Dec. 12. Coal which is finely (but not colloiddally) pulverized is mixed with a fuel oil contg. at least 6% of fixed carbon.

Hydrocarbons. I. G. Farbenind. A.-G. (Hans G. Grimm and Josef Jannek, inventors). Ger. 585,652, Oct. 6, 1933. App. is described for producing hydrocarbons by the hydrogenation of coal, peat, semi-coke, pitch, etc., at high temp. and pressure.

Apparatus for removing dust and water from lignite. Deutsche Erdöl A.-G. Ger. 585,794, Oct. 14, 1933.

Apparatus for mixing peat with peat dust. Karl Neynaber. Ger. 585,418, Oct. 10, 1933.

Aqueous dispersions of montan wax, etc. Oscar F. Neitzke (to Bennett, Inc.). U. S. 1,940,431, Dec. 19. An alk. aq. dispersion suitable for use in waterproofing paper, etc., comprises a solid content composed largely of montan wax, a normally solid asphalt and the saponification products resulting from reaction of an alkali with a portion of the saponifiable content of the wax (the dispersion being of sufficiently low alkyl. to be free-flowing and substantially free from stabilizing agents other than the saponification products mentioned). U. S. 1,940,432 relates to generally similar products formed from paraffin wax, montan wax, rosin soap and sapon. derivs. of saponifiable matter in the montan wax.

Conversion products of montan wax. I. G. Farbenind.

- A.-G. (Michael Jahrstorfer and Erwin Wals, inventors). Ger. 587,450, Nov. 3, 1933. Crude or derefinised montan wax is saponified, and then extd. with a solvent which dissolves alcs. and soaps from the wax, but does not dissolve the asphaltic constituents of the sapon. product. Suitable solvents are MeOH, EtOH, PrOH or a mixt. of EtOH and acetone. Sapon. may be effected in the presence of the solvent. Details are given.
- Superheating steam.** Andre Huet (to Superheater Co.). U. S. 1,938,099, Dec. 12. Various details of app. and operation are described.
- Apparatus for superheating steam.** Charles W. Gordon (to Superheater Co.). U. S. 1,938,695, Dec. 12. Structural details.
- Steam superheater.** Douglas S. Carter (to Superheater Co.). U. S. 1,941,246, Dec. 26. Structural details.
- Oxidation products produced in internal-combustion engines.** Wm. W. Odell. U. S. 1,939,018, Dec. 12. Oxidizable material and an amount of an oxidizing agent insufficient for complete combustion are admitted into the combustion chambers of an internal-combustion engine, combustion is caused to occur with formation of incompletely oxidized products such as aldehydes, etc., some at least of which are recovered from the cooled exhaust gas.
- Filter for removing soot and moisture from compressed gas tapped from the cylinders of an internal-combustion engine.** Carl Holmbergs Mek. Verkstads-Aktiebolag. Brit. 397,523, Aug. 28, 1933.
- Lighting gas.** Soc. de construction d'appareils pour gaz à l'eau et gaz industriels. Fr. 755,142, Nov. 20, 1933. A part of the CO in blue water gas is replaced by an equal vol. of H and CO<sub>2</sub> by the known Fe-steam reaction, i. e., oxidation of the CO to CO<sub>2</sub> by means of Fe<sub>3</sub>O<sub>4</sub> and production of H by injection of superheated steam on to the FeO formed.
- Fuel gas.** Bamag-Mequin A.-G. Ger. 585,439, Oct. 3, 1933 (Cl. 24e. 2.01). Addn. to 571,666 (C. A. 27, 4381). The production of fuel gas from coke or semi-coke is described.
- Fuel gas of low carbon monoxide content.** Franz Bössner and Carl Marischka. Austrian 135,095, Nov. 25, 1933 (Cl. 26a.). Addn. to 132,040. Details are given of an alternative method of carrying out the process of Austrian 132,040, which corresponds to Fr. 716,088 (C. A. 26, 2040).
- Gas mixtures.** Edmond Voituren. Ger. 584,775, Nov. 14, 1933 (Cl. 12o. 19.01). Addn. to 582,664 (C. A. 28, 883). The method of 582,664 for treating satd. hydrocarbons or gases rich in these, with O in the presence of water at high temps. to give a reactive gas mixt. contg. practically no satd. hydrocarbons, is applied to gas mixts. relatively poor in satd. hydrocarbons, such as coke-oven gas.
- Determining the combustibility content of gas mixtures.** Joseph A. Stein (to Bacharach Industrial Instrument Co.). U. S. 1,940,513, Dec. 19. A device of catalyzing material such as Pt wire is electrically heated in a confined space through which the gas to be tested is passed after admixture with a large excess of dilg. air and changes in elec. resistance are noted. Various details of app. and operation are described.
- Device for cleaning flue gases by water sprays.** Mendel Frey. Ger. 586,674, Oct. 25, 1933 (Cl. 24g. 6.20).
- Purifying gases such as coal gas.** Thyssen'sche Gas- und Wasserwerke G. m. b. H. Ger. 588,310, Nov. 15, 1933 (Cl. 26d. 12.01). Addn. to 457,264 and 482,880 (C. A. 24, 445). The cooling process described in Ger. 457,264 is effected in two stages, cooling being indirect in one stage and direct in the other stage. The same cooling medium, which may be hygroscopic, may be used in both stages, or a hygroscopic medium may be used in the direct stage only. Cf. Ger. 583,417 (C. A. 28, 2937).
- Cracking and carbureting hydrocarbon gases.** Joseph A. Perry (to United Gas Improvement Co.). U. S. 1,939,410, Dec. 12. A hydrocarbon gas such as natural gas or by-product refinery oil gas is passed through an incandescent fuel bed, producing a reformed gas with deposition of C and formation of a stiff pitch; steam is passed through the incandescent fuel bed, generating blue water gas, and the stored heat is utilized for carbureting and fixing the water gas and producing fluid tar, the stiff pitch and fluid tar are mixed for removal from the gas-making app., and the fuel bed is air-blasted to store heat in it and utilize a remaining portion of the previously deposited C. App. is described.
- Carbureted water gas.** Edwin L. Hall (to United Gas Improvement Co.). U. S. 1,939,393, Dec. 12. An agnited column of solid fuel resting on a grate is air-blasted, thereby making producer gas; simultaneously secondary air is introduced to the producer gas adjacent to the top of the fuel bed and in a generally downward direction and at such velocity as to reduce the quantity of fuel blown off at the top of the fuel bed; heat is stored in the upper portion of the fuel bed by burning the producer gas with the secondary air; a steam run is made through the fuel bed, producing blue water gas, and simultaneously oil deposited on the top of the fuel bed is vaporized and serves to carburet the blue water gas. App. is described Cf. C. A. 27, 5174.
- Apparatus for producing water gas.** I. G. Farberman A.-G. (Fritz Winkler, inventor). Ger. 585,531, Oct. 4, 1933.
- Rotary-drum apparatus for making water gas, with or without coal gas, from pulverulent coal.** Bamag-Mequin A.-G. Ger. 589,129, Dec. 2, 1933 (Cl. 24e. 2.01).
- Water-gas plant.** Julius Pintsch A.-G. Ger. 586,672, Oct. 24, 1933 (Cl. 24e. 13.02). Details of valves are given.
- Water-gas generator.** Frank W. Steere (to Squibb Solvay Engineering Corp.). U. S. 1,939,470, Dec. 12. Structural and mech. features. U. S. 1,939,471 also relates to details of gas-generator construction.
- Gas generators.** Wilhelm Voigt. Ger. 586,670, Oct. 25, 1933 (Cl. 24e. 3.05). Gas for driving vehicles or vessels is produced from a mixt. of fuel such as lignite or coal coke contg. S, and fuel such as crude coal, which gives an oil distillate to form a film on the cylinder wall of the engine.
- Gas producer for use with finely granular coke, etc.** Kohlenveredlung und Schwelwerke A.-G. Ger. 586,669, Oct. 24, 1933 (Cl. 24e. 3.03). Addn. to 576,008 (C. A. 27, 3807).
- Rotary-grate gas producer.** Max Orb. Ger. 585,401, Oct. 3, 1933.
- Rotary-grate gas producer.** Bamag-Mequin A.-G. Ger. 589,081, Dec. 2, 1933 (Cl. 24e. 11.03).
- Downward-draft gas producer.** Ernst Mahlkuch. Ger. 585,355, Oct. 2, 1933.
- Operating slagging gas producers.** Louis Chavanne. Ger. 587,721, Nov. 8, 1933 (Cl. 24e. 3.04). Addn. to 567,082 (C. A. 27, 1489). A modified method of regulating the height of the fusion zone is described.
- Feeding device for gas producers.** Demag A.-G. Ger. 589,090, Dec. 2, 1933 (Cl. 24e. 9).
- Stationary grate for gas producer.** Wm. Clime and James E. Dunlop. Ger. 585,291, Sept. 30, 1933. This corresponds to Brit. 343,094.
- High-pressure constant-volume gas holder.** Roland W. Broadhead, Gerald W. Allott and Newton Chambers & Co., Ltd. Brit. 398,439, Sept. 14, 1933.
- Apparatus for drawing off heavy gases from above the sealing piston in waterless gas holders.** Friedrich Limbeck (to the firm of Aug. Klönne). U. S. 1,940,555, Dec. 19. Structural features.
- Desulfurizing gases.** Ges. für Kohlentechnik m. b. H. Ger. 588,528 and 588,529, Nov. 20, 1933 (Cl. 26d. 9.11). Addns. to 578,420 (C. A. 27, 4381). Gases contg. NH<sub>3</sub> and H<sub>2</sub>S are washed with a polysulfide soln. contg. free S, before they are washed as described in Ger. 578,420. The preliminary washing removes CN compds. from the gases (588,528). S is added to the washing liquid described in Ger. 578,420 when the gases contain more than 2 mols. of NH<sub>3</sub> per mol. of H<sub>2</sub>S. The S may be added as crude S contg. Fe compds., e. g., as a spent gas-purifying mass (588,529).

- Desulfurizing gases.** Ges. für Kohlentechnik m. b. H. (Walter Klammt, inventor). Ger. 588,610, Nov. 21, 1933 (Cl. 26d. 9.11). Addn. to 578,420 (C. A. 27, 4381). In applying the process of Ger. 578,420 to gases containing more than 2 mols. of  $\text{NH}_3$  per mol. of  $\text{H}_2\text{S}$ , addnl.  $\text{SO}_2$  is added to the washing liquor in an amt. corresponding to the excess of  $\text{NH}_3$ . The  $\text{SO}_2$  may be obtained by decomp. a part of the thiosulfates produced in the process.
- Removing hydrogen sulfide from coal gas.** Gustaf H. Hultman. Ger. 589,032, Dec. 1, 1933 (Cl. 26d. 9.04). Coal gas is washed with an alkali carbonate soln., which is regenerated after use by subjecting it to a very low pressure, e. g., 30 mm., without applying heat, until all the absorbed  $\text{H}_2\text{S}$  is evolved.
- Device for removing sulfur dioxide, etc., from flue gases by cooling.** Alfred Heilbronn and Bernhard Moll. Ger. 585,558, Oct. 2, 1933.
- Sulfur from gas-purification masses.** Hermann Deneke. Brit. 399,069, Sept. 28, 1933. See Ger. 562,737 (C. A. 27, 1111).
- Distilling tar, etc.** The Barrett Co. Ger. 585,359, Oct. 2, 1933. See Brit. 306,093 (C. A. 23, 5034).
- Low-volatile coke.** Georg Kerkel. U. S. 1,939,457, Dec. 12. Solid carbonizable material such as coal, lignite, peat or wood is passed through a chamber or retort toward the coke outlet, and a stream of inert gas such as coal gas, producer gas, water gas or N is introduced at a temp. of about 750–1000° adjacent the coke outlet; sufficient cold inert gas is introduced into the gas stream after it has traversed the coking part of the chamber to reduce its temp. to about 450° or lower. App. is described.
- Semicoke.** Alfred Beau. Ger. 585,273, Sept. 30, 1933. Preheated coal is mixed rapidly in a rotary furnace with smoke obtained from the same coal in a preceding operation, and the mixt. is warmed to convert the coal into smoke. A part of the furnace charge is then withdrawn and replaced by fresh coal, and the process repeated.
- Discontinuous apparatus for making piece coke or semicoke.** Gustav Hilger. Ger. 585,331, Oct. 2, 1933.
- Coke and gas production in chamber ovens.** Carl Still. U. S. 1,940,567, Dec. 19. Externally heated oven chambers, contg. a charge of coal and provided with a gas-collecting space above the surface of the charge and with interior ducts, are intermittently operated. Volatile distn. products are drawn separately from the interior of the body of coal and from the gas-collecting space; the gas pressure in the collecting space is maintained constantly approx. equal to atm. pressure and the pressure in the ducts of the charge is gradually reduced from the start of the coking process to at least 100 mm. water gage below atm. pressure. App. is described. Cf. C. A. 28, 1172<sup>1</sup>.
- Coke and gas generator.** Wilhelm Voigt. Ger. 586,071, Oct. 24, 1933 (Cl. 24e. 11.02).
- Regenerative gas and coke oven.** Collin & Co. Ger. 586,956, Oct. 27, 1933 (Cl. 10a. 5.03).
- Coke oven.** C. Otto & Co. G. m. b. H. Ger. 584,056, Sept. 14, 1933 (Cl. 10a. 13). Addn. to 581,940 (C. A. 28, 1174<sup>1</sup>).
- Coke oven with horizontal or inclined chambers.** Didier-Weike A.-G. Ger. 588,155, Nov. 14, 1933 (Cl. 10a. 19.01).
- Regenerative coke-oven battery.** Heinrich Koppers A.-G. Ger. 588,154, Nov. 13, 1933 (Cl. 10a. 5.01). Addn. to 527,474 (C. A. 25, 4693).
- Apparatus for charging horizontal coke ovens with a rammed coal charge.** Hermann Petsch (to the firm of Carl Still). U. S. 1,940,562, Dec. 19.
- Coking pitch and coal in a by-product coke-oven battery.** Wm. Tiddy (to Semet-Solvay Engineering Corp.). U. S. 1,940,893, Dec. 26. In operating a coke-oven battery having coking chambers and heating walls for the chambers arranged side by side in a row (the heating walls being constituted of combustion flues, and the walls of some of the coking chambers being lined with a heat-resistant metal such as "Fahrite" while the remaining coking chambers are unlined and are formed of refractory brickwork), coal is coked in the unlined coking chambers, pitch is coked in the lined coking chambers to form pitch coke, the hot gases from the coking of the coal and pitch are withdrawn, admixed, tar is removed from them, the tar is distd. by contact with hot gases from the coking chambers to form a pitch residue, and the latter is coked in the lined coking chambers. An arrangement of app. is described.

## 22—PETROLEUM, LUBRICANTS, ASPHALT AND WOOD PRODUCTS

W. F. PARAGHER

**Optical density color measurement for petroleum oils.** S. W. Ferris and J. M. McIlvain. *Ind. Eng. Chem., Anal. Ed.* 6, 23 9(1934).—The development of a method for detg. color density of oils by a Duboseq colorimeter is described, and comparative data are given to indicate that this method meets the requirements for a satisfactory color scale. Benzene was found to be the most suitable solvent for the sample. Matches were made with the use of a green light secured by means of a light filter consisting of  $\text{CuCl}_2$  and  $\text{HgCl}_2$  soln. Check detns. by this method by several observers agreed within 2% of the av.

D. F. Brown

**Changes in the physical properties of petroleum products kept in the light.** T. G. Kovalev and V. V. Illarionov. *I. prakt. Chem.* 138, 306 10(1933).—Paraffin Grozny petroleum distillates were examd. previously for the relationship between compn. and dielec. const. (cf. C. A. 27, 4600). The same distillates, kerosene, light and heavy solar oil, spindle oil, engine oil, and cylinder oil, have now been exposed to sunlight for 3 months, with free access of air. The sp. gr. and the  $n$  changed very little. The dielec. const. increased at first, but after 2 months decreased. The presence of mois. with rings closed by O must raise the dielec. const. sharply. The drop in the 3rd month is easily explained by supposing that rearrangement takes place in the O compds. in which the added active O is given off to other unsatd. mois., this forming ketoxy- and oxy-compds. No aldehydes were found.

American Society for Testing Materials Standards on Petroleum Products and Lubricants, 1933. Philadelphia Am. Soc. for Testing Materials. 202 pp. \$1.25. Reviewed in *J. Inst. Petroleum Tech.* 19, 953(1933).

**Breaking petroleum emulsions.** Melvin De Groot and Louis T. Monson (to Tretolite Co.). U. S. 1,940,390, Dec. 19. An oil-sol. sulfonated deriv. of hydrogenated castor oil is used as a demulsifying agent. Cf. C. A. 28, 1178<sup>4</sup> and the following 3 abstracts.

**Breaking petroleum emulsions.** Melvin De Groot and Arthur F. Wirtel (to Tretolite Co.). U. S. 1,940,391, Dec. 19. A demulsifying agent is used contg. a substantially anhyd. Na salt of a naphthenic acid, produced from naphthenic acids of a mol. wt. of from 200 to 575, a mean mol. wt. of about 225 and a distn. range of from 230° to 310°, mixed with a relatively small amount of an unneutralized naphthenic acid of the same kind. U. S. 1,940,392 relates to the use of a mixt. comprising not over 40% of water, material produced by partial neutralization with  $NH_4OH$  of naphthenic acids as specified in U. S. 1,940,391 and about an equal amt. of a water-sol.  $NH_4$  salt of a butylated naphthalene sulfonic acid. U. S. 1,940,393 relates to the use of a mixt. contg. not more than 40% of water together with a water-sol.  $NH_4$  salt of a butylated naphthalene sulfonic acid, and a product derived by the partial saponification of oleic acid with  $NH_4OH$  dild. with 25% of kerosene. U. S. 1,940,394 relates to the use of a generally similar demulsifying agent in prep. which however an oil-sol., water-insol. petroleum sulfonic acid is used instead of oleic acid.

**Breaking petroleum emulsions.** Melvin De Groot (to Tretolite Co.). U. S. 1,940,395, Dec. 19. An oil and water-sol. demulsifying agent is used contg. not more than 40% of water together with a dialkyl polysulfonate  $NH_4$  salt produced from Blau gas tar by reaction of  $H_2SO_4$  at 40°, and substantially an equal amt. of a naphthenic acid or naphthenate material as specified in U. S. 1,940,392. U. S. 1,940,396 relates to the use of similar naphthenic acids or their salts together with an  $NH_4$  compd. of a petroleum sulfonic acid substantially free from polymers and non-sulfo type hydrocarbons and derived from Gulf Coast naphthene crude oil by multiple acid treatment of the kind in which the first acid draw-off is discarded.

**Breaking petroleum emulsions.** Melvin De Groot and Arthur F. Wirtel (to Tretolite Co.). U. S. 1,940,397, Dec. 19. A demulsifying agent is used such as a mixt. which may comprise a product obtained by hydrolysis of sulfonated castor oil together with a water-sol. salt of a butylated naphthalene sulfonic acid, in specified proportions. U. S. 1,940,398 relates to the use of a demulsifying agent comprising an oil-sol., water-insol. petroleum Na sulfonate, a modified fatty acid product partially saponified with  $NH_4OH$ , dil. alc. and a hydrophobe solvent such as kerosene and neutral compatible salts of inorg. acids in specified proportions. Numerous details and modifications are described.

**Dewaxing petroleum oils.** Robert E. Stanton. U. S. 1,940,654, Dec. 19. For sepg. solid wax particles from a petroleum oil, elec. charges of a definite polarity are impressed upon the solid wax particles by subjecting the wax-bearing oil to the action of a high potential unidirectional current, and the charged particles are collected upon an electrode of opposite polarity with which the wax-bearing oil is brought into contact. App. is described.

**Conversion of high-boiling petroleum fractions.** Wm

Legemann. U. S. 1,936,633, Nov. 28. Material such as a petroleum or shale oil is heated in a chamber to 120-370° with a halogenated O compd. of N such as NOCl and an Al and Fe halide such as  $AlCl_3$  and  $FeCl_3$  in an amt. not over 12% by wt. of the original charge, until a gasoline substitute is obtained. App. and various details of operation are described.

**Cracking heavy petroleum oils.** Walter J. Perelis (to Universal Oil Products Co.). U. S. 1,939,274, Dec. 12. Feed oil is heated in a tubular heater to an effective cracking temp. under a pressure not exceeding 200 lb. and this heating is terminated as soon as an effective cracking temp. is reached. Reflux condensate from a later stage of the process is heated in a tubular heater to an effective cracking temp. and this secondary cracking treatment is prolonged while the temp. is first lowered and then again raised (both within the range of cracking temps.), the pressure at the termination of the secondary cracking treatment being at least 200 lb. Refluxes of both cracking treatments are united, easily coking heavy material is removed from the joint stream by vaporization of the lighter material; the material heavier than pressure distillate is thereafter condensed and this reflux condensate is passed to the secondary cracking treatment. An arrangement of app. is described. Cf. C. A. 28, 888<sup>4</sup>.

**Cracking oils.** Jean Delattre-Seguy (to Universal Oil Products Co.). Brit. 398,506, Sept. 21, 1933. Oil is cracked under pressure in heating and reaction zones, the vapor and liquid products sep'd. and the vapors subjected to reflux condensation with return of the reflux to the cracking zone, the cracking temps. and pressures and the ratio of reflux returned to the raw oil treated being so correlated that an operating index given by the formula  $\frac{[ \text{rav. of heating zone outlet temp. and middle of reaction zone temp. } ^\circ\text{F.} ] \div 30 + [ (\text{pressure on reaction zone (lb. per sq. in.) } \cdot 100) \div \text{reflux ratio} ]}{\text{is maintained between 36 and 38, so that a distillate is produced equal to at least 1.5 times the A. P. I. gravity of the raw oil treated at least equal to the yield given by the formula (min. gasoline yield) : (gravity of charging stock) = 3 - [ (gravity of charging stock) ] \div 32}$ . The app. used is that described in Brit. 380,060 (C. A. 27, 4067). In 398,507, Sept. 21, 1933, the cracking process is conducted so that an operating index given by the formula, the 3 terms of formula  $\frac{[ 2.33 \times [ \text{combined feed (gals. per hr.) } \div \text{vol. of heating and reaction zones (gals.) } ] ]}{\text{is maintained between 3 and 43 so that the yield of distillate is the same as in 398,507}$ . Cf. following 2 abstracts and C. A. 28, 888<sup>4</sup>.

**Cracking hydrocarbon oils.** Jean Delattre-Seguy (to Universal Oil Products Co.). U. S. 1,939,281, Dec. 12. Oil such as gas oil, fuel oil or crude oil is subjected to pressure distn.; vapors and unvaporized liquid are separately removed from the pressure distn. zone; the unvaporized liquid is introduced while hot into a zone of lower pressure in which the heat in the oil effects substantial distn., and before this latter distn., the said unvaporized oil is mixed with a lighter oil of lower temp. Vapors from the lower pressure distn. zone are subjected to vapor phase cracking. App. is described.

**Cracking hydrocarbon oils.** Jean Delattre-Seguy (to Universal Oil Products Co.). U. S. 1,939,282, Dec. 12. Vapors and non-vaporized oil are sep'd. from a pressure cracking zone; the vapors are subjected to reflux condensation, remaining vapors are finally condensed; reflux condensate is withdrawn and subjected to a vaporization under reduced pressure so controlled that the reflux condensate is not completely vaporized; the first-mentioned non-vaporized oil is subjected to partial vaporization under reduced pressure; the two vapor products thus derived are mixed with each other and the mixt. is subjected to vapor-phase cracking by heat exchange with heating gases; the remaining reflux condensate is mixed with the unvaporized oil and reflux from the cracked vapors evolved is subjected to retreatment with fresh charging stock in the primary cracking zone. App. is described. Cf. preceding 2 abstracts.

**Cracking hydrocarbon oils.** Lyman C. Huff (to Universal Oil Products Co.). U. S. 1,937,959, Dec. 5.

Vapors from an oil-cracking process are dephlegmated in a dephlegmating zone, and C is pptd. from the cracked liquid oil in enlarged chambers which are alternately cut in and out of the cracking system for C deposition therein and for cleaning. Prior to being cut into the system, and after cleaning, the chambers are preconditioned by introducing into them charging oil which has been preheated in the dephlegmating zone, and such charging oil is then supplied to the cracking zone. App. is described.

**Cracking hydrocarbon oils.** Gustav Egloff (to Universal Oil Products Co.). U. S. 1,938,817, Dec. 12. Vapors from a pressure cracking zone are dephlegmated at a temp. above the b. p. of water in contact with an aq.  $ZnCl_2$  soln.; this treatment evapg. water from the soln. and forming reflux condensate contg. suspended  $ZnCl_2$ ; the reflux condensate is supplied to the cracking zone so that cracking takes place in the presence of  $ZnCl_2$ . App. is described. Cf. C. A. 28, 625<sup>9</sup>.

**Cracking hydrocarbon oils.** Charles H. Angell (to Universal Oil Products Co.). U. S. 1,940,673, Dec. 26. Oil is heated to a conversion temp. in a heating zone such as a pipe coil, and the heated material is passed into a separator in which vapors and non-vaporous residue are sep'd.; the residue is introduced into a coking chamber; vapors from the separator are subjected to further conversion in a sep. heating coil and the heated vapors are introduced into the coking chamber to coke the residue by their direct contact heating action; vaporous products from the coking chamber are subjected to fractionation; overhead vaporous products are removed from the fractionator, subjected to condensation, the resulting distillate and gas are collected; a relatively heavy portion of the reflux condensate condensed in the fractionator is removed and subjected to conversion together with the raw oil charging stock; a relatively light portion of the reflux condensate condensed in the fractionator is removed and subjected to further conversion in a third heating coil and the heated materials are introduced into the separator. App. is described.

**Cracking hydrocarbon oils.** Rene de M. Taveau (to Texas Co.). U. S. 1,936,735, Nov. 28. Products of a vapor phase cracking operation are delivered into a body of oil in an otherwise unheated still to maintain the oil at a cracking temp. and to effect cracking in the liquid phase; evolved vapors from both the vapor phase and liquid phase cracking operations are delivered to a separator, lighter constituents are sep'd., and heavier constituents are subjected to back-trapping to supply oil for the vapor phase cracking operation. App. is described.

**Cracking hydrocarbon oils.** Harry D. Loeb. U. S. 1,941,440, Dec. 26. During cracking of an oil by heating under pressure, the oil is mixed with a small proportion of finely divided lime and fuller's earth, in equal quantities. App. is described.

**Cracking hydrocarbon oils.** Gewerkschaft Kohlenbenzin. Ger. 585,609, Oct. 13, 1933. Hydrocarbon oil vapors and steam are passed over activated fuller's earth at 300-550°, then over pumice stone impregnated with Ni, Co, Cu or similar metallic catalysts at 300-450°, and finally over activated fuller's earth impregnated with oxides of metals such as Ni, Co or Al at 150-300°, to effect a catalytic "cracking." App. is indicated.

**Cracking hydrocarbon oils to produce gasoline.** Eugene C. Herthel (to Sinclair Refining Co.). U. S. 1,939,263, Dec. 12. In producing gasoline by cracking oils of higher b. p. at temps. above 480°, to obtain a product of high antiknock value, a mixt. of vapors and gases from the cracking operation is fractionated to sep. constituents of higher b. p. than suitable for the gasoline product; the remaining mixt. of vapors and gases is subjected to condensation to produce a condensate including the gasoline product; the pressure on this sep'd. condensate is increased and it is fractionated under the increased pressure to sep. constituents of lower b. p. than are suitable for inclusion in the gasoline; remaining condensate is digested with an adsorptive catalyst such as fuller's earth under maintained pressure and at a temp. not substantially lower than that at which it is discharged from the second-

mentioned fractionating operation, and the pressure is thereafter reduced on the digested condensate, constituting the gasoline product. App. is described.

**Apparatus for cracking hydrocarbons.** Milton J. Trumble and Wm. L. Seeley (to Petroleum Hydrogenation Co., Ltd.). U. S. 1,938,877, Dec. 12. A rotary still to which uncracked vapors are supplied such as those of a heavy mineral oil fraction contains a body of catalytic material such as molten Pb and Ni oxide in its bottom portion, and this catalytic material is lifted (by a described device) toward the top of the still and poured downwardly through the vapors.

**Apparatus for cracking hydrocarbon oils.** Sigbert Seelig. Ger. 587,983, Nov. 10, 1933 (Cl. 23b. 1.04). Addn. to 535,277 (C. A. 26, 1111).

**System for cracking hydrocarbon oils.** Standard Oil Development Co. Ger. 587,313, Nov. 2, 1933.

**Apparatus for coking and cracking hydrocarbons.** Trent Process Corp. Ger. 586,971, Oct. 28, 1933 (Cl. 10a. 22.04).

**Removing carbon deposits from oil-cracking tubes.** Adam J. Kulberg. U. S. 1,939,112, Dec. 12. Steam is admitted to the heated tubes and the temp. of the steam blast is raised to about 650° by heating the tubes; subsequently, a stream of gravel-like material is added to the steam blast while its temp. and pressure are maintained.

**Heat-transmission medium suitable for use in oil-cracking systems, etc.** Owen D. Lucas (to Whessoe Foundry and Engineering Co., Ltd.). U. S. 1,941,014, Dec. 26. Diphenyl oxide 60-70% is mixed with about 10% of naphthalene and diphenylamine or aniline in proportions giving a compn. of initial freezing point not higher than about 6°. Cf. C. A. 27, 876.

**Hydrocarbon oil conversion.** Jacob B. Heid (to Universal Oil Products Co.). U. S. 1,936,874, Nov. 28. A closed circuit of liquid hydrocarbon oil and a closed circuit of hydrocarbon vapors are cyclically circulated and during a portion only of their circulation are brought into contact with each other. The liquid circuit is heated to a temp. sufficient to effect substantial vaporization during its sep. circulation; the vapor circuit is heated to a cracking temp. during its sep. circulation; and vapors are removed from the vapor circuit for condensation and collection. App. is described.

**Apparatus for conversion of hydrocarbon oils.** Gustav Egloff (to Universal Oil Products Co.). U. S. 1,940,711, Dec. 26. A cracking app. comprises a heating coil in a furnace, a separator, connections for withdrawing vapors from the separator and for reducing the pressure on and flash-distg. the residual oil; vapors from this flash distn. are subjected to more severe cracking conditions in a second cracking coil in a sep. furnace subjected to higher temp. than the first-mentioned coil.

**Hydrocarbon oil conversion.** Lyman C. Huff (to Universal Oil Products Co.). U. S. 1,938,836, Dec. 12. Oil heated to a conversion temp. is discharged into an enlarged chamber where substantial sepn. of lighter fractions in the form of vapors takes place; the vapors are subjected to dephlegmation; uncondensed vapors are removed after dephlegmation; reflux condensate from the dephlegmation zone is returned and mixed with the oil being heated; unvaporized residue is separately withdrawn from the enlarged chamber; a substantial superatm. pressure is maintained on the oil and vapors under treatment, and the vapors are removed from the dephlegmation zone and heated residue is removed from the enlarged chamber without substantially reducing the pressure, and such vapors and residue are mixed and cooled while still under pressure. App. is described.

**Hydrocarbon oils.** Eugene Ayres and Herschel G. Smith (to Gulf Refining Co.). Brit. 398,032, Sept. 7, 1933. The oils are obtained as described in Fr. 748,807 (C. A. 27, 5529). They are then treated with fine clay and Ca(OH)<sub>2</sub>, followed by filtration, or with H<sub>2</sub>SO<sub>4</sub> or by heating to 232-281° to remove suspended sludge.

**Hydrogenating heavy hydrocarbon oils.** Harry H. Semmes (to Standard-I. G. Co.). U. S. 1,940,651, Dec. 10. In a continuous process for the destructive

hydrogenation of S-contg. hydrocarbon oils, the oil, in liquid phase and contg. in suspension a finely divided hydrogenation catalyst subject to S poisoning and comprising Fe, Co or Ni or oxides of these metals, is treated with H under pressure above 20 atm. and at a suitable destructive hydrogenation temp.; vapor and gas and a liquid suspension of the catalyst are continuously withdrawn from the reaction zone; a portion of the catalyst is sep'd. from the suspension, reactivated by roasting, and then reintroduced into the suspension and returned to the reaction zone. App. is described. U. S. 1,940,652 also relates to a generally similar process suitable for producing lubricating oils. U. S. 1,940,653 relates to a similar process in which one reaction zone contg. catalyst may be used while the catalyst is being regenerated in another zone by roasting. App. is described in both these parts.

**Desulfurizing hydrocarbon oils.** Frederick W. Sullivan, Jr., and Arthur B. Brown (to Standard Oil Co. of Ind.). U. S. 1,938,670, Dec. 12. Liquid petroleum distillates are passed, together with molten alkali metal, through a colloid mill to disperse the alkali metal in the form of a colloid suspension; the material is heated to cause the alkali metal to react with the S contained in the distillate, and the alkali metal sulfide formed is sep'd. from the treated oil (suitably by settling). U. S. 1,938,671 relates to desulfurizing pressure distillates, successively higher boiling fractions of which contain increasing S contents. The distillate is redistilled, the redistillate is discontinued when the temp. has risen to a point approx. within the range of 90-165°; bottoms from the redistillate are agitated with alkali metal at a temp. of about 175° under a pressure of over 150 lb. per sq. in. to reduce the S content to an unobjectionable point, and the treated bottoms are then reblended with the overhead from the redistillate.

**Desulfurizing hydrocarbon oils.** Robert F. Ruthruff (to Standard Oil Co. of Ind.). U. S. 1,938,672, Dec. 12. A distillate within the gasoline-kerosene b. p. range is desulfurized by being agitated in the liquid state with a molten alkali metal at a temp. of about 230-330° under a pressure of about 150 lb. per sq. in. or more.

**Desulfurizing overhead products of oil cracking.** Jacques C. Morrill (to Universal Oil Products Co.). U. S. 1,940,726, Dec. 26. The material is treated with an alk. soln. of an alkali or alk. earth metal sulfide.

**Dewaxing hydrocarbon oils.** Earl Petty (to Alco Products, Inc.). U. S. 1,940,014, Dec. 19. Oil to be dewaxed is dild. with an amount of liquefied normally gaseous substance such as liquefied C<sub>2</sub>H<sub>6</sub> to chill the oil to the desired low temp. by the evapn. of the added liquefied gas at atm. pressure; the temp. of the dild. oil is reduced by heat exchange with a cooling medium to a temp. still above the desired low temp., and further reduction in temp. is effected by evapn. of the liquefied gas so that wax is thrown out of soln. in readily filterable form. App. is described. U. S. 1,940,015 also relates to a generally similar process and also describes app.

**Apparatus for refining hydrocarbons.** Eddeleanu G. m. b. H. Fr. 754,836, Nov. 14, 1933. An app. is described for treating hydrocarbons with SO<sub>2</sub> with means for regulating the level and flow of liquid, the heating steam for the evaporators, the pressure and the temp.

**Apparatus for refining hydrocarbon vapors by treatment with fuller's earth, etc.** Arthur G. Connolly (to Universal Oil Products Co.). U. S. 1,938,908, Dec. 12. Structural features.

**Refining products from the heat treatment of hydrocarbon oil.** Richard F. Dazis (to Universal Oil Products Co.). U. S. 1,941,251, Dec. 26. Condensed overhead products from oil heat treatment are subjected in liquid condition to the action of liquid SO<sub>2</sub> contg. a dissolved metal halide such as SnCl<sub>4</sub> or HgCl<sub>2</sub> in order to promote polymerization of unsatd. compds. AlCl<sub>3</sub>, SnBr<sub>4</sub>, FeCl<sub>3</sub>, TiCl<sub>4</sub> and ZnCl<sub>2</sub> also may be used.

**Refining residual hydrocarbon oil.** Joseph Kochan (to Standard Oil Co. of Ind.). U. S. 1,938,629, Dec. 12. Residual oil is treated with H<sub>2</sub>SO<sub>4</sub>; the oil is sep'd. from the

acid sludge. A viscous hydrocarbon-oil distillate having a viscosity of between 80 sec. Saybolt universal at 38° and 95 sec. Saybolt universal at 99° is treated with  $H_2SO_4$ ; acid sludge thus formed is sepd. and heated with water to sep. it into acid oil, sepd. sludge and weak acid; the sepd. sludge from the last mentioned operation is removed and washed with water and the resulting wash water is then further used to wash the first-mentioned acid-treated residual oil.

**Refining "sour" hydrocarbon oils.** Lawrence M. Henderson (to Atlantic Refining Co.). U. S. 1,940,801, Dec. 26. The oil is treated with a soln. of Na plumbite, this forming oil-sol. Pb compds.; the oil is sepd. from the treating soln., and the sepd. oil is treated with an aq. soln. of  $CuCl_2$ , this forming Pb compds. which are insol. in the oil, and the oil is sepd. from the insol. substances formed and from the aq. treating soln.

**Refining impure hydrocarbon distillates.** Robert P. Russell (to Standard-I. G. Co.). U. S. 1,940,649, Dec. 19. Distillates such as heavy lubricating oil stock are treated with H under 20-200 atm. pressure at temps. of about 380-450° in the presence of sulfactive catalytic materials which promote hydrogenation. The hydrocarbon material and H are passed downwardly continuously through a vertical elongated reaction zone packed with lumps of the catalytic material at a rate below about 1.5 volumes of hydrocarbon per vol. of catalyst per hr. U. S. 1,940,650 relates to refining lubricating oils by subjecting the oil to the action of H in a reaction zone packed with a catalyst such as oxides or sulfides of Cr, Mo or W at temps. above 380° and under a pressure of 20 atm. or more while a steady flow of oil is passed in one direction through the catalyst at an absolute velocity above about 0.25 lb. per sec. per sq. ft. of reaction zone cross section. A limited amount of naphtha is formed. App. is described.

**Refining hydrocarbon distillates of low boiling point.** Ernest B. Miller and Gerald C. Connolly (to Silica Gel Corp.). U. S. 1,939,129, Dec. 12. Low-boiling distillates contg. gum-forming constituents are treated with an acidic reagent such as  $H_2SO_4$  of such concn. and quantity, at ordinary temp. and atn. pressure, as to polymerize only the more easily reactive of the gum-forming constituents and form only a small amt. of sludge; the sludge formed is sepd. and the remaining material is heated (in the absence of solid porous adsorbent material) to a temp. and under a pressure to maintain it liquid while polymerizing the more difficultly reactive of the gum-forming constituents; the purified product is then recovered by distn. An arrangement of app. is described.

**Stabilizing hydrocarbon oil pressure distillates.** Joseph K. Roberts (to Standard Oil Co. of Ind.). U. S. 1,939,633, Dec. 12. The distillate is rectified at an elevated p. under a pressure of about 250 lb. per sq. in. to sep. undesired excessively volatile substances, and the remaining material is recovered as a single fraction which is then discharged into a rectifying zone maintained under a lower pressure of about 30 lb. per sq. in., vapors from which are further rectified, and condensate from this rectification is blended with the other desired portion of the distillate. Various details of app. and operation are described.

**Hydrocarbon distillates from solid bituminous material** such as coal, pitch or grahamite and heavy hydrocarbon oil. Jacque C. Morrell (to Universal Oil Products Co.). U. S. 1,940,725, Dec. 26. A portion of a mixt. of the solid material and heavy oil is placed in an enlarged distn. zone. Another portion of the heavy oil, unmixed with solid material, is heated to a vapor phase cracking temp. of about 540° in another zone and the resulting vapor phase cracked vapors are introduced into the distn. zone to supply heat for the distn. of the mixt. App. is described.

**Apparatus for distilling liquids such as hydrocarbon oils.** Gustav A. Beiswenger (to Standard Oil Development Co.). U. S. 1,939,382, Dec. 12. A vaporizing chamber in the form of a vertical pipe of enlarged cross section fitted with baffles spaced at increasing intervals

from the inlet to the discharge end has its inlet end connected with a heating coil and its discharge end connected with a separator. Various other structural and operative details are described.

**Continuously operating apparatus for fractionating hydrocarbon oils, etc.** Floyd L. Kallam. U. S. 1,940,802-3, Dec. 26. Numerous structural and operative details are described.

**Low-boiling liquid hydrocarbons from solid carbonaceous material such as coal, tars, etc.** Robert P. Russell (to Standard-I. G. Co.). U. S. 1,940,648, Dec. 19. A body of a suspension of finely ground carbonaceous material in a heavy oil is maintained at a decompn. temp. under high pressure, and a hot mixt. of the suspension and a gas rich in free H is continuously forced into this body of material; vapor is continuously withdrawn, low-boiling hydrocarbons are condensed from the vapor; a part of the suspension is separately withdrawn from the body of material under treatment, subjected to a reduction of pressure such that substantially all the oil is vaporized, the vapor is condensed and part of the condensate is returned to the body of material undergoing treatment. App. is described.

**Polymerizing olefinic gases.** Wm. B. Plummer (to Standard Oil Co. of Ind.). U. S. 1,940,227, Dec. 19. Gases of concd. olefinic content such as may be obtained by cong. olefins from a cracking system are subjected to polymerization at temps. of about 400-540° under pressures of 500-3000 lb. per sq. in. and the gases and products are cooled without substantial reduction in pressure, introduced into a separator also supplied with unconcd. olefinic gases at a low point of the separator, and undissolved fixed gases are removed from an elevated point of the separator and eliminated from the system. Liquid products and dissolved gases are withdrawn, the pressure on them is reduced to effect their sepn. and the released gases are passed to the heating and polymerizing stage. App. is described, and a liquid product is obtained contg. low-boiling hydrocarbons.

**Mineral oils.** N. V. de Bataafsche Petroleum Maatschappij. Fr. 755,023, Nov. 18, 1933. The formation of mud when certain petroleum or like hydrocarbon residues are dild. with light mineral oil distillates, is prevented by heating the products to be dild. to above 205°.

**Refining mineral oils with alkali metal amalgams.** Evan C. Williams and Herbert P. A. Groll (to Shell Development Co.). U. S. 1,939,839, Dec. 19. For treating oils such as in "sweetening" cracked distillate, an amalgam contg. about 0.7% of an alkali metal such as Na or K is used. App. is described.

**Cracking mineral oils.** Wilbur G. Laird (to Heat Treating Co.). U. S. 1,940,955, Dec. 26. Oil is passed through a heating coil and thence directly into a rotatable unheated reaction drum contg. freely-moving loose abrading elements such as iron or steel balls, and the drum is rotated to cause the loosening and grinding of the oil residuc; vapors produced in the cracking are withdrawn from the drum during its rotation and are conducted into a fractionating zone after an intermediate cooling by contact with a cooling fluid such as charging oil to reduce them below the cracking temp. before the fractionation. App. is described.

**Apparatus for distilling and cracking mineral oils and tars.** Hans Magnus. Ger. 589,018, Dec. 1, 1933 (Cl. 23b. 1.04). Addn. to 568,313 (C. A. 27, 2028).

**Fractional distillation of oils.** Foster Wheeler Corp. Brit. 398,099 Sept. 7, 1933. In the fractional distn. of oils a mixt. of oil and vapor is introduced into a zone from which liquid is withdrawn to a 2nd zone of lower total pressure, the vapor from the 2nd zone passing back to the 1st zone. App. is described.

**Oil-distillate cooler or condenser.** John S. Wallis. U. S. 1,940,338, Dec. 19. Structural details.

**Apparatus for testing the flash point of oils.** Masakichi Mizuta and Teiji Yoshimura (to Nippon Sekiyu Kaishiki Kaisha). U. S. 1,941,182, Dec. 26. Various structural details are described.

**Filtering oils.** Charles W. McKinley (to A C Spark

- Plug Co.). U. S. 1,940,317, Dec. 19. Intermixed cotton waste and curled hair are used as filtering agents.
- Apparatus suitable for filtering automobile engine oil. Charles W. McKinley (to A C Spark Plug Co.). U. S. 1,940,316, Dec. 19.
- Apparatus for purifying oils such as crude oils at wells by separating water, etc. Thomas F. Knoles. U. S. 1,939,988, Dec. 19. Structural features.
- Apparatus with inclined baffles for gravity separation of water, etc., from oil. Harmon F. Fisher (to Petroleum Rectifying Co. of Calif.). U. S. 1,940,794, Dec. 26. Structural details.
- Treatment of calcareous shale, etc. Oskar Tetens. Ger. 587,289, Nov. 1, 1933. Calcareous shale and like bituminous materials contg. flint or other hard minerals are comminuted in a rapidly operated hammer mill or the like with the addn. of dust-evolving material such as ground flint from the treatment of a preceding batch,  $\text{Ca(OH)}_2$ , sand or peat. Oil is distd. from the product in known manner, and the residue is used in the manuf. of cement.
- Fractionating tower suitable for dephlegmating hydrocarbons. George W. Gray and Burt E. Hull (to Texas Co.). U. S. 1,939,392, Dec. 12.
- Fuel for internal-combustion engines. Gellert Alleman (to Sun Oil Co.). U. S. 1,940,439, Dec. 19. A hydrocarbon deriv. of a metal contg. a diethylmethyl group such as Pb, Ti or Ni compds. or a dimethyldiamyl Pb or the like is added (suitably in a proportion of about 0.1%) to a "low compression" fuel such as gasoline. U. S. 1,940,440 also relates to the use of similar fuels for suppressing detonation in internal-combustion engine operation.
- Inhibiting gum formation in gasoline. Wm. S. Calcott and Herbert W. Walker (to E. I. du Pont de Nemours & Co.). U. S. 1,939,659, Dec. 19. A diarylguanidine salt of acetic, butyric, propionic, palmitic, stearic or oleic acid, *e. g.*, about 0.002% of di-*o*-tolylguanidine stearate, is added to gasoline to inhibit gum formation.
- Inhibiting gum formation in cracked gasoline. Wm. S. Calcott and Ira E. Lee (to E. I. du Pont de Nemours & Co.). U. S. 1,940,445, Dec. 19. Cracked gasoline is stabilized by the addn. of about 0.002% or more of a polybutylamine or an amylamine. Di- and tri-ethanolamine 0.05% also may be used.
- Refining overhead gasoline-containing products from oil cracking. Jacques C. Morrell and Gustav Egloff (to Universal Oil Products Co.). U. S. 1,941,266, Dec. 26. The heated vaporous material is treated with  $\text{SO}_2$  and steam in the presence of an Fe oxide under conditions which effect removal of S and gum- and color-forming constituents. Cf. C. A. 28, 889<sup>2</sup>.
- Refining cracked hydrocarbon-oil products of motor-fuel boiling-point range. Jacques C. Morrell (to Universal Oil Products Co.). U. S. 1,941,267, Dec. 26. In order to reduce the S content and to remove color- and gum-forming constituents, the material, in heated vaporous condition, is subjected to the action of a mixt. of  $\text{H}_2\text{SO}_4$  and HOAc. Cf. C. A. 28, 889<sup>2</sup>.
- Gasoline-like hydrocarbons from hydrocarbons of lower molecular weight. Cary R. Wagner (to Pure Oil Co.). U. S. 1,938,945, Dec. 12. Unsatt. hydrocarbon gases obtained from vapor-phase systems of oil conversion are passed over a catalyzing agent such as fuller's earth, activated C, silica gel, bentonite or the like while the gases are at a temp. of about 175-370° and at a pressure of 600-1500 lb. per sq. in., to effect an exothermic reaction. Cf. C. A. 28, 631<sup>1</sup>.
- Gas and liquid separator suitable for separating gasoline from air, etc. Warren H. De Lancey (to Gilbert & Barker Mfg. Co.). U. S. 1,941,390, Dec. 26. Structural features.
- Stable iron carbonyl composition for addition to motor fuels. Martin Müller-Cunradi and Wilhelm Wilke (to I. G. Farbenind. A.-G.). U. S. 1,940,096, Dec. 19. Fe carbonyl is used in admixt. with a benzene-sol. simple amine contg. not more than 12 C atoms such as aniline, monomethylaniline or dimethylaniline as an antiknock agent.
- Refining benzene. Concordia-Bergbau A.-G. (Louis Nettlebusch and Reinhard Schneider, inventors). Ger. 588,048, Nov. 11, 1933 (Cl. 12r. 1). A hydrocarbon oil b. 200-300° is obtained as a by-product from the refining of benzene by proceeding as follows: Crude benzene is washed with  $\text{H}_2\text{SO}_4$ , and the mixt. is dild. with water before the benzene is sepd. The benzene is then sepd. and treated with NaOH soln., and then sepd. from the NaOH soln. and from the intermediate resinous layer. Finally, the benzene is distd., and the still residue is subjected to dry distn. to obtain the hydrocarbon oil.
- Bollers for vaporizing naphtha, heavy mazout, petroleum, etc., for use as fuel in internal-combustion engines with spark ignition. Antonio Olivotti and Elia Olivotti. Brit. 398,357, Sept. 14, 1933.
- "Synthetic oil." Wm. A. Gruse and Karl P. McElroy (to Gulf Refining Co.). U. S. 1,941,169, Dec. 26. A residual oil from a cracking process is atomized into an atm. of natural gas in such proportion that the C content of the mixt. is somewhat less than 85.7% by wt., and the mixt. is passed through a restricted reaction zone such as a pipe coil at a temp. of about 500-550° under 1000-3000 lb. pressure per sq. in.; the resulting "synthetic oil" is condensed at about the same pressure. App. is described.
- Separating crystalline wax, amorphous wax and lubricating oil from wax slop. Walter S. Baylis (to Filtrol Co. of Calif.). U. S. 1,939,946, Dec. 19. A mixt. of adsorbent clay and wax slop contg. a small percentage of an activating substance such as  $\text{Al}_2(\text{SO}_4)_3$  which promotes adsorption is subjected to steam distn. until approx. 50-60% by wt. of the charge has been distd. over; the distd. fraction is slightly chilled and the wax is sepd. from it; the clay is sepd. from the bottoms of the distn., the bottoms are dild. with a light hydrocarbon material, the dild. bottoms are chilled to a low temp. to sep. cryst. wax, the latter is filtered out, the filtrate is chilled to a lower temp. to effect sepn. of amorphous wax, the latter is removed, and the light hydrocarbon diluent is then sepd. from the remaining oil. App. is described.
- Lubricating oil. Alfred Henriksen and Bert H. Lincoln (to Continental Oil Co.). U. S. 1,939,979, Dec. 19. A hydrocarbon lubricating oil is mixed with a small proportion (suitably about 1%) of a halogenated org. acid-diphenylene oxide condensation product such as one formed from chlorinated stearic acid and diphenylene oxide which serves to improve the film strength of the oil. Cf. C. A. 28, 1182<sup>7</sup>.
- Lubricating oil. Bert H. Lincoln and Alfred Henriksen (to Continental Oil Co.). U. S. 1,939,993, Dec. 19. In order to improve their film strength, hydrocarbon lubricating oils are mixed with a small proportion (suitably about 0.1-5%) of condensation products such as may be derived from chlorinated lard oil and naphthalene or the like. U. S. 1,939,994 relates to the similar use of a condensation product derived from 2 halogenated fatty acids or halogenated esters by use of an alkali condensing agent. U. S. 1,939,995 relates to the like use of a halogenated wax-halogenated org. acid condensation product such as that derived from chlorinated paraffin and chlorinated stearic acid.
- Lubricating oils. Edeleanu G. m. b. H. Brit. 398,992, Sept. 28, 1933. Highly viscous mineral lubricating oils are purified by liquid  $\text{SO}_2$  in a countercurrent mixer by first reducing the viscosity of the oil by mixt. with about 10-40% of  $\text{SO}_2$ , introduced as liquid or as gas under pressure. Mixts. of  $\text{SO}_2$  with, *e. g.*,  $\text{C}_6\text{H}_6$  or low-boiling ext. may be used for the extn. and dildn. App. is described. In 399,030, Sept. 28, 1933, lubricating oils of high-viscosity index are obtained by treating crude material, *e. g.*, a Jaolo residual oil, with liquid  $\text{SO}_2$  at above 25°. Cf. C. A. 27, 2800.
- Lubricating oils. Edeleanu G. m. b. H. Ger. 587,393, Nov. 3, 1933. Lubricating oil fractions are refined by treatment with liquid  $\text{SO}_2$  followed by vacuum distn. in the presence of alkali, with or without the aid of steam.

**Lubricating oils.** I. G. Farbenind. A.-G. Fr. 754,456, Nov. 8, 1933. A lubricant comprises a viscous hydrocarbon contg. a condensation product of a carboxylic acid chloride of mol. wt. above 200. Examples are given of the use of condensation products from oleic and stearic acid chloride. Cf. C. A. 28, 1182<sup>1</sup>.

**Lubricating oils.** Red River Refining Co. Inc. Fr. 754,932, Nov. 16, 1933. A lubricating oil is obtained by 1st sepg. rapidly, from an appropriate mineral oil fraction, the desired constituents having lubricating properties by an instantaneous vaporization at an appropriate temp. and under reduced pressure not appreciably above 50 mm. and preferably not above 20, this vaporization taking place in 2 stages. The constituents contg. the lubricating oil are condensed under a corresponding low pressure. The impure oil thus obtained is subjected to a redistn. under a still lower pressure not above 10 mm., and so that the distn. temp. increases progressively and the desired constituents are vaporized successively in the order of their vaporization points. These constituents are afterward condensed while the uncondensed vapors and contaminating substances are removed rapidly. No filtration or acid treatment is required. An app. is described.

**Petroleum lubricating oils.** Robert T. Haslam (to Standard-I. G. Co.). U. S. 1,940,050, Dec. 19. The quality of lubricating oils is improved by subjecting them to the action of H at temps. of about 400–465° under pressures above 50 atm. for a limited time whereby an appreciable but restricted quantity of low-boiling hydrocarbons is formed, the treatment with H being carried out in a series of reactors (of a described app.) and vapors formed being continuously removed from each reactor. Liquid is withdrawn from each reactor when only a portion of it has been improved to a predetd. extent, the portion so improved is removed from the liquid which is withdrawn and the remaining liquid is passed to a succeeding reactor for further treatment. Cf. C. A. 28, 632<sup>2</sup>.

**Apparatus for testing the lubricating quality of oils by opacity (indicating suspended impurities).** Virgil A. Schoenberg (to Light-Sensitive Apparatus Corp.). U. S. 1,940,772, Dec. 26. Various structural and operative details are described.

**Lubricants.** Wm. Helmore and Ernest W. J. Mardles. Brit. 398,222, Sept. 11, 1933. Lubricants formed of mineral oils, castor or olive oil, oleic acid and mixts. thereof are mixed with a small proportion of Sn or a Sn

compd., e. g., oleate, naphthyl, ricinoleate, phenyl, methyl iodide, to minimize the formation of sludge. Pb compds., e. g., tetraethyl, oleate, may also be added to increase the spontaneous ignition temp.

**Lubricants.** Kenneth C. D. Hickman (to Kodak Ltd.). Brit. 398,936, Sept. 28, 1933. Lubricants, suitable for hubs and gear-boxes of automobiles, consist substantially of a cellulose ester or ether, vegetable and (or) fish oils and a heavy mineral lubricating oil. In an example 6 lb. triethyl cellulose is soaked 15–25 hrs. in 64 lb. castor oil, dissolved by heating to 210°, cooled and masticated and then masticated with 30 lb. crank-case oil.

**Base for use in heavy oils and greases.** Alexander Horwitz. U. S. 1,939,170, Dec. 12. An Al stearate base is compounded with about 5% of glycerol, and about 5% of the base is compounded with a mineral oil for the production of a highly viscous and stringy lubricant. Cf. C. A. 27, 836.

**Greases.** I. G. Farbenind. A.-G. Fr. 42,897, Nov. 15, 1933. Addn. to 740,407 (C. A. 27, 2293). Consistent greases are obtained by adding to greases, products of high mol. wt. prepd. by polymerizing aliphatic, aromatic or hydroaromatic hydrocarbons, e. g., polystyrene, hydro-rubber or polymerization products of terpenes, cyclohexene or tetrahydronaphthalene.

**Bituminous emulsions.** Leo Liberthson (to L. Sonneborn Sons Inc.). U. S. 1,940,807, Dec. 26. An emulsifying agent for producing stable emulsions with bituminous material such as tar or asphalt is prepd. from impure green petroleum sulfonic acids produced by the treatment of petroleum oil with H<sub>2</sub>SO<sub>4</sub> and contg. non-acid org. compds. by sepg. the green sulfonic acids from the assocd. non-acid org. compds. by dissolving the acids in an aq. soln. of an alc. contg. not more than 3 C atoms such as EtOH and then producing an aq. soln. of the Na or K salts of the sulfonic acids.

**Dividing asphalt into particles.** Roy A. Curran (to Standard Oil Development Co.). U. S. 1,939,391, Dec. 12. Molten asphalt is directed against a rotating surface (of a described app.) which, as well as the adjacent air, is sufficiently heated that the asphalt remains molten while in contact with the surface.

**Refining sulfate wood turpentine.** Wilbur F. Gillespie and Daniel M. Wadsworth (to Bogalusa Paper Co.). U. S. 1,938,693, Dec. 12. Ethylenediamine is used for removing offensive odors. A bleaching powder also may be used.

## 23—CELLULOSE AND PAPER

CARLETON E. CURRAN

**Viscosity of cellulose solutions.** Mme. A. Dobry and J. Duclaux. *Compt. rend.* 497, 1318 20(1933).—To det. the relation between the nature of the solvent and  $k$  in the Arrhenius equation (C. A. 7, 2714) relating the viscosity and concn. of a cellulose deriv., D. and D. detd. the viscosity of a nitrocellulose (11.4% N, obtained by fractional pptn.) in 11 solvents at concns. of 0.04 and 1%. The lower concn. permitted extrapolation to the origin to calc.  $k$  at infinitesimally small concns. Such values for  $k$  varied little from one solvent to another, in confirmation of Duclaux's previous statement (C. A. 14, 3154) that at large diln.:  $k$  is independent of the nature of the solvent and represents the sp. viscosity of a cellulose deriv. The variation of the viscosity and  $k$  observed at the higher concn. depends largely on the solvent; this confirms McHain's results (C. A. 20, 1714).  $k$  is independent of the solvent at infinite diln. because the micelles are neither swollen nor hydrated. Staudinger's theory (C. A. 24, 1564–5, 3130) that the rapid increase of viscosity with concn. is due to the space occupied by the spheres of action of the macromols. is inadequate since the relative increase is much larger with certain solvents than with others. The best solvent is that one in which a low viscosity results at a relative high concn. F. A. S.

**Fractionation of ethylcellulose.** I. Okamura. *Cellu-*

*lochemie* 14, 135–8(1933).—Com. ethylcellulose with 2.9% moisture and 49.4% EtO was dissolved in glacial AcOH and fractionated by addn. of water. The temp. used in prepn. of fractions had only a slight effect on viscosity, and there was no evidence of acetylation. Viscosity of 1% solns. remained unchanged at 20° for 7 days. Fractionation into 8 parts (5 selected for detns.) was carried out according to the method of Rocha (C. A. 24, 2597). Ethoxy content was approx. the same except for the very small fractions. The I no. by the method of Bergmann and Machmer (C. A. 24, 2877) increased in the later fractions. For pptn. by water in 1% AcOH soln. increasing amts. of pptg. agent are required in passing from the higher to the lower fractions; for pptn. by hexane in 1% C<sub>6</sub>H<sub>6</sub> soln. the reverse is true. Viscosity in the Ostwald viscometer with capillary of 0.067 cm. radius and 11 cm. length at 20° and 50° showed a decrease in lower fractions. The sp. mol. const. (Staudinger) is the same for homologous series. Osmotic pressure in the osmometer, with C<sub>6</sub>H<sub>6</sub> as solvent, and membrane of finest "cellafilter" at 35 ± 0.1° increased in lower fractions, mol. wts. being higher in first fractions. Mol. wts. by the osmotic pressure, I no. and viscosity detns. were approx. the same for each fraction. C. A. Brautlecht

**Hypochlorite-oxycellulose.** Robert Haller and Fritz

- Lorenz. *Helv. Chim. Acta* 16, 1165-80(1933).—Oxy-cellulose, prepd. from purified cotton cloth by treating with alk. NaClO and CO<sub>2</sub>, was extd. with wet steam. The Cu no. (Schwalbe) decreased 60% from 11.3 in 12 hrs. The extn. results in soln. of a part of the reducing degradation products in the oxycellulose as such without hydrolysis and the sol. part is adsorbed on the original oxycellulose. Optical rotation in cupric tetramine hydroxide showed that the extd. oxycellulose still contained oxidation degradation products. The compn. of the oxycellulose ext. was studied. The appearance of a polymer of glucose and a partly oxidized deriv. of it which is built up chiefly of glucose residues indicates that the oxidation of cellulose with hypochlorite causes a hydrolytic splitting of the mol. On the basis of a chain structure of glucose residues for cellulose, hydrolysis means a breaking of acetal bonds between pairs of glucose residues and freeing of aldehyde groups. Oxidation of these chain fragments splits them further and changes the aldehyde groups to COOH groups. The absence of *d*-glucuronic acid in hypochlorite-oxycellulose is shown, contrary to Pringsheim (*C. A.* 15, 2721). M. Heinig
- The Scholler method for the saccharification of wood. Henry Brahmier. *Tek. Tid., Uppl. C, Kemi* 63, 86-7 (1933).—A review with data on the economy of the process. D. Thuesen
- Air oxygen, a factor in wood formation. C. G. Schwalbe and K. E. Hoffmann. *Cellulosechemie* 14, 133-4(1933).—Sections of the bark of pine, beech and spruce trees were covered with paraffin paper during the vegetation period (May-Oct.) and the trees cut in Nov. Sections of bandaged and unbandaged parts of the underlying cambial layer were examd. for OMe content by Fellenberg's method. The bandaged parts of pine and beech showed a slight decrease in OMe when compared to the unbandaged part (1.54-1.41%; 2.17-1.96%), while the spruce showed an increase (1.87-2.00%). Max. variation in OMe detns. was 1.16%. The bark of pine and beech, low in tannins, appears to permit passage of air O to the cambial layer, while spruce bark, rich in tannin, prevents O passage. Lignin was computed from the OMe content. Analytical methods for detn. of pentoses and pectins in spring sap, etc., are not available but S. and H. regard that most of the necessary pentose to form pectin and lignin must first be formed in the spring sap. C. A. B.
- Lignin determination by Halse's method. Sigrid Samuelsen and Erik Stephansen. *Papir-J.* 21, 217-18 (1933); cf. *C. A.* 27, 1505.—Halse's original method (*C. A.* 20, 3082), in which the sample is digested in an open flask for 12 hrs. at 20° with H<sub>2</sub>SO<sub>4</sub> and 39% HCl, is modified by digesting in a closed flask for 2 hrs. at 30° with H<sub>2</sub>SO<sub>4</sub> and 36% HCl. Clinton L. Brooke
- Combined lignosulfonic acid and its liberation. Carl Kullgren. *Svensk Pappers-Tid.* 36, 499-501, 532-8 (1933); cf. *C. A.* 25, 5986; 26, 4948.—K. reviews previous investigations on free and combined lignosulfonic acid and discusses various explanations of the relation involved, with special reference to the role played by Ca and H ions. Wilhelm Segerblom
- Tetraconiferylaldehydesulfonic acid. (Tetralignosulfonic acid.) Peter Klason. *Svensk Pappers-Tid.* 36, 735-6(1933).—Descriptive. K. suggests that the mol. wt. of lignin must be at least 3640. Wilhelm Segerblom

- A new apparatus for production of acid in sulfite pulp plants. L. Sæther. *Papir-J.* 21, 227-9(1933).—A suspension of finely ground limestone is circulated through a battery of vertical chambers while SO<sub>2</sub> is forced through in the opposite direction. The content of CaO and free SO<sub>2</sub> in the resulting acid can be regulated at will, with much greater accuracy than in the usual tower method of acid production. Clinton L. Brooke
- Investigations of soda- and sulfate-digesting processes. V. Investigation of the influence of the maximum temperature in the preparation of sulfate pulp. Erik Hägglund and Ingmar Eidem. *Svensk Pappers-Tid.* 36, 632-6(1933); cf. *C. A.* 25, 1992; 26, 1776.—No great advantages seem to be assocd. with lowering the max. temp. below 170° either in quality or yield of pulp. The moisture of the chips does not influence the strength of the pulp. These statements hold only for first-class circulation of liquor and for uniform chips. VI. Investigation of the significance of the concentrations of the liquor in the production of sulfate pulp. Erik Hägglund and Knut Aarsud. *Ibid.* 807-9.—Production of pulp proceeds faster when air-dry rather than moist wood is digested. High concn. of liquor also hastens the action. The tearing and bursting strength increase with a lowering of the concn. of the liquor. Moist and dry woods give pulps of about the same strength. Wilhelm Segerblom
- The chemistry of sulfite pulping. XXVII. The consumption of sulfur in the sulfite-cooking processes. Erik Hägglund and Frank Carrick. *Svensk Pappers-Tid.* 36, 704-8(1933); cf. *C. A.* 27, 1749.—The S consumed in sulfite-digesting processes, *i. e.*, S which cannot be recovered, originates from the H<sub>2</sub>SO<sub>4</sub> formed, the loosely bound H<sub>2</sub>SO<sub>4</sub>, and the tightly bound S. The formation of the H<sub>2</sub>SO<sub>4</sub> occurs early in the digesting and is due to the presence of air. The H<sub>2</sub>SO<sub>4</sub> content rises as the SO<sub>2</sub> content increases. About 20% of the SO<sub>2</sub> produced is used in forming H<sub>2</sub>SO<sub>4</sub>. The loosely bound H<sub>2</sub>SO<sub>4</sub> depends on the amt. of SO<sub>2</sub> in the digesting acid. The loosely bound H<sub>2</sub>SO<sub>4</sub> accounts for about 20-30% of the total S consumed, and the tightly bound S about 50-60%; the latter bears no relation to the SO<sub>2</sub> content. The S consumption rises rapidly toward the end of the digesting. The increasing consumption of S with the increasing Ca content is compensated for by the increased yield of pulp. Wilhelm Segerblom
- What may be expected of liquor circulation in the sulfite process. Karl Ehninger. *Papier-Fabr.* 31, Tech.-wiss. Teil 461-6(1933).—Savings in steam and time seem to be less significant than the improved quality of pulp due to more uniform cooking. R. H. Doughty
- Use and recovery of causticizer sludge [in the alkaline pulping processes]. W. Schmid. *Papier-Fabr.* 31, Tech.-wiss. Teil 509-10(1933).—Descriptive. R. H. Doughty
- The screen analysis of beaten pulp. K. Dittrich and W. Boos. *Papier-Fabr.* 31, Tech.-wiss. Teil 425-31, 439-45(1933).—The previously described method (*C. A.* 26, 6126) was applied to several chem. pulps processed in the lab. beater and Lämpén mill. Sheets of the 4 fractions sepd. were tested for strength, density and air transmission. The difference between the cutting action of the beater and the pounding action of the mill was shown clearly in the amts., appearance and strength properties of the finest fractions. Detailed test data and photomicrographs are given. Simple measurement of the amt. of the fractions is not a safe criterion of pulp quality. However, in connection with other tests, as freeness, it can give valuable information as to the effect of processing variables. It should be of particular value in developing products with special properties. R. H. Doughty
- The beating process in hollander and Jokro mill. K. G. Jonas. *Papier-Fabr.* 31, Tech.-wiss. Teil 473-83 (1933).—The beating actions of the Mallickh expl. beater and Jokro mill (*C. A.* 25, 1074) are fundamentally different, the former having a much greater cutting action. The interrelations of processing time, slowness, fiber length, pulp strength, specific cutting and hydrating effects, operating conditions and efficiency are set forth in 30 curve figures. Analysis of the data by the beater theories of S. Smith shows how operating conditions of the

water should be controlled to give desired combinations of rubbing and cutting action, and also the practical limits of this control. Since the Jokro mill is less sensitive than the heater to small changes in charge, speed and working pressure, it seems a more suitable test instrument.

Wilhelm Segerblom  
**The permeability of paper to water vapor.** Wilhelm Staedel. *Papier-Fabr.* 31, Tech.-wiss. Teil 535-40, 545-9(1933). Consideration of previous work (12 citations) led to the following method: A 200 sq. cm. sample is clamped over a shallow Al pan contg. a well-satd. felt; the wt. loss is detd. at intervals and the rate calcd. For consistent results: the felt must carry sufficient water; 0.5-3 hrs. must be allowed, depending on the sheet wt., for the rate to reach a const. value; an air velocity of 3 = 0.25 m./sec., humidity const. to 2% and temp. const. to 0.1° must be maintained over the sample. Rag, straw, chem. and mech. pulp sheets at beating degrees from 20 to 90 Schopper and wts. from 30 to 250 g./sq. m. give water permeability values of 30-70 g./sq. m./hr. at 20° and with an external relative humidity of 65%. Calendering and rosin sizing do not affect the value. Com. papers, including parchment and greaseproof papers, and Cellophane give values of 35-60, waxed paper 5 and moistureproof Cellophane 0.5. There is no relation between water permeability and air transmission. S. agrees with Abrams and Chilson (*C. A.* 24, 6011), that the vapor-pressure difference across the sheet is the driving force in vapor transmission, and further that vapor-phase diffusion is relatively unimportant, most of the transfer being through the fiber substance, at a rate specific for the nature of the fiber.

R. H. Doughty  
**Paper testing with the Schubert puncture-dynamometer.** Max Radligger. *Wochbl. Papierfabr.* 64, 685-7(1933).—The construction and operation of the app. (cf. *C. A.* 27, 5971) are briefly criticized. By making certain (not stated) changes in design and taking proper account of the deflection, the results obtained with either strip or round samples may be calcd. to tensile strength with reasonable accuracy. The sample must have negligible stiffness.

R. H. Doughty  
**Examination of the Elmendorf [tearing test] apparatus, its operation and the significance of the test.** W. Brecht

and O. Imset. *Papier-Fabr.* 31, Fest.-u. Auslandsheft 46-60(1933).—A method of calibration of the Poller-Elmendorf tester based on the operating characteristics and estn. of friction losses is described; results agree closely with those of the Clark method (cf. *C. A.* 26, 1777). When a no. of sheets are torn together: (1) the starting cut is not the same in all, because of poor design of the knife; (2) there is a marked tendency for the outer sheets to split, an abnormally high tearing force being required; (3) the friction between the torn edges increases the tearing resistance abnormally. The errors from these sources are separately evaluated, and shown to reach 15% or more. Also, the relation of tearing resistance to weight of sheet is not linear. To obtain reasonably concordant and useful results the instrument should be calibrated often and enough sheets torn to give a scale reading of at least 20 g.; wt. of sheets should be quite const.; and wt. and no. of sheets torn should be reported. Systematic errors of about 8% may then be expected. Not enough is known as yet about the mechanism of this complex test to permit its use as a measure of fiber shortening in process.

S. A. K.  
**Paper and printing ink.** Julius Beek. *Papier-Fabr.* 31, Tech.-wiss. Teil 485-9(1933).—Printing quality of paper must be evaluated with reference to the ink and process which is to be used; hence tests such as capillarity, air permeability and oil absorption furnish no sure measure of quality. The following tests est. the tendency to offset, hence permissible speed and weight of impression with the ink and paper used. (1) A sheet is printed with a standard ink and plate, the excess ink rapidly removed by blotting and the amt. taken up by the paper detd. by weighing. (2) A sheet is printed, the amt. of ink applied detd. by weighing the plate before and after impression. The printed sheet is covered with a smooth paper to which a detd. pressure is intermittently applied. The interval elapsing before this pressure fails to blur the printing is the desired measure of quality.

R. H. Doughty  
**The fluffing of newsprint.** Håkon Störvik. *Papir-J.* 21, 207-9(1933); cf. *C. A.* 27, 5972.—Projecting fibers are dyed by passing a strip of the paper under an inked roller, the dyed fibers are pressed down with a glass plate, and the sample thus prepd. is photographed.

West, Clarence J.: Bibliography of Paper Making and United States Patents on Paper Making and Related Subjects, 1932. New York: Tech. Assoc. Pulp and Paper Ind. 175 pp. \$2.00.

Cellulose. Francesco C. Palazzo and Fortunato Palazzo. *Brit.* 398,730, Sept. 21, 1933. Wood pulp with a high content of alkali-resisting cellulose is made by treating the material to be refined, e. g., sulfite cellulose, in an autoclave with a liquid contg. 1-1.5% NaOH and

0.2-0.3% colloidal emulsoid Na salt, stable to alkali, at 1-2 atm. 1-2 hrs. Na soaps of higher fatty acids may be used. The treatment removes hemicelluloses, fats and resins. Complete removal of residual lignin components is effected by a mild oxidizing treatment in 2 stages, first in a feebly alk. and then in a feebly acid medium. Thus the pulp, in concn. of 5-6%, may be treated with a hypochlorite soln. contg. a little  $\text{Na}_2\text{CO}_3$  or  $\text{Ca}(\text{OH})_2$ , or with a dil.  $\text{Na}_2\text{O}_2$  soln., and then with a soln. of  $\text{HClO}$  or with dil.  $\text{KMnO}_4$  contg. a little  $\text{H}_2\text{SO}_4$ . The pulp is then treated with dil.  $\text{H}_2\text{SO}_4$  soln., washed and made into boards, sheets or flakes. If desired, the bleached material may be heated with dil.  $\text{Na}_2\text{SO}_3$  and a little colloidal Na salt, washed, treated with  $\text{H}_2\text{SO}_4$  and again washed. The product may be used in the manuf. of cellulose esters and ethers and of artificial fibers and films.

**Cellulose.** Henry Dreyfus. Brit. 398,801, Sept. 18, 1933. Cellulose particularly suitable for esterification is obtained from wood, straw, grass or other lignified cellulose material by sepg. the non-cellulosic constituents therefrom by a liquid comprising a glycol, *e. g.*, ethylene glycol, propylene glycol, trimethylene glycol. An aq. soln. of the glycol, contg. 30-80%  $\text{H}_2\text{O}$ , may be used at, *e. g.*, 120-80°. Increased pressure, if required, may be obtained by use of an autoclave and introduction of an inert gas, *e. g.*,  $\text{CO}_2$ , N, under pressure or a low-boiling liquid, *e. g.*,  $\text{MeOH}$ ,  $\text{EtOH}$ ,  $\text{C}_6\text{H}_6$ , petr. ether. The material may be subjected to a prior or simultaneous treatment, *e. g.*, with dil. alkali or the usual liquors, to remove resins, lignins, etc. In an example mech. spruce pulp is subjected in a closed digester to reduced pressure and an aq. soln. of ethylene glycol is run in. The treatment is carried out 6 hrs at 160°, after which the cellulose is removed and washed. Cf. C. A. 28, 634<sup>9</sup>.

**Continuous apparatus for extracting cellulose from wood, etc.** Lubomir Lemberger. Ger. 589,241, Dec. 6, 1933 (Cl. 55b. 2.10).

**Apparatus for extracting cellulose by the sulfurous acid process.** Aktiebolaget A. Ekströms Maskinaffär. Ger. 585,062, Sept. 28, 1933.

**Making cellulose bands.** Vereinigte Glanzstoff-Fabriken A.-G. Ger. 585,957, Oct. 13, 1933.

**Apparatus for circulating and storing cellulose solutions.** Soc. industrielle de Moy. Ger. 588,275, Nov. 16, 1933 (Cl. 29a. 6.06). See Fr. 692,647 (C. A. 25, 1671).

**Cellulose derivatives.** Henry Dreyfus. Brit. 394,722, July 6, 1933. See Fr. 747,727 (C. A. 27, 5535).

**Colored cellulose derivatives.** Ralph Dinklage. Brit. 398,279, Sept. 14, 1933. Products that are colored throughout are obtained by condensing cellulose or an alkali cellulose with a reactive aromatic compd. and then producing from the condensation product a colored deriv. by introducing into the aromatic radical a chromophoric group and an auxochrome. The colored cellulose compd. may be admixed in soln. with viscose, *e. g.*, for the production of colored threads. Among examples (1) cotton wool dissolved in  $\text{H}_2\text{SO}_4$  is added to  $\text{PhNO}_2$  and the product poured onto ice and dissolved or dispersed in a suitable medium; after reduction by  $\text{NaHSO}_3$  or nascent H the amino deriv. is diazotized and coupled with a naphthol; and (2) alkali cellulose is treated with 1,2-diketo-1-*p*-nitrophenyl-3-chloropropane and the product condensed with dibenzyl ketone in presence of a little sodamide to give a compd. contg. a cyclopentanone group. The nitro compd. is then reduced, diazotized and coupled with Naphthol AS. Cf. C. A. 27, 1166.

**Hot-pressed cellulosic products.** Adriaan Nagelvoort (to Delaware Chemical Engineering Co.). U. S. 1,939,404, Dec. 12. Products such as those of pulp board are formed with an addn. of S in water-repellent form and of a fineness of about 200 mesh, substantially free from peptizing agents for S, the S serving to give improved strength.

**Cellulose esters.** Carl J. Malm and Charles L. Fletcher (to Kodak Ltd.). Brit. 398,626, Sept. 21, 1933. The soly. characteristics of  $\text{Me}_2\text{CO}$ -sol. mixed org. esters of cellulose, *e. g.*, acetate propionate, acetate propionate butyrate, acetate butyrate, acetate stearate, acetate laurate, are changed by treating with a hydrolyzing agent,

*e. g.*, a dil. mineral acid. Among examples a reaction mixt., comprising fully esterified cellulose acetate propionate, propionic acid,  $\text{AcOH}$  and  $\text{H}_2\text{SO}_4$ , is dild. with aq.  $\text{AcOH}$  and heated to 100°F. The products may be used in producing filaments, films, plastics, lacquers, etc.

**Cellulose esters.** I. G. Farbenind. A.-G. (Frich Correns and Rudolf Hofmann, inventors). Ger. 581,954, Aug. 5, 1933. Addn. to 526,479 (C. A. 25, 4401) and 528,821 (C. A. 25, 5030). Mixed cellulose esters are prepd. by treating cellulose with a fatty acid and the anhydride of another fatty acid in the presence of a catalyst, *e. g.*,  $\text{H}_2\text{SO}_4$ , and a chlorinated hydrocarbon having a solvent action, *e. g.*,  $\text{CH}_2\text{Cl}_2$  or  $\text{C}_2\text{H}_4\text{Cl}_2$ . Examples are given.

**Cellulose esters.** C. F. Boehringer & Soehne G. m. b. H. (Richard Müller, Martin Schenck, Wilhelm Wirlatz and Fritz Müller, inventors). Ger. 588,214, Nov. 14, 1933 (Cl. 12a. 6). Haloalkyl sulfonic acids, *e. g.*,  $\text{Cl}_2\text{-CSO}_3\text{H}$ ,  $\text{ClCH}(\text{SO}_3\text{H})_2$  and  $\text{BrCH}(\text{SO}_3\text{H})_2$ , are used as catalysts in the esterification of cellulose.

**Cellulose esters.** Kodak-Pathé. Fr. 754,866, Nov. 16, 1933. Cellulose esters or derivs. thereof contg. a dicarboxylic acid radical are obtained by\* esterifying a cellulose material with a dicarboxylic anhydride, such as phthalic, succinic, dilactic or diglycolic, in the presence of a base such as pyridine or quinoline. The alkali salts of these compds., *e. g.*, of acetoglycolate and acetodilactate, are sol. in water and are therefore of great application in adhesive compns., sizing and vehicles for dyes and pigments.

**Cellulose esters.** Soc. des usines chimiques Rhône-Poulenc. Fr. 754,961, Nov. 17, 1933. Cellulose esters are made by causing a cellulose material, as such or partly etherified or esterified, to react with one or more acylating agents, in the presence of a practically anhyd. hydracid, *e. g.*, HF, in amt. at least equal to and preferably 3 to 6 times the wt. of cellulose. An inert solvent may also be present. Cf. C. A. 27, 189.

**Mixed cellulose ester.** Herbert Kranich. U. S. 1,940,218, Dec. 19. A hydrated sulfonitrocellulose acetate contg.  $\text{H}_2\text{SO}_4$  about 2-3,  $\text{HOAc}$  6-14 and N 7-10%, which is suitable for films, etc., is prepd. by treating cellulose with a specified mixt. contg.  $\text{H}_2\text{SO}_4$ ,  $\text{HNO}_3$  and  $\text{HOAc}$ .

**Cellulose esters of lauric acid.** Max Hagedorn and Georg Hingst (to I. G. Farbenind. A.-G.). U. S. 1,940,589, Dec. 19. Esters sol. in aromatic hydrocarbons and in chlorinated aromatic hydrocarbons are formed by acting on unaltered cellulose, at a temp. below 110° (suitably about 80-100°), with lauryl chloride in the presence of an org. base such as pyridine in an amt. not substantially greater than that equiv. to the lauryl chloride, and of a diluent such as  $\text{PhCl}$  and then heating the ester thus formed to a temp. above 110° (suitably 135-40°). A cellulose distearate is formed in a generally similar manner. Cf. C. A. 28, 636<sup>2</sup>.

**Alkoxyalkacyl esters of cellulose.** Henry Dreyfus. U. S. 1,940,709, Dec. 26. Products such as cellulose ethoxy- or methoxy-acetates are formed by treating cellulose with reagents such as alkoxyacetic anhydrides in the presence of an acylation catalyst and of a liquid solvent for the cellulose deriv. Products suitable for films, etc. are obtained and several examples and numerous details and modifications of procedure are described. U. S. 1,940,710 relates to the production of mixed cellulose esters such as cellulose acetate-methoxy or ethoxy-acetates by treating cellulose separately both with aliphatic acid anhydrides and with alkoxy acid anhydrides, both in the presence of acylation catalysts. Various examples with details and modifications of procedure are given.

**Making cellulose ester capsules.** Chemische Fabrik von Heyden A.-G. (Friedrich Klein, inventor). Ger. 582,796, Oct. 12, 1933 (Cl. 39b. 12.03).

**Solvents for cellulose esters.** Carbide and Carbon Chemicals Corp. Ger. 585,530, Oct. 10, 1933. Dialkyl ethers of  $\text{C}_2\text{H}_4(\text{OH})_2$ , especially the dimethyl ether, are used as solvents for acetylcellulose, etc.

**Cellulose acetate.** Cyril J. Staud and Charles S.

Webber (to Eastman Kodak Co.). U. S. 1,939,235, Dec. 12. Esterification of cellulose fibers is facilitated by pretreatment with a bath contg. a substantial proportion of  $\text{N}_2\text{O}_4$ .

**Cellulose acetates.** British Celanese Ltd. Brit. 398,192, Sept. 4, 1933. Cellulose acetates obtained with the aid of  $\text{H}_2\text{SO}_4$ ,  $\text{H}_3\text{PO}_4$  or other oxy acids or derivs. of such acids are ripened until the Ac content is reduced to only 56.80% (calcd. as  $\text{AcOH}$ ) so that although  $\text{Me}_2\text{CO}$  soly. is reached the process does not proceed to normal  $\text{Me}_2\text{CO}$  soly. Ripening is carried out under conditions such that any acid present is an oxy acid. The resultant cellulose acetates yield non-delustering products, e. g., rayon.

**Cellulose acetate compositions.** Russell L. Jenkins (to Swann Research, Inc.). U. S. 1,941,262, Dec. 26. A chlorinated biphenyl is used as a waterproofer and flame retarder with cellulose acetate compns. suitable for photographic films, etc., and which also may contain various solvents and plasticizers, etc.

**Translucent cellulose nitrate products.** Charles S. Webber and Cyril J. Staud (to Eastman Kodak Co.). U. S. 1,939,244, Dec. 12. Products such as cellulose acetate or nitrate sheets are rendered translucent by treatment with a bath formed of equal proportions of  $\text{MeOH}$  and acetone or the like and then with an  $\text{EtOH}$  or  $\text{C}_2\text{H}_5$  bath.

**Making hollow cellulose bodies.** Wolff & Co., Emil Czapek and Erwin Bauer. Ger. 566,770, Oct. 17, 1933 (Cl. 39b. 12.03).

**Dipping-formers for the manufacture of hollow articles of cellulose.** Ernst Bleibler. Brit. 398,092, Sept. 7, 1933.

**Apparatus for making patterned bands of regenerated cellulose.** Kalle & Co. A.-G. (Maximilian Paul Schmidt and Julius Voss, inventors). Ger. 585,903, Oct. 12, 1933.

**Apparatus for drying seamless tubes of regenerated cellulose.** Kalle & Co. A.-G. (Julius Voss, inventor). Ger. 588,102, Nov. 14, 1933 (Cl. 39a. 19.03). Addn. to 334,241 (C. A. 26, 843).

**Plasticizers for use with nitrocellulose, etc.** Wm. C. Arsen. U. S. 1,938,791, Dec. 12. Esterification compds. are formed from poly- and mono-hydric alcs. such as glycerol, ethylene glycol, ethyl, butyl and benzyl alcs. with "polybasic" acids such as phthalic acid, tartaric acid or citric acid, these products being suitable for use in lacquers or other compns. such as those contg. synthetic resins. In general, these products are viscous liquids. Several examples with details of procedure are given.

**Manufacture of seamless celluloid articles from bars of celluloid.** Lucifer J. Most. U. S. 1,940,223, Dec. 19. In making articles such as fountain pen barrels and caps, a recessed celluloid bar is softened, placed in a form larger than the bar, and a compressed fluid such as compressed air is introduced into the recess of the bar to expand it and fill the form. App. is described.

**Metallizing celluloid surfaces, etc.** Karl Kiefer. U. S. 1,941,438, Dec. 26. The surface of celluloid or the like is treated with a soln. of a Sn salt contg. alc., and the treated surface is then metallized (suitably by use of  $\text{AgNO}_3$ ).

**Compound sheet material.** Ernest Hibbert. Australia 9851/32, Sept. 21, 1933. Alternate layers of paper and rubber latex are vulcanized together to produce a material suitable for wall papers, floor coverings, elec. insulators, cement bags, etc.

**Phytosterol, fatty acids and resin acids from raw tall-oil soap.** Håkan Sandqvist and Torsten O. H. Lindström. U. S. 1,940,372, Dec. 19. Raw tall-oil soap obtained in the manuf. of cellulose by the sulfate method is dried under a pressure of less than 30 mm. Hg, the concd. material is extd. with a solvent such as ether in which phytosterol and non-saponifiable substances are sol., impurities are removed from the ext. by shaking with an alk. material such as  $\text{NaOH}$  soln., and the solvent is distd. off and the residue is crystd. to obtain pure phytosterol. Fatty and resin acids are also recovered.

**Ripening viscose sirup.** George A. Richter (to Brown Co.). U. S. 1,938,722, Dec. 12. A film of unripened viscose sirup is progressively deposited on a heated surface

such as that of a rotating steam-heated drum under atm. pressure, and the heated film is removed from the heated surface in a ripened but unjelled condition. App. is described.

**Rayon from viscose.** Vereinigte Glanzstoff-Fabriken A.-G. (Hugo Elling, inventor). Ger. 589,467, Dec. 9, 1933 (Cl. 29a. 6.08). In the manuf. of rayon from viscose by the reel- or pot-spinning process, the filaments are subjected to tension, and if desired to friction, between the spinning nozzle and the collecting device, but the intermediate drying before the usual after-treatment is effected without tension. Rayon of uniformly high wet strength is obtained.

**Rayon.** Algemeene Kunstzijde Unie N. V. Fr. 755,140, Nov. 20, 1933. A method of winding on bobbins to avoid "mirror" effects is described.

**Rayon.** Soc. pour l'ind. chim. à Bâle. Fr. 755,267, Nov. 22, 1933. Threads made from regenerated cellulose are esterified in the form of spinning cakes while the structure of the threads is maintained.

**Rayon.** Soc. pour la fabrication de la soie artificielle Rhodiaseta. Fr. 755,309, Nov. 23, 1933. Rayon having a normal luster, but easily dulled, is made from a spinning soln. obtained by dissolving several cellulose acetates having different characteristics, e. g., contg. different amts. of  $\text{AcOH}$ .

**Rayon, etc.** Adrianus J. L. Moritz (to American Enka Corp.). U. S. 1,940,602, Dec. 19. Colored filaments, films, etc., of a silk-like luster are obtained from solns. such as those of viscose by incorporating into the soln. when it is made 0.05-0.4% of a pigment (calcd. on the wt. of the cellulose content) and then, prior to spinning, adding less than 1.5% of pine oil (calcd. on the soln.).

**Rayon, etc.** Henry Dreyfus. Fr. 754,683, Nov. 10, 1933. Filaments, etc., made from cellulose acetate or other derivs. are submitted to a sapon. while in movement but without being submitted to any or only to a very low tension. The filaments are afterward washed and dried, also without tension. Before sapon. they are submitted to a drawing. Fr. 754,684. Threads, ribbons, textiles, etc., contg. cellulose derivs. are treated with a sapon. agent in the presence of an oil, e. g., Turkey-red oil, olive oil or a light mineral oil in the form of an emulsion.

**Rayon, etc.** Henry Dreyfus. Fr. 754,685, Nov. 10, 1933. In treating products contg. cellulose derivs. with softening agents for the purpose of drawing them, an oily or fatty substance or a soap and (or) a wetting agent is added to the softening agent. Thus, an aq. soln. of dioxane contg. 1-2% of the Na salt of the sulfuric ester of lauryl alc. may be used. Cf. C. A. 28, 896<sup>4</sup>.

**Producing, delustering and other treatments of rayon, films, etc.** Henry Dreyfus. Brit. 398,258, Sept. 14, 1933. Artificial filaments, threads, yarns, films, fabrics, etc., are delustered, weighted, mordanted, etc., by incorporating therein an inorg. compd. in finely divided form and treating the formed products with a reagent to convert said compd. into its final form. Thus yarn contg. finely divided Zn or Sn hydroxide is treated with a soln. of  $\text{H}_2\text{PO}_4$  or a phosphate. The inorg. compd. is preferably incorporated in the spinning soln. Among examples (1) an  $\text{Me}_2\text{CO}$  soln. of cellulose acetate contg. finely divided  $\text{Na}_2\text{SO}_4$  is spun into an aq. soln. of  $\text{Ba}(\text{CNS})_2$  and  $\text{NH}_4\text{CNS}$ , and (2) cellulose acetate yarn is soaked in a dispersion of  $\text{NaH}_2\text{PO}_4$  in alc., lifted and immersed, without boiling, in a Na zincate soln.

**Apparatus for manufacture of rayon filaments by the stretch-spinning process.** August Hartmann and Gotthard Bauredel (to American Bemberg Corp.). U. S. 1,939,800, Dec. 12. Various structural mech. and operative details are described.

**Device for spinning rayon by the aid of two different precipitating liquids.** Edwin Schurz and Kurt Melkus. Ger. 580,824, Oct. 26, 1933 (Cl. 29a. 6.02). Addn. to 572,705 (C. A. 27, 4398).

**Spinning centrifuge for rayon.** Waldemar zu Löwen (to American Bemberg Corp.). U. S. 1,940,339, Dec. 19. Structural and mech. features.

**Spinning machine for rayon.** Soc. anon. textiles artificiels de Reims. Ger. 585,759, Oct. 13, 1933.

**Spinning nozzles for rayon.** Comptoir général des métaux précieux. Fr. 755,342, Nov. 23, 1933. Construction.

**Artificial threads.** "Sidac," Société industrielle de la cellulose, Soc. anon. Brit. 398,427, Sept. 14, 1933. Bands of cellulose, film, *e. g.*, waste strips produced in the manuf. of cellulose films, preferably from regenerated viscose, are loosely compressed or crushed in the direction of their width. The resulting strands may be loosely twisted or doubled with other yarns and they may be fireproofed, *e. g.*, by treatment with a borax soln.

**Dry-spinning apparatus for producing artificial filaments, ribbons, etc.** British Celanese Ltd. and Edward Kinsella. Brit. 398,478, Sept. 12, 1933.

**Artificial filaments, films, etc.** Henry Dreyfus. Brit. 398,166, Aug. 28, 1933. Artificial films, etc., of org. derivs. of cellulose, of modified properties, *e. g.*, luster, wt., heat resistance, etc., are obtained by incorporating therein an org. B compd., *e. g.*, Me, Et or glycerol borate. The B compd. may be decompd. in the spinning soln. or in the materials to form other B compds., *e. g.*, Et borate, dissolved in alc., may be added to an aq. Me<sub>2</sub>CO cellulose acetate soln., H<sub>2</sub>BO<sub>3</sub> being formed in the spinning soln.

**Artificial filaments from materials such as cellulose acetate.** Camille Dreyfus and Wm. Whitehead (to Celanese Corp. of America). U. S. 1,938,623, Dec. 12, 1933. Filaments of low luster are obtained by extruding a soln. contg. an org. cellulose deriv. such as cellulose acetate and a water-sol. salt of a higher aliphatic acid such as triethanolamine trioleate or K ricinoleate which is sol. in the org. solvent (*e. g.*, acetone) of the cellulose deriv. used, the extrusion being effected through orifices into a setting fluid such as an evaporative atm. which does not alter the soly. of the salt, so that on solidification of the filaments at least some of the water-sol. salt is retained in them.

**Artificial filaments from materials such as cellulose acetate.** Wm. I. Taylor (to Celanese Corp. of America). U. S. 1,938,646, Dec. 12, 1933. A soln. of an org. cellulose deriv. such as cellulose acetate contg. a wetting agent such as Turkey-red oil and a solvent such as acetone is extruded into a setting medium (such as a current of air) which does not remove the wetting agent. The product may be delustered by use of steam, water or alc.

**Filaments of low denier from cellulose acetate.** Henry Dreyfus. U. S. 1,941,204, Dec. 26, 1933. Solns. of cellulose acetate in acetone contg. sufficient water (suitably 10% or more) to yield solns. of substantially lower viscosity than that of solns. of the same concn. in acetone contg. 5% of water are spun and drawn down. The soln. may also contain EtOH.

**Ascertaining and recording the thickness or denier of artificial filaments.** Julius Brenzinger (to Max Arms Chemical Engineering Corp.). U. S. 1,940,072, Dec. 19, 1933. A record is made, with respect to elapsed time, of variations in the relative speeds of the pump that delivers the synthetic material and the spool that winds the thread. App. is described.

**Textile materials.** Henry Dreyfus. Brit. 398,820, Sept. 11, 1933. In the manuf. of spun yarn from org. cellulose derivs. the material is provided, before the opening, carding, drawing and carding operations, to minimize electrification difficulties, with an outer coating contg. a hygroscopic substance, which is cellulose or cellulose deriv. material, (a deriv. of) a degraded cellulose or (a deriv. of) a polyvinyl alc. The coating may contain also other hygroscopic, non-colloidal materials, *e. g.*, glycerol, NH<sub>4</sub> citrate, chlorides and nitrates of Mg, Ca, Zn, Fe, acetamide, methylamine-HCl, etc., and roughening media, *e. g.*, SiO<sub>2</sub>, BaSO<sub>4</sub>, kieselsol, etc., to assist spinning. A cellulose coating may be regenerated from a coating of viscose, NH<sub>4</sub> viscose, nitrocellulose or an ammoniacal Cu or metallic salt soln. of cellulose or may result from the surface sapon. of the filament or fiber. A cellulose deriv. coating may be of esters, *e. g.*, acetate, propionate or ethers, *e. g.*, Me, Et or benzyl ethers, of a cellulose so degraded, previous to, during or subsequent to the intro-

duction of the substituents that the product is hydrophilic, or of a deriv. contg. substituents of a hydrophilic character, *e. g.*, OH, COOH or carboxylic salt groups, as, *e. g.*, esters of oxalic, maleic, glycolic, malic, lactic, tartaric or glyceric acid or hydroxy and carboxy alkyl ethers.

**Separating fibrous and non-fibrous constituents of vegetable materials such as cereal straws.** Adolf Hawerlander (to Albert D. Stewart). U. S. 1,941,350, Dec. 26, 1933. The material is agitated with steam in a solvent such as aq. liquor contg. Ca(OH)<sub>2</sub> to loosen and dissolve non-fibrous material, the soln. formed is sepd. by mech. pressure from fibrous material, and the soln. is then evapd. to recover a non-fibrous residue.

**Reducing the solution viscosity of cellulose fiber.** George A. Richter (to Brown Co.). U. S. 1,941,154, Dec. 26, 1933. Materials such as cotton and preliberated wood pulp are digested at temps. above 150° in a sulfurous acid soln. of a sulfite contg. no more free than combined SO<sub>2</sub>.

**Cellulose digester.** Aktiebolaget Nordiska Armaturfabrikerna. Ger. 584,600, Sept. 22, 1933.

**Sieve for cellulose digesters.** Aktiebolaget Nordiska Armaturfabrikerna. Ger. 586,701, Oct. 25, 1933 (Cl. 55b. 2.40).

**Sulfite cellulose digestion.** Gustaf Haglund (to Patent-aktiebolaget Gröndal-Ramen). U. S. 1,940,136, Dec. 19, 1933. Cellulose-contg. material such as wood chips is first cooked with a soln. of a sulfurous acid salt such as NaHSO<sub>3</sub> and then, after withdrawal (if necessary) of a suitable amt. of the original soln. from the cooking vessel, a soln. of SO<sub>2</sub> is added in waste liquor or wash water from a similar cooking operation, and the cooking is continued for a further period. There is thus obtained a high concn. of by-products in the waste liquor formed. Cf. C. A. 27, 5188.

**Chemical pulping of fibrous materials.** Carl E. Beaman and Alrik H. Lundberg (to Chemipulp Process, Inc.). U. S. 1,938,802, Dec. 12, 1933. Material such as wood chips is fed through a plurality of superposed digesting chambers in each of which the material is treated with a heated chem. liquor under a pressure independent of the pressures existing in the other chambers. Various features of app. are described.

**Apparatus for separating longer fibers from the white water of paper pulp.** Carl B. Thorne. Brit. 398,980, Sept. 28, 1933.

**Apparatus for producing white pulp from resinous wood.** Harald Jensen and Johan K. B. Raeder. Ger. 586,559, Oct. 23, 1933 (Cl. 55a. 1.40).

**Apparatus for bleaching cellulose pulp of high density.** Gebr. Bellmer. Ger. 585,146, Sept. 30, 1933.

**Agitating tank for cellulose pulp, etc.** Olaf Qviller (to A/S Thunes mek. Vaerksted). U. S. 1,939,225, Dec. 12, 1933. Various details of an app. with circulating pumps are described.

**Apparatus for mixing and blending paper pulp.** Randolph V. Bingham. U. S. 1,939,101, Dec. 12, 1933. Various details are described of an app. with a tank and a plurality of material-circulating pumps.

**Tool for taking samples of baled pulp or the like.** Arthur B. Andrews. U. S. 1,939,430, Dec. 12, 1933. Structural details.

**Hammer mills for paper pulp.** William T. Doyle (to Sturtevant Mill Co.). Brit. 398,747, Sept. 21, 1933.

**Centrifugal sieve for paper stuff.** Andreas Biffar. Ger. 588,116, Nov. 13, 1933 (Cl. 55d. 2.10).

**Apparatus for refining and screening fiber stock for paper manufacture.** John A. Wiener. U. S. 1,939,747, Dec. 19, 1933. Mech. features.

**Paper-making apparatus.** Wilhelm Poeschl, Rudolf Poeschl and Wilhelm Roth (to Rohrbacher Lederfabrik Josef Poeschl's Söhne A.-G.). U. S. 1,938,637, Dec. 12, 1933. Portions of suction chests which come into direct contact with strainers are formed with leather facings.

**Paper-making apparatus.** James K. Darby (to Wm. H. Millsbaugh). U. S. 1,939,337, Dec. 12, 1933. Structural and mech. features.

**Round-sieve machine for making paper, etc.** Akt.-Ges. der Maschinenfabrik von Theodor Bell & Cie. Ger. 585,637, Oct. 6, 1933.

- Paper-making machine (fourdrinier type).** Gumal Knopp. Ger. 585,147, Oct. 11, 1933.
- Paper machine with two suction rollers.** Wm. H. Millsbaugh. Ger. 585,729, Oct. 9, 1933.
- Long-sleeve paper machine.** Firma J. M. Voith. Ger. 585,508, Oct. 4, 1933.
- Hollander for paper making.** Anton D. J. Kuhn. Ger. 585,636, Oct. 6, 1933.
- Press rolls for paper manufacture.** Firma Arthur Schutz. Austrian 135,558, Nov. 25, 1933 (Cl. 55b.). Addn. to 132,595 (C. A. 27,8609).
- Method of joining the ends of wire cloth for paper-making machines.** T. J. Marshall & Co. Ltd. and Robert D. Debenham. Brit. 397,629, Aug. 31, 1933.
- Spray-treating web material on paper-making apparatus.** Edmund P. Arpin, Jr. U. S. 1,938,790, Dec. 12. Web material passing through the app. and while in heated condition is sprayed with a liquid treating material such as melted paraffin.
- Weight regulating of paper stock.** Ernest Poirier. U. S. 1,939,411, Dec. 12. Various details of app. and operation are described.
- Paper.** The Mead Corp. Ger. 588,003, Nov. 11, 1933 (Cl. 55c. 3.10). A suspension of any of the usual fillers is supplied to the wire side of a moist paper web during the manuf. of the paper. Pressure may be applied to force the suspension into the web. Paper having the same appearance on both sides is obtained. Various forms of app. are described.
- Waterproof paper.** Kodak-Pathé. Fr. 754,614, Nov. 10, 1933. A waterproof packing paper is obtained by impregnating paper with a dil. soln. of wax and afterward coating it with a soln. of nitrocellulose contg. a relatively high proportion of a plasticizing agent, with or without the addn. of a resin.
- Coated paper.** The Champion Coated Paper Co. Ger. 585,063, Sept. 28, 1933. See Brit. 333,226 (C. A. 25, 343).
- Waxed wrapping paper.** Carroll B. Wilkins (to Nashua Gummed & Coated Paper Co.). U. S. 1,938,949, Dec. 12. A product of substantial opacity and high gloss comprises a body of paper stock assoc. with material of substantially different refractive properties such as "titanox" and treated with colorless wax.
- Heat and adhesive treatment, etc., applied to wax-coated paper as in paper-bag manufacture.** Stuart Moore (to Dixie Wax Paper Co.). U. S. 1,940,559-60-1, Dec. 19. Various details of app. and operation are described.
- Safety paper.** Frank S. Wood (to Inkset Safety Paper Co.). U. S. 1,939,378, Dec. 12. Safety paper is made in one continuous operation comprising at least approx. dehydration and subsequent application and absorption of about 8% water, decolorized iodine, tannic acid and HOAc or equiv. substances, no further drying being required.
- Translucent paper.** Fred O. Reiss (to Aladdin Industries Ltd.). Brit. 397,550, Aug. 28, 1933. Paper with a high  $\alpha$ -cellulose content is impregnated with a glyptal-type artificial resin to form a translucent, heat-resistant paper, e. g., for shades of incandescent mantle lamps. The paper is made from spruce chips digested with  $H_2SO_4$ , blown and washed, sufficient  $\beta$ - and  $\gamma$ -cellulose, e. g., 5%, being left to act as binding medium and no size being used.
- Transparent paper coated with adhesive.** Wm. W. McLaurin. U. S. 1,940,363, Dec. 19. A coating of normally dry and non-tacky character but adapted to adhere to glass and to take various printing inks without causing the inks to run comprises a high proportion of dextrin and a small proportion of a gelatin glue.
- Cigaret paper.** Soc. anon. des anciens établissements Braunstein Frères. Ger. 588,327, Nov. 15, 1933 (Cl. 55f. 16). See Brit. 380,724 (C. A. 27, 5541).
- Apparatus for forming wallboard and like fiber webs from viscous stock.** Henry W. Piquet (to MacAndrews and Forbes Co.). U. S. 1,939,518, Dec. 12. Mech. and operative details.
- Pulpboard.** Hubert L. Becher (to Agasote Millboard Co.). U. S. 1,939,616, Dec. 12. Pulpboard is formed of a compressed mixt. of fiber together with paraffin about 1-4% and montan wax about 0.25-1.0%, a substantial proportion of the latter being in the form of a metallic salt in uniform distribution with the paraffin in a condition such as can be obtained by pptn. from an emulsion including paraffin and saponified montan wax.
- Fiberboard.** Robert G. Quinn (to International Paper Co.). U. S. 1,939,082, Dec. 12. In the manuf. of fiberboard, a fiber pulp stock impregnated with fireproofing salts and having a  $pH$  of about 5.2 is mixed with a colloidal suspension of bituminous material having the property of being pptd. by material of this  $pH$ .

## 24—EXPLOSIVES AND EXPLOSIONS

CHARLES R. MUNROE AND C. G. STORM

- The flammability of the mixture  $2H_2 + O_2$  at low pressure.** Pierre Tauzin. *Compt. rend.* 197, 1046 (1933).—The pressure limits between which the mixt. will burn are detd. as a function of temp. between 420° and 560°.
- J. B. Austin
- Calcn. of mixts. of acids [prepn. of nitration mixts.] (Beskov) 18.
- Explosive.** Norman G. Johnson (to E. I. du Pont de Nemours & Co.). U. S. 1,940,255, Dec. 19. A solid metallic nitrate such as  $NaNO_3$  is used in the form of spherical pellets in making explosives such as a non-gelatinous dynamite compn. contg. also nitroglycerin,  $NH_4NO_3$ , sawdust and  $CaCO_3$ . Cf. C. A. 28, 646°.
- Explosives.** Dynamit-A.-G. vorm. Alfred Nobel & Co. (Ph. Naef and K. F. Meyer, inventors). Ger. 583,179, Nov. 13, 1933 (Cl. 78c. 17). In the manuf. of explosives comprising  $NH_4NO_3$  and nitroglycerin or nitroglycol, a liquid or semiliquid hydrocarbon or a mineral or fatty oil is added in an amt. at least 15% of that of the nitroglycerin or nitroglycol. The proportion of the latter in the compns. can then be raised to over 10%, without increasing the sensitiveness of the compns. to handling, friction or shock. The nitroglycerin or nitroglycol may be given a sirupy consistency by addn. of a little nitrocellulose.
- Explosives.** I. G. Farlenund. A.-G. Fr. 755,050, Nov. 18, 1933. Mixed crystals of  $NaNO_3$  and  $NaClO_3$ , either as such or mixed with an excess of these salts are used for the manuf. of explosives.
- Fuses for explosives.** Schaffler & Co. Austrian 135,704, Dec. 11, 1933 (Cl. 78b.). Elec. time fuses charged with a mixt. of powd. Fe and an oxidizing agent, e. g.,  $KMnO_4$ , contain as a retarding agent a powd. inert material of good adherent properties, e. g., chalk. Preferably, the inert material is mixed with the powd. Fe, and the oxidizing agent then added.
- Separating nitroglycerin and residual acid.** Arnold Schmid. U. S. 1,939,634, Dec. 12. Various details of app. and operation are described involving the use of an inclined sepg. vessel with a temp. control jacket, etc. Cf. C. A. 27, 4403.
- p-Phenylenediamine dipicrate.** Jean Piccard (to Hercules Powder Co.). U. S. 1,939,365, Dec. 12. This compd., which is suitable for use in delay elec. blasting caps for igniting time fuses, is formed by reaction of p-phenylenediamine with picric acid in alc. or other solvent.
- Hydraulic press for gunpowder, celluloid and like inflammable materials.** Fried. Krupp Grusonwerk A.-G. Ger. 588,010, Nov. 11, 1933 (Cl. 78c. 2).
- Discharge cap for blasting cartridges.** Frank H. Armstrong (to Safety Mining Co.). U. S. 1,941,196, Dec. 26. Structural details.
- Flashlight cartridges.** Schaffler & Co. Austrian 135,-

707, Dec. 11, 1933 (Cl. 78b.). An elec. actuated igniting device for flashlight cartridges comprises a pill, prep'd. from powd. Zr and an oxidizing agent, in which leads for the current are inserted.

**Ignitable compositions for making matches, candles, torches, etc.** Emil Sokal, Hans Bausch and Johann Bayer. Austrian 135,500, Nov. 25, 1933 (Cl. 78b.). A mixt. of powd. Mg or Al with an alk. earth oxalate is

assocd., with the aid of a binder, with a cheap combustible material such as paper or wood. The compns. so obtained are insensitive to friction or shock. A flame is necessary to ignite them, but once ignited they are not extinguished by wind. Various methods of prepg. and using the compns. are indicated. Thus, ordinary matches may be coated with a mixt. of powd. Mg and  $\text{SrC}_2\text{O}_4$ , or a candle wick may be similarly impregnated.

## 25—DYES AND TEXTILE CHEMISTRY

L. A. OLNEY

**The dyestuffs industry in 1933.** R. Brightman. *Ind. Chemist* 10, 18-21 (1934).

**The action of alkaline copper-solution on silk fibroin.** V. Application of the conductometric titration to the system of fibroin-copper-amine. 1 and 2. Yujiro Takamatsu. *J. Soc. Chem. Ind., Japan* 36, Suppl. binding 662-8 (1933); cf. C. A. 28, 9014.

Conductometric titration curves were established for solns. of ethylenediamine (I), and  $\text{Cu}(\text{OH})_2 + \text{I}$ . The curve for I has 2 breaks, the first at the point of complete neutralization to the mono-acidic-base and the second where all is neutral salt. If  $\text{Cu}(\text{OH})_2:\text{I} = 1:2$ , the curve shows 2 breaks, the first at the end of a descending branch at the point of complete neutralization of the base ( $\text{CuI}_2(\text{OH})_2$ ), and the second in a rising curve at the point of complete decompn. of the complex salt into simple salts. If  $\text{Cu}(\text{OH})_2:\text{I} = 1: > 2$ , an addnl. break enters the curve, for the point of complete neutralization of the excess I. Similar curves were detd. for the system fibroin Cu I for exact and excess quantities of I. VI. **The mechanism of the solution of fibroin in copper-amine solution.** *Ibid.* 668-72. The soln. of fibroin can be expressed by the equation  $x = kt^n$ , where  $x$  is the dissolved amt. of fibroin at the time  $t$  and  $k$  and  $n$  are consts. which were detd. from exptl. data. The equation was found to give values which agreed well with actual data.

Karl Kammermeyer

**Chemical examination of furs in relation to dermatitis.** IV. **The chemical reactions of dyeing with *p*-phenylenediamine and *p*-aminophenol.** H. E. Cox. *Analyst* 59, 3-11 (1934); cf. C. A. 28, 9021. A quantitative study of the oxidation of the diamine with  $\text{H}_2\text{O}_2$  in the presence of fur, shows that the principal pigment formed is an azine combined with proteins from the fur. Bandrowski's base was found on the surface of the fibers and in the dye-bath there remained considerable of the unoxidized dye-stuff together with B.'s base and traces of quinone and  $\text{NH}_3$ . Similar study with the aminophenol showed the presence of an oxazine on the fur. The azine from the diamine forms a leuco compd., with the addn. of only 0.18%  $\text{H}_2\text{O}_2$ , by the action of  $\text{TiCl}_3$ ; the leuco compd. can also be formed by direct oxidation of B.'s base in soln. and contains at least 9 benzene rings. A preliminary account is given of the reaction of B.'s base with dil.  $\text{HCl}$  whereby free *p*-phenylenediamine is formed. This base is not, as has been assumed, the desired product in fur-dyeing. The properties of other intermediate oxidation products were studied in connection with possible irritation to the skin and the final conclusion was drawn that it is *p*-phenylenediamine itself, and not any intermediate oxidation product, that is the active irritant in dermatitis caused by wearing fur. W. T. H.

**Catechu [use in dyeing]** (Heim de Balsac, et al.) 29. Reaction capacity of the methyl group. 1. Synthesis of 6,8'-dibenzoylindigo (Chardonnens) 10. Pyrrole blacks obtained by reduction (Ilari) 10. Utilization of *Caesalpinia spinosa* [in textile finishing] (Castiglioni) 18. Detergents, etc. [cleansing baths for wool] (Brit. pat. 398,818) 18. Ketones [products used for dye manuf.] (Ger. pat. 575,857) 10. App. for coating or impregnating cloth or cotton batting with rubber compus. (U. S. pat. 1,939,842) 30. 5 **Technologie der Textilfasern.** Edited by R. O. Herzog. Bd. IV, Tl. 4: Die Weltwirtschaft der Baumwolle. Edited by Paul Koenig and Arnold Zelle. Berlin: J. Springer. 180 pp. M. 20.50. Cf. C. A. 27, 5547.

**Dyes.** I. G. Farbenind. A.-G. (Georg Kränzlein, Martin Corell and Heinrich Vollmann, inventors). Ger. 583,716, Sept. 8, 1933. Addn. to 577,963 (C. A. 28, 648<sup>9</sup>). The method of 577,963 for obtaining substitution products of monoamino-3,4,8,9- and 4,5,8,9-dibenzopyrenequinone is extended to polyamino derivs., the amino groups being replaced or substituted. Thus, a suspension of diamino-3,4,8,9-dibenzopyrenequinone in  $\text{PhNO}_2$  is treated with  $\text{BzCl}$  to give a fast yellowish red dye. Other examples are given. Cf. C. A. 27, 1193.

**Dyes.** I. G. Farbenind. A.-G. (Fritz Baumaun and Berthold Stein, inventors). Ger. 585,528, Oct. 4, 1933. The dyes 1,4-diamino-2-aryloxyanthraquinone-3-sulfonic acids are prep'd. by treating 1,4-diamino-2-aryloxy-3-haloanthraquinones with neutral sulfites in the presence of water, and, optionally, org. solvents. The reaction takes place under raised temp. and pressure. Examples are given.

**Dyes.** I. G. Farbenind. A.-G. (Walther Benade, inventor). Ger. 585,897, Oct. 12, 1933. Addn. to 582,688 (C. A. 28, 905<sup>9</sup>). The method of 582,688 for forming *o*-hydroxyazo dyes is modified by coupling diazotized 2-amino-1-hydroxybenzenesulfonic acid with 5,6- or 6,7-benzo-2,4-dihydroxyquinoline. Examples are given.

**Dyes.** Soc. pour l'ind. chim. à Bâle. Fr. 751,061, Aug. 26, 1933. Chromatable azo dyes are treated in neutral or acid medium with chroming agents, the chroming being completed without pptn. of the chromed intermediate products in alk. medium. As azo dyes those from 1-diazo-2-naphthol-4-sulfonic acids and naphthols may be used.

**Dyes.** Soc. pour l'ind. chim. à Bâle. Fr. 751,127, Aug. 28, 1933. Dyes for viscose silk are made by coupling 1 mol. of a tetrazotized 4,4'-diaminobiphenyl compd. with 1 mol. of 1-hydroxynaphthalene-4,8-disulfonic acid (I) and 1 mol. of any other coupling component. Thus, the dye obtained from 4,4'-diamino-3,3'-dimethoxybiphenyl, I and 1,3-dihydroxybenzene gives a reddish blue on viscose silk. Other examples are given.

**Dyes.** Soc. pour l'ind. chim. à Bâle. Fr. 751,222, Aug. 29, 1933. Fastness to friction of dyes obtained by impregnating wool in alk. bath with arylides of org. carboxylic acids and developing with diazo compds., is increased by treating the wool with liquids contg. buffer substances capable of lowering the alk. of the prep'd. wool, after impregnation with the arylides. Suitable buffers include  $\text{NaHCO}_3$ ,  $\text{MgSO}_4$ , acid phosphates and weak acids.

**Dyes.** I. G. Farbenind. A.-G. Fr. 754,387, Nov. 6, 1933. 3-Aminophenols (having the 4-position unoccupied) are coupled in alk. soln. with diazo compds. contg. at least one solubilizing group,  $\text{SO}_3\text{H}$  or  $\text{COOH}$ , and not contg. any group capable of giving rise to the formation of a metal complex. The products are treated with oxidizing agents, preferably compds. of Cu.

**Dyes.** I. G. Farbenind. A.-G. Fr. 755,376, Nov. 23, 1933. *p*-Aminodiphenylamine or its homologs or substitution products or its hydrazine or primary aliphatic or aromatic substitution products are condensed with 2- or 4-alkoxy-3,5-dinitrobenzoic acids or their alkyl esters, in the presence of water or an org. solvent and with or without an agent capable of fixing acid. The dyes dye animal fiber in brown-yellow and brown-red shades. Examples are given.

**Azo dyes.** Friedrich Muth (to General Aniline Works). U. S. 1,940,059, Dec. 19. Azo dyes which may be produced on the fiber and which yield fast, usually brown, dyes are formed from components such as 9-methyl-2-hydroxycarbazole-3-carboxylic acid or *p*-chloroaniline and 4-nitroaniline or the like. Cf. C. A. 27, 4405.

**Azo dyes.** Werner Zerweck, Carl Schütz, Alfred Carl and Johann Rosenbach (to General Aniline Works). U. S. 1,940,068, Dec. 19. Dyes, most of which, in the case of examples given, are of various red shades, and which are of good fastness, are obtained by diazotizing an aminodiaryl contg. at least one nitro group in a *m*- or *p*-position (such as 4'-nitro-2-aminobiphenyl) and coupling the diazo compd. with a coupling component of the naphthalene, carbazole or acylacetic acid series (numerous examples being given). The dyes may be produced on the fiber.

**Azo dyes.** Leopold Laska and Bruno Heyn (to General Aniline Works). U. S. 1,941,035, Dec. 26. Dyes (most of which, in examples given, dye green shades) are formed by combining various diazo, tetrazo and diazoazo compds. of the benzene, naphthalene and anthracene series not contg. sulfonic or carboxylic groups with 6-phenylamino-2-naphthol-3-carboxylic acid arylides (numerous examples being given).

**Azo dyes.** Ernst Runne, Karl Moldenke and Werner Kust (to General Aniline Works). U. S. 1,941,057, Dec. 26. Dyes which generally dye red shades are formed from components such as 2-amino-5-chloro-1-methyl-4-isopropylbenzene or the like and an arylamide of 2,3-hydroxynaphthoic acid or a  $\beta$ -ketocarboxylic acid.

**Azo dyes.** I. G. Farbenind. A.-G. Fr. 754,639, Nov. 10, 1933. 1-Phenyl-5-pyrazolone-3-carboxamide or its derivs. is combined with diazotized 1-hydroxy-2-aminobenzenes which have a  $\text{SO}_3\text{H}$  group in the 4-position and a halogen or alkyl group in the 6-position or a  $\text{SO}_3\text{H}$  group in the 6-position and a halogen or alkyl group in the 4-position. Examples are given.

**Azo dyes.** I. G. Farbenind. A.-G. Fr. 754,674, Nov. 10, 1933. Dyes sol. in water are prep'd. by sulfonating an azo

dye of the formula  $\text{CY}:\text{C}(\text{CO}_2\text{H})\text{C}(\text{OH})\text{CH}:\text{CY}:\text{C}-$

$\text{N}:\text{NC}:\text{CY}:\text{C}(\text{CO}_2\text{H})\text{C}(\text{OH})\text{CX}:\text{CY}$ , where X is H, alkyl or halogen and Y is H, alkyl or halogen. The prep'n. of 5-sulfo-, 5-sulfo-6-methyl-, 5-sulfo-6-chloro- and 5,5'-disulfo-3,3'-dicarboxy-4,4'-dihydroxyazobenzene is given.

**Azo dyes.** Soc. pour l'ind. chim. à Bâle. Fr. 754,798, Nov. 14, 1933. The dyes are prep'd. by combining diazo compds. of the formula 2-(HON:N)-5- $\text{XC}_6\text{H}_4\text{SO}_3\text{Y}$  (X is NO<sub>2</sub> or NH-aryl and Y an aromatic ring of the benzene series) with coupling components and transforming, if desired, the NO<sub>2</sub> or NH-aryl to NH<sub>2</sub>.

**Azo dyes.** Soc. pour l'ind. chim. à Bâle. Fr. 755,268, Nov. 22, 1933. New azo dyes are prep'd. by coupling arylides of 2,3-hydroxynaphthoic acid with diazo compds. of aryl or aralkyl ethers of *o*-aminophenols which still contain at least one esterified carboxylic group. Thus, Et ester of 2-amino-1,1'-diphenyl-4-carboxylic acid is diazotized and coupled with 2'-naphthalide of 2,3-hydroxynaphthoic acid, giving a red ppt. A large no. of examples is given.

**Azo dyes.** I. G. Farbenind. A.-G. Fr. 755,290, Nov. 22, 1933. Azo dyes of the stilbene series are prep'd. by submitting dyes, obtained by condensing dinitrostilbene-disulfonic acid or diinitrobenzylsulfonic acid or transformation products of nitrotoluenesulfonic acid, with aminoazo compds., successively and in any order to the action of alk. reducing and oxidizing agents. The oxidation may be replaced by other purification such as a partial

3 pptn. by ordinary salt.

**Azo dyes.** I. G. Farbenind. A.-G. Fr. 755,337, Nov. 23, 1933. 1,3-Dihydroxybenzene or a carboxylic acid thereof is coupled with 1 mol. of 2-nitro-1-amino-4-diazobenzene and 1 mol. of the same or another diazo or diazoazo component. Examples are given.

**Azo dyes.** I. G. Farbenind. A.-G. Fr. 755,338, Nov. 23, 1933. Insol. azo dyes, particularly for dyeing cellulose esters, are prep'd. by coupling diazotized 6-bromo- or chloro-2,4-dinitro-1-aminobenzene with  $\text{C}_6\text{H}_5$  or  $\text{C}_6\text{H}_5$  derivs. contg. an  $\text{NH}_2$  group which may be substituted by alkyl or hydroxyethyl. Examples are given.

**Azo dyes.** I. G. Farbenind. A.-G. Ger. 586,638, Oct. 26, 1933 (Cl. 22a.9). Polyazo dyes are prep'd. by coupling further diazotized compds. from optional starting components (except *peri*-aminonaphthols and derivs. of 1-aminonaphthalene substituted by  $\text{NH}_2$  in the *p*-position) or their sulfonic or carboxylic acids which contain etherified OH or SH groups in the *o*-position to the  $\text{NH}_2$  group, with

compds. of the general formula  $\text{XCyRA}$  in which Cy denotes cyanuryl, A *peri*-aminohydroxynaphthalene or a *peri*-(aminobenzoylamino)hydroxynaphthalene, R an aminoazo compd. and X a halogen atom or a residue bound by an O, N or S atom or cyanuric ring. Thus, the aminoazo compd. from diazotized 4-amino-1,3-dimethylbenzene-6-sulfonic acid and 1-amino-2-ethoxynaphthalene-6-sulfonic acid is dissolved in pyridine and treated with the condensation product from 1 mol. of cyanuric chloride or bromide, 1 mol. of amino-8-naphthol-3,6-disulfonic acid, and 1 mol. of 4-amino-4'-hydroxyazobenzene-3'-carboxylic acid. The resulting dye colors cotton from a Glauber salt-soda bath in fast light green shades. Several other examples are given.

**Azo dyes; dyeing.** I. G. Farbenind. A.-G. (Georg Kranzlein and Josef Erber, inventors). Ger. 585,351, Oct. 2, 1933. Diazo or tetrazo compds. not contg. the OH group are coupled in substance or on the fiber or other substrate with barbituric acid, thiobarbituric acid or

other compd. of the formula  $\text{OC}(\text{CH}_2)_2\text{C}(\text{O})\text{N}(\text{R}_1)\text{CX}:\text{NR}$ , where X is O or S, and R and R<sub>1</sub> are H atoms or the same or different aliphatic or cyclic radicals. Greenish yellow or red dyes are generally obtained, according to whether diazo or tetrazo compds. are used. Examples are given.

**Azo dyes; dyeing.** I. G. Farbenind. A.-G. (Wilhelm Neelmeier and Wilhelm Lamberz, inventors). Ger. 587,652, Nov. 7, 1933 (Cl. 22a.1). Addn. to 575,216 (C. A. 27, 3616). This corresponds to Fr. 742,326 (C. A. 27, 3616), but gives addnl. examples.

**Azo dyes; intermediates.** I. G. Farbenind. A.-G. Brit. 398,516, Sept. 15, 1933. H<sub>2</sub>O-insol. azo dyes are made in substance, on a substratum or on the fiber by coupling a 2-hydroxy-5,6- or -7,8-benzocarbazole-3-carboxylic acid arylamide with a diazo compd. In examples cotton is impregnated with the *p*-chloroanilide of the 5,6-deriv. or the *p*-aniside of the 7,8-deriv. and developed with diazotized 4-chloro-2-toluidine or *o*-chloroaniline, resp. The hydroxycarbazoles are made by taking a 5,6- or 7,8-benzocarbazole, substituted in the 2-position by a substituent that can be transformed into

an OH group, and replacing said substituent by known methods. Among examples Na 5,6-benzocarbazole-2-sulfonate (from 2,3-hydroxynaphthoic acid, 3-sulfo-phenylhydrazine and  $\text{NaHSO}_4$ ) is fused with KOH. The hydroxycarbazolecarboxylic acids are made by reacting  $\text{CO}_2$  with an alkali metal salt of the corresponding hydroxy compd. with the hydroxy compd. itself in the presence of an alkali metal carbonate. Examples are given. The arylides are prepd. by customary methods. Among examples 2-hydroxy-5,6-benzocarbazole-3-carboxylic acid is condensed with *p*-chloroaniline or  $\alpha$ -naphthylamine in presence of PhMe and  $\text{PCl}_5$ .

**Azo dyes; intermediates.** I. G. Farbenind. A.-G. Brit. 398,854, Sept. 22, 1933. Insol. azo dyes are made by coupling a 2-hydroxy-5,6-dihydro-7,8-benzocarbazole-3-carboxylic acid arylamide with a diazo compd. in substance, on the fiber or on a substratum. In an example cotton is impregnated with the *p*-aniside and developed with diazotized 2,5-dichloroaniline. The arylamides are made from the corresponding carboxylic acid and amines by customary methods. In an example the acid is condensed with *p*-anisidine by means of  $\text{PCl}_5$  in PhMe. The acid is made by the action of  $\text{CO}_2$  on the alkali metal salt of the corresponding OH compd. or on the OH compd. in the presence of an alkali metal carbonate. An example is given. 2-Hydroxy-5,6-dihydro-7,8-benzocarbazole is made from a 5,6-dihydro-7,8-benzocarbazole contg. a group in the 2-position which can be converted into an OH group by known methods, e. g.,  $\text{NH}_2$ ,  $\text{HSO}_3$  or alkoxo. In examples the 2-sulfonate is fused with KOH and the 2-methoxy compd. is heated with  $\text{AlCl}_3$  in PhMe. The 2-substituted benzocarbazoles are made by condensing the corresponding phenylhydrazine compd. with  $\alpha$ -ketotetrahydronaphthalene by methods similar to that of Bucherer.

**Copper-containing azo dyes.** Richard Stüsser (to General Aniline Works). U. S. 1,940,066, Dec. 19. See Ger. 575,840 (C. A. 27, 5549).

**Disazo dyes.** Henry Jordan (to E. I. du Pont de Nemours & Co.). U. S. 1,940,683, Dec. 20. Dyes generally dyeing bluish red shades are formed by coupling a diazotized aminoazo compd. of the benzene series, contg. not more than one sulfo or carboxy group with benzoylaminobenzoyl-2-amino-5-naphthol-7-sulfonic acid.

**Disazo dyes.** Heinrich Clingstein and Karl Dobmaier (to General Aniline Works). U. S. 1,940,662, Dec. 20. Disazo dyes generally dyeing yellow shades of good fastness to washing, to Cl and to kier-boiling are formed from components such as diacetoacetic- $\alpha$ -tolilide and diazotized *o*-aminobenzophenone or the like.

**Disazo dyes.** J. R. Geigy A.-G. Ger. 587,449, Nov. 4, 1933. See Fr. 739,468 (C. A. 27, 2309).

**Polyazo dyes.** Ralph B. Payne (to National Aniline & Chemical Co.). U. S. 1,938,976, Dec. 12. Dyes producing violet to blue shades on cotton rendered fast by development with  $\beta$ -naphthol are formed from components such as 1,8-aminonaphthol-3,6-disulfonic acid, cresidine, 5,5'-dihydroxy-2,2'-dinaphthylamine-7,7'-disulfonic acid and oxalyl-*p*-phenylenediaminesulfonic acid or the like.

**Vat dyes.** Ernst Honold (to General Aniline Works). U. S. 1,936,716, Nov. 28. New dyes are obtained by treating with an alk. condensing agent *Bs*-1-benzanthronyl-1-aminoanthraquinone compds. contg. in 4-, 5- or 8-position of the anthraquinone nucleus one of the groups NH-alkyl, NH-aryl, NH-cycloalkyl or NH-aralkyl. These starting materials which themselves are scarcely sol. in the vat are obtainable according to the usual methods for instance by condensing *Bs*-1-bromo-benzanthrone with a 1-aminoanthraquinone contg. in 4-, 5- or 8-position an alkylamino, cycloalkylamino, aralkylamino, arylamino, dialkylamino and alkyl-aralkylamino group in presence of an acid-binding agent and advantageously of a Cu compd. acting as catalyst. The new dyes are, when dry, grayish powders sol. in concd.  $\text{H}_2\text{SO}_4$  with a greenish color and dyeing the vegetable fiber from a bluish to violet to black vat gray shades of a good fastness particularly to light and exposure.

<sup>1</sup> By these shades they differ from the dyes of U. S. Pat. 995,936 (C. A. 5, 2728) which do not contain a substituted amino group in the 4-, 5- and 8-position of the anthraquinone nucleus. Several examples with details of procedure are given.

**Vat dyes of the acridone series.** Max A. Kunz, Karl Koeberle and Anton Hensle (to General Aniline Works). U. S. 1,939,011, Dec. 12. Vat dyes which dye cotton brown to orange shades are formed by the action of a halogenating agent, such as Br in the presence of 1, on a compd. contg. a condensed ring system of at least 5 rings comprising the acridone ring system, at least 2 further aromatic carbocyclic rings being connected to the said condensed ring system and at least 2 ketonic groups being contained in the whole ring system in addn. to that in the acridone ring, such as 1,2,5,6-diphthaloylacridone. Numerous examples are given.

<sup>3</sup> **Vat dyes of the anthraquinone series.** Paul Nawiasky, Emil Krauch and Berthold Stein (to General Aniline Works). U. S. 1,936,949, Nov. 28. Vat dyes, generally dyeing yellow and orange shades, are obtained by condensing an anthraquinoneacridone or anthraquinone-thioxanthonecarboxylic acid or substitution product with an aromatic amine which is substituted in the  $\alpha$ -position to the amino group by an OH, SH or  $\text{NO}_2$  group or halogen (numerous examples with details of procedure being given).

<sup>4</sup> **Vat dyes of the dibenzanthrone series.** Edward T. Howell and Otto Stallmann (to E. I. du Pont de Nemours & Co.). U. S. 1,940,419, Dec. 19. Dyes producing various green shades on cotton are produced by reacting with an isopropyl ester such as iso-Pr bromide and an acid-binding agent upon a hydroxydibenzanthrone contg. at least one reactive hydroxy group. Several examples with details of procedure are given.

<sup>5</sup> **Derivatives of vat dyes.** Durand & Huguenin A.-G. Ger. 589,484, Dec. 8, 1933 (Cl. 22b. 2.07). Sulfonic acid esters of leuco compds. of vat dyes are converted into their Li salts, which are more sol. in water than the Na salts ordinarily used.

**Dyes of the anthraquinone series.** Klaus Weinand, Carl Taube and Hans Hertlein (to General Aniline Works). U. S. 1,941,063, Dec. 20. Dyes suitable for dyeing wool or for dyeing cotton or viscose from a neutral or slightly alk. bath, bluish green to green shades, are prepd. by heating, with a Cu catalyst such as  $\text{Cu}_2\text{Cl}_2$  and an acid binding agent, reacting components such as 1-amino-4-bromoanthraquinone-2-sulfonic acid and monoxinamoyl-*p*-phenylenediamine or the like.

**Acid dyes of the anthraquinone series.** Georg Kränzlein and Ernst Diefenbach (to General Aniline Works). U. S. 1,936,944, Nov. 28. Fast blue dyes suitable for dyeing wool and silk are obtained by condensing a 1-amino-4-haloanthraquinone-2-sulfonic acid or a salt of such an acid with a compd. of the general formula  $\text{NH}_2\text{RCH}_2\text{R}'\text{COOH}$  in which R and R' represent radicals of the benzene series and the COOH group is in  $\alpha$ -position to the  $\text{CH}_2$  group in the radical R', by heating the components in the presence of an acid-binding agent and of a small quantity of a Cu compd. such as  $\text{Cu}_2\text{Cl}_2$ . Various examples with details and modifications of procedure are given.

**Anthraquinone dyes.** I. G. Farbenind. A.-G. Fr. 751,283, Aug. 30, 1933. Dyes are prepd. by causing a 1-amino-4-haloanthraquinone sulfamide to react with  $\text{NH}_3$  or a primary or secondary amine, so that the halogen in the 4-position is replaced by the basic radical. The products obtained may be sulfonated. Examples are given of the prepn. of 1-amino-2-sulfocyclohexylamido-4-anilido-, m. 215-6°, 4-(*p*-methoxyanilido)-, m. 244.5°, and 1-amino-2-sulfomethylamido-4-cyclohexylaminoanthraquinone, m. 228-9°, and 1-amino-4-cyclohexylaminoanthraquinone-2-sulfomethylamide. Cf. C. A. 27, 5549.

**Anthraquinone dyes.** I. G. Farbenind. A.-G. (Georg Kränzlein, Martin Corell and Ernst Diefenbach, inventors). Ger. 585,814, Oct. 11, 1933. See U. S. 1,924,44 (C. A. 27, 5548).

**Acid wool dyes.** I. G. Farbenind. A.-G. (Georg

Kränzlein, Martin Corell and Ernst Diefenbach, inventors). Ger. 587,530, Nov. 4, 1933 (Cl. 22b. 3.02). Addn. to 554,324 (C. A. 27, 850). Blue or violet dyes are prep'd. by esterifying on the COOH group 1-aminoanthraquinones substituted with COOH in the 5-, 6-, 7- or 8-position, and further substituted (a) in the 4-position with a sulfonated arylamino residue and in the 2-position with a halogen, or (b) in the 4-position with an unsulfonated alkyl- or aryl-amino residue and in the 2-position with  $\text{SO}_3\text{H}$ . The prep'n. of suitable starting materials is described in Ger. 585,814 (preceding abstr.). Esterification of the starting materials is effected by standard methods. Examples are given.

**Acid wool dyes.** I. G. Farbenind. A.-G. Fr. 755,074, Nov. 18, 1933. A diazo comp'd. of *o*-aminodiphenyl sulfone, which may be substituted in the  $\text{C}_6\text{H}_4$  rings by a halogen, alkyl or alkoxy radical is coupled in an acid soln. with 2-amino-8-hydroxynaphthalene-6-sulfonic acid.

**Dibenzoxacarboquinone dyes.** Leslie G. S. Brooker (to Eastman Kodak Co.). U. S. 1,939,201, Dec. 12. Two mol. proportions of a  $\mu$ -methyl-naphthoxazole quaternary salt such as 2-methyl- $\beta$ -naphthoxazole metho-*p*-toluenesulfonate is condensed with one mol. proportion of ethyl orthoformate in the presence of an org. base such as pyridine which is a solvent for the reactants and which serves to bind acid liberated in the reaction. The products may be used as photographic sensitizing dyes.

**Polymethine dyes.** Soc. pour l'ind. chim. à Bâle. Ger. 585,186, Oct. 10, 1933. This corresponds to Brit. 321,155 (C. A. 24, 2609), but gives addnl. examples.

**Fast blue sulfur dyes.** Richard Herz and Wilhelm Hechtenberg (to General Aniline Works). U. S. 1,939,008, Dec. 12. A quinone vat dye such as that described in U. S. pat. 1,588,384 (C. A. 20, 2587) is treated with a sulfurizing agent such as an alkali metal or  $\text{NH}_4$  sulfhydrate, sulfide or polysulfide.

**Green sulfur dyes.** Raymond W. Hess and Maurice H. Fleisher (to National Aniline & Chemical Co.). U. S. 1,938,963, Dec. 12. An indophenol is heated with a polysulfide such as that of Na the S content of which is higher than that represented by the formula  $\text{M}_2\text{S}_x$  in which M represents a metal; the finished polysulfide melt is dissolved in water, and the dye is ppt'd. by satg. the soln. with salt and aerating the resulting soln.

**Dye for cellulose acetate.** Henry R. Lee and Edwin C. Busbaum (to E. I. du Pont de Nemours & Co.). U. S. 1,939,593, Dec. 12. Cellulose acetate is dyed reddish violet of redder shades than the product obtainable by heating 1,4-dimethyldiaminoanthraquinone with  $\text{H}_2\text{SO}_4$  monohydrate for 1 hr. at 180–220° but of bluer shade than 1,4-diaminoanthraquinone, by use of a demethylated 1,1-dimethyldiaminoanthraquinone such as may be prep'd. by heating 1,4-dimethyldiaminoanthraquinone in 93–100%  $\text{H}_2\text{SO}_4$  at 175–200° for 4–8 hrs. in the presence of  $\text{HgSO}_4$  or  $\text{HgCl}_2$ .

**Dyeing liquor.** Charles W. Cameron. Australia 9142/32, Sept. 21, 1933. A dye liquor for silk, etc., contains an org. dye, borax, white bleached shellac and a small amt. of PhOH in water. The dyed fabric may be coated with a fixative or seal composed of cellulose lacquer of low viscosity.

**Intermediates for dyes.** I. G. Farbenind. A.-G. Fr. 42,592, Aug. 23, 1933. Addn. to 704,633. The acenaphth-*peri*-indandione 3,5-diketimidides of Fr. 704,633 are treated with halogenating agents, giving *N,N'*,4,4-tetrahalo derivs. The products are very reactive and may be transformed to dihaloacenaph-*peri*-indandiones, the N.Hg groups being replaced by O atoms by heating them in a dil. acid. The indandiones when heated with alkalis form 5-di(haloacetyl)acenaphthene-6-carboxylic acids, and in a soln. of dil. alkali hypochlorite give acenaphthalic acid, which, on subsequent oxidation gives 1,4,5,8-naphthalenetetracarboxylic acid.

**Arylides of 2,3-hydroxynaphthoic acid.** Ernest F. Grether and Lindley E. Mills (to Dow Chemical Co.). U. S. 1,938,002, Dec. 12. New arylides of 2,3-hydroxynaphthoic acid (useful as dye intermediates) are prep'd. by the reaction of the acid with various substituted anilines

such as methoxydichloroaniline, ethoxydichloroaniline, phenoxydichloroaniline, etc. Various examples with details of procedure are given. Cf. C. A. 28, 654<sup>4</sup>.

**Anthracene derivatives.** I. G. Farbenind. A.-G. (Max A. Kunz, Rudolf Stroh and Hermann Dimroth, inventors). Ger. 588,353 and 588,354, Nov. 15, 1933 (Cl. 12g. 37). The condensation products of anthraquinone (I) or its derivs. with aliphatic amides, described in Ger. 586,068 (C. A. 28, 487<sup>4</sup>), are treated with alk. reagents in the presence or absence of a reducing agent. The products vary in character according to the concn. of alkali. They yield I, or the deriv. used as starting material, when treated with acid. The condensation product from I and  $\text{HCONH}_2$ , boiled for 1–2 hrs. in 15 times its wt. of  $\text{EtOH}$  with nearly 4 times its wt. of  $\text{NaOH}$ , is believed to yield 9,10-diaminoanthracene (II), m. 195°; under similar conditions, the product from 2-chloro-I and  $\text{HCONH}_2$  is believed to yield 2-chloro-II (unstable) (588,353). The products described in Ger. 586,068, heated with aromatic amines or with acid halides or anhydrides, yield new products believed to be 9,10-di-(arylamino)- or 9,10-di-(acylamino)-anthracenes. Examples are given of the prep'n. of compds. believed to be 9,10-di-(phenylamino)-, 9,10-di-(*p*-tolylamino)-, 9,10-di-(benzoylamino)- and 9,10-di-(diacetylamino)-anthracene, m., resp., 315–17°, 195°, 380° and 275° (588,354). The products are useful for coloring lacquers or as intermediates for dyes.

**Anthracene condensation products.** I. G. Farbenind. A.-G. Fr. 754,842, Nov. 14, 1933. Methyleneanthrone or its ring substitution products are caused to react with compds. contg. the grouping  $\text{CH}_2\text{CH}$  one or more times, e. g., toluquinone,  $\alpha$ - and  $\beta$ -naphthoquinone, naphthazarin, maleic anhydride, cinnamic acid or its esters, crotonic acid or aldehyde, benzalacetophenone, stilbene, 2,5,6-trichlorobenzoquinone or 2-chloro- $\alpha$ -naphthoquinone. The prep'n. of several compds. which are dyes are described and of *Bz*-1,*Bz*-2-benzanthronedicarboxylic anhydride, m. above 300°.

**Acylaminoanthraquinones.** Rhys J. Loveluck and John Thomas (to Imperial Chemical Industries Ltd.). U. S. 1,939,218, Dec. 12.  $\alpha$ -Aminoacylaminoanthraquinones are formed by the treatment of  $\alpha$ -arylsulfonamidoacylaminoanthraquinones with a hydrolyzing agent such as 95%  $\text{H}_2\text{SO}_4$  at 20–30° to remove only arylsulfonyl groups. Details are given of the production of 1-amino-5-benzoylaminoanthraquinone, m. about 261°, 1-amino-4-benzoylaminoanthraquinone, etc., and general claim is made to all  $\alpha$ -arylsulfonamidoacylaminoanthraquinones, as being new products, generally suitable for use as dye intermediates.

**Symmetric bis(arylamino)phenols.** I. G. Farbenind. A.-G. (Leopold Laska, Arthur Werdermann and Rudolf Heil, inventors). Ger. 586,647, Oct. 25, 1933 (Cl. 12g. 32.10). Phloroglucinol is heated with about a double mol. amt. of an aromatic amine in the presence of a diluent, so that the resulting water is dist'd. off. Thus, phloroglucinol is heated with *p*-chloroaniline to give a 90% yield of 3,5-bis(*p*-chlorophenylamino)phenol, m. 112°. The prep'n. of 3,5-bis(phenylamino)phenol, m. 95–6°, 3,5-bis( $\beta$ -naphthylamino)phenol, m. 106°, and 3,5-bis(3'-nitrophenylamino)phenol, m. 183°, is also described. The products are used as dye intermediates.

**Symmetric bis(arylamino)phenols.** I. G. Farbenind. A.-G. (Leopold Laska and Oskar Haller, inventors). Ger. 586,806, Oct. 26, 1933 (Cl. 12g. 32.10). The above are prep'd. by treating phloroglucinol with alkali bisulfites and non-nitrated arylamines in the proportions of about 2 mols. of the arylamide to 1 mol. of phloroglucinol in aq. soln. Thus, phloroglucinol is treated with  $\text{PhNH}_2$  and  $\text{NaHSO}_3$  to give an 80% yield of diphenyldiaminohydroxybenzene, m. 110°. The prep'n. of 3,5-bis(*p*-methoxyphenylamino)phenol, m. 155°, 3,5-bis(*m*-tolylamino)phenol, m. 108°, 3,5-bis(4'-methoxy-3'-methylphenylamino)phenol and 3,5-bis(4'-amino-2',5'-dichlorophenylamino)phenol, m. 167°, is also described.

**Arylides of hydroxy aromatic acids (dye intermediates).** Ernest F. Grether (to Dow Chemical Co.). U. S. 1,938,-

901, Dec. 12. The 2,3-hydroxynaphthoic acid arylide of 3,4-dichloroaniline is prepd. by condensing the acid and amine in the presence of  $\text{PCl}_5$  in toluene at refluxing temp. The product, m. 255°, is suitable for forming on cotton fiber or the like an azo dye with another component such as diazotized 2-methyl-4-chloroaniline (forming a scarlet dye). Similarly, bisaniline yields a blue, and 2-nitro-4-ethoxyaniline a dark cardinal dye, and the use of some other components also is mentioned. Cf. C. A. 27, 5340.

**Dyeing.** Imperial Chemical Industries Ltd., Charles H. Barlow and Leslie G. Lawrie. Brit. 398,175, Aug. 31, 1933. Textiles composed of natural or regenerated cellulose, wool and (or) silk are treated before or after the dyeing operation with a dil. aq. soln. of a heterocyclic  $\text{NH}_4$  salt in which the  $\text{NH}_4$  N atom is a member of the heterocyclic ring and carries a long-chain aliphatic residue of at least 12 C atoms, acyl, hydroxyalkyl and hydroxycycloalkyl groups being absent. The fastness of the dyeing is thus increased. Among examples cotton yarn dyed with Chlorazol fast red K or Chlorazol sky blue FF is treated with octadecylpyridinium bromide.

**Dyeing.** Bleachers' Association Ltd., Charles L. Wall and Franklin Farrington. Brit. 398,532, Sept. 14, 1933. Dyeings with direct dyes contg. 1 or more free amino groups are diazotized on the fiber and coupled with an arylide of an arylhydroxycarboxylic acid contg. at least 3 rings or with a binuclear arylide of a  $\beta$ -keto carboxylic acid. Specified coupling components are hydroxycarbazolecarboxylic arylides, hydroxynaphthoic arylides, hydroxydiphenylaminocarboxylic acid arylides, bisacetoacetic- $\alpha$ -tolidide and similar compds. in which the amino and carboxy groups are interchanged between the nuclei. Dyes and developers named are Diazo fast yellow 2G, Diazo sky blue 3GL, Diazo brilliant green 3G, Diazo fast blue 2RW and Diazo indigo blue 4GL; Naphthol AS/G, AS/LT, AS/GR, AS/LH, AS/SG and AS/SW.

**Dyeing.** British Celanese Ltd. and George H. Ellis. Brit. 398,842, Sept. 12, 1933. Materials made of or contg. cellulose esters or ethers are colored by applying, in soln., suspension or dispersion, disazo dyes, free from  $\text{COOH}$  or  $\text{HSO}_3$  groups, of the type  $\text{RN}:\text{NR}'\text{N}:\text{NR}'\text{OH}$ , wherein R, R' and R'' are residues of the  $\text{C}_6\text{H}_5$  series, each contg. a single  $\text{C}_6\text{H}_5$  nucleus, which may be substituted, e. g., by alkyl, alkoxy or halogen groups. The dyes are obtainable by diazotizing suitable aminoazo compds., e. g., those obtained by coupling diazotized  $\text{PhNH}_2$ , chloroanilines, toluidines, xylidines, anisidines or phenetidines with middle components of the  $\text{C}_6\text{H}_5$  series, e. g., *m*-toluidine, *p*-xylidine, cresidine and coupling with phenols, e. g.,  $\text{PhOH}$ , *o*- or *m*-cresol. The dye aminoazobenzene  $\rightarrow$   $\text{PhOH}$ , being resistant to  $\text{HNO}_3$ , is useful for producing compd. shades in conjunction with dyes produced by azoic methods. Among examples a cellulose acetate woven fabric, dyed navy blue with a dispersion of the dye *p*-aminobenzeneazodimethylaniline diazotized on the fiber and developed with  $\beta$ -hydroxynaphthoic acid, is further dyed in a bath, contg. an aq. paste of the dye aminoazo benzene  $\rightarrow$   $\text{PhOH}$  until the color deepens to a fine black and is washed and dried. Cf. C. A. 28, 3404.

**Dyeing.** I. G. Farbenind. A.-G. Brit. 398,846, Sept. 18, 1933. Insol. azo dyes are made on the fiber by applying a mixt. contg. an alkali salt of a hydrazinesulfonic acid of formula 2-Y-4-(acyl-NH)-5- $\text{XC}_6\text{H}_4\text{NHNHSO}_3\text{H}$ , where X and Y are substituents, e. g., alkyl, alkoxy, halogen and an alkali salt of a hydroxylated coupling component which combines in the position adjacent to the OH group, and then steaming. The free coupling component with the equiv. amt. of alkali may be used and dyeing or printing assistants may be added. Among mixts. specified are Na salts of 4-benzoylamino-2,5-dimethoxybenzene-1-hydrazinesulfonic acid with 4,4'-di(acetoacetyl)-3,3'-dimethylbiphenyl, 2'-hydroxyanthracene-3'-carbonyl-1-amino-2-methylbenzene, 3-benzoylamino-2-naphthol or 2',3'-hydroxynaphthyl - 1 - amino - 2 - methoxy - 4 - chlorobenzene and of 4-benzoylamino-2-methoxy-5-methylbenzene-1-hydrazinesulfonic acid with *m*-nitroanilide of 2,3-hydroxynaphthoic acid.

**Dyeing.** I. G. Farbenind. A.-G. (Alfred Bergdolt, A.

Ossenbeck, E. Tietze and F. Gund, inventors). Ger. 585,352, Oct. 2, 1933. Diazo compds. are coupled on the fiber with diketones of the formula  $\text{XCOCH}_2\text{COY}$ , where X and Y are alkyl, aryl or aralkyl radicals. Neither component should contain a group conferring soly. in water. Yellow to orange dyeings dischargeable to pure white are obtained. Examples are given.

**Dyeing.** I. G. Farbenind. A.-G. (Hermann Jäger, inventor). Ger. 588,211, Nov. 14, 1933 (Cl. 8m. 12). In producing azo dyes on the fiber, the material is impregnated with an alk. soln. of an azo dye component and then treated with a diazo soln. in the presence of a neutralizing agent comprising  $\text{NH}_4\text{Cl}$  and  $\text{CH}_3\text{O}$ . The alkali reacts with the  $\text{NH}_4\text{Cl}$  to form  $\text{NH}_3$ , which combines with the  $\text{CH}_3\text{O}$ .

**Dyeing animal fibers.** Hans Bucherer. Ger. 587,361, Nov. 2, 1933. In dyeing animal fibers or mixed textiles contg. animal fibers with mordant dyes, the unmordanted material is treated with the dye in an acid bath and then at atm. temp. with an acidified chromate soln.  $\text{Cr}_2\text{O}_3$  is then produced on the fiber by treating the material with a cold soln. of  $\text{SO}_2$ , and finally the dye is fixed on the fiber by treating the material with hot water.

**Dyeing wool.** Soc. pour l'ind. chim. à Bâle. Brit. 398,878, Sept. 25, 1933. See Fr. 734,189 (C. A. 26, 1205).

**Fast dyeings on wool.** Albert Landolt (to Soc. pour l'ind. chim. à Bâle). U. S. 1,940,551, Dec. 19. In producing fast tints on wool by means of unsulfonated diazo compds. of the benzene series, and unsulfonated arylides of 2,3-hydroxynaphthoic acid derived from such aromatic amines as, besides one or two amino groups, contain no other groups capable of coupling, such arylides are caused to "rush onto" the wool from baths which contain at least 0.1%  $\text{NaOH}$ , followed by development with the diazo compds.

**Dyeing furs, hairs and feathers.** Erich Lehmann and Hans Wassenecker (to General Aniline Works). U. S. 1,910,757, Dec. 26. A dyeing bath is used contg.  $\text{H}_2\text{O}$ , together with a diamine such as 5-amino-2-dihydroxypropylamino-1-chlorophenyl ethyl sulfide or the like. Cr or Cu salts may be used as mordants. Cf. C. A. 27, 852.

**Yarn-dyeing and -twisting apparatus.** Eugene C. Gwaltney. U. S. 1,940,748 9, Dec. 26. Structural and mech. features.

**Printing or dyeing textiles.** Durand & Huguenin S. A. Fr. 755,351, Nov. 23, 1933. In printing or dyeing animal fibers with mordant dyes the duration of steaming may be reduced to 8 mins. while obtaining fast to friction shades, by adding to the printing color or to the "foularding" soln. a high amt. of a nonvolatile org. acid or an easily dissociable salt thereof, e. g., oxalic acid, tartaric acid, citric acid or adipic acid. A urea or thiourea may also be added.

**Printing on wool.** A. Holtmann & Co., G. m. b. H. Brit. 398,944, Sept. 28, 1933. In printing other than vat dyes on wool, improved penetration of the goods by the color is obtained by adding to the printing paste, in proportion forming at least 4% thereof, a  $\text{H}_2\text{O}$ -sol. mono- or di-amido deriv. of carbonic, thiocarbonic or imidocarbonic acid, free from substitution of the primary amino group(s) and still retaining at least 1 of these, said deriv. remaining uncondensed after the printing. Specified derivs. are (thio)urea, (thio)urethans, guanidine and salts thereof. Among examples an aq. paste contg. Crystal ponceau, British gum, oxalic acid and urea is printed on wool and the printed goods are steamed, washed and dried. Cf. C. A. 28, 6569.

**Dyeing apparatus.** Smith, Drüm & Co. Brit. 398,710, Sept. 21, 1933.

**Dyeing machine.** Hans W. Mettler. Ger. 585,155, Sept. 29, 1933 (Cl. 8a. 9.50). Addn. to 528,983 (C. A. 25, 5300).

**Apparatus and method for dyeing fabrics.** George E. Burgess, Burgess, Ledward & Co. Ltd. and Brown & Adam Ltd. Brit. 398,887, Sept. 25, 1933.

**Beam for apparatus for dyeing yarn, etc.** Wm. P.

Hornbuckle and Robert F. Craig. U. S. 1,939,816, Dec. 19. U. S. 1,939,817 also relates to app. for dyeing yarn.

Apparatus for rotating hanks during dyeing, etc. Wm. G. Gass. Ger. 588,035, Nov. 11, 1933 (Cl. 8a. 8.01). This corresponds to Brit. 361,087 (C. A. 27, 1200).

Fibers from plants. Bernard Beddingfield Wood. Australia 8065/32, Oct. 12, 1933. The plants are submitted to a vacuum to remove air, then soaked in water and heated under pressure, with sudden release of the pressure to break up the structure. An app. is described. Cf. C. A. 27, 3833.

Treating textile materials. Harry W. Turner (to The British Thomson-Houston Co. Ltd.). Brit. 398,909, Sept. 25, 1933. See U. S. 1,901,678 (C. A. 27, 3346).

Dressing textiles. Oranienburger Chemische Fabrik A.-G. Ger. 585,724, Oct. 10, 1933. Fabrics are finished, glossed, etc., by using phosphatides such as lecithin, in org. solvents. Waxes, paraffins, mineral oils, etc., and emulsifying agents may also be added. In an example, linseed oil, vegetable lecithin,  $C_6H_6$  and  $C_2H_5Cl$  are used.

Machine for wet-treating textiles. Alfred W. Hennis. Ger. 586,799, Oct. 31, 1933 (Cl. 8b. 13.03).

Loading textiles. Waldemar Zanker. Brit. 398,323, Sept. 14, 1933. Natural silks or rayon, or mixed materials contg. them, are loaded by treatment in a bath contg. 1 or more Sn salts and then in 1 or more baths contg. no Sn but 1 or more salts of another loading metal, at least 1 of the baths contg. a Mg salt. Addnl. loading metals are Pb, Al, Fe, Cr, Mn, Ce and Zr. Among examples silk is treated in a bath at 40–50° contg.  $SnCl_4$ ,  $MgCl_2$  and  $NaH_2PO_4$ , centrifuged, treated, without washing, in a cold bath contg.  $H_2PO_4$ , again centrifuged, treated, without washing, in a bath at 60° contg.  $NaH_2PO_4$ , washed, treated in a water-glass bath at 55°, further treated in a sec. loading bath at 25–30° contg.  $Al(OAc)_3$  or  $Al(HCOO)_3$  and acetates of Pb and Mg and finally treated with water glass and soaped.

Decorating silk fabrics. Herbert Sieben (to Textile Dyeing and Printing Co. of America). U. S. 1,939,322, Dec. 12. There is deposited upon the fabric in a selected design a plastic resist comprising a printing gum and gum acacia in the resp. proportions of about 1:2, the fabric is subjected to a formic acid bath in order to straighten and compact the exposed threads and the action of the acid is finally nullified (suitably by washing in cold water) and the resist is removed. A dye and weighting compn. also may be applied.

Apparatus for the wet treatment of silk textiles. René Clavel. Ger. 585,140, Sept. 29, 1933.

Apparatus for washing and weighting silk fabrics. Conrad Frih. Ger. 569,143, Oct. 19, 1933.

Treating artificial filaments, etc. British Celanese Ltd. and Ernest L. Greenwood. Brit. 398,191, Sept. 7, 1933. Liquid, e. g., dyes, sizes, conditioning and solvent liquids, is applied to traveling artificial filamentary material, e. g., yarns, threads, straws, taps, bristles, continuously with its production by a wick through which the liquid is flowing continuously past the point of contact of the yarn with the wick. App. is described.

After-treating artificial filaments. I. G. Farbenind. A.-G. Brit. 398,738, Sept. 21, 1933. Rayon, which has been washed free from acid and dried, is twisted and wound onto a bobbin of variable diam. and the wound package of threads, after diminishing the diam. of the bobbin, is irrigated with the after-treatment liquids. App. is described.

Washing and other treatments of wrapped cakes of materials such as artificial filaments. Conrad Herrmann (to American Glanzstoff Corp.). U. S. 1,938,830, Dec. 12. Various details of app. and operation are described.

Treatment of materials containing cellulose acetate. Archibald J. Hall (to Celanese Corp. of America). U. S. 1,939,261, Dec. 12. For preventing loss of texture in bleaching, dyeing, printing, steaming and other treatments of materials contg. cellulose acetate at temps. of about 85° or higher, the treatment is effected in the presence of a sol. salt of a multivalent metal such as  $Mg(NO_3)_2$ ,  $CaCl_2$ , alum or  $FeSO_4$  in aq. soln. of a concn. of at least 10%.

1 Delustering knit fabrics such as those of cellulose acetate, etc. Herbert Platt (to Celanese Corp. of America) U. S. 1,940,730, Dec. 26. While loosely hung in loops, the material is treated with a delustering agent such as wet steam, hot water or a soap soln. Cf. C. A. 28, 1203<sup>1</sup>.

2 Delustering artificial threads, etc. British Celanese Ltd. Brit. 398,371, Sept. 14, 1933. Artificial yarns or fabrics, made of cellulose acetate or other org. deriv. of cellulose, are delustered by treating with a higher fatty acid, e. g., oleic, and then with hot aq. liquid or moist steam. The pretreatment with the org. acid obviates uneven delustering. When applied to sized fabrics the size is first removed by padding and the acid may be contained as an emulsion in the desizing liquid.

3 Delustering rayon. Imperial Chemical Industries Ltd. Fr. 754,478, Nov. 8, 1933. Rayon is delustered by treating it with an aq. soln. contg. a sulfonated, alkylated polynuclear hydrocarbon or a sulfonated, alkylated petroleum distn. product, and an Al salt. The Al salt may be the acetate and the hydrocarbon one of those described in Brit. 274,611 (C. A. 22, 2268) or 311,885 (C. A. 24, 932).

4 Relustering materials made of cellulose derivatives. Aceta G. m. b. H. (Wolfgang Stahl and Paul Kraus, inventors). Ger. 585,272, Sept. 30, 1933. Filaments, fabrics, etc., of cellulose derivs., which have become delustered by the action of hot liquids or steam, are relustered by treating the hot wet materials with a hot aq. soln. of an agent which represses swelling, e. g.,  $CaCl_2$ , glycerol or sugar. This treatment may be preceded by treatment with a hot aq. softening bath.

5 Rayon. Algemeene Kunstzijde Unie N. V. Ger. 585,193, Sept. 29, 1933. Regenerated cellulose rayon, while still on the rolls or bobbins on which it was spun, is subjected to the usual wet treatment and dried. It is then steamed, redried, wound (or twisted and wound) on a fresh bobbin, steamed and dried again. Each steaming period may be about 1 hr. Rayon of uniform character as regards shrinkage is obtained.

6 Rayon. La Soie de valenciennes and Maurice A. Starink. Fr. 42,852, Nov. 15, 1933. Addn. to 750,101 (C. A. 28, 639<sup>6</sup>). The torsion of viscose silk is suppressed and replaced by a sufficient aggregation of the fibers of the thread.

7 Rayon. Vereinigte Glanzstoff-Fabriken A.-G. Fr. 755,182, Nov. 21, 1933. The upper and lower layers of viscose or cuprammonium silk wound on bobbins or rollers are divided separately and made into hanks which are allowed to shrink in this form in a moistening treatment and are afterwards finished. The middle part of the layers of thread on the bobbin or roller are divided, separately twisted and finished in known manner without any complementary treatment with liquids in hank form.

Apparatus for after-treating rayon on perforated bobbins. Ernst Berl. Ger. 585,194, Sept. 29, 1933.

8 Dressing rayon. Dubois & Kaufmann G. m. b. H. Ger. 585,512, Oct. 4, 1933. Rayon is dressed by treatment with an emulsion of oil-rubber. Thus, a dressing prepn. is made by grinding oil-rubber with Na alkylphthalene-sulfonate to form a paste with water.

Artificial wool. Gino M. Rossati. Ger. 585,780, Oct. 7, 1933. Jute or other vegetable fiber is treated with 25–30% alkali lye for 30–45 mins. at ordinary temps. The excess of lye is removed by centrifuge and the fiber dried till it commences to curl.

Apparatus for humidifying yarn. Frank J. Hejduk and Harry Sarfert. U. S. 1,941,087, Dec. 26. Structural and mech. features.

9 Apparatus for drying webs of fabric looped over the transverse bars of a traveling chain. Emil Wenzel. Brit. 398,344, Sept. 14, 1933.

Coated fabrics. Benjamin D. Porritt, John R. Scott and The Research Association of British Rubber Manufacturers. Brit. 397,506, Aug. 22, 1933. Waterproofed textile material consists of fabric made wholly or substantially of cellulose ester(s) and (or) ether(s) coated or impregnated with unvulcanized rubber (compn.). The

rubber compn. or soln. may contain fillers, pigments, antioxidants, softeners, etc.

**Coated fabrics.** Deutsche Gasglühlicht-Auer-Ges. m. b. H. (Ferdinand Stern, inventor). Ger. 588,282, Nov. 15, 1933 (Cl. 8/ 4). A coating of rubber or varnish is caused to adhere to the surface of a fabric impregnated with rubber, synthetic resin or glue, e. g., to artificial leather, by dusting the impregnated fabric with comminuted fibers, e. g., cotton fibers, at a stage when the impregnating agent is still tacky, and then applying the rubber or varnish coating in known manner. A roughened fabric may be used instead of the comminuted fibers.

**Coating fabrics with metals.** Siegfried Epstein. Brit. 396,978, Aug. 17, 1933. Socks, stockings, etc., are made from fabric coated with finely distributed metal or are coated, after manuf., with such metal. Zn, Ag, Cu, Al, etc., may be applied to the fabric or article by the Schoop metal-splatter process.

**Airplane fabric.** Guy C. Given, Harold W. Letts and Norman W. Thomson (to E. I. du Pont de Nemours & Co.). U. S. 1,940,212, Dec. 19. A taut fabric such as one of cotton or linen is provided with an undercoat film contg. cellulose nitrate and cellulose acetate, and with an overcoat film formed by coating over the undercoat film with a compn. comprising cellulose nitrate and a mixed solvent such as BuOAc, EtOH, EtOAc and toluene of such character as to have substantially no solvent action on the cellulose acetate in the undercoat film.

**Ornamented felts and felted materials.** Ferdinand R. Stirn (to F. & A. Stirn Corp.). U. S. 1,941,281, Dec. 26. A material suitable for hats, upholstery, etc., is prepd. by forming an embossed pattern on a felt, abrading the elevated portions of the embossed pattern, and then steaming.

**Bleaching threads.** Louis Penfaillit. Fr. 755,458, Nov. 25, 1933. Threads are creamed and bleached by treatment in a bath contg.  $Al_2(SO_4)_3$  and  $NaHSO_3$ , or an alkali sulfite, hyposulfite or metabisulfite and then submitting them to an ordinary bleaching such as treatment with  $Cl_2$ .

**Bleaching fur skins such as those of rabbits.** Wm. E. Popkin. U. S. 1,940,768, Dec. 26. The skins are impregnated with a colorless sol. cyclic oxidizing catalyst such as acetone bisulfite or formaldehyde and then subjected to an oxidizing bleaching action, as by  $H_2O_2$  or a persalt soln.

**Mercerizing.** I. G. Farbenind. A.-G. (Richard May, Karl Brodersen and Alois Waldmüller, inventors). Ger. 588,351, Nov. 15, 1933 (Cl. 8/ 2). The wetting properties of mercerizing lyes are improved by addn. of sulfonates obtained in purifying low-boiling mineral oil fractions with  $H_2SO_4$ . Cf. C. A. 27, 855, 3833, 4422.

**Bucking and mercerizing baths.** Moritz Freiberger. Brit. 398,958, Sept. 28, 1933. See U. S. 1,927,363 (C. A. 27, 5691).

**Paraffin derivatives containing nitrogen.** I. G. Farbenind. A.-G. and Arthur Carpmael. Brit. 398,510, Sept. 14, 1933. Addn. to 339,962 (C. A. 25, 2734). Those bases (or their neutral or basic salts) obtained according to 339,962 which still contain halogen are heated, with or without a Cu catalyst or an acid-binding agent and (or) a suitable diluent, at about 200–300° under ordinary or

1 elevated pressure to give bases having a lower halogen content, which are more unsatd. in character and may be used, as such or as salts of org. or inorg. acids, as auxiliary agents for the textile industry. Aq. solns. of the salts, particularly, have wetting, dispersing and softening properties and improve the fastness of substantive dyes to boiling  $H_2O$  and acid. The bases may be sulfonated according to Brit. 383,736 or by condensation with Na chloroethanolsulfonate to give other useful products for the textile industry. Among examples (1) the product of heating a tetrachlorinated hard paraffin with alc.  $NH_3$  at 100–200° in a closed vessel is heated at 200–215° a few hrs.; on adding alkali a pyro-base, almost free from  $Cl$ , is obtained; the base may also be heated in presence of dimethylamine to give a similar pyro-base, and (2) the base obtained by heating a hexachlorinated hard paraffin with alc.  $NH_3$  at 140–150° for some hrs. is heated with 3 addn. of powd. Cu, at 210–220° 2–3 hrs.

**Lubricating and sizing textile materials.** British Celanese Ltd., Harold M. Hibbert and Robert P. Roberts. Brit. 398,243, Sept. 11, 1933. Textile materials are lubricated or sized with an oil or fat obtained by completely or partly hydrogenating an oil or fat of the coconut oil group, e. g., coconut or palm-kernel oil. The oil may be applied as such or in soln. or emulsion and with or without other agents, e. g., plasticizers, swelling agents, 4 hygroscopic solids.

**Apparatus for scrubbing, sizing, starching, impregnating or otherwise treating fabrics.** James H. Bayliss, Derek G. Bayliss and Kenneth Bayliss. Brit. 399,006, Sept. 28, 1933.

**Waterproof fabrics.** Firma Ewald Dörken. Ger. 580,012, Dec. 1, 1933 (Cl. 8/ 1). Textile fabrics are impregnated with a compn. prepd. by heating pitch from the refining of fats with a metal oxide and an oxidizing agent, e. g., with  $PbO$ ,  $ZnO$ ,  $MnO$ ,  $Fe_2O_3$  or  $Al_2O_3$  and  $MnO_2$  or  $Pb_2O_4$ . Other pitches and other water-repelling agents may be added to the compn. The products may be used for covering railway trucks.

**Fibrous compositions containing rubber, etc.** Dunlop Rubber Co. Ltd., The Anode Rubber Co. Ltd. and Edward A. Murphy. Brit. 398,319, Sept. 14, 1933. Relatively long fibers, e. g., horsehair, pig's hair, jute, coconut fiber, kapok, cotton, rayon residues, are coated with flocculent or granular rubber, gutta-percha, balata, and other ppts., prepd. from aq. dispersions, and the treated fibers are interlocked into sheet or web, e. g., by felting or carding. The sheets may be vulcanized after compressing if desired. The ppts. are prepd. by coagulating in the presence of a relatively large quantity of  $H_2O$ , with or without coagulation retardants, e. g., KOH, casein, Na aluminate, glue, gum acacia.

7 **Rendering fibrous materials (such as cotton insulation on wire) noninflammable.** Rudolf Engelhardt (to I. G. Farbenind. A.-G.). U. S. 1,938,746, Dec. 12. The material is impregnated with an inorg. salt such as  $NH_4$  biphosphate in aq. soln., then dried and further treated with dichlorinated naphthalene.

8 **Fluid suitable for dry-cleaning clothes, etc.** Arnold Mohn (to Rhodes-Perry-Martin, Inc.). U. S. 1,910,688, Dec. 26.  $C_2H_2Cl_2$  and  $CCl_4$  are used together in relative quantities substantially in inverse proportion to their latent heats of vaporization.

## 26 PAINTS, VARNISHES AND RESINS —

A. H. SABIN

**Paint and varnish industry during 1933.** S. Marks and R. S. Morrell. *Ind. Chemist* 10, 24–6 (1934). E. H.

**A plan for a model paint factory.** Ching-Hsu Tsai. *Chem. Ind. (China)* 8, 153–89 (1933). Wm. H. Adolph

**Microextraction apparatus for use with small particles of paint film.** Rutherford J. Gettens. *Tech. Studies Field of Fine Arts* 2, 107–10 (1933).—A modification of the Hettlerich app. (C. A. 26, 2088), designed so that the paint particles are maintained in a fixed position during

9 extn. (thus facilitating transfer of the extd. pigment to a microscope slide), and so that the extd. vehicle may be recovered by transferring the liquid to a hollow-ground object slide and allowing evapn. of the solvent.

A. Papineau-Couture

**The problem of building protection. A new method of stone conservation with silicic acid-ester paints.** W. Graulich. *Tonind.-Ztg.* 57, 677 (1933).— $Si(OC_2H_5)_4$  prepd. from  $C_2H_5OH$  and  $SiCl_4$  is used in alc. soln. as a

paint drier, resulting in the formation of a  $\text{SiO}_2$  film through the hydrolyzing action of the moisture content of the air. It is also possible to produce heat-resistant coatings which withstand temps. up to  $1200^\circ$ . K. K.

**The problem of lining adhesives for paintings.** Geo. L. Stout and Rutherford J. Gettens. *Tech. Studies Field of Fine Arts* 2, 81-104 (1933).—A report of results obtained to date (but not considered conclusive in themselves) of empirical test on adhesives used for "lining" old paintings (a new canvas is attached to the back of the old). The most safe and effective adhesives developed up to date are those which are insol. in water and which do not require the application of org. solvents to reverse the soln.; these are the adhesives of the wax and wax-resin type. If they could be applied without any use of glue (or similar water-permeable and mold-growing substances) on the new canvas, and if the old canvas with its paint film could be rid of its latent infection, it seems likely that such adhesives would serve well in the conservation of oil paintings on cloth. A. Papineau-Couture

**Iron oxide mineral pigments of the United States.** Hewitt Wilson. *Bur. Mines Bull.* 370, 198 pp. (1933).—W. reviews the occurrence of mineral pigments and the nomenclature and common methods of classifying and testing many commercial mineral pigments. Results are given of tests for color, tinting strength, fineness of grain, oil absorption and content of Fe oxide on 274 samples of used and unknown minerals having possible pigment value; 46 samples from new deposits have possible value. Alden H. Emery

**The permanence of artists' pigments.** E. J. Hartung. *Chem. Eng. Mining Rev.* 26, 135 8 (1933).—Oxidation causes many changes in shade. Nonpermanent and permanent pigments are listed and briefly discussed. W. H. Boynton

**The relation between acid concentration and stability in writing inks.** Ming-Shan Hsieh. *Chem. Ind. (China)* 8, 22 50 (1933).—Data are recorded for ink prepd. from nut galls. The amt. of ppt. formed on standing is proportional to  $\text{pH}$ . Wm. H. Adolph

**Tung seed and oil from Empire sources.** II. Anon. *Bull. Imp. Inst.* 31, 327-34 (1933); cf. C. A. 27, 432. A sample of *Aleurites fordii* fruits from Bihar and Orissa, India, were of satisfactory compn., and contained a normal percentage of oil, which was apparently of good quality. A sample of *A. fordii* oil from Bihar and Orissa had the following characteristics:  $d_{4}^{20}$  0.9391, acid no. 0.2-0.3,apon. no. 192.3,  $n_D^{20}$  1.514, I no. (Wjs) 175.5, heat test (A. S. T. M.) 10.25 min., color pale yellow. Oil extd. in a lab. press from *A. fordii* grown in Nairobi, Kenya, in 1931 and 1932, resp., had the following characteristics: color (Lovibond, 1-cm. cell) red 0.30, 0.36; yellow 1.0, 1.4;  $n_D^{20}$  1.5181, 1.5181;  $d_{4}^{20}$  0.9361, 0.9358; heat test 12.25, 12.25 min.; acid value 0.6, 0.4; I value 167.7, 168.0; apon. value 192.6, 194.4. Oil cold-pressed in the lab. from *A. fordii* grown at Misiones, Argentina, had the following characteristics: color (Lovibond, 1-cm. cell) red 0.24, yellow 1.2, acid value 0.37, I value 167.0, heat test 11.5 min.,  $n_D^{20}$  1.5178,  $d_{4}^{20}$  0.9334. Comparative tests on the natural and artificial weathering of varnishes prepd. with oils of *A. montana* and *A. fordii* showed little difference between the 2 varnishes, but reliable conclusions can be drawn only from experience of some hundreds of preps. A. Papineau-Couture

**The aging of oil varnishes.** Pascal Snitter. *Bull. inst. pte* 1933, 223 36 (+9 tables).—Results are given of an extensive investigation into the aging of oil varnishes, more particularly from the standpoint of ascertaining, if possible, if there are any practical methods permitting of detg. quickly and scientifically the quality of a given varnish. Varnishes were prepd. according to a no. of different formulas, from the following materials: Benguela copal, raw and polymerized linseed oil, polymerized tung oil, Bordeaux spirit of turpentine (90% b. 155-70°, acidity less than 0.15%), white spirit (distg. 100-90°,  $d_{4}^{20}$  0.781), Co drier, Albertol 111L, Albertol 209L and rosin. Test panels were prepd. on wood (oak, beech) and metal (Al, duralumin, Zn and steel) and subjected to natural aging

(exposure to the weather) and artificial aging (action of distd.  $\text{H}_2\text{O}$ , natural  $\text{H}_2\text{O}$ , 3.3% NaCl, 0.1%  $\text{H}_2\text{O}_2$ , alternate immersion and emersion at 30-min. intervals in 3.3% NaCl at 55°, ultra-violet rays,  $\text{O}_2$  and heat (70°)). The changes in, or deterioration of, the varnish films were observed by means of Dixmier's app. (Dutron and Dixmier, C. A. 24, 3121; Fr. pat. 705,690, C. A. 26, 323), by detg. the rate of attack by elec. cond., and by means of the flexometer. In the latter instrument the test panel is gradually bent, the line at which bending is effected is observed under a magnifying glass, and the angle at which fissuring of the varnish film occurs is noted. Conclusions.

—The natural gum varnishes were superior to the Albertol varnishes as regards resistance to weather, but inferior as regards resistance to chem. agents; Albertols confer greater elasticity and resistance to attack than copal and rosin. Boiled oil (linseed or tung) is the ingredient which confers most elasticity and resistance to attack. Spirit of turpentine is a decidedly better solvent than white spirit. It improves resistance to weather and to chem. agents in proportion to its oil content; but the latter has autocatalyzing properties and acts as a drier, so that if present in excess it is injurious to the elasticity of the film. Cold immersion in 3.3% NaCl or alternate immersion and emersion in 3.3% NaCl at 55° is recommended for comparing the resistance to attack of varnishes of the same type. The elec. cond. method indicates the resistance of the film and also its impermeability to salt water or to weakly acid solns. Artificial aging methods are not satisfactory for evaluating the changes in elasticity of varnishes, because the results are not comparable to the effects of exposure to the weather. Use of the flexometer is recommended for following variations in elasticity. A. Papineau-Couture

**Weathering tests of nitrocellulose lacquers on wood, with various ground coats.** Fr. Kolke. *Nitrocellulose* 4, 206 8 (1933). By using suitable ground coats, the durability of nitrocellulose lacquers on wood can be improved. Lacquer coats are also improved by incorporating therein glyptal resins. E. M. Symmes

**Polished-wood imitations based on cellulose lacquers.** Adolf Rudolf. *Deut. Lackierzeitung* 13, 5 (1933); *Nitrocellulose* 4, 187 (1933). E. M. Symmes

**Formaldehyde condensations with phenol and its homologs.** II. Gilbert T. Morgan and N. J. L. Megson. *J. Soc. Chem. Ind.* 52, 418 20T (1933); cf. C. A. 24, 4286. —One g. mol. *m*-5-xyleneol was warmed with 1 g. mol.  $\text{CH}_2\text{O}$  and 0.5 cc. concd. HCl in 200 cc. alc. and extd. with  $\text{H}_2\text{O}$  and steam. Crystals deposited on cooling and extd. with benzene left *A* (m. 274-6°, soly. in boiling alc. 3.9 g./100 g.) and yielded *B* (m. 169.5°) and *C* (m. 168°) which were sepd. with hot petroleum. *A* was synthesized by refluxing 3.0 g. *p*-hydroxyhemimellityl alc. and 2.4 g. *m*-5-xyleneol 15 min. in 10 cc. alc. with 1 drop concd. HCl in 8 cc. alc., cooling, and crystn. from MeOH. *A* is thus identified as 4,4'-dihydroxy-2,2',6,6'-tetramethyldiphenylmethane (I). The dibenzoate of I (m. 148°) was prepd. from BzCl in pyridine and the tetrabromo deriv. (m. 246°) by bromination in cold AcOH. Both *B* and *C* are isomerides of I but definite formulas cannot be assigned. The bromo deriv. of *B* m. 230° and dibenzoate of *C* m. 130°. The resin residue of original condensation had a high volatile portion (25%). Ten g. *o*-4-xyleneol left standing with 32 cc. 40%  $\text{CH}_2\text{O}$  and 20 cc. concd. HCl in cold acetone, and extd. with hot  $\text{H}_2\text{O}$ , yielded 2.18 g. of *D* (m. 163°) and *E* (m. 164.5-6°). Benzene ext. of washed resin yielded *F* (m. 212-3°). *D* and *F* were synthesized by refluxing 0.5 g. *o*-4-xyleneol monoalc.

(CH:CMc:CMc:CH.C(OH):CCH<sub>2</sub>OH) and 0.5 g. *o*-4-xyleneol 15 min. with 2 drops 2 N HCl in 10 cc. alc., and extg. with hot water. *E* should be represented by 6,6'-dihydroxy-2,2',3,3'-tetramethyldiphenylmethane; *D* is probably the dissymmetric and *F* the symmetric isomeride. III. N. J. L. Megson. *Ibid.* 420-4T (1933).—Nqvolaks, produced by acidic condensations, are straight-chain polynuclear compds. with  $\text{CH}_2$  linkage. Their formation is easier the greater the possible no. of straight-chain isomer-

ides based on ortho-para directive influence of the hydroxyl. Resoles are straight- or branched-chain compds. which are produced in all condensations. Resites, obtained by heating, are irreversible structures made up of branched-chain macromols. Resoles or B-stage resins are only partly united macromols. P. S. Roller

**Catalysts in phenol-formaldehyde condensations.** E. Leighton Holmes and N. J. L. Megson. *J. Soc. Chem. Ind.* 52, 415-18T (1933).—The time of resinification with 40% formalin was measured for phenol, *m*-*s*-xlenol, *o*-, *m*-, and *p*-cresol and a low-temp. tar (b. 180-200°) in the presence of a no. of substituted amines and inorg. bases. The hyperbolic relation  $w(t - a) = b$  was found to hold where  $w$  = wt. of catalyst,  $t$  = time and  $a$  and  $b$  are consts. *m*-*s*-Xlenol reacts faster than *m*-cresol which in turn is faster than the other phenols. The order of reactivity for different tar fractions between 170° and 230° is that to be anticipated from the phenols which they contain. The time of heat hardening at 100° was exceptionally low for *o*-cresol, and decreased for *m*-cresol over 5-fold between 110° and 160°. P. S. Roller

**Theoretical aspects of urea-formaldehyde resins.** C. A. Redfarn. *Brit. Plastics* 5, 238 40 (1933).—The importance of  $p_H$  is emphasized. This is kept at 4.5 by the buffer action of HCOOH present in or formed from the CH<sub>2</sub>O. The following steps are formulated:  $\text{CO}(\text{NH}_2)_2 + 2\text{CH}_2\text{O} \rightarrow \text{CO}(\text{NHCH}_2\text{OH})_2 \rightarrow \text{CO}(\text{N}:\text{CH}_2)_2 \rightarrow (\text{CH}_2\text{NCO}\cdot\text{N}\cdot\text{CH}_2\cdot\text{CH}_2\cdot\text{N}\cdot\text{CONCH}_2)_x$ . Arnold M. Collins

**Paper and printing ink (Bekk) 23.** Rubber in paints (Stevens, Icaton) 30. Sapic acid, a constituent of American pine resin (Voeke) 10. Manuf. of synthetic masses, esp. those like linoleum (Foulon) 18. Brazilian resins as bandage material (Freise) 17. Detergents [products used in the manuf. of pigments] (Brit. pat. 398,818) 18. Artificial products [for making varnishes] (Fr. pat. 755,048) 18. Resin acids from raw tall-oil soap (U. S. pat. 1,940,372) 23. Anthracene derivs. [for coloring lacquers] (Ger. pat. 588,353 4) 25.

**Die Harze: Die botanischen und chemischen Grundlagen unserer Kenntnisse über die Bildung, die Entwicklung und die Zusammensetzung der pflanzlichen Exkrete.** Edited by A. Tschirch and Erich Stock. 3rd ed. revised by A. Tschirch. Die Harze und die Harzbehälter. Bd. I. Berlin: Gebr. Borntraeger. 418 pp. M. 47.25. Reviewed in *Ind. Chemist* 10, 32 (1934).

**Paints, etc.** Albin Winterling. Austrian 135,688, Nov. 25, 1933 (Cl. 45g.). A known substance for repelling flies and other insects is added to paints or dis-tempers. Specific compns. are described.

**Paints, etc.** Établissements Weeks (Soc. anon.). Fr. 750,668, Aug. 16, 1933. Pigments used in paints, etc., having a basis of nitrocellulose, synthetic resin, etc., are surrounded by a monomol. film of a fatty acid or an ester of a fatty acid, before incorporation in the base.

**Luminous paint.** I. G. Farbenind. A.-G. (Georg Meder and Konrad Schad, inventors). Ger. 585,541, Oct. 5, 1933. An embedding medium for the paint consists of polystyrene or its homologs or pure hydrocarbon derivs.

**Grinding mills for paints, lakes, inks, etc.** Anciens établissements le Clezio (S. à r. l.). Fr. 42,820, Nov. 4, 1933. Addn. to 743,656 (C. A. 27, 3835).

**Pigments.** Titanium Pigment Co., Inc. Ger. 588,230, Nov. 15, 1933 (Cl. 22f. 7). See Brit. 364,112 (C. A. 27, 1773).

**Pigments.** Titanium Pigment Co., Inc. Ger. 588,446, Nov. 23, 1933 (Cl. 22f. 7). See Brit. 364,562 (C. A. 27, 2050).

**Pigment and adsorbent from powdered coal, etc.** Carl A. Jacobson. U. S. 1,940,352, Dec. 19. Finely divided carbonaceous material such as coal, charcoal or wood is mixed with about an equal wt. of silicious material such as

1 diatomaceous earth and the mixt. is subjected to destructive distn. in a retort excluding air at temps. above the carbonizing point but not substantially exceeding 1100°; the resulting black product is classified by air flotation into at least 2 portions, a lighter portion having the properties of a black pigment and a heavier portion which can be used as an adsorbent for gases or as a filtering medium.

**Lead fluoride.** Léon Paindavoine. Fr. 754,721, Nov. 13, 1933. PbF<sub>2</sub>, for use in under-water paints, is obtained by pptn. from a soln. of a Pb salt (nitrate) by HF or an alkali fluoride. The HF may be obtained by the action of H<sub>2</sub>SO<sub>4</sub> on natural CaF<sub>2</sub> (previously bleached at above 500°) in the presence of a Na or K salt as catalyst.

**Lithopone.** Firma W. Sander. Ger. 589,128, Dec. 2, 1933 (Cl. 22f. 5). Lithopone is made fast to light by adding a compd. of Be during or after its manuf.

**Drying oils, paints, varnishes, etc.** Herman A. Bruson (to Röhm & Haas Co.). U. S. 1,939,622, Dec. 12. Siccatives are used such as the Al, Ba, Cd, Ca, Ce, Cr, Co, Cu, Au, Fe, Pb, Mg, Mn, Hg, Ni, Pt, Sr, Ti, Th, Sn, U, V and Zn salts of butylbenzoyl-*o*-benzoic acid, amylbenzoyl-*o*-benzoic acid, sec-amylbenzoyl-*o*-benzoic acid, di-sec-amylbenzoyl-*o*-benzoic acid, sec-hexylbenzoyl-*o*-benzoic acid, sec-octylbenzoyl-*o*-benzoic acid, sec-amyltoluyl-*o*-benzoic acid, sec-octyltoluyl-*o*-benzoic acid, sec-amyloxyloyl-*o*-benzoic acid, sec-octyloxyloyl-*o*-benzoic acid, sec-amylnaphthoyl-*o*-benzoic acid, sec-amylnaphthoyl-*o*-benzoic acid, sec-octylnaphthoyl-*o*-benzoic acid, etc.

**Oil-soluble basic salts of aroyl benzoic acids.** Herman A. Bruson (to Resinous Products & Chemical Co.). U. S. 1,939,621, Dec. 12. Salts, various of which are suitable for use as siccatives with oils, paints and varnishes, are formed from acids such as *p*-toluyl-*o*-benzoic acid, *p*-cymoyl-*o*-benzoic acid, sec-amylbenzoyl-*o*-benzoic acid, caprylbenzoyl-*o*-benzoic acid, etc., by reaction with Co-SO<sub>4</sub>, Al<sub>2</sub>(SO<sub>4</sub>)<sub>3</sub>, ZnCl<sub>2</sub>, Pb nitrate, MnCl<sub>2</sub>, Ni chloride or salts of Cu, U, Ba, Cd, Ca, Cr, Cu, Hg, Sr, Ti, Th, Sn, V, Au or Pt.

**Drier composition for use with oil-resin coating materials.** Charles A. Thomas (to Dayton Synthetic Chemicals, Inc.). U. S. 1,940,613, Dec. 19. A metallic drier such as Co resinate is used with a phenolic inhibitor of crystn. such as  $\beta$ -naphthol in proportions such as to prevent crystn. during drying of the coating film without retarding the rate of drying of the film.

**Flexible apron-loop drier for paints, pigments, "chemicals," etc.** Joseph Roberts (to Proctor & Schwartz, Inc.). U. S. 1,939,523, Dec. 12. Structural and mech. features.

**Printing inks.** I. G. Farbenind. A.-G. (Walther Lutkendorf, inventor). Ger. 585,167, Sept. 29, 1933. Aq. printing inks, which give waterproof print, are prepd. with a vehicle comprising an aq. dispersion of an oily or resinous condensation product which forms a water-insol. resin when exposed to air. Suitable condensation products are obtainable from polyhydric alcs., polybasic acids, and unsatd. higher fatty acids, or from phenol or urea, CH<sub>2</sub>O and drying oils.

**Apparatus for testing the properties of printing inks in films applied to different papers.** Fred W. Hoch. U. S. 1,939,814, Dec. 19. Various mech. and operative details are described.

**Apparatus and method for drying freshly printed webs.** Frank J. Tone (to Carborundum Co.). U. S. 1,941,328, Dec. 26. The freshly printed surfaces are carried by carrier webs having on their surfaces gritty material such as sand.

**Apparatus for drying freshly printed webs.** Edward R. Newcomb (to Carborundum Co.). U. S. 1,941,362, Dec. 26. Freshly printed webs such as those of Cellophane or the like are dried in contact with a layer such as woven fabric having grains of material such as feldspar upon its opposite sides and provided with depressed portions communicating with the longitudinal edges of the layer so as to provide air passageways when the material is wound into a roll.

**Coating composition.** Walter E. Lawson. (to E. I. du

Pont de Nemours & Co.). U. S. 1,938,662, Dec. 12. A coating compn. suitable for use on wood, etc., contains a polymerized vinyl ester such as polymerized vinyl chloride together with Chinawood oil, linseed oil, perilla oil or hempseed oil, etc.

**Coating compositions.** John W. Iliff and Paul Robinson (to E. I. du Pont de Nemours & Co.). U. S. 1,941,398, Dec. 26. See Brit. 396,081 (C. A. 28, 663<sup>4</sup>).

**Coating compositions.** The International Latex Processes Ltd. Fr. 754,577, Nov. 9, 1933. Granular or floccular ppts. of rubber, obtained from aq. dispersions, are mixed with powders of good covering power, such as kaolin, Spanish white, chalk or talc to form water paints, distempers, etc. Pigments, such as ZnO, lithopone, TiO<sub>2</sub> and ultramarine may be added.

**Coating compositions containing cellulose nitrate.** George R. Enslinger (to E. I. du Pont de Nemours & Co.). U. S. 1,939,076, Dec. 19. A compn. adapted to give non-opaque films comprises cellulose nitrate, pearl essence and an Fe, Cu, Co, Ni or Mn salt of a compatible character derived from a half ester of phthalic, sebacic, succinic, maleic, tartaric or malic acid.

**Composition for coating and insulating various materials.** Mortimer T. Harvey (to Harvel Corp.). U. S. 1,939,773, Dec. 19. A compn. which is suitable for coating metals, etc., is prepd. by heating the oil of the nut of *Sterculia foetida* at 38° or higher and discontinuing the heating before the polymerized oil reaches the rubbery state.

**Coating processes.** Allgemeine Elektrizitäts-Gesellschaft (to International General Electric Co., Inc.). Brit. 398,070, Sept. 7, 1933. Coatings of artificial resin are prepd. by spraying or squirting an amine-aldehyde resin of low softening temp., with or without the addn. of filling or softening material, e. g., powd. quartz, kaolin.

**Coating compositions for floor coverings.** R. I. du Pont de Nemours & Co., Wilmer F. Whitescarver and Horace H. Hopkins. Brit. 398,209, Sept. 11, 1933. Print paints for floor coverings comprise polyhydric alc.-polybasic acid resins modified with a resin acid such as rosin and pontianac gum. Examples describe the prepn. of resins with acid nos. of 5-20 by heating the components at 250-70°. CO<sub>2</sub> may be blown through the mixt. during heating. The resins preferably contain 50-95% rosin glyceride. Part of the resin acids may be replaced by drying or semidrying oils or their acids.

**Colored spirit varnishes.** Hermann Schladebach and Herbert Hähle (to General Aniline Works). U. S. 1,941,958, Dec. 26. Spirit varnishes are colored fast to light with a basic dye such as Victoria blue B or Crystal violet 6B and a spirit-sol. metal nitrate such as uranyl or Th nitrate. Cf. C. A. 27, 5560.

**Apparatus for ascertaining the drying time of varnish,** etc. Alfred M. Parks. U. S. 1,938,975, Dec. 12. The material under test is applied as a layer to a strip such as sheet metal, glass, wood or paper onto which while stationary a band of material such as corrugated rubber is applied at a known and regular rate per unit of time by a roller actuated by clockwork, thus producing markings on the layer under test until it dries.

**Synthetic lacquers.** Soc. des laques et matières plastiques. Fr. 755,422, Nov. 24, 1933. Comps. which are transformable by oxypolymerization into lacquers are made by the union of a polyphenolic compd. with an ethylenic compd., preferably of high mol. wt., and contg. one or more COOH functions (or their immediate derivs.). Thus, comps. are prepd. by condensing pyrocatechol with ricinoleic acid, Et ricinoleate, oleic acid, linoleic acid and olostearic acid, pyrogallol with ricinoleic acid and hydroquinone with oleic acid, in the presence of condensing agents. The comps. are converted to lacquers by heating.

**Coloring lacquers, waxes, fats, oils and natural or synthetic resins.** I. G. Farbenind. A.-G. (Hermann Schladebach and Herbert Hähle, inventors). Ger. 588,308, Nov. 15, 1933 (C. A. 22<sup>h</sup>, 4). An *o,o'*-dihydroxy azo dye, not contg. a free COOH or SO<sub>3</sub>H group, is dissolved in the liquid or fused material, and a heavy metal

1 salt of a soap-forming acid is then added, with or without an org. deriv. of NH<sub>2</sub>. Examples are given.

**Printing with half tones.** John P. Young (to Armstrong Cork Co.). U. S. 1,940,931, Dec. 26. In reproducing designs by printing on materials such as linoleum floor covering, a base color corresponding to the underlying tone of the design is printed; the design is photographed through filters of color complementary to the primary colors in the design; the photographs thus made are superposed, a half tone is made from the superposed photographs, and the half tone is used for printing over the base color.

**Resinous products.** Willard H. Woodstock (to Victor Chemical Works). U. S. 1,940,383, Dec. 19. Products which are of resinous character and suitable for rust-proofing coatings on metals are obtained by reaction between an aldehyde such as paraformaldehyde and a phosphorus amide (or a P chloride and NH<sub>3</sub>).

**Resinous products.** Imperial Chemical Industries Ltd. and Archibald Renfrew. Brit. 398,194, Aug. 29, 1933. Thermoplastic resinous material, e. g., polymerized methacrylate, is deacrated by subjecting to heat and pressure while covered by an inert liquid, e. g., H<sub>2</sub>O, alc., castor and hydrocarbon oils. The temp. used is sufficient to soften the mass without effecting curing. Among examples a block of polymerized vinyl acetate in a Sn vessel is covered with hydrocarbon oil and heated in an autoclave to 60° under 400 lb. per sq. in., the temp. then being allowed to fall in 12 hrs. to 20° before release of the pressure. The bubbles, which are all at the surface of the block, may be removed with the surface layers.

**Complex polymerization products.** I. G. Farbenind. A.-G. (Otto Jordan, Heinrich Hopff and Erich Kühn, inventors). Ger. 588,306, Nov. 18, 1933 (C. A. 22<sup>h</sup>, 2). Addn. to 580,234 (C. A. 27, 4943). The halovinyl or cyanovinyl compd. used in the process of Ger. 580,234 is replaced by a monomeric or not highly polymerized aliphatic, hydroaromatic or polycyclic aromatic vinyl compd. not contg. O, e. g., by a butadiene hydrocarbon, vinylacetylene or vinylnaphthalene.

**Complex polymerization products.** I. G. Farbenind. A.-G. (Leo Kollek and Hanns Ufer, inventors). Ger. 588,307, Nov. 18, 1933 (C. A. 22<sup>h</sup>, 2). Addn. to 580,234 (C. A. 27, 4943). The halovinyl or cyanovinyl compd. used in the process of Ger. 580,234 is replaced by a monomeric or not highly polymerized oxygenated vinyl compd. other than an ester, e. g., by a vinylalkyl ether or ketone.

**Plastic mass.** László d'Antal. Ger. 585,766, Oct. 9, 1933. Addn. to 538,800 (C. A. 26, 2333). The method of 538,800 for producing plastic linoleum-like masses by heating mineral oil-acid resins with vegetable oils is improved by using 20-60 parts by wt. of the former with 80-40 parts of the latter and heating till a homogeneous mass results. In an example, a mixt. of rape-seed and sunflower-seed oils is heated with acid resin.

**Condensation products.** I. G. Farbenind. A.-G. (Josef Binapfl, inventor). Ger. 584,967, Sept. 27, 1933. Products substituted in the *o*-position are produced by condensing natural resins or their derivs. substituted in the COOH group, with PhOH and introducing an alkyl-, aralkyl- or acyl-residue in the phenolic OH group by treatment with a suitable substance such as *n*-BuCl, benzyl chloride, etc. Examples are given. The products are resins with good mech. properties.

**Condensation products.** I. G. Farbenind. A.-G. (Josef Binapfl, inventor). Ger. 584,968, Sept. 27, 1933. Addn. to 582,847 (C. A. 28, 919<sup>1</sup>). The method of 582,847 for condensing phenols, natural resins and aldehydes is modified by using esters of acid natural resins instead of the resins. Examples are given.

**Condensation products of resinic acids.** Hans Krzikalla and Werner Wolff (to I. G. Farbenind. A.-G.). U. S. 1,940,092, Dec. 19. An aliphatic non-drying hydroxycarboxylic acid such as ricinoleic acid (or castor oil) is heated to above 200° (suitably about 260°) with a resinic acid such as abietic acid (or colophony). Products thus formed may be used as softening agents for celluloid, phenol condensation products, etc.

**Colophony.** Newport Industries, Inc. Ger. 585,529, Oct. 4, 1933. Colorless colophony crystg. with difficulty is prepd. by heating bleached purified resin from 10 min. to 8 hrs. to 260-325°.

**Hard light amber resin.** Charles A. Thomas (to Dayton Synthetic Chemicals, Inc.). U. S. 1,939,932, Dec. 19. A mixt. of hydrocarbons essentially comprising a terpene such as pinene and an alkyl benzene such as toluene or xylene is caused to react in the presence of a metallic halide catalyst, such as  $AlCl_3$ , by adding the latter (suitably while the materials are at a temp. of about 25-35°) until a resin having a predetd. I value is obtained (the I value varying inversely with the proportion of metallic halide catalyst used). Numerous examples are given.

**Resin solutions.** Andre Thiriet and Pierre Delcroix (to Produits Navarre). U. S. reissue 19,036, Dec. 26. A reissue of original pat. No. 1,759,526 (C. A. 24, 3002).

**Pectose resins.** Adolf Hawerlander (to Albert I. Stewart). U. S. 1,941,351, Dec. 26. Pectose, an aldehyde such as formaldehyde and a ketone such as dimethyl ketone are caused to react in the presence of an alkali such as KOH to obtain a product which yields an amber-like resin with  $HNO_3$  soln. and warm water treatment. U. S. 1,941,352 relates to the reaction of generally similar materials by heating at about the b. p. to form a sol. reaction product, then adding a hardening agent such as  $(CH_3)_2N_2$  and further heating to produce an infusible and insol. material.

**Transparent resins.** Thelma Muller née Benari. Fr. 755,331, Nov. 23, 1933. Transparent glass-like materials made by condensing  $CH_2O$  or its polymers with ureas, thioureas or mixts. thereof are molded in closed molds made of non-metallic materials, such as acid rocks, glass or plywood and the molded articles are dried in a moist medium until the sp. gr. no longer diminishes. Before completion of the drying the molded piece is submitted to a compression.

**Molding compositions including artificial resins.** Alfred R. Steele and Alexander Stewart (to Imperial Chemical Industries Ltd.). U. S. 1,941,059, Dec. 26. In prepg. a molding compn. of high bulk d. and low-moisture content a filling material is prepd. by subjecting material such as wood meal to treatment with a caustic soln. and kneading at an elevated temp., then removing the caustic soln. and reducing the moisture content, and the material thus prepd. is mixed with an artificial resin.

**Synthetic resins.** Arthur Runyan (to Sinclair Refining Co.). U. S. 1,938,642, Dec. 12. A mixt. comprising an ester such as triphenyl phosphate or tritolyl phosphate and an oxide of Ba, Ca, Zn or Mg is resinated by heating to

about 260-315°. The products thus obtained may be used in varnishes, for molding, etc.

**Synthetic resins.** Paul Haller and Hans Kappeler (to Ciba Products Corp.). U. S. 1,939,691, Dec. 19. For the manuf. of infusible synthetic resins, one mol. proportion of aniline is caused to react, in the presence of at least an approx. equiv. proportion of a strong inorg. acid such as  $HCl$ , with more than one mol. proportion of formaldehyde until a solid jelly is formed, followed by treatment of the latter with an agent such as  $NaOH$  soln. which substantially eliminates the effect of the inorg. acid, with subsequent washing and drying.

**Synthetic resin.** Wm. H. Moss and George W. Seymour (to Celanese Corp. of America). U. S. 1,940,727, Dec. 26. Allyl alc. is caused to react with cresol in the presence of  $ZnCl_2$  as a catalyst (suitably at a temp. of about 130°). The resulting product may be blended with cellulose acetate, etc. (various formulas being given).

**Synthetic resins.** Presswerk Königstein G. m. b. H. Ger. 585,657, Oct. 6, 1933.  $PhOH \cdot CH_2O$  resins contain about twice their own wt. of wood C and  $1/4$  of their own wt. of coke as filling material.

**Synthetic resins.** Soc. pour l'ind. chim. à Bâle. Ger. 585,061, Oct. 13, 1933.  $PhOH \cdot CH_2O$  resins are colored by indigoid or anthraquinoid vat dyes.

**Synthetic resins.** I. G. Farbenind. A.-G. (Karl Eisenmann, Erich Scholz and Karl Wolf, inventors). Ger. 588,426, Nov. 18, 1933 (Cl. 12o. 17.05). Urea (or thiourea) and  $CH_2O$  are condensed in the presence of an org. solvent contg. the OH group with the addn. of at least 50%, calcd. on the urea and  $CH_2O$ , of an ester which contains a free OH group in the alc. residue and is derived from a higher fatty acid and a di- or poly-hydric alc. The ester may be added before the condensation or later. When the condensation is completed, the solvent is distilled off and the product is heated until it becomes sol. in solvents not contg. the OH group, e. g., in hydrocarbons, esters and ketones. Preferably, the product is stirred or kneaded while it is heated. The final products form solid solutions with fatty oils, and are useful as components of lacquers. Dimethylol-urea and -thiourea, or the products obtainable therefrom by dehydration, may also be used as starting materials. Examples and numerous details are given.

**Synthetic resins.** I. G. Farbenind. A.-G. Fr. 755,316, Nov. 23, 1933. A polymeric vinyl alc. is condensed with an aldehyde in an anhyd. or practically anhyd. medium, the water formed during the reaction being removed by  $CaCl_2$  or other dehydrating agent, or by distn. along with an inert diluent insol. in water, during the reaction.

## 27 - FATS, FATTY OILS, WAXES AND SOAPS

L. SCHLUBERL

**Oils, fats and soaps in 1933.** Rex Furness. *Ind. Chemist* 10, 21-3(1934).

**Studies on Twitchell reagents. IX. The fat-splitting power of three kinds of Twitchell reagents and the darkening of fatty acids hydrolyzed by them.** Kyo-suke Nishizawa and Arihiro Tominaga. *J. Soc. Chem. Ind., Japan* 36, Suppl. binding 681-4(1933); cf. C. A. 26, 1145; 27, 200.

**A new unsaturated acid in the kernel fat of "akarittom," *Parinarium laurinum*.** II. Mitsumaru Tsujimoto and Hanji Koyanagi. *J. Soc. Chem. Ind., Japan* 36, Suppl. binding 673-5(1933); cf. C. A. 27, 3099. The chem. constitution of the new acid was investigated by the ozone method. As the chief products of decompn. azelaic acid and probably azelaic semialdehyde were obtained. The provisional formula given in the previous paper should be withdrawn as erroneous. No definite constitution is given for the acid, but it may be identical with coucopic acid.

Karl Kammermeyer

**Micro method for the determination of iodine numbers.** J. O. Ralls. *J. Am. Chem. Soc.* 56, 121-3(1934).—A method is described which is applicable to samples of from

0.75 to 25 mg. and which permits the detn. of total halogen consumed and the halogen acid produced, on a single sample. Results are given for 30 compds. IBr is used as the reagent and  $CCl_4$  as the solvent.

**The glass electrode and sulfonated oils.** I. D. Burton and G. F. Robertshaw. *J. Intern. Soc. Leather Trades Chem.* 18, 19-22(1934).— $pH$  values of several sulfonated oils at different dilns. were measured with the glass electrode, with the quinhydrone electrode, colorimetrically, and with the H electrode. The last gave much lower results because of poisoning; results by the other 3 methods were in substantial agreement. Best checks were obtained with the glass electrode. The  $pH$  values of the oils employed decreased on increasing diln. and increased on addn. of mineral oil.

H. B. Merrill

**The oil of "karasumi."** Mitsumaru Tsujimoto. *J. Soc. Chem. Ind., Japan* 36, Suppl. binding 676(1933). Karasumi is the salted and dried ovary of gray mullet, *Mugil japonicus*. The oil was found to be a liquid wax and resembled sperm oil and inguandaram oil, but differed from them in the higher unsatn. of the acids and the large content of cholesterol. Cetyl alc. and octadecenol were

also present. The properties of the oil are  $d_4^{20} = 0.8818$ ,  $n_D^{20} = 1.4695$ , acid value = 16.0, sapon. no. = 120.1, I no. = 130.6, unsaponifiable matter = 40.64%.

Karl Kammermeyer

**Characteristics and composition of Wisconsin-grown tobacco-seed oil.** Willard L. Roberts and H. A. Schuette. *J. Am. Chem. Soc.* 56, 207-9 (1934).—That it forms a film on exposure to air is perhaps the earliest characterization which tobacco-seed oil has received. As a result, practically all investigators since that time have classified it as a drying oil. If this classification is a valid one, then this oil is unusual in that it contains none of those highly unsatd. acids usually associated with products of this type. Its predominating unsatd. acid is linoleic acid, which apparently is present here in 2 isomeric forms. In much smaller amt. is found oleic acid. The av. compn. of these oils is: palmitic acid 3.1, stearic acid 4.8, oleic acid 16.2, linoleic acid 70.4, unsaponifiable matter 1.25%. Insofar as comparable data are available, it appears that the phys. and chem. const. of Wisconsin-grown oils fall within the limits of those reported by others but not so the chem. compn. This is perhaps explainable on the ground that the compn. reported by several others represent mere approximations. Chem. and phys. characteristics are given for the extd. and expressed oil. C. J. West

**Shea kernels from Nigeria.** Anon. *Bull. Imp. Inst.* 31, 334-41 (1933); cf. *C. A.* 27, 437.—Seven samples of shea kernels were picked from each of 2 individual trees at different stages of maturity and analyzed. **Conclusions.**—The oil content of the kernels increases and the unsaponifiable content of the oil decreases as the kernel ripens. The unsaponifiable content of the fresh kernels remains more or less const. throughout the period of ripening. The unsaponifiable content of the oil remains practically const. once the kernels have reached maturity. The lower the oil content of the kernels, the higher the unsaponifiable content of the oil. It is suggested that the unsaponifiable constituent is present in the nuts at an early stage of their development, before the formation of the oil begins; that it remains more or less const. in amt. during the secretion of the oil, and that consequently as the seed ripens the percentage of unsaponifiable constituents in the oil falls proportionately as the oil content increases. A. P.-C.

**Effect of carbon dioxide on the growth of molds which attack oil seeds in storage.** N. I. Kayukova. *Schriften zentral. biochem. Forschungsinst. Nahr.-Genussmittelind.* (S. S. R.) 3, 193-218 (1933).—The  $CO_2$  accumulating from respiration of moist oil seeds inhibits mold growth. Higher  $CO_2$  concns. are more effective; at 80%  $CO_2$  growth is very slow and at 90% it is practically stopped for molds, with only slight growth of yeasts and bacteria persisting. Decreasing the  $O_2$  concn. to 4% had no effect. Flavored is more susceptible than soy beans to preservation by  $CO_2$ . Julian F. Smith

**Studies on Chinese wax. I. The composition of fatty acids.** I. Ryosei Koyama. *J. Chem. Soc., Japan* 54, 1233-7 (1933). The wax-producing insect, *Erytherus pela* Chevannel, grown on the plant *Ligustrum ovalifolium* is extd. with ether and  $C_6H_6$ . The yield is 87%. It consists mainly of ceryl cerotate with less melissyl cerotate. The acids identified are chiefly stearic and oleic acids with less myristic, palmitic and arachidic acids. The presence of dihydrolaganic acid is also confirmed. K. Kitsuta

**New source of sucrose [de-oiled peanut cake]** (Lamy-lorillon) 28. Treating cacao waste [to ext. cacao butter] (U. S. pat. 1,939,178) 13. Filter for oils (U. S. pat. 1,938,934) 1. Oil filter (U. S. pat. 1,941,311) 1. Fatty acids from raw tall-oil soap (U. S. pat. 1,940,372) 23. Coloring waxes, fats, oils (Ger. pat. 588,308) 26.

**Stearin and paraffin.** A. Motard & Co. A.-G. Ger. 585,756, Oct. 7, 1933. A method of obtaining the above in small globules by dropping is described.

**Utilization of fatty acid distillation residues.** Henkel & Cie G. m. b. H. (Hans Leue, inventor). Ger. 588,376, Nov. 17, 1933 (Cl. 23c. 2). The unsaponifiable residue

from the vacuum distn. of fatty acids is used as an emulsifying agent or as an addn. to soaps, cosmetics, ointments, disinfectants, polishes, sizes, adhesives, etc.

**Modified fatty oils.** Firma Louis Blumer. Ger. 585,187, Sept. 29, 1933. Products of the stand-oil type are prepd. by heating fatty oils to about 250° in the presence of a halogenated org. compd. as a catalyst, e. g., *p*-toluene-sulfonyl chloride or a chlorinated fatty oil.

**Purifying oils.** Camille Deguide. Fr. 754,856, Nov. 10, 1933. A Ba soap, obtained by sapon. a fatty substance with crystd.  $Ba(OH)_2$ , is used for purifying oils.

**Refining animal and vegetable oils, fats and waxes.** Ludwig Rosenstein and Walter Jacob Hund. Ger. 589,284, Dec. 8, 1933 (Cl. 23a. 3). See Can. 328,300 (C. A. 27, 1225).

**Continuous apparatus for extracting fatty oils, etc.** Hanscatische Mühlenwerke A.-G. Ger. 589,233, Dec. 4, 1933 (Cl. 23a. 2).

**Continuous extraction and filtration apparatus suitable for extracting oils from seeds.** Philipp L. Fauth. U. S. 1,940,585, Dec. 19. Various structural and operative details of a rotary-drum app. are described.

**Apparatus for extracting oils, fats and waxes by means of solvents.** Lothar Martinus. Ger. 585,435, Oct. 10, 1933.

**Continuous apparatus for distilling solvents from extracted fatty oils and for deodorizing the oils.** Philipp L. Fauth G. m. b. H. Ger. 588,084, Nov. 13, 1933 (Cl. 23a. 2).

**Testing oils by measuring the light passing through an oil film of definite thickness on a transparent slide.** Virgil A. Schoenberg. U. S. 1,940,373, Dec. 19. Various details of app. and operation are described.

**Tubercle waxes.** Carl L. Lautenschlager (to Winthrop Chemical Co.). U. S. 1,940,174, Dec. 19. For making tubercle waxes free from any tubercle bacilli and tuberculin, the waxes, after being freed from the greater part of the tubercle bacilli and fatty matter, are treated with a dil. acid and are then further purified by repeated solution by means of org. solvents insol. in water such as ether and pptn. by means of water-sol. org. solvents such as alc.

**Substantially anhydrous per-salt soap.** Adolf Welter. U. S. 1,940,570, Dec. 19. A product readily sol. in water is prepd. by mixing about 100 parts of highly split, saponifiable and satd. acids of nondrying oils such as coconut and tallow oils with 44 parts of calcined soda, permitting saponification by the spontaneous heat of reaction, stirring the mass until it becomes stiff, adding 15 parts Na perborate and shaping the material as desired before it becomes cold and brittle.

**Shaving soap mixture.** Robert F. Smith. U. S. 1,940,026, Dec. 19. A major proportion of a lathering soap is mixed with minor proportions of a salt of alginic acid such as Na alginate, a slippery inert inorg. filler such as talc and water.

**Soap-cooling machine.** Weber & Seeländer, Maschinenfabrik. Ger. 589,222, Dec. 4, 1933 (Cl. 23f. 1).

**Soap powder.** Adolf Welter. Ger. 588,488, Nov. 20, 1933 (Cl. 23e. 2). Curd soap heated to above 100° is sprayed with the aid of a compressed gas which is introduced into the vessel contg. the soap before the latter is heated to the required temp.

**Barium soap for lubricating grease.** Camille Deguide. Brit. 398,402, Sept. 14, 1933. See Fr. 746,309 (C. A. 27, 4707).

**Cleansing agent.** Inspro Products Ltd. Fr. 755,264, Nov. 22, 1935. A cleansing agent is composed of a mixt. of gelatinous  $SiO_2$  and a soln. of soap and water.

**Wetting and other agents.** I. G. Farbenind. A.-G. Fr. 755,143, Nov. 20, 1933. Monomeric aliphatic aldehydes or ketones contg. more than 6 C atoms are caused to react with org. substances which will form products sol. in water, or which allow of the introduction of groups causing soly. in water, these groups being introduced if necessary. Examples of aldehydes are lauric, stearic, oleic, ricinoleic, capric, myristic and palmitic aldehyde, of ketones, heptadecyl methyl, diheptadecyl, undecyl methyl, penta-

decenyl methyl ketone or laurone. Products with which they are caused to react include glycerol, sorbitol, Grignard reagents, HCN, aldehydes or ketones contg. up to 9 C atoms, mono-, di- or tri-alkylamines and sulfonic acids of alcs. Several examples are given.

**Wetting, emulsifying and washing agents.** I. G. Farbenind. A.-G. (Hans Beller and Hermann Schütte, inventors). Ger. 588,130, Nov. 13, 1933 (Cl. 12o. 23.-02). Liquid or solid paraffin or naphthene hydrocarbons are subjected to partial oxidation in known manner until practically no unoxidized hydrocarbon remains, and the products are sulfonated.

**Urethans.** I. G. Farbenind. A.-G. (Heinrich Ulrich and Karl Saurwein, inventors). Ger. 585,161, Oct. 6, 1933. Aliphatic or cycloaliphatic aminocarboxylic or

aminosulfonic acids, or their substitution products not contg. a hydroxyalkyl group, are condensed with chlorocarbonic esters of alcs. or substituted alcs. contg. 4 or more C atoms. Thus, octadecyl chlorocarbonate may be added to an aq. NaOH soln. of *N*-methylaurine and the mixt. warmed to 80°, this yielding the urethan  $C_{18}H_{37}OCON(CH_2)_{17}CH_2CH_2SO_3Na$ . Examples are given also of the prepn. of  $C_{18}H_{37}OCONHCH_2COONa$ ,  $C_6H_{11}OCON(C_4H_9)_2$ ,  $CH_3CH_2SO_3Na$ ,  $CH_3(CH_2)_7CHOH(CH_2)_8OCON(CH_2)_7CH_2CH_2SO_3Na$ ,  $CH_3(CH_2)_8CHOH(CH_2)_8OCON(C_2H_5)_2$ ,  $CH_3COONa$ , and a urethan from glycine and 1,3-butylene glycol monochlorocarbonate. The products are useful as *wetting, dispersing and cleansing agents*. They may be sulfonated, if necessary, to confer soly. in water. Cf. C. A. 28, 594<sup>4</sup>.

## 28—SUGAR, STARCH AND GUMS

J. K. DALE

**Key for the determination of the varieties of sugar cane grown in Tucumán.** G. L. Fawcett. *Rev. ind. agr. Tucumán* 23, 87-99 (1933).—Over 90 varieties of sugar cane grown in Tucumán are classified by a key described in detail in which the following features are used in descending order of importance: color of stalk, presence of mosaic disease, thickness of barrel, shape and size of bud, node and groove, no. and size of auricles, hairiness of sheath, other features. Nelson McKaig, Jr.

**Which is the better cane, P. O. J. 36 or P. O. J. 213?** Wm. E. Cross. *Rev. ind. agr. Tucumán* 23, 109-11 (1933); *Circ. estac. expl. agr. Tucumán* 1933, No. 37.—Review of the relative agronomic and mfg. merits of the 2 varieties. Nelson McKaig, Jr.

**Another mutation of P. O. J. 36 of greater productivity. The sugar cane "Paz Posse."** Wm. E. Cross. *Rev. ind. agr. Tucumán* 23, 104-8 (1933); *Circ. estac. expl. agr. Tucumán* 1933, No. 35; cf. C. A. 28, 671<sup>7</sup>.—The sugar canes are similar in appearance although "Paz Posse" (I) is somewhat darker purple, is more vigorous, sprouts earlier, is less mature throughout the harvest season and is more resistant to injury by freezing than P. O. J. 36 (II). Expts. since 1928 indicate I produces more cane and somewhat more sugar per hectare than II and the juice of I is about 1% lower in Brix solids and purity. Nelson McKaig, Jr.

**New source of sucrose.** Lamy-Tortillon. *Circ. heb. fabr. sucre, Suppl.*, No. 2336, (Dec. 31, 1933).—Deoiled peanut cake often contains as much as 10% sucrose, which can be recovered by extg. with 66% EtOH.

O. W. Willcox  
**Control of sugar boiling by electric conductivity.** Courrière. *Circ. heb. fabr. sucre, Suppl.*, No. 2333, (Dec. 10, 1933); cf. C. A. 27, 4948.—Historical, showing priority of C. O. W. Willcox

**Thermophil bacteria in sugar, especially sugars of Dutch origin.** L. N. S. Homans. *Tijdschr. algem. tech. Ver. Bietwortsuikerfabr. Raffin* 29, 29-49 (1933).—All 3 classes of organisms noted by American investigators as causes of spoilage of canned foods were found in various European sugars; Dutch sugars contained sulfate-spoilage bacteria in numbers greatly exceeding those reported from America. To det. these bacteria it is best to make the yeast-water by heating a 20% suspension of yeast in water in an autoclave for 20 min. at 120°; this water is used with 1% of  $Na_2SO_4$ , iron being supplied as Fe wire instead of  $FeCl_3$ . O. W. Willcox

**Yeasts found in fermented maple sirup.** F. W. Fabian and Harlow H. Hall. *Zentr. Bakt. Parasitenk.*, II Abt. 89, 31-47 (1933).—The ant. of alc. in samples of fermented maple sirup from which yeasts were isolated ranged from 0.83 to 2.66% by wt. Sterile maple sirup inoculated with yeasts isolated from fermented maple sirup, in a moist atm., required 21-29 days to show visible fermentation. The moisture content of fresh sirup ranged from 26.3 to 36.5%. All samples showing visible

fermentation had moisture contents between 32.7 and 34.6%.

John T. Myers  
**Volume of sugar-beet marc and its adsorptive effect.** S. J. Osborn. *Ind. Eng. Chem., Anal. Ed.* 6, 37-40 (1934).—Detns. of marc vol., including the Pb ppt., by the method of Osborn and Brown (C. A. 26, 6173) gave values from 0.84 to 1.10 ml., av. 1.0 ml. No significant difference was found when 6, 7 or 8 ml. of Pb soln. was used per normal wt. The effect of  $H_2O$  adsorbed by the marc on the vol. of the latter is difficult to det. polarimetrically; tests made indicated that the effect is small in the hot-water digestion method, although perhaps justifying a slightly higher marc allowance than 1.0 ml.

F. W. Zetban  
**Consistency of potato-starch size.** Walter T. Schreiner, M. N. V. Geib, and O. C. Moore. *Bur. Standards J. Research* 11, 705-73 (1933) (Research Paper No. 623). Lab. expts. show that the decrease in consistency of size is dependent upon the temp. of cooking, speed of agitation, and length of the cooking period. The addn. of a soln. contg. small quantities of dispersed lecithin and lanum to the sweet potato-starch size materially retarded the decrease in consistency—a fact as yet not fully explained. The treatment of sweet potato size with solns. of sol starch and certain salts resulted in a great consistency of size but the rate of breakdown was not materially affected. Changes in consistency seem to be less in sweet potato starch than in Irish potato starch. W. H. Boynton

**Fertilizing of sugar cane (Dodds) 15.** Effect of manure on the tonnage and the juice of sugar cane (McRae) 15. Various N fertilizers for stock beets (Engels) 15. Effect of various treatments of sugar-cane cuttings on the rate and extent of germination and the yield of cane (McIntosh) 11D.

**Recovery Nomograms [for sugar manufacture]** Port Louis, Mauritius: The General Printing & Stationery Co. Ltd. 5 rupees.

**Apparatus for automatic control of processes such as sugar refining.** Jacob J. Neuman. U. S. 1,939,143, Dec. 12. Various structural, mech. and elec. details att. described.

**Apparatus for concentrating-sugar solutions.** Wilhelm Schildener. Ger. 585,973, Oct. 14, 1933.

**Extrinsizing starch in cereals.** Hans F. Bauer (to Stah, Hall Mfg. Co.). U. S. 1,938,574, Dec. 12. A product which is suitable for use in foods, adhesives, etc., is prepd. by treating corn kernels or other cereal material with a non-starchy liquefying agent such as  $NaHSO_4$  and with a starch-conversion agent such as HCl and heating the mixt. (suitably at a temp. of about 250°).

**Gelatinized corn-starch product suitable for use in adhesives, sizes, core binders, etc.** Fred O. Giesecke (to International Patents Development Co.). U. S.

1,939,978, Dec. 19. A product which may contain starch 82, protein 6, sol. substances 9-10, dextrin 9 and oil 0.7 % and may have a capacity for water absorption of about 16 to 8 is prepd. from "mill starch" by partial dewatering to a water content of about 40% and passing between rolls heated by steam under pressure.

## 29—LEATHER AND GLUE

ALLEN ROGERS

**Theory of tannage.** Edmund Stiasny. *Cuir tech.* 22, 352 3 (1933).—A brief summary of Stiasny's views.

H. B. Merrill

**Characteristics of vegetable tanning materials.** III. The influence of aging of vegetable-tanned leather on its content of combined tannin. Fritz Stather. *Collegium* 1933, 612-17; cf. *C. A.* 27, 4951.—Hide powder was shaken 4 hrs. with 3°Bé. tannin ext., then washed until tannin free, either at once or after aging. The increase in wt. after drying was considered combined tannin. Combined tannin increased with time (3 to 30 days) and temp. up to 40°, but did not increase from 40° to 60°. Influence of atm. was slight or irregular; the 4 conditions tried were: storage over water; H<sub>2</sub>SO<sub>4</sub>; dry O; or dry N.

Ira D. Clarke

**Sulfiting and decolorizing quebracho extract.** A. Dohogue. *J. Intern. Soc. Leather Trades Chem.* 18, 6 4 (1934).—Color is diminished by replacing part of the Na<sub>2</sub>SO<sub>3</sub> by NaHSO<sub>3</sub>, but duration of sulfiting is thereby increased. Adding HCOOH after sulfiting decreases the color. The decrease is related to reduction in *p<sub>H</sub>* value.

H. B. Merrill

**Catechu and present-day interest in its production.** J. Heim de Balsac, A. Wahl and H. Heim de Balsac. *Halle aux cuirs* 1933, 259-62, et seq.—A review of the history, sources, compn., and uses of catechu, especially in dyeing.

H. B. Merrill

**Determination of chromium and iron in liquors and leathers.** Max Bergmann and Ferdinand Mecke. *Collegium* 1933, 609 12; cf. *C. A.* 24, 1313.—The perchloric acid method can be applied to Cr liquors or leather by digesting very slowly in Kjeldahl flasks to prevent loss of Cl by spattering or as chromyl chloride.

I. D. C.

**An interesting damage to dry goatskins.** Eugen Belavsky. *Collegium* 1933, 551 5.—Stains were of 2 kinds: lesser stains caused by fat and more serious stains caused by the curing salt (Indian "Kharri" salt).

I. D. Clarke

**The variable action of acids on animal hide and the latest methods for detecting harmful acids in leather.** Gerhard Otto. *Collegium* 1933, 586-602; cf. *C. A.* 27, 5573. From hide substance said. with the acid, HCl could be washed out easily, H<sub>2</sub>SO<sub>4</sub> slightly less easily, an acid dye with difficulty and a substantive dye and a tanning sulfo acid I (condensation product of β-naphthalene-sulfonic acid and HCHO) practically not at all. For irreversible fixation mol. size has a decisive role. Irreversibly fixed acid will replace a hydrolyzable acid (as HCl, H<sub>2</sub>SO<sub>4</sub>); it will change the isoelec. point of hide powder from *p<sub>H</sub>* 4.9 toward the acid side. Hide substance completely satd. with I is no longer amphoteric and has a *p<sub>H</sub>* of 3.0; this value of 3 is important in connection with the deterioration of leather by acid on aging (cf. *C. A.* 23, 4367, 25, 3868; 27, 2334). Hide substance tanned with I will absorb less mineral acid from a given soln. than if vegetable tanned, and after the acid treatment it will deteriorate less on heat-aging. The presence of destructive acid in vegetable-tanned leather can be detd. by electrometric titration of an aq. ext. of the leather. If tan *φ* is greater than 0.75 harmful acid is absent; *φ* is the angle between the titration curve and *p<sub>H</sub>* 4.0 to 5.5 and the ordinate axis.

Ira D. Clarke

**Experimental study of animal intestine products.** L. M. Horovitz-Vlasova. *Izvestiya Tsentral. Nauch.-Issledovatel. Inst. Pishchevoi Vkhosovoi Prom.* Separate, 1931, 5 38.—The literature of red staining of salted intestine products, fish, hides, etc., is reviewed. The organism responsible for reddening is named *Tetracoccus carneus halobius*; it is widespread and requires strict general

antiseptic control, with the added precaution of storage below 5°. Blue staining is caused by reaction between tannins in wood tubs and Fe salts; the tubs should be treated to ext. tannins before use, and Fe salts should be excluded. "Rust" is well named, for it is actually caused by Fe oxides deposited in the intestine walls; the intestine should be kept away from Fe and salted with Fe-free salt. *Dermestes lardarius*, the chief pest of dried intestine, can be destroyed (insects, larvae and pupae) by fumigation with CCl<sub>4</sub>, which is better than gasoline or SO<sub>2</sub>, because it has no fire hazard. The salt commonly used is superior to the substitutes sometimes proposed, but should be Fe-free and protected from halophilic bacteria. Linden or aspen tubs are better than oak or beech, having less tannin. "Folliculosis" in intestine products comes from worm (*Strongylois nodularis intestinalis*)-infested animals; the best prevention is veterinary inspection before slaughter. So-called artificial brines have little superiority over the natural brines. Manuf. of intestine products should be subject to strict lab. control for dependable, profitable results.

Julian F. Smith

**Microbiological studies of salt in relation to the reddening of salted hides.** L. S. Stuart, R. W. Frey and Lawrence H. James. U. S. Dept. Agr., *Tech. Bull.* 383, 1-23 (1933).—An examn. of 165 samples of com. salts for the presence of microorganisms that cause reddening of hides and skins showed that 34 out of 35 samples of crude solar-evapd. salts and 25 out of 39 open-pan-evapd. grainer salts were contaminated with red chromogens. All kiln-dried solar-evapd., vacuum-pan evapd. and mined salts were found to be free from these organisms. A modification of Clayton and Gibbs (*C. A.* 21, 3922) fish-salt-rice medium in which fish broth was replaced by hide broth was found to be reliable for culturing salts to det. the presence of these red chromogenic microorganisms. No correlation was found between the *p<sub>H</sub>* of the salts and the presence of the organisms. Relatively high humidities and slightly alk. conditions are favorable to reddening. Cultural studies of red chromogenic growths on media of high concns. of salt showed them to consist usually of a highly mixed microbial flora. When the mixed cultures were subcultured in dextrose broth and then on dextrose agar, a group of organisms capable of causing reddening was isolated in apparently pure cultures. Studies of the salt tolerance of these organisms showed that their ability to withstand high concns. of salt is markedly enhanced by repeated propagation on media of high salt content.

W. H. Ross

**Report on practical salting experiments in 1932.** M. Bergmann and W. Hausam. *Ledertech. Rundschau* 25, 100-4, 114-16 (1933); cf. *C. A.* 27, 1779.—Calfskins cured 6-8 weeks with soda salt and 1-3% naphthalene had few salt, red or violet stains as compared to skins cured with salt alone. Naphthalene was distinctly advantageous. NaF was poorer than soda-salt-naphthalene. 3700 skins were used.

I. D. Clarke

**Quality of vegetable-tanned sole leather.** I. Robert H. Marriott. *J. Intern. Soc. Leather Trades Chem.* 18, 22-34 (1934).—In general the total wt. of material assoc. with 100 g. hide substance is lower for the higher-priced leathers.

H. B. Merrill

**Study of grease stains on leather.** I. Cause of grease stains on vegetable-tanned heavy leather. John H. Highberger and E. K. Moore. *J. Am. Leather Chem. Assoc.* 29, 16-37 (1934).—Most stains are due to excessive natural skin fat, laid down in the corium during the life of the animal; some stains appear to be due to uneven absorption of oil during oiling. Absorption of oil de-

creases with increase of natural fat. No relation is found between grease stains and degree of tannage. Skins of excessive natural fat content can be detected in the cured state by a simple sp. gr. test ( $< 1.225$  by flotation method in sugar soln. with fleshed, hair-clipped sample). About 80% of stained leather can be predicted by this test.

H. B. Merrill

The physical testing of artificial leather. Walter M. Münzinger. *Nitrocellulose* 4, 219(1933); cf. C. A. 27, 625.—The necessity of control tests during manuf. is emphasized.

E. M. Symmes

The glass electrode and sulfonated oils (Burton, Robertshaw) 27. Utilization of *Caesalpinia spinosa* [in finishing leather] (Castiglioni) 18. Spent sulfite liquor [use as tanning material] (Vogel) 14. Detergents [products used in tanning] (Brit. pat. 398,818) 18. Glue product (U. S. pat. 1,940,486) 18. Coated fabrics [artificial leather] (Ger. pat. 588,282) 25. Sulfonating rubber [products used as tanning agents] (Ger. pat. 585,622-3) 30.

Treatment of hides. Chem. Fab. Schwalbach A.-G. Ger. 585,080, Sept. 28, 1933. Delimed and bated hides are treated with a mixt. contg. an ester of a lower mono-basic aliphatic acid and subordinate amts. of MeOH and an aliphatic ketone. A suitable mixt. is obtained in the distn. of wood. The hides are dried after the treatment, and are then ready for tanning.

Treatment of hides or leather. I. G. Farbenind. A.-G. (Richard Alles, inventor). Ger. 589,175, Dec. 4, 1933 (Cl. 28a. 3). Hides are treated before, during or after tanning with complex compds. formed from chromic salts and urea. The complex compds. may be used alone or mixed with other compds. which do not form a ppt. with the complex compds. or which form a ppt. which redissolves in an excess of the added compd. Suitable addns. to the complex compds. are  $Al_2(SO_4)_3$ ,  $MgSO_4$ ,  $(COOH)_2$ , *p*-toluenesulfonic acid and wetting agents contg. a sulfo group. The complex compds. or the mixts. contg. them form insol. ppts. in the hides or leather with compds. of high mol. wt. which would otherwise be removed by washing, e. g., with natural or synthetic tanning agents, fats and higher fatty acids. Examples are given.

Sheets for separating hides while subjected to tanning solutions. Robert M. Allard (to Armstrong Cork Co.). U. S. 1,940,480, Dec. 19. A double-faced sheet comprises a satd. felt web having on each side a plurality of paint coatings and an overlying lacquer coating to provide smooth, impervious surfaces.

Drenching skins. Wilhelm Neugebauer (to Kalle & Co. A.-G.). U. S. 1,940,265, Dec. 19. See Brit. 373,567 (C. A. 27, 3635).

Unhairing and bating hides. Robert Biedermann (to J. R. Geigy A.-G.). Brit. 398,524, Sept. 15, 1933. See Fr. 731,445 (C. A. 27, 439).

Depilatory. Oonah Ltd. Fr. 754,841, Nov. 14, 1933. A depilatory contains  $Na_2S$ , soap, neat's foot oil and  $C_{10}H_{18}$ .

Tanning agents. Anna I. Gruner. Austrian 135,337, Nov. 10, 1933 (Cl. 28b.). Insol. residues from the extn. or use of vegetable tanning agents are subjected to the action of fungi, e. g., *Aspergillus niger*, whereby sol. products useful as tanning agents are obtained. Nutrient materials for the fungi may be added to the insol. residues to be treated. Various details are given.

Tanning agents. Progil Soc. anon. Ger. 587,496, Nov. 4, 1933. See Fr. 720,712 (C. A. 26, 4204).

Tanning agents (condensation products of carbohydrates with sulfuric acid and phthalic anhydride). Alphons O. Jaeger (to Selden Co.). U. S. 1,938,966, Dec. 12. Carbohydrates such as cellulosic material and pure or crude phthalic anhydride are caused to react in the presence of concd.  $H_2SO_4$  or oleum and the product is further caused to react with materials such as the residue from the purification of crude anthracene.

"Mineral tanning." Ian C. Somerville (to Röhm & Haas Co.). U. S. 1,940,810, Dec. 19. Water-sol. salts of Zr such as the sulfate, chloride or nitrate are used as tanning agents.

Titanium sulfate preparations. Ludwig Teichmann and Hermann Noerr (to I. G. Farbenind. A.-G.). U. S. 1,941,285, Dec. 26. Preps. easily sol. in water and suitable for use as tanning and weighting agents contain an alkali metal sulfate together with 0.3-0.5 mol.  $H_2SO_4$ , combined with each mol. of  $TiO_2$ .

Dyeing leather and skins. I. G. Farbenind. A.-G. Fr. 754,388, Nov. 6, 1933. In dyeing leather or skins by means of S dyes, the formation in the dyeing or brushing bath of NaOH, from the alkali sulfides used for dissolving the dyes, is prevented by adding to the bath a certain amt. of equally ionized substances, such as Glauber salt. An alkali bicarbonate may be added at the same time or an addn. of NaSH may be made immediately.

Leather, skins, etc. Soc. d'exploitation des procédés Escaich. Fr. 755,434, Nov. 24, 1933. Skins, leather, furs, hair, etc., are tanned, partly decolorized and have their natural qualities protected by treatment in an aq. bath contg. metal salts (except alkali or alk. earth salts) and alkali nitrite in a medium allowing the liberation of nascent  $HNO_2$ . Phenols or aromatic amines are generally added.

Furs. Paul Kestenbaum and Israel Kestenbaum. Brit. 397,800, Aug. 31, 1933. Horse pelts, etc., having a thick skin are prepd. by splitting the skin and then dressing the part carrying the hair. The treatment may consist of soaking in a soln. contg. ground barley, alum,  $HCOOH$  and NaCl, greasing with fish oil and tallow, drumming with sawdust to remove external grease, washing, shaving and drumming again with dry sawdust (and sand).

Artificial leather. Paul Meyersberg and Georg Wolf. Brit. 397,676, Aug. 31, 1933. See Fr. 742,295 (C. A. 27, 3636).

"Artificial leather" (coated fabric). Edgar H. Nollan and Donald A. Rankin (to E. I. du Pont de Nemours & Co.). U. S. 1,940,402, Dec. 19. A washable, oil- and grease-resistant "artificial leather" comprises a relatively heavy fabric base such as a drill or sheeting to which is cemented on one face a lighter fabric on which is superposed a film comprising cellulose nitrate, a softener and a pigment, and a surface film comprising cellulose nitrate, a wax such as ceresin wax and a softener such as di-Bu phthalate which is a non-solvent for the wax (the character of the surface film being such that it is discontinuous with respect to the cellulose nitrate).

Artificial leather. E. I. du Pont de Nemours & Co. Ger. 586,582, Oct. 23, 1933 (Cl. 8. 2). Fabric is treated with rubber, coated with asphalt varnish and heated to vulcanize the rubber and dry the varnish. An intermediate layer of oil lacquer may also be added. Cf. C. A. 28, 928.

Artificial leather. The Mechanical Rubber Co. Ger. 588,344, Nov. 15, 1933 (Cl. 39a. 10.04). See Brit. 295,387 (C. A. 23, 2320).

Artificial leathers. Rafael Müller. Fr. 755,243, Nov. 21, 1933. Sheets of cellulose or paper pulp are impregnated with aq. dispersions of rubber, etc., on a metallic support, excess liquid is expelled and the product is dried on the same support, then grained and vulcanized.

Composition for coating leather or rubber. Luzie Loewenthal née Walter. Ger. 589,248, Dec. 4, 1933 (Cl. 71a. 19.10). Leather dust, sugar, powd. S and rubber soln. are mixed together, and the mixt. is allowed to ripen in a closed vessel. Sufficient subdivided leather is then added to yield a mass which can be applied by spreading.

Apparatus for making strips of gelatin, cellulose derivatives, etc. Folien- und Flitterfabrik A.-G. Ger. 589,176, Dec. 6, 1933 (Cl. 39a. 16).

## 30—RUBBER AND ALLIED SUBSTANCES

C. C. DAVIS

**Review of progress and developments in the chemistry and technology of latex and of rubber from 1927 to July, 1932.** St. Reiner. *Caoutchouc and gutta-percha* 30, 10612-14(1933); cf. C. A. 28, 365<sup>2</sup>.—Numerous patents are cited.

**Iodine value of rubber and gutta-percha hydrocarbons.** A. R. Kemp and G. S. Mueller. *Ind. Eng. Chem., Anal. Ed.* 6, 52-6(1934).—The reactivities of various halogens toward rubber and gutta-percha hydrocarbons (I and II, resp.) were measured quantitatively. The behavior of I and of II is similar in that each combines with halogens (either free or in combination with I) with reactivities which are the greatest with Cl, and are progressively less so with Br, ICl, IBr and I, in the order given. II has a greater initial reactivity toward I than does I, but a longer time is required to complete the reaction with II than with I. The ICl method for detg. the unsatn. of hydrocarbons of the I and II types was improved for use with I and II over the method in its earlier developed form (cf. K., C. A. 21, 1901). Methods for the prepn. of pure I and II are described. After purification in this way, the I values of I and II were found to be very close to the theoretical values. Polyvinyl chloride (Duprene) adds only 30% of the theoretical proportion of I.

**Fluorescence of rubber and of compounding ingredients.** V. N. Morris. *Ind. Eng. Chem.* 26, 107-11(1934).—Various important materials used in com. rubber mixts. were exposed to ultra-violet light and the colors of the fluorescent light, when emitted, were observed. Many accelerators, antioxidants and softening agents are fluorescent, whereas among all the inorg. ingredients (examd. only ZnO) show characteristic colors. The fluorescent colors of different com. brands of ZnO are distinctive enough to make it possible to distinguish the various types, and the ash of a vulcanizate will reveal the particular type of ZnO used in the mixt. Well-vulcanized rubber shows a fairly intense yellow fluorescence, whereas the same mixt. in an undercured condition is only slightly fluorescent. In general, however, no well-defined relation between the optimum phys. properties and the intensity of the fluorescence is evident. Exposure to direct sunlight almost completely destroys the fluorescence of vulcanized rubber mixts. which are normally fluorescent.

**General comparison of antioxygens.** F. Jacobs. *Caoutchouc and gutta-percha* 30, 16573-5, 16008-11(1933); cf. C. A. 28, 307<sup>2</sup>.—Three mixts.: (1) a white mixt. with a high proportion of powder, (2) a black mixt. of the tread type, and (3) a "pure gum" mixt. were used to det. the effects of 34 com. protective agents in the mixts. when the latter were exposed to sunlight, to air at 70° (Geer oven), in an air oven at 120° and in an O-bomb under 21 kg. pressure at 60°. On exposure to sunlight, every substance caused discoloration, some much more severely than others. The 70° oven gave misleading results, and it is concluded that it is not a reliable test either for the comparative effects of protective agents or even to judge the aging properties in general of rubber products. In the O-bomb, unexpected results were obtained, in that numerous of the well-known com. agents were without appreciable protective action.

**The synthetic-rubber problem.** Wallace H. Carothers. *Ind. Eng. Chem.* 26, 30-3(1934).

**Testing reclaimed rubber.** Henry F. Palmer. *Ind. Eng. Chem., Anal. Ed.* 6, 56-9(1934).—The object of the paper is to discuss and evaluate methods for testing reclaimed rubber, both from the manufacturers' and the consumers' points of view, and to suggest a simple, rational and practical series of tests for the consumer to apply to reclaimed rubber. The discussion, which is based on both exptl. lab. data and practical considerations, leads to the recommendation of a definite procedure for the consumer to follow in his examn. of the quality of a reclaimed rubber. This procedure includes a method of

sampling, chem. tests for various ingredients, d. (on a reclaim-S mixt.), optional lab. processing tests of the raw reclaimed rubber and of mixts. contg. it, and mech. tests of vulcanizates contg. the reclaimed rubber. Large-scale tests of tech. mixts. contg. the reclaimed rubber, both for the effect of the reclaimed rubber on processing and on the quality of the finished products, are essential.

C. C. Davis

**Rubber in paints.** The incorporation of rubber in oil paints and corresponding investigations with rubber latex in water paints. H. P. Stevens and Noel Heaton. *Bull. Rubber Growers' Assoc.* 15, (XXX) 15(1933).—Systematic expts. were carried out to ascertain the practicability of using raw rubber in paints. To utilize rubber it is essential to reduce the viscosity of its solns. or to use it in a form other than a soln. Various factors were studied, including the effect of masticating the rubber, the effect of various agents on the viscosity (before and after soln.), the soly. of rubber in various solvents, the dispersion of rubber in linseed oil with and without pigments, the initial mixing of rubber and pigments, evapd. oil emulsions of rubber latex, the addn. of latex to water paints, and hypochlorinated and nitrated rubbers. The use of "white spirit" solns. of masticated rubber with ordinary paint driers sol. in the solvent was found to be the best technic. Metal salts of fatty acids were the most effective viscosity reducers, of which the linoleates were the best of all. The most powerful single compd. was Co linoleate. Pure fatty acids and metal oxides were only slightly effective. The drier should be added to the rubber during mastication or to the solvent. Various formulas for the prepn. of flat paints, gloss paints and enamels are given. The presence of rubber in these paints greatly improves the ease of flow and diminishes the tendency to settle. Preliminary expts. on the use of "molten rubber" (heated at 300° to liquefaction) and on the use of latex in washable distempers are described.

C. C. Davis

**Latex in pulp and paper manuf. (Richter) 23.** Fibrous compns. contg. rubber (Brit. pat. 398,319) 25. [Rubber] coated fabrics (Brit. pat. 397,506 and Ger. pat. 588,282) 25. Bandages [of unvulcanized crude rubber] (Brit. pat. 397,604) 17. Compn. for coating rubber (Ger. pat. 589,248) 29. Compound sheet material [of paper and rubber latex] (Australian pat. 9851/32) 23.

**Rubber.** Rubber Growers' Association, Inc. and George Martin. Brit. 396,880, Aug. 17, 1933. Coagulum in crumb or powder form is produced by adding substances to latex which render the wet coagulum short and weak, coagulating, creping by passing several times through rolls the spacing of which decreases as the operation proceeds and disintegrating the shredded crepe. The addns. may be substantial amts. of mineral compounding ingredients, e. g., china clay, C black, ZnO or substances that dissolve in the rubber, e. g., oleic and stearic acids, NH<sub>4</sub> stearate, linseed and palm oils, lecithin and other higher fatty acid compds. Disintegration is preferably by rubbing the crepe through a sieve, a dusting powder, e. g., talc, Zn stearate, powd. antioxidants, S, accelerators such as lecithin, being used to prevent subsequent coherence of the particles.

**Rubber.** Thomas J. Drakeley, Frank H. Cotton and David Bridge & Co., Ltd. Brit. 398,306, Sept. 14, 1933. Rubber is masticated or worked in an atm. of N, flue gas, CO<sub>2</sub> or other inert gas. This reduces softening and loss of nerve and is specially applicable to heavily loaded mixes. Cf. C. A. 27, 3863.

**Rubber compositions.** Dunlop Rubber Co., Ltd. and Anode Rubber Co. (England) Ltd. Ger. 587,397, Nov. 3, 1933. Addn. to 582,982 (C. A. 27, 6019). See Brit. 351,938 (C. A. 27, 443).

**Rubber compositions.** Soc. anon. des pneumatiques

**Dunlop.** Fr. 751,093, Aug. 26, 1933. Compns. having a basis of vulcanized rubber are protected by incorporating therewith a product obtained by condensing an aliphatic amino compd. contg. several OH group, such as di- or tri-hydroxyethanolamine, with a compd. contg. an imino group, i. e., a secondary amine, such as phenyl- $\alpha$ -naphthylamine or phenylene- $p$ -di- $\beta$ -naphthylamine. The compds. are treated with an isocyanate or isothiocyanate of an org. radical (Ph or naphthyl) before incorporation in the compns.

**Rubber compositions.** International Latex Processes Ltd. Fr. 751,307, Aug. 31, 1933. Compns. are made by mixing asbestos fiber with flocculent or granular ppts. obtained from aq. emulsions or dispersions of rubber. The ppts. are obtained by coagulating rubber latex in the presence of a relatively large amt. of water and in the presence or not of substances retarding coagulation.

**Preserving rubber.** Waldo L. Semon (to B. F. Goodrich Co.). U. S. 1,940,815, Dec. 26. Substances such as phenyl- $\alpha$ - or - $\beta$ -naphthyl- $p$ -phenylenediamine, di- $\alpha$ - or - $\beta$ -naphthyl- $p$ -phenylenediamine in which the aryl groups are attached to different N atoms are used as preservatives in rubber compns. U. S. 1,940,816 relates to preserving rubber by treatment with the reaction product of a non-accelerating secondary aromatic diamine such as diphenyl- $p$ -phenylenediamine with S or S chloride. U. S. 1,940,817 relates to preserving rubber with the addn. product of  $\beta$ -naphthol and ditolylamine. U. S. 1,940,818 relates to preserving rubber by use of a secondary monamine in which one of the groups attached to the amino N consists of 2 distinct, but directly connected, aromatic ring structures, such as  $\beta$ -naphthyl-biphenylamine. U. S. 1,940,819 relates to the similar use of a secondary amino biaryl compd. such as dibiphenyl- $p$ -phenylenediamine. Cf. C. A. 27, 5217.

**Preserving rubber.** Arthur W. Sloan (to B. F. Goodrich Co.). U. S. 1,940,824, Dec. 26. A secondary amino deriv. of a poly-aryl methane, such as diphenyldiaminodiphenylmethane, is used as a preservative agent.

**Preserving rubber.** Webster N. Jones (to B. F. Goodrich Co.). U. S. 1,941,012, Dec. 26. Deterioration is retarded by adding to rubber compns. about 0.5% of the condensation product of di- $p$ -tolylethylenediamine with alkol.

**Preserving rubber.** Röbel & Fiedler G. m. b. H. Ger. 585,448, Oct. 4, 1933. Deterioration of rubber after vulcanization is retarded by impregnating the crude rubber with three reagents, viz. (1) a nitrile, amine, aminophenol or aminonaphthol or a deriv. thereof other than a nitro deriv., (2)  $H_2S$ , HCN or a cyanide or sulfide, e. g.,  $NH_4HS$ , and (3) an aliphatic or aromatic aldehyde or ketone or a deriv. thereof. The crude rubber may be purified and dissolved in  $CH_2Cl_2$  and the soln. mixed with solns. of the impregnating substances.

**Rubber solutions.** Immalin-Werke chem. Fab. Eisend-rath G. m. b. H. Ger. 585,405, Oct. 3, 1933. See U. S. 1,909,219 (C. A. 27, 3854).

**Concentrating aqueous rubber dispersions.** Henry B. Townsend (to Vultex Corp. of America). U. S. 1,939,635, Dec. 12. In purifying vulcanized rubber latex, most of the vulcanized rubber particles are sepd. from associated serum and from a large proportion of non-rubber substances; proteins and water-sol. components, excess vulcanizing agents and by-products are removed by washing with water and  $NH_3$ , without adding other extraneous non-rubber components.

**Rubber goods from aqueous dispersions.** Wilfred H. Chapman and Donald W. Pounder (to Dunlop Rubber Co., Ltd.). U. S. 1,941,200, Dec. 26. An emulsion or dispersion of rubber or the like is rendered heat-sensitive and shaped while still in the fluid state and then gelled by the action of a heating medium such as steam.

**Multicellular rubber.** Soc. anon. des établissements Hutchinson. Fr. 754,302, Nov. 6, 1933. Rubber objects during vulcanization are submitted to a vacuum to accelerate the formation of cells by an appropriate difference of pressure.

**Chlorinated rubber and other compounds.** I. G. Far-

benind. A.-G. Fr. 755,486, Nov. 25, 1933. Compds. obtained by chlorinating rubber, paraffins, waxes, fats, oils, colophony, higher fatty acids, resinous acids and naphthenic acids are rendered stable by the addn. of derivs. of ethylene oxide, e. g., epichlorohydrin, phenoxypropene oxide, dimethylglycidol or phenylmethylglycidol. Cf. C. A. 27, 4439.

**Sulfonating rubber.** I. G. Farbenind. A.-G. (Erich Konrad and Helmut Kleiner, inventors). Ger. 585,622 and 585,623, Oct. 6, 1933 (Cl. 39b. 3). Addns. to 582,505 (C. A. 28, 686<sup>3</sup>). The sulfonation process described in Ger. 582,565 is applied to synthetic rubber prep'd. from butadiene hydrocarbons or from mixts. of these with other polymerizable substances (585,622). The ester or ether used in the process of Ger. 582,565 may be replaced by an aliphatic alc. of more than 8 C atoms with or without a diluent. \* The products are useful in the textile industry or as tanning agents (585,623).

**Apparatus for handling and cutting rubber.** Henry H. McGregor and Knut E. Eck (to Firestone Tire & Rubber Co.). U. S. 1,941,099, Dec. 26. Mech. features.

**Expanding and sponging molded products such as rubber compositions.** Clarence B. Siegfried (to Construction Materials Patents, Inc.). U. S. 1,941,420, Dec. 26. A plastic mixt. contg. a gas-forming material is fed to a vulcanizer in which a vacuum is formed concomitantly with vulcanization. App. is described.

**Compound rubber sheet materials.** Marcel Dupret Brit. 398,780, Sept. 21, 1933. Addn. to 396,503 (C. A. 28, 686<sup>9</sup>). An aq. rubber suspension other than latex is used instead of latex in at least 1 stage of the process of 396,503.

**Rubber articles.** Soc. anon. Septa. Fr. 754,839, Nov. 14, 1933. Liquid latex or other aq. dispersion of rubber is spread on a plate to produce a dry rubber sheet which is combined with a reinforcing product, with latex as adhesive.

**Cellular rubber articles.** Soc. belge du caoutchouc-Mousse. Ger. 584,891, Sept. 26, 1933 (Cl. 39b. 9). Addn. to 575,440 (C. A. 27, 3638). The process of Ger. 575,440 is modified by uniting the partly vulcanized and expanded rubber with other materials, e. g., metals, fabrics or non porous hard rubber. Vulcanization is then completed as described in Ger. 575,440.

**Spongy rubber articles.** Dunlop Rubber Co. Ltd. and The Anode Rubber Co. Ltd. Ger. 587,664, Nov. 7, 1933 (Cl. 39b. 9). Addn. to 551,467 (C. A. 26, 4505). See Brit. 365,546 (C. A. 27, 2340).

**Porous rubber diaphragms, filters, etc.** Julius Neuhaus Brit. 398,349, Sept. 14, 1933. See Fr. 743,485 (C. A. 27, 3855).

**Luster finish on rubber articles.** Edward E. McKay (to Revere Rubber Co.). U. S. 1,940,315, Dec. 19. The surface of a rubber article such as a water bottle or bathing cap is sprayed with a mixt. of low-viscosity colored rubber ink and uncolored Al powder and is treated with S chloride.

**Rubber threads.** Ernest J. Joss (to International Latex Processes, Ltd.). Brit. 397,419, Aug. 24, 1933. Rubber thread of reduced cross-sectional dimension is made from thread of greater cross section by stretching the unvulcanized or partly vulcanized thread and then partially or wholly relieving the stresses while in the extended condition, preferably by the action of heat.

**Rubber threads, filaments or tubes from rubber dispersions.** The Dunlop Rubber Co. Ltd. and The Anode Rubber Co. Ltd. Ger. 585,447, Oct. 4, 1933. See Brit. 393,057 (C. A. 28, 374<sup>3</sup>).

**Rubber coverings.** Allgemeine Elektrizitäts-Gesellschaft (to International General Electric Co., Inc.). Brit. 398,477, Sept. 11, 1933.  $C_6H_6$ -rubber solns. are rendered sprayable by dilg. to the approximate d. of  $H_2O$  with  $C_6H_6$ , etc., and adding protective colloids or emulsifying agents, e. g., soaps, mineral or vegetable oils, fats. In an example a mix of rubber 55,  $ZnO$  35, S 3, an accelerator 1.5 and an oil 5.5 parts is dissolved in 4.5 times its wt. of solvent.

**Coating fabrics.** Dunlop Rubber Co. Ltd., The Anode

Rubber Co. Ltd., Edward A. Murphy and David N. Simmons. Brit. 397,907, Sept. 7, 1933. Fabrics are coated by spreading, brushing or spraying with flocculent ppts. of rubber, obtained by coagulating largely dild. rubber dispersions with acids, *e. g.*, AcOH, salts, *e. g.*, ZnSO<sub>4</sub>, MgSO<sub>4</sub>, and metallic salts produced *in situ*, in presence or absence of substances having a restraining effect on the coagulation, *e. g.*, KOH, casein, Na aluminate, glue, gum acacia. The ppt. may be filtered, *e. g.*, by ceramic material, cotton fabric, wire gauze. Vulcanizing and compounding agents may be added to the dispersion or ppt. Cf. C. A. 28, 1223<sup>7</sup>.

Apparatus for coating or impregnating sheet materials such as paper, cloth or cotton batting with rubber compositions, etc. Carlton W. Crumb and Frank M. Saunders (Crumb to Oliver United Filters Inc., and Saunders to St. Clair Rubber Co.). U. S. 1,939,842, Dec. 19. Structural and mech. details.

Rubber-covered wooden rolls. Charles Berlow (to American Wringer Co.). U. S. 1,939,948, Dec. 19. Rolls such as those for use in paper manuf. have a natural wooden body portion with a rubber covering vulcanized to the wood at a temp. below its charring point.

Treating shoe socks with rubber dispersions. Douglas F. Twiss and Edward A. Murphy (to Dunlop Rubber Co. Ltd.). U. S. 1,941,120, Dec. 26. A fibrous structure which may be formed of and which is substantially of the size and shape of a shoe sock to be made is dipped into a foamed aq. dispersion of rubber material to enclose the surface and edges, and is then caused to set and dry.

Pressed rubber footwear. Henry C. L. Dunker. U. S. 1,939,440, Dec. 12. Various details of manuf. are described.

Insulating splices in rubber-insulated wire. Edward H. Darby (to American Anode, Inc.). U. S. 1,939,843, Dec. 19. The cut surfaces of the rubber insulation are coated with cement, the exposed metal of the wire is coated with Zn; rubber is deposited on the material by electro-deposition from an aq. dispersion, and is dried and vulcanized.

Inserts for shoes, etc. Magyar Ruggyantáru gyár Rt. (to The Anode Rubber Co. Ltd.). Brit. 397,700, Aug. 31, 1933. Shoe insertions and heel cushions, arch supports, etc., for treatment and care of the feet are made of sponge or cellular unmanipulated rubber having a porous superficial skin. Latex is mixed with other known ingredients, whipped into a cream 5 times the original vol., ZnO and Na<sub>2</sub>SiF<sub>6</sub> are added and the foam is poured into molds and vulcanized at 100°.

Balls. St. Mungo Manufacturing Co. Ltd., Reginald C. Swabey and Geo. Bottomley. Brit. 397,944, Sept. 7, 1933. Golf balls and the like are provided with a mobile central core comprising a soln. of approx. 14.5% concd. size powder in approx. 85.5% H<sub>2</sub>O. ZnO or other powder may be added to the soln. to vary the sp. gr.

Balls. Dunlop Rubber Co. Ltd. and Leo V. Kenward. Brit. 398,580, Sept. 21, 1933. A covering for tennis, etc., balls is provided by assembling on an adhesive surface substances in suitably divided form, *e. g.*, powd. metal, cork dust, wood flour, comminuted cotton or flock, the adhesive surface being formed by an adhesive, *e. g.*, rubber (soln. or latex), gutta-percha, balata, celluloid, cellulose, varnish, resins, linseed oil, glue, gelatin, which sets or otherwise changes in state by suitable treatment, *e. g.*, by heating or vulcanization. The adhesive may be applied to the surface of the ball or to textile material to be applied thereto.

Golf ball. Alexander Munro (to St. Mungo Mfg. Co. of America). U. S. 1,940,009, Dec. 19. A cover of vulcanizable material is molded upon a ball core under controlled heat and pressure conditions preclusive of vulcanization; the ball is removed from the mold, and accelerating fluid is applied to the cover and the latter is then vulcanized.

Cellular rubber balls and similar articles containing closed gas cells. Maurice P. H. L. Rupeaet (to Société belge du caoutchouc-Mousse). U. S. 1,941,053, Dec. 26.

Various details of manuf. are described. Cf. C. A. 27, 3638.

Adhesive from rubber latex. Imperial Chemical Industries Ltd. Ger. 585,446, Oct. 4, 1933. See Brit. 357,238 (C. A. 27, 441).

Rubber tubing. Paul A. Raiche (to Davol Rubber Co.). U. S. 1,940,145, Dec. 19. Raw rubber is wound in spiral form and the seam formed by the contiguous ribbon edges is subjected to rapid hammer impacts to produce a weld. App. is described.

Device for producing rubber tubes, etc. New York Belting and Packing Co. Ger. 585,540, Oct. 11, 1933.

Utilizing waste rubber. Maximo L. Gomez. Brit. 397,669, Aug. 31, 1933. Boot and other soles are made by cutting rough blanks from tire covers, enclosing them in a patterned mold, subjecting the mold to 2.7 atm. steam pressure in an autoclave 20 min., removing from the autoclave and maintaining the pressure another 20 min. A sheet of rubber cut from an inner tube may be placed in the mold with the blank so as to cover the unornamented side and overlap the edges.

Floor-covering material comprising fiber and rubber. Gerald F. Cavanagh and Albert B. Schultz (to Ohio Rubber Co.). U. S. 1,939,293, Dec. 12. Various details of vulcanization and molding are described.

"Artificial turf" from rubber and fiber. Frank Fenton (to B. F. Goodrich Co.). U. S. 1,939,846, Dec. 19. A product which resembles turf in appearance is made by pressing unwoven fibrous material such as rubberized threads against the surface of an unvulcanized rubber compn., and then vulcanizing.

Artificial rubber. Victor Kaufmann. Brit. 399,009, Sept. 28, 1933. Artificial rubber is freed from unstable Cl compds. by treatment with H<sub>2</sub>O or steam at ordinary or raised pressure in presence of hydroxides, carbonates or other substances neutralizing HCl. Mixts. of the product with natural rubber are readily vulcanized in presence of accelerators. *E. g.*, 1000 kg. of artificial rubber (sulfurized oil) is damped with H<sub>2</sub>O, 30 kg. chalk added and the whole steamed at 3 atm. for 2.5 hrs., the H<sub>2</sub>O is drained off and the rubber dried. Seventy kg. of the product, mixed with rubber 100, lithopone 50, zinc white 30, S 4 and accelerator 0.5 kg., vulcanizes well at 145° in 15-20 min.

Rubber-like products containing styrene polymerizates. Eduard Tschunker and Walter Bock (to I. G. Farbenind. A.-G.). U. S. 1,938,730, Dec. 12. A polymerizate derived from a compd. such as butadiene is uniformly interpenetrated with a polymerizate derived from a polymerizable styrene compd. such as  $\alpha$ -methylstyrene (suitably so that the polymerizate mixt. contains about 45% of the styrene polymerizate); the mixt. is treated with a vulcanizing agent such as S and ZnO, etc., and with a finely divided soot 20-70% and the mixt. is vulcanized. The product thus formed is of good strength and elasticity.

Rubber-like products containing styrene polymerizates. Eduard Tschunker and Walter Bock (to I. G. Farbenind. A.-G.). U. S. 1,938,731, Dec. 12. A heat or emulsion polymerizate derived from a compd. such as butadiene is combined with a heat or emulsion polymerizate derived from a vinyl benzene hydrocarbon in a proportion of the latter of less than 45%. This mixt. may be vulcanized in the presence of lampblack, etc.

Rubber-like products containing olefin naphthalene polymerizates. Kurt Meisenburg and Walter Bock (to I. G. Farbenind. A.-G.). U. S. 1,938,751, Dec. 12. A heat or emulsion polymerizate derived from a compd. such as 1,3-butadiene is mixed with a somewhat smaller proportion of a heat or emulsion polymerizate derived from a vinyl naphthalene hydrocarbon such as  $\alpha$ -vinyl-naphthalene to obtain a product which has good strength when vulcanized.

Rubber vulcanization accelerators. Albert F. Hsman (to Kelly-Springfield Tire Co.). U. S. 1,939,600, Dec. 19. Ultra-accelerators which may be used without premature vulcanization are prepd. by bringing together

in soln. an alkali metal salt of a monobasic dithiocarboxylic acid such as  $\text{NH}_4$  dithiofuroate and an alkali metal salt of a halogen-substituted aliphatic acid such as  $\text{NH}_4$  chloroacetate and treating with an acid such as  $\text{HCl}$ . Several examples of the prepn. and use of these accelerators are given.

**Vulcanization accelerators.** Schering-Kahlbaum A.-G. Brit. 398,118, Sept. 7, 1933. The vulcanization of rubber is accelerated by adding to the mix mixed dithiocarbamates of the formula  $\text{RR}'\text{NCSSHR}''\text{R}'''\text{NH}$ , in which R and R' are the same or different C-contg. residues which are closed to form a ring and R'' and R''' are the same or different C-contg. residues which are also closed to form a ring, R and R' always being different from R'' and R'''. Both rings may carry further substituents. Compds. mentioned are cyclohexylaminepentamethylene dithiocarbamate (I) and cyclohexylethylaminepentamethylene dithiocarbamate. They are prepd. by the reaction of  $\text{CS}_2$  with or without solvents, with an equimol. mixt. of piperidine (II), or homologs thereof, and other primary or secondary bases or by reaction of free dithiocarbamic acids with a base different from the corresponding starting base. Thus  $\text{CS}_2$  and an equimol. mixt. of II and cyclohexylamine give I together with a little piperidine cyclohexyldithiocarbamate. Pure I may be obtained by recrystn. from alc. or  $\text{Me}_2\text{CO}$ .

**Vulcanizing rubber.** I. G. Farbenind. A.-G. (Walter Huhn, inventor). Ger. 585,696, Oct. 23, 1933. In vulcanizing natural or synthetic rubber, thiuram sulfides are used as accelerators. Thus, rubber is vulcanized by S,  $\text{ZnO}$  and tetramethylthiuram disulfide. Cf. C. A. 28, 932<sup>6,7</sup>

**Rubber vulcanization.** Ira Williams (to E. I. du Pont de Nemours & Co.). U. S. 1,938,651, Dec. 12. Accelerators are used of the general formula  $\text{R}'\text{R}''\text{NCSSA}$ , in which R' and R'' each represent an alkyl group at least one of which contains a straight chain of at least

4 C atoms and Arep resents an alkali metal, e. g., K, butyl- or Na diheptyl dithiocarbamate.

**Rubber vulcanization.** Ira Williams and Arthur M. Neal (to E. I. du Pont de Nemours & Co.). U. S. 1,940,280, Dec. 19. A small proportion of butyl-substituted  $\text{NH}_4$  acetate together with tetramethylthiuram monosulfide or mercaptobenzothiazole is used for accelerating vulcanization.

**Rubber vulcanization.** Marion W. Harman (to Rubber Service Laboratories Co.). U. S. 1,941,146, Dec. 26. An accelerator is used comprising a reaction product of a ketone amine and a mercaptoaryltriazole, e. g., the reaction product derived from diacetoneamine and a mercaptobenzothiazole. Cf. C. A. 28, 376<sup>8,9</sup>.

**Vulcanizing tires.** The Goodyear Tire & Rubber Co. Brit. 397,508, Aug. 23, 1933. The use of air-bags in vulcanizing tires is obviated by applying a layer of a gas-impermeable compn. to the surface to be subjected to gas pressure. A suitable compn. is gelatin 22.9,  $\text{H}_2\text{O}$  35.1, PhOH 7.8, alc. 18.0 and glycerol 15.3 parts; this is spread as a thin film and allowed to dry before vulcanizing.

**Apparatus for vulcanizing rubber hose.** George K. Bedur (to B. F. Goodrich Co.). U. S. 1,939,871, Dec. 19. Mech. features.

**Apparatus for vulcanizing rubber tires.** Fred J. Beighey (to Morgan & Wright). U. S. 1,938,794, Dec. 12. Mech. features. Cf. C. A. 27, 632.

**Press for vulcanizing rubber tires and tubes.** Peter De Mattia (to National Rubber Machinery Co.). U. S. 1,939,670, Dec. 19. Mech. features.

**Securing tread or intermediate soles of macroporous or microporous rubber to the uppers by vulcanization.** Hans Rollmann. Brit. 397,579, Aug. 31, 1933.

**Yellow- and orange-colored vulcanized rubber.** Winfrid Hentrich, Max Hardtmann and Peter Backes (to General Aniline Works). U. S. 1,940,053, Dec. 19. See Ger. 566,725 (C. A. 27, 2601).

# CHEMICAL ABSTRACTS

Vol. 28

MARCH 20, 1934

No. 6

## I—APPARATUS AND PLANT EQUIPMENT

W. L. BADGER

Aluminum in the construction of apparatus for chemical industry. P. Urech. *Tech.-Ind. Schweiz. Chem.-Ztg.* 16, 191 7, 214-17(1933).

The graduation of glassware. Eric F. Hersant. *Pharm. J.* 131, 553(1933).—Distinction is made between the regular l. measure (= 1000.000 ml. = 1000.028 cc.) and the now rarely used "Mohr l." (= 1002.02 ml. = 1000 "G. W. A." units). A Mohr l. is the vol. occupied by 1 kg. H<sub>2</sub>O at 17.5°.

Comparison of constancy of gold- and chromium-plated analytical weights. Harvey V. Moyer and Paul K. Winter. *Ind. Eng. Chem.* 26, 238(1934).—After a year's use in the student lab. Cr-plated gold wts. were close to their adjusted values, whereas most reconditioned Au-plated wts. were seriously in error.

A new drier for granular or pulverized materials. *Revue. universelle mines* 9, 612-13(1933).—App. described for drying slimes and other watery residues in a chamber in which heated blades or other metallic parts rotate and dry the material by bringing it into intimate contact with the heated parts.

Description of a simple extractor using solvents heavier than water. W. L. Dulière. *Compt. rend. soc. biol.* 115, 257-6(1934).—One cut.

A gas buret. John Hume. *Chemistry & Industry* 1934, 47.—A double-tube app. is described, the smaller tube being graduated for accurate readings.

Gas analysis with a modified Orsat apparatus. A. C. Egerton and F. L. Smith. *J. Sci. Instruments* 11, 28 (1934).—Egerton and Pidgeon (*C. A.* 26, 2897) have described a gas pipet in which the absorption of each gas is hastened by introducing the absorbant in the form of spray from a fountain. In ordinary gas analysis less accuracy is required than that obtainable with this pipet, and an app. like that of Orsat has been devised in which CO<sub>2</sub>, O and CO can be detd. in a mixt. during about 10 min. In the Orsat app., the usual absorption bulb has been replaced by a pipet and the absorbant enters the pipet as from a fountain. The measuring pipet is jacketed with water, and ammonia is recommended as confining liquid. Its vapor tension is negligible at room temp., the meniscus is shallow and easy to read and there is less tendency for drops of liquid to adhere to the sides of the vessel. Probably it would not work as well if hydrocarbons are present in the analyzed.

A vessel for acid-alkali titrations. J. Jackson. *Chemistry & Industry* 1934, 36.—The app. is for making titrations with exclusion of air.

Apparatus for the separation of liquid or solid suspensions from gases and their determination. A. Blackie. *J. Soc. Chem. Ind.* 53, 11-12T(1934).—The gas impinges as a jet on the inner surface of a glass bulb. With dust suspensions it is necessary to moisten either the dust or the surface of deposition.

An apparatus for the determination of density. Noel Deerr. *Intern. Sugar J.* 35, 476-7(1934).—The app. consists of a hydrometer jar provided with a rectangular slot in its upper portion which acts as a weir, over which the liquid is allowed to flow. At a distance of 1 cm. above the level of the overflow a fine horizontal line is engraved round the cylinder, while the foot of the cylinder is ground parallel to this line. By means of a tubulure and an

attached funnel the cylinder can be overflowed at will, and the reading taken. The readings, can be made with an accuracy of 0.01%.

Procedure for the preparation of uniform nephelometric suspensions. Arthur F. Scott and Frank H. Hurley. *J. Am. Chem. Soc.* 56, 333-5(1934).—A device is shown and described by which the reagent can be added in exactly the same way in every analysis so that no error will be introduced in the measurement of the optical properties of AgCl as a result of a varying rate of adding the AgNO<sub>3</sub>.

A combined vacuum and pressure gage. Noel Deerr. *Intern. Sugar J.* 36, 23(1934).—The device consists of 2 connected glass tubes with Hg reservoirs, so arranged that either pressure or vacuum can be detd. at will.

New types of dust collectors. N. P. Okulov. *Tsvetnaya Metall.* 1933, No. 1, 69 86.—Descriptive.

A study of a sensitive manometer due to Albert Griffiths. P. C. Vincent. *Proc. Phys. Soc. (London)* 45, 808-32 (1933).—The difference in the ds. of H<sub>2</sub>O and a dil. aq. soln. of uranin is utilized in a manometer capable of measuring pressure differences of 2 dynes per sq. cm.

Official introduction of a new hundred point for the Ventzke-scale saccharimeters and its significance for analysis and scientific measurements. K. Šandera. *Chem. Obzor* 8, 244-5(1933).—By the recognition of a long-established error of 0.1° in the hundred point of saccharimeters the 8th international commission for uniform methods of sugar analysis was successful in removing the uncertainties in using this app. not only for sugar-house control, but also in general analytical and scientific work.

Universal camera and self-indicating rotating crystal camera. Erwin Sauter. *Z. physik. Chem.* B23, 370-8 (1933).—The construction and operation of the x-ray camera previously described (*C. A.* 27, 3643) is given in detail.

Design of town gas-fired furnaces. F. L. Atkin. *Gas J.* 205, 104 7, 152-3(1934).—See *C. A.* 28, 286°.

Powdered-coal furnaces for unground dust. O. Haller. *Arch. Warmewirt.* 15, 43-6(1934).—By the use of a perforated refractory hearth through which air is admitted, and by firing downward, it has been found possible to burn coal fines up to 0.3 cm. without grinding. Results are given for inclined and vertical water-tube boilers, and for fire-tube boilers with dutch oven.

A thermostat for higher temperatures. Břetislav G. Šimek and Jevgenij Zamrzla. *Mitt. Kohlenforschungsinst. Prag.* 1933, 485-9.—The thermostat is based on the principle that if the pressure on a boiling liquid is held const. to within 1 mm. Hg, the temp. of the thermostat, which is heated by satd. vapor, can be held const. to within 1/10°. A vacuum regulator is used to regulate the pressure. A diagram shows the satn. pressures of several liquids suitable for thermostat material. By using a suitable construction material, liquid and condensation temp. this principle can be applied to the regulation of very low or relatively high temps.

Marion E. Headington

The pneumodynamometer (Borasio, De Rege) 12.

Handbuch der chemisch-technischen Apparate. Edited by A. J. Kleser. Tl. III. Destillierapparate—Druckregler. Leipzig: Otto Spamer. 90 pp. M. 8.50. Cf. C. A. 27, 1240.

Air filter. Stig G. Sylvan (to American Air Filter Co.). U. S. 1,941,450, Jan. 2.

Air filter. Hans Wittemeier and Willy Neumann (Wittemeier to Midwest Mfg. Co.). U. S. 1,941,524, Jan. 2.

Cells for rotary suction filters. Maschinenfabrik Buckau R. Wolf A.-G. Ger. 587,642, Nov. 6, 1933 (Cl. 12d. 16.02).

Textile filter tube for liquids. Société des établissements Daubron. Ger. 587,887, Nov. 13, 1933 (Cl. 12d. 19).

Filtering material. Jesus de la Torre (to J. de La Torre e Hijo). U. S. 1,943,165, Jan. 9. A material suitable for filtering liquids comprises a thoroughly degreased woven fabric body of readily permeable vegetable fibers such as cotton duck or canvas. Cf. C. A. 27, 5221.

Funnel (with a central "breather tube"). Louis Green. U. S. 1,942,282, Jan. 2.

Centrifugal steam separator. Alan Urquhart. Brit. 398,363, Sept. 14, 1933.

Process and apparatus for separating granular materials of different specific gravities. Hans Heidenreich. Brit. 399,294, Oct. 5, 1933.

Apparatus for classifying particles of different specific gravities, comprising a bowl classifier superposed on a secondary compartment which is preferably a rake classifier. The Dorr Co., Inc. Brit. 398,579, Sept. 21, 1933.

Apparatus for separating particles such as fibers from liquids by suction and flotation. Adolf M. R. Karlström. U. S. 1,943,180, Jan. 9. Numerous structural and operative details are described.

Blower-type separator suitable for cleaning air, etc. Stig G. Sylvan (to American Air Filter Co.). U. S. 1,941,449, Jan. 2. Structural and mech. details.

Sifting or bolting machine. Frank Pascall. Brit. 399,300, Oct. 5, 1933.

Three-way mixing cock, e. g., for air and combustible gas. Walter Jönsson and Selas A.-G. Brit. 399,396, Oct. 5, 1933.

Self-regulating siphon overflow. James P. Wells. Brit. 399,080, Sept. 28, 1933.

Apparatus suitable for distillation in a high vacuum. Kenneth C. D. Hickman (to Eastman Kodak Co.). U. S. 1,942,858, Jan. 9. Liquid to be distd. is dropped onto an internally heated corrugated cascade dome surrounded by a chamber which can be evacuated and is provided with outlets for the distn. products.

Weighing apparatus arranged for testing the moisture content of sand, etc. Edward G. Thomas (to Toledo Scale Mfg. Co.). U. S. 1,941,818, Jan. 2. Various mech. and operative details are described.

Surface condenser suitable for condensing steam, etc. Karl Baumann (to Westinghouse Elec. & Mfg. Co.). U. S. 1,941,650, Jan. 2.

Steam boiler and mercury condenser. Charles E. Lucke (to Babcock & Wilcox Co.). U. S. 1,941,480, Jan. 2.

Remote temperature indicator. Clarence A. de Giers (to Richard C. Murphy). U. S. 1,943,267, Jan. 9. Structural and operative details.

Thermocouple pyrometer. Horace N. Packard (to Cambridge Instrument Co.). U. S. 1,942,519, Jan. 9.

Thermometer. Harry D. Bolton (to Taylor Instrument Cos.). U. S. 1,942,006, Jan. 9. Structural details.

Thermometer for measuring the temperature of the skin. Bradford Noyes, Jr., (to Taylor Instrument Cos.). U. S. 1,942,516, Jan. 9. Structural features of thermocouples, etc. U. S. 1,942,517 also relates to structural details of thermometers.

Turbidimeters (smoke detectors). Walter Kidde & Co., Inc. Brit. 399,449, Oct. 5, 1933.

Viscosimeters. John G. A. Rhodin. Brit. 399,802, Oct. 11, 1933.

Evaporator suitable for use as a salt crystallizer. Martin J. Kermer (to Buffalo Foundry & Machine Co.). U. S. 1,941,693, Jan. 2.

Spray evaporators. Norsk Hydro-Elektrisk Kvælstof-Aktieselskab. Brit. 399,764, Oct. 12, 1933.

Tubular heaters such as Mantius-type evaporator tubes. Thomas Griswold, Jr. (to Dow Chemical Co.). U. S. 1,942,094, Jan. 9. Structural features.

Pneumatic drier. Paul Rosin and E. Rammler. Ger. 587,874, Nov. 9, 1933 (Cl. 82a. 1.02).

Apparatus for drying grain or like granular materials. John Murphy and The Bandon Milling & Electric Lighting Co. Ltd. Brit. 398,628, Sept. 21, 1933.

Open-hearth furnace operation. Arthur J. Boynton (to Open Hearth Combustion Co.). U. S. 1,942,682, Jan. 9.

Various details of furnace construction and draft control are described.

Hot-blast stove construction and operation. Frank R. McGee. U. S. 1,942,702, Jan. 9. Various structural and operative details.

Furnace operation with pulverized fuel. Fred H. Daniels (to Riley Stoker Corp.). U. S. 1,942,687, Jan. 9.

Fusion of ash is avoided in a main furnace combustion chamber, but sufficient addnl. fuel is burned in suspension in the furnace ash pit to melt the ash and the latter is removed in liquid form. Various structural and operative details are described.

Gas-fired retort and other furnaces. Charles C. Carpenter, Arthur H. Andrews and South Metropolitan Gas Co. Brit. 399,948, Oct. 19, 1933.

Gaseous, liquid- and powdered-fuel annealing and other furnaces. Ernest E. Lucas. Brit. 398,391, Sept. 14, 1933.

Gas, oil and pulverulent-fuel furnaces in which primary air is supplied to the burner and secondary air to the furnace, provided with means for controlling the air supplies simultaneously in opposite senses so as to leave the total supply constant. Soc. anon. des fours spéciaux. Brit. 399,720, Oct. 12, 1933.

Apparatus for indicating and recording the temperature of the charge within a furnace. Edward P. Jones. Brit. 399,541, Oct. 5, 1933.

Arrangement for measuring deviations of temperature in a thermostatically controlled furnace. Lionel F. Prosser. Brit. 399,641, Oct. 12, 1933.

Apparatus for controlling furnaces by variations of the gas pressure within the furnace chamber. Geo W. Smith. Brit. 398,198, Sept. 7, 1933.

Rotary grates for furnaces, gas producers, etc. Charles Groll. Brit. 399,083, Sept. 28, 1933.

Open-top tilting boiling pan or digester. Francis B. Kern and Thomas E. French (to Aluminium Plant & Vessel Co. Ltd.). U. S. 1,942,818, Jan. 9, Brit. 398,879, Sept. 25, 1933. Structural and mech. details.

Thermally actuated valve device for use with gas burners. Radiation Ltd. and Robert Poole. Brit. 398,964, Sept. 28, 1933.

Thermally operated regulating device for controlling the supply of gas to cookers, etc. Radiation Ltd. and Harry J. Yates. Brit. 399,266, Oct. 5, 1933.

Heat regenerator for use with furnaces. Harold Etherington (to A. O. Smith Corp.). U. S. 1,941,970, Jan. 2.

Heat exchangers such as recuperative air heaters. The Underfeed Stoker Co. Ltd., Walter F. Harlow and Arthur E. Bingham. Brit. 399,862, Oct. 16, 1933.

Indirect heat-exchange apparatus suitable for heating air with steam or hot water. R. Harry Stone and Edwin F. Tilley (to Titeflex Metal Hose Co.). U. S. 1,941,587, Jan. 2. Structural and mech. features.

Plate heat exchangers. Owen D. Lucas and The Whessoe Foundry & Engineering Co. Ltd. Brit. 399,186, Sept. 25, 1933.

Casings and headers for heat exchangers. Fred Hepworth. Brit. 399,690, Oct. 12, 1933.

Concentric tubular heat exchangers. Compagnie des

- Surchauffeurs (to The Superheater Co. Ltd.). Brit. 399,735, Oct. 12, 1933.
- Gilled tubes for heat exchangers. Wm. Mills Ltd. and John F. Paige. Brit. 399,995, Oct. 19, 1933.
- Heat-storing apparatus. Archibald A. H. Douglas. Brit. 398,927, Sept. 28, 1933. The app. comprises an assembly of sealed tubes contg. a substance, e. g., paraffin, stearin, stearic acid,  $C_{10}H_8$ , beeswax,  $FeSO_4$ ,  $MgSO_4$ , with a high latent heat of fusion which is melted by passing a hot liquid through the spaces between the tubes, and the absorbed latent heat is thereafter transmitted to a colder liquid.
- Heat-transmitting media. Owen D. Lucas and The Whessoe Foundry & Engineering Co. Ltd. Brit. 398,492, Sept. 11, 1933. A compn. for use in transmitting heat in systems such as described in Brit. 336,209 (C. A. 25, 2279) and 360,816 (C. A. 27, 876) is made by melting diphenyl oxide (I) with 2  $C_6H_5$  derivs., 1 of which has an amine group. I 60, diphenylamine 30 and  $C_{10}H_8$  10 and I 70,  $PhNH_2$  20 and  $C_{10}H_8$  10% are given as examples which yield products melting at 4° and 6° and boiling at 246° and 212°, resp.
- Cathode-ray tubes for television, picture-telegraph or like receivers. John C. Batchelor (to Marconi's Wireless Telegraph Co. Ltd.). Brit. 399,961, Oct. 19, 1933.
- X-ray tube. Louis F. Ehrke (to Westinghouse Lamp Co.). U. S. 1,941,975, Jan. 2.
- X-ray tube and associated apparatus. Charles Fayer (to Wappler Elec. Co.). U. S. 1,941,978, Jan. 2.
- Soft x-ray tube. Charles M. Slack (to Westinghouse Lamp Co.). U. S. 1,942,007, Jan. 2.
- Light-sensitive cell. Arthur W. Carpenter (to United Research Corp.). U. S. 1,942,958, Jan. 9. Structural details.
- Light-sensitive device. Samuel Ruben. U. S. 1,941,194, Jan. 2. A photosensitive electrode has a Cu base and a thermally integrally formed etched cryst.  $Cu_2O$  surface and may be used with a cooperating electrode of Cu and an electrolyte such as lactic acid. Various modifications also are described.
- Photoelectric cell. George R. Stilwell (to Bell Telephone Laboratories, Inc.). U. S. 1,942,501, Jan. 9. Structural features.
- Thermionic valves. The M-O Valve Co. Ltd., David A. Rankin and Colin J. Smithells. Brit. 399,535, Oct. 2, 1933. Those parts of interior electrodes, other than cathodes, which, if made of Ni, could not be adequately heated by eddy currents from a coil outside the bulb without overheating other parts, are made of Fe or mild steel.
- Process for the exhaustion of a thermionic valve having a plurality of metallic electrodes one of which wholly or partly surrounds another and is of higher resistance material than the inner electrode or consists of a foraminous metal body. Harold A. Snow (to Marconi's Wireless Telegraph Co. Ltd.). Brit. 399,797, Oct. 4, 1933.
- Electron-emitting element. Hector Rabezzana and Ora S. Duffendack (to A C Spark Plug Co.). U. S. 1,943,027, Jan. 9. An electron emitter such as a spark plug electrode is made of a ductile alloy contg. Ni together with Ca 0.04-0.1% and Mn about 2%.
- Gaseous-discharge tubes for use in direction finding on aircraft. Willem F. Westendorp (to The British Thomson-Houston Co. Ltd.). Brit. 399,787, Sept. 29, 1933.
- Apparatus for treating gases or vapors with solids such as purifying agents or catalysts. Gewerkschaft Kohlenbenzin. Ger. 578,484-5, June 14, 1933. Addns. to 573,505 (C. A. 27, 4378).
- Apparatus for effecting catalytic exothermic gas reactions such as synthesis of ammonia or methanol. Roger Du Chaffaut (to E. I. du Pont de Nemours & Co.). U. S. 1,942,021, Jan. 2. A catalyst container provided at one end with a gas outlet and having a helically grooved exterior is closely and removably fitted within a shell so as to form a helical gas passage communicating at the end of the catalyst container first named with a gas inlet and at the other end with the interior of the catalyst container.
- Apparatus for estimating the dust in air, etc. Davidson & Co. Ltd. Ger. 587,852, Nov. 9, 1933 (Cl. 421. 4.15).
- Mixing device for gases carrying solid particles such as pulverized coal. Ralph M. Hardgrove (to Fuller Lehigh Co.). U. S. 1,941,471, Jan. 2. Structural details.
- Gas-detecting apparatus, e. g., for fire-damp. Wm. M. Thornton. Brit. 399,978, Oct. 19, 1933.
- Water-cooled gas condensers. Humphreys & Glasgow Ltd. and George H. Morgan. Brit. 399,746, Oct. 12, 1933.
- Water-flow gas calorimeters. Wm. Masterton. Brit. 399,323, Oct. 5, 1933, and 399,326, Oct. 5, 1933.
- Service governor for regulating the pressure of gas. Albert G. Ford. U. S. 1,941,831, Jan. 2. Structural and mech. features.
- Volumetric displacement meter for gases or liquids, particularly applicable for quantitatively adding gas to water, etc. Charles B. Bramwell. Brit. 399,803, Oct. 16, 1933.
- Apparatus for dispensing gases from containers of liquefied gas. Lee C. Updegraff (to Linde Air Products Co.). U. S. 1,943,047, Jan. 9. Structural and operative details.
- Apparatus for dispensing gases from containers of liquefied gas. Leo I. Dana (to Linde Air Products Co.). U. S. 1,943,059, Jan. 9. Structural and operative details.
- Apparatus for dispensing gases such as oxygen, nitrogen or methane from storage containers of liquefied gas. Hallam C. Smith (to Linde Air Products Co.). U. S. 1,942,944, Jan. 9. Structural and operative details.
- Apparatus for discharging gases into liquids as in treating water with chlorine. Wm. J. Orchard (to Wallace & Tiernan Co.). U. S. 1,942,659, Jan. 9. See Brit. 383,896 (C. A. 27, 2746).
- Apparatus for aerating liquids. Bell Brothers (Manchester 1927) Ltd. and Charles G. Benson. Brit. 398,521, Sept. 7, 1933.
- Process and apparatus for aerating liquids. Nikolaus Meurer. Brit. 399,352, Oct. 5, 1933.
- Control valves for apparatus for elevating liquids, particularly acids. Wm. H. Exley and Walter Haddon. Brit. 399,918, Oct. 19, 1933.
- Flow meter for liquids. Bell Brothers (Manchester 1927) Ltd. and Charles G. Benson. Brit. 398,490, Sept. 7, 1933.
- Liquid flow meter, with means for completing an electric circuit for operating an alarm or closing a valve when a predetermined quantity has passed therethrough. The Leeds Meter Co. Ltd. and Leslie Watson. Brit. 399,966, Oct. 19, 1933.
- Mixing valve suitable for use with hot and cold water. Edward F. Niedecken. U. S. 1,943,140, Jan. 9.
- Pressure- and temperature-controlled device for mixing fluids such as hot and cold water. Lloyd L. Davies, Jules V. Resek and Wm. W. Carson, Jr. (to Fulton Syphon Co.). U. S. 1,942,269, Jan. 2. Various structural, mech. and operative details are described. U. S. 1,942,270 also relates to a thermostatically controlled mixing app.
- Doors for resisting fluid pressure. Joseph C. Robinson and James Slater & Co. (Engineers) Ltd. Brit. 399,748, Oct. 12, 1933.
- Covers and doors for resisting fluid pressure. Carl Wiemann. Brit. 399,433, Oct. 5, 1933.
- Electric control apparatus for proportioning the flow of gas and air through tubes to burners, etc. Wm. H. Bailey (to Colo. Fuel and Iron Co.). U. S. 1,942,793, Jan. 9. Numerous structural and operative details are described.
- Foam-generating apparatus. Jan A. S. van Deurs and Binar Schröder. Brit. 398,405, Sept. 14, 1933.
- Critical-pressure boilers. Siemens-Schuckertwerke A.-G. Brit. 398,413, Sept. 14, 1933.
- Disk mill in which the material is dried by hot air. Hans Barthelmess. Brit. 398,914, Sept. 28, 1933.
- Conical and disk mills. Walter G. Hamblin. Brit. 399,928, Oct. 19, 1933.
- Pneumatic conveyors for pulverulent materials. International Cement-Gun Co., G. m. b. H. and Claudius Peters. Brit. 399,730, Oct. 12, 1933.

- Jigging conveyors.** Alfred Bickhoff (trading as Gebr. Bickhoff Maschinenfabrik und Eisengiesserei). Brit. 398,134, Sept. 7, 1933.
- Jigging conveyors.** Robert P. Finlay and The Finlay Conveyor Co. Ltd. Brit. 399,344, Oct. 5, 1933.
- Tubular headers for steam superheaters, reheaters, feedwater heaters and other heat exchangers.** The Superheater Co. Brit. 398,414, Sept. 14, 1933.
- Apparatus for cooling, moistening and conveying hot dusty materials such as ore calcines.** Oscar Lee. U. S. 1,942,897, Jan. 9. Various details are described of an app. with spraying and dust-collecting chambers.
- Apparatus for cleansing and degreasing metal, glass, horn, celluloid, etc., articles by exposure to heavy solvent vapors, e. g., of tri- or per-ethylene or carbon tetrachloride.** Alexander Wacker Gesellschaft für elektrochemische Industrie G. m. b. H. Brit. 399,717, Oct. 12, 1933.
- Apparatus for spraying the interior of a building with a fire-extinguishing or disinfecting liquid.** Charles Orr. Brit. 398,943, Sept. 28, 1933.
- Centrifugal air cleaner.** Federico Lüdke. Brit. 399,365, Oct. 5, 1933.
- Combined isolating and safety cut-off valve for use in pipe lines where inflammable liquid is handled by a pump.** Rosser & Russell Ltd. and Ernest J. Naylor. Brit. 399,809, Oct. 2, 1933.
- Metal pots provided with electrically operated devices for indicating the fall of the metal below or above a pre-determined level.** Wm. Young. Brit. 398,865, Sept. 21, 1933.
- Apparatus of the rotary-drum and scraper type for cooling fatty emulsions, e. g., margarine.** Aage Gerstenberg. Brit. 399,253, Oct. 5, 1933.
- Arrangement for ensuring the discharge of accumulated sediment, etc., from a tank.** Josefa Borch. Brit. 399,109, Sept. 28, 1933.

## 2—GENERAL AND PHYSICAL CHEMISTRY

FREDERICK L. BROWN

- Hungarian iatrochemists.** László Szathmáry. *Magyar Gyógyszerésztud. Társaság Értesítője* 9, 297-320(1933). 4
- Historical. S. S. de Finály

- Daniel Rutherford and the discovery of nitrogen.** Mary Elvira Weeks. *J. Chem. Education* 11, 101-7(1934). E. H.
- The works of Maurice Bourguet.** R. Lespieau. *Bull. soc. chim.* 53, 1145-53(1934). G. G.
- The earliest portrait of Joseph Priestley.** Douglas McKie and W. Cameron Walker. *Science Progress* 28, 456-60(1934); cf. C. A. 27, 3861. J. S. Hepburn
- Chemical, pharmaceutical and technological material from the "Papyrus Erzherzog Rainer."** Edmond O. v. Lippmann. *Chem.-Ztg.* 57, 1009-11(1933).—Discussion of a papyrus discovered in the province of Fayum, Egypt. E. H.
- Three Arabic treatises on alchemy by Muhammad Bin Umair (10th Century A.D.).** H. E. Stapleton and M. Hidayat Husain. *Mem. Asiatic Soc. Bengal* 12, No. 1, 1 213(1933). E. H.
- Report of the Committee on Chemistry Libraries.** V. S. Culp, W. A. Noyes and Rufus D. Reed. *J. Chem. Education* 11, 114-23(1934). E. H.
- Safety in the chemical laboratory.** Edwin C. Buxbaum. *J. Chem. Education* 11, 73 6(1934). E. H.
- Class exercises in the industrial chemistry course.** IV. Advertisements and manufacturers' bulletins. V. Specifications. VI. Transportation of a chemical. Kenneth A. Kobe. *J. Chem. Education* 11, 41-2, 108, 109(1934); cf. C. A. 28, 939'. E. H.
- Evaluating unknowns in qualitative analysis.** II. W. Marlow. *J. Chem. Education* 11, 109-10(1934).—A basis for scoring a student's efforts in qual. analysis is suggested. This gives the student credit for proving ions, and also groups, absent as well as present. E. H.
- Recent advances in science: general and organic chemistry.** O. L. Brady. *Science Progress* 28, 476-81 (1934).—A review of recent work on (a) the at. wt. of C, (b) an optically active inorg. salt of Rh, (c) ascorbic acid (vitamin C), (d) addn. of OH groups at double bonds and (e) org. compds. of Li. Joseph S. Hepburn
- Recent advances in science: Physics.** L. F. Bates. *Science Progress* 28, 469-76(1934).—A review of recent work on the magnetic rotation of gases and vapors, and the magnetic behavior of cryst. compds. J. S. Hepburn
- Factors in the presentation and comparison of particle-size data.** E. J. Dunn, Jr., and John Shaw. *Proc. Am. Soc. Testing Materials* 3, Part II, 692-703(1934); cf. C. A. 27, 4462. G. G.
- The construction of nomographs for the solution of formulas.** A. Alison. *Ind. Chemist* 9, 429-30(1934) E. H.
- The measurement of humidity in closed spaces.** E. R. Griffiths, J. H. Awbery, et al. *Dept. Sci. Ind. Research, Food Investigation, Special Rept. No. 8* (Revised Ed.), 70 pp.(1933). E. J. C.
- The story of zinc.** IV. H. R. Hanley. *J. Chem. Education* 11, 111-13(1934); cf. C. A. 28, 939'. E. H.
- Calcium sulfate in sea water. II. Solubilities of calcium sulfate hemihydrate in sea waters of various concentrations at 65-150°.** T. Tomumi, T. Kuwahara and K. Hara. *J. Soc. Chem. Ind., Japan* 36, Suppl. binding 689 90(1933); cf. C. A. 26, 1485.—Solubilities of  $\text{CaSO}_4 \cdot \frac{1}{2}\text{H}_2\text{O}$  are reported for sea waters of Cl content 0-10% and temps. of 60-160°. Karl Kammermeyer
- The history of calcium phosphate, monophosphate (superphosphate), pyrophosphate and orthophosphate of bone earth, plants, etc.** Max Spetel. *Superphosphat* 6, 217-26(1933); cf. C. A. 26, 1373; 27, 4450. K. D. J.
- Periodic unequal potential minima and torsion oscillation of molecules.** Ta-You Wu. *Phys. Rev.* 45, 60 7 (1934).—A math. discussion of the torsion oscillation of *cis*- and *trans*- $\text{ClHC:CHCl}$ . Gerald M. Petty
- Autoxidation and ionization potentials of molecules.** Nicholas A. Milas. *J. Am. Chem. Soc.* 56, 486-7(1934).—In passing down each group of the hydrides, from the lightest to the heaviest central element, there is a regular decrease in the ionization potentials, which means an increasing looseness of the reactive unshared electrons with an increase of looseness of these electrons there is a relative increase in the tendency toward autoxidation. C. J. West
- Thermal analysis of picrates. I. Dehydration, melting points and initial and pre-explosive temperatures of lithium, sodium, potassium, rubidium, cesium, copper and silver picrates.** T. Tucholski. *Roczniki Chem.* 13, 435 47(1933); cf. C. A. 27, 8.—The picrates used were prepd from trinitrophenol (Merek), m. 122.5°, and the appropriate hydroxides or carbonates (Li, Na, K, Cu and Ag picrates) or Ag picrate and inorg. chlorides (Rb, Cs and Cu picrates). An attempt to prep. the Au compd. was unsuccessful. Li picrate ( $4\text{H}_2\text{O}$ ) begins to lose 3 mol.  $\text{H}_2\text{O}$  at 13.3°, the 4th at 106.2°. Its m. p., initial temp. (4) and pre-explosive temp. ( $t_{ps}$ ), resp., are 301.5°, 321° and 342°. Na picrate ( $1\text{H}_2\text{O}$ ) is dehydrated at 154.3°, m. 270.4°,  $t_i$  313°,  $t_{ps}$  302°. K picrate m. 250.1°,  $t_i$  331°,  $t_{ps}$  333°. Rb picrate m. 233.1°,  $t_i$  335°,  $t_{ps}$  336°. Cs picrate m. 276.3°,  $t_i$  301°,  $t_{ps}$  302°. Cu picrate ( $11\text{H}_2\text{O}$ ) loses 3  $\text{H}_2\text{O}$  at 29.6°, 3 at 35.2°, 2 at 71.9° and is dehydrated at 120.5°; m. 305°,  $t_i$  290°,  $t_{ps}$  290°. Ag picrate m. 296°,  $t_i$  332°,  $t_{ps}$  339°. C. T. Ichniowski
- Carbamide-containing media.** VI. Alb. J. J. Vande

Velde. *Natuurw. Tijdschr.* 15, 192-8(1933); cf. C. A. 27, 2706.—The influence of neutral salts on the aqueous hydrolysis of  $\text{CO}(\text{NH}_2)_2$  at elevated temp. was studied, 100 cc. soln. with 10 g.  $\text{CO}(\text{NH}_2)_2$  with or without 5 or 10 g. K, Na,  $\text{NH}_4$  chlorides or nitrates were heated in 150-cc. Kjeldahl flasks with air-cooled reflux cooler to 100°, liquid samples were rapidly cooled and analyzed with 0.1 N acid and methyl orange. The hydrolysis as shown from tables and curves is accelerated by Na and K salts to a decreasing degree; it is retarded by  $\text{NH}_4$  salts; chlorides act more strongly in 5% soln., nitrates in 10% soln. The effect of phosphates in the same soln. (15 cc. of  $1/10$  mol. solns. of  $\text{H}_3\text{PO}_4$ ,  $\text{NaH}_2\text{PO}_4$ ,  $\text{Na}_2\text{HPO}_4$ , and  $\text{Na}_3\text{PO}_4$ ) was an increase of hydrolysis rate by  $\text{PO}_4$  ions. The effect of the cations in these solns. was the same as before.

The magnetic and gyromagnetic properties of pyrrhotite. D. R. Inglis. *Phys. Rev.* 45, 118-19(1934).—A model is constructed which accounts for the  $g$ -value and other magnetic properties of pyrrhotite ( $\text{Fe}_7\text{S}_{10}$ ). G. M. P.

Magnetic properties of Rochelle salt. C. T. Lane. *Phys. Rev.* 45, 66(1934).—The magnetic susceptibility of 2 rectangular crystals of Rochelle salt, about  $12 \times 3 \times 3$  mm., was detd. at 8000 gauss. The mass susceptibility was  $\chi = -0.54 \times 10^{-6}$  if  $\chi_{\text{Au}} = 0.145 \times 10^{-6}$ . The susceptibility did not vary in the 3 principal directions from 10° to 30°. Apparently the Weiss elec. field postulated by Müller (C. A. 28, 698) to account for the anomalous elec. behavior of Rochelle salt has no effect on its magnetic properties. Gerald M. Petty

The magnetic susceptibility of manganous oxide as a function of the temperature. Rayen W. Tyler. *Phys. Rev.* 44, 776-7(1933).—The magnetic susceptibility of  $\text{MnO}$  was studied from 26° to -202°. There is a sharp discontinuity in the susceptibility-temp. curve at the same point,  $t = -156^\circ$ , as in the sp. heat-temp. curve and a 2nd one at a lower temp., -188°. The mass susceptibilities are 68.6, 73.6, 85.8, 78.1, and  $91.4 \times 10^{-6}$  c. g. s. units at 26°, -38.4°, -154.7°, -188°, and -202°, resp. The susceptibility-temp. curve follows Weiss' modification of Curie's law down to  $t = -156^\circ$ . The consts. of this law are  $C = 0.0575$  and  $\theta = -548^\circ \text{K}$ . The no. of Bohr magnetons in the compd. calcd. from exptl. data is 5.7.

Bernard Lewis

Determination of dielectric constant and electric moment by the electrical-resonance method (a preliminary test). Kiang-Shu Chang and Ya-Teh Cha. *J. Chinese Chem. Soc.* 1, 107-15(1933).—The elec. resonance method based on the heterodyne principle is used to det. dielec. consts. for a series of dil. solns. of  $\text{PhNO}_2$  in  $\text{C}_6\text{H}_6$  at 25°, from which  $P_0$  (molar polarization) and  $\mu$  (elec. moment) for  $\text{PhNO}_2$  are calcd. as 32.77 cc. and  $3.82 \times 10^{-18}$  e. s. u., resp.

Wm. H. Adolph

Some electrostatic factors which can operate in polar reactions. Wm. A. Waters. *J. Chem. Soc.* 1933, 1551-7.—Equations were derived (a) for the field effect of ionic charges and of permanent dipoles, and (b) for the induced and inductively transmitted effects of ionic charges and permanent dipoles. These support the empirical equation of Nathan and Watson (C. A. 27, 4787; 28, 24) for reactivity, viz.,  $E = E_0 + C(\mu + a\mu^2)$ . The term  $C\mu$  is suggested as that to be correlated with the direct, or field, effect, and the term  $C\mu^2$  to be correlated with the induced polarization effect. Bond polarizabilities are computed from bond refractivity data, and indicate that the transmission of chem. reactivity by induction in any org. mol. should be much smaller than by direct action across space. This is in accord both with qual. experience and with the small value (0.032) for the factor  $\alpha$  of N. and W. Secondary effects, due to the disturbances set up in the arrangements of intermediate atoms in a polarized chain, are limited to second-order magnitude. This applies also to effects between mols. in any reaction mixt., and hence local electrostatic fields due to mols. do not appreciably change the frequency of intermol. collisions from that calculable for electrically neutral mols. G. Calingaert

The dipole moments of some long-chain molecules. John W. Smith. *J. Chem. Soc.* 1933, 1567-70.—From

measurements of the dielec. consts. and ds. of dil. solns. of palmitic acid, myristic acid and Me myristate in benzene, and on the assumption that the at. polarization of these mols. is approx. 15% of the electronic polarization, their elec. dipole moments ( $\times 10^{18}$ ) were evaluated as 0.72, 0.76 and 1.61, resp. The results are discussed with reference to the variation of the elec. moment of a mol. with the length of the C chain, and also with reference to the assocn. of fatty acid mols. in benzene soln. G. Calingaert

Viscosity, thermal conductivity and diffusion in gas mixtures. XXIV. Determination of the mean viscosity  $\eta_{12}$ ; use, verification and differences in interpretation of the viscosity law for binary mixtures. Max Trautz. *Ann. Physik* 18, 816-32, 833-66(1933); cf. C. A. 27, 4145.—A viscosity law for binary mixts. is developed in detail. While its form is that of the Maxwell viscosity law, it contains 3 adjustable consts.: the ratio of the collision diams. of the 2 kinds of mols., a mean collision diam. and a mean viscosity  $\eta_{12}$ . The development is compared to the Chapman-Enskog modification of the Maxwell theory. The dependence of the consts. on temp. and molar ratio is discussed. Details of the calcn. of consts. from exptl. data are given. Values for a large no. of binary mixts. of the common gases are tabulated.

E. J. Rosenbaum

Formula for specific volumes of saturated vapors. Cyril H. Meyers. *Bur. Standards J. Research* 11, 691-701(1933)(Research Paper No. 616).—The formula  $\log_{10}[1 - (\pi u/R\theta)][1 - (\pi u'/R\theta)] = A \log_{10}(\pi/2.718\pi_c)$  expresses the sp. vol. of the vapor ( $u$ ) in terms of the vapor pressure ( $\pi$ ), the sp. vol. of the liquid ( $u'$ ) and two empirical consts. ( $A$  and  $1/2.718$ , the latter being the same for all substances tested).  $R$  is the gas const.,  $\theta$  the abs. temp. and  $\pi_c$  the crit. pressure. For pressures up to  $1/4$  of the crit. pressure the formula represents the data for 23 substances within the exptl. error. H. A. Smith

Azeotropic mixtures in the system hydrochloric acid-water-chlorobenzene-phenol. W. Prah and W. Mathes. *Angew. Chem.* 47, 11-13(1934).—The binary mixt. 71.6% chlorobenzene-28.4%  $\text{H}_2\text{O}$  boiling at 90.2° as found by Young was confirmed. According to Roscoe the mixt. 20.24%  $\text{HCl}$ -79.76%  $\text{HCl}$  b. 110°. The mixt. 9.21% phenol-90.79%  $\text{H}_2\text{O}$  b. 99.57°. The mixt. 5.3%  $\text{HCl}$ -20.2%  $\text{H}_2\text{O}$ -74.5% chlorobenzene b. 96.9° and the mixt. 15.8%  $\text{HCl}$ -64.8%  $\text{H}_2\text{O}$ -19.4% phenol b. 107.33°. Six references.

Karl Kammermeyer

A study of the degree of purity of benzene and its dehydration by heteroazeotropic distillation. W. Świątowski and J. Usakiewicz. *Roczniki Chem.* 13, 495-9 (in French 499-500)(1933).—Dehydration was accomplished within 0.001%. Heteroazeotropic distn. was performed by using a differential ebullioscope with a dephlegmator. Relative purities of  $\text{C}_6\text{H}_6$  as shown by  $b_{760}$  are: Merck's (pro analysis) 80.089°; triply purified 80.110°; differences between b. p. and condensing points are 0.008° and 0.004°, resp.,  $\text{C}_6\text{H}_6$  forms zeotropic solns. with thiophene.

C. T. Ichniowski

The plasticity of rock salt and its dependence upon water. R. Bowling Barnes. *Phys. Rev.* 44, 898-902 (1933); cf. C. A. 27, 2858.—Measurements are reported which show that if a piece of rock salt is placed in  $\text{H}_2\text{O}$  the latter actually penetrates into the interior of the crystal. A discussion is given of the role played by  $\text{H}_2\text{O}$  in causing the high degree of plasticity and tensile strength (Joffé effect), characteristic of salt crystals that have been so treated.

Bernard Lewis

The conductivity of  $\alpha$ -silver sulfide. II. Carl Wagner. *Z. physik. Chem.* B23, 469-72(1933); cf. C. A. 27, 3372.—Further expts. substantiate the conclusions of the earlier work.

G. M. Murphy

Energy content, particle dimension and lattice formation of active beryllium oxide. R. Fricke and J. Lücke. *Z. physik. Chem.* B23, 319-29(1933); cf. C. A. 27, 4980.— $\text{BeO}$  was prepd. from cryst.  $\text{Be}(\text{OH})_2$  by heating for 1 hr. at 400°, 500°, 600°, 800°, 1000° and 1300°. Measurements of heats of soln. show that the products prepd. at the lower temps. have higher energy contents by as much as 1 kg.-cal. per mol. X-ray photographs also show considerable

differences. Intensity measurements indicate that the lattice formation of the energy-rich preps. is not complete.

G. M. Murphy

**Determination of the space-lattice of a triclinic mineral by means of the Weissenberg x-ray goniometer.** Geo. Tunell. *Am. Mineral.* 18, 181-6(1933).—With one setting of the crystal the data obtainable with certainty and ease are: the coordinates of the points of the space lattice; the indexes of the plane producing each diffraction spot; and the approx. intensity of diffraction from each plane, estd. from the d. of the spot on the film. Further crystallographic interpretation can be readily made on the basis of these data.

A. M. Brant

**The space lattice and optical orientation of chalcantite ( $\text{CuSO}_4 \cdot 5\text{H}_2\text{O}$ ): an illustration of the use of the Weissenberg x-ray goniometer in the triclinic system.** Tom F. W. Barth and George Tunell. *Am. Mineral.* 18, 187-94 (1933).—The procedure and calcs. necessary to det. the space lattice of chalcantite by means of the Weissenberg x-ray goniometer are given. The dimensions of the unit cell are  $a_0 = 6.110$ ,  $b_0 = 10.673$ ,  $c_0 = 5.95$  A.;  $\alpha = 82^\circ 16'$ ,  $\beta = 107^\circ 26'$ ,  $\gamma = 102^\circ 40'$ . The optical orientation is discussed also.

A. M. Brant

**X-ray examination of konjak mannan. III. Orientation of the micelle in stretching, thawing and drying.** Ichiro Sakurada and Keiroku Futino. *J. Soc. Chem. Ind., Japan* 36, Suppl. binding 662(1933); cf. *C. A.* 27, 3130, 28, 947.—X-ray examn. showed that the micelle of  $\beta$ -konjak mannan is oriented in dried films and thawed out disks and when stretched it is oriented parallel to the direction of stretching.

Karl Kammermeyer

**Freezing points of mixtures of  $\text{H}_2\text{O}$  and  $\text{H}_2\text{O}$ .** Victor K. La Mer, W. C. Bichelberger and H. C. Urey. *J. Am. Chem. Soc.* 56, 248 9(1934).— $\text{H}_2\text{O}$  contg. 14.7, 19.1, 39.9%  $\text{H}_2\text{O}$  freezes at 0.632, 0.824 and 1.679, resp., and has  $d_{4^\circ}$  1.01644, 1.02135, 1.04456, resp.; these observations indicate that the solid phase is a solid soln. of the 2 components and that on freezing the mixts. behave as though they were pure substances. The f. p. is a linear function of the d. to 20%  $\text{H}_2\text{O}$ , but a deviation outside the exptl. error is perceptible at 40%.

C. J. West

**Vapor pressure of liquid and solid deuterochloric acid [deuterium chloride].** Gilbert N. Lewis, Ronald T. Macdonald and Philip W. Schutz. *J. Am. Chem. Soc.* 56, 494-5(1934).— $\text{H}^2\text{Cl}$  was obtained from  $\text{H}_2\text{O}$  with anhyd.  $\text{MgCl}_2$  at  $600^\circ$ . The vapor pressure in mm. is given from 152.6° (54.5) to 200.9°K. (1474.5);  $\log_{10}(p_1/p_2) = (15.4/T) - 0.075$  for the liquid and  $-(57.7/T) + 0.387$  for the solid, where  $p_1$  and  $p_2$  are the vapor pressures of  $\text{HCl}$  and  $\text{H}^2\text{Cl}$ , resp. The ratio of the 2 vapor pressures reaches a max. of 1.05 at the triple point. The heat of vaporization of liquid  $\text{H}^2\text{Cl}$  is greater than that of  $\text{HCl}$  by  $70 \pm 1$  cal. per mol., while with the solid there is a difference of  $265 \pm 20$  in the other direction; the heat of fusion of  $\text{H}^2\text{Cl}$  is 141.

C. J. West

**The refractive indexes of ethylene chloride, 1,1,2,2-tetrachloroethane, and of their mixture and the molar refractions of these substances.** Senzo Hamai. *Bull. Chem. Soc., Japan* 8, 297-306(1933).—The  $n_D$  of  $\text{C}_2\text{H}_2\text{Cl}_4$  and  $\text{C}_2\text{H}_2\text{Cl}_2$  are linearly dependent on the reciprocal of the abs. temp.  $n_D$  for  $\text{C}_2\text{H}_2\text{Cl}_4$ :  $14^\circ$  1.44561,  $15^\circ$  1.44510,  $15.7^\circ$  1.44470,  $16.2^\circ$  1.44440,  $17^\circ$  1.44400,  $17.5^\circ$  1.44380,  $18.5^\circ$  1.44341,  $19.1^\circ$  1.44290,  $20.0^\circ$  1.44240,  $21.1^\circ$  1.44189,  $22.0^\circ$  1.44138,  $23.6^\circ$  1.44088,  $24.1^\circ$  1.44038,  $25.0^\circ$  1.43987,  $26.8^\circ$  1.43927,  $27.0^\circ$  1.43927,  $27.4^\circ$  1.43866. Molar refraction 20.82, elec. moment (liquid)  $1.375 \times 10^{-18}$ .  $n_D$  for  $\text{C}_2\text{H}_2\text{Cl}_2$ :  $13.0^\circ$  1.49486,  $15.7^\circ$  1.49354,  $16.5^\circ$  1.49345,  $17.5^\circ$  1.49298,  $18.5^\circ$  1.49260,  $19.3^\circ$  1.49222,  $20.0^\circ$  1.49196,  $21.1^\circ$  1.49146,  $21.4^\circ$  1.49136,  $22.0^\circ$  1.49108,  $25.0^\circ$  1.49004; molar refraction, 31.23.  $n_D^m$  of mixts. (mol. fractions of  $\text{C}_2\text{H}_2\text{Cl}_4$ ) 0.129, 1.44903; 0.156, 1.45074; 0.198, 1.45324; 0.270, 1.45664, 0.425, 1.46617; 0.470, 1.46884; 0.525, 1.47109; 0.687; 1.47861; 0.748, 1.48035; 0.782, 1.48171.

J. E. A.

**The reversible sorption of gases and vapors by potassium benzene sulfonate.** Willy Lange and Gerda v. Krueger. *Z. anorg. allgem. Chem.* 216, 49-65(1933). Lange and

Lewin (*C. A.* 25, 21, 864) found that the sorption of  $\text{H}_2\text{O}$  by  $\text{C}_6\text{H}_5\text{SO}_3\text{K}$  depends on the pressure until a  $1/4$ -hydrate is formed, when, at a certain pressure, this suddenly goes over to a  $1/2$ -hydrate. The sorption of  $\text{H}_2\text{S}$  depends on the pressure and  $1/4$  mol. is taken up at satn. The authors tested the reversible sorption of various gases. That of the following depended on the pressure (the fraction indicates the part of a mol. of gas sorbed at satn. at 0°):  $\text{C}_2\text{H}_6$ ,  $1/5$ ;  $\text{CH}_3\text{Cl}$ ,  $1/5$ ;  $\text{CO}_2$ ,  $1/4$ ;  $\text{N}_2\text{O}$ ,  $1/4$ . The isotherm and isobar of  $\text{NH}_3$  were irregular. The 0 isotherm of  $\text{SO}_2$  approached  $1/5$  mol., then at 242 mm. it suddenly jumped to  $1/2$  mol. in the same manner as that of  $\text{H}_2\text{O}$ . That of  $(\text{CH}_3)_2\text{O}$  approached  $1/7$  mol. until the pressure reached 46.6 mm.; then there was a kink in the curve and it approached  $1/6$  mol. The sorptions of various gases at 0° and 760 mm. were:  $\text{NO}$ , 0.004 mol.;  $\text{CO}$ , 0.014;  $\text{C}_2\text{H}_6$ , 0.100;  $\text{CO}_2$ , 0.139;  $\text{PH}_3$ , 0.143;  $\text{N}_2\text{O}$ , 0.146;  $(\text{CH}_3)_2\text{O}$ , 0.167;  $(\text{CN})_2$ , 0.168;  $\text{CH}_3\text{Cl}$ , 0.197;  $\text{H}_2\text{S}$ , 0.234;  $\text{CH}_3\text{NH}_2$ , 0.250;  $\text{NH}_3$ , 0.288;  $\text{C}_2\text{H}_4$ , 0.280,  $\text{SO}_2$ , 0.503 and  $\text{HCl}$ , 0.89. This sorption of gases is independent of the previous history of the  $\text{C}_6\text{H}_5\text{SO}_3\text{K}$  and in most cases cannot be compared to hydration.

John E. Milbery

**Two types of activated adsorption of hydrogen on the surface of a promoted iron synthetic ammonia catalyst.** R. W. Harkness and P. H. Emmett. *J. Am. Chem. Soc.* 56, 490-1(1934).—There are 3 types of adsorption of  $\text{H}_2$  on a promoted Fe catalyst (1.3%  $\text{Al}_2\text{O}_3$  and 1.59%  $\text{K}_2\text{O}$ ) phys., at  $-196^\circ$ ,  $-183^\circ$  and  $-144^\circ$ ; at which temp. 10 cc. of catalyst adsorbs 5, 2.8 and 0.25 cc.  $\text{H}_2$ , resp. type A activated, between  $-78^\circ$  and  $0^\circ$ , the isobar at 700 mm. showing a gradual decrease from an adsorption of 7 to 5-6 cc.; type B activated, at  $100^\circ$  or higher, an addnl. but much slower adsorption, the total adsorption of both types reaching 8-9 cc. at  $100^\circ$  in 2 hrs.; at  $212^\circ$  and 450 the adsorption reached an apparent equil. in less than 1 hr., the adsorption being 5.6 and 3.5 cc., resp.

C. J. West

**The heat of adsorption of noble gases and carbon dioxide on ionic crystals.** Fritz Victor Lenel. *Z. physik. Chem.* B23, 379-98(1933). The energy of mol. attraction of A, Kr and  $\text{CO}_2$  on ionic crystals was calcd. The total energy is due to dispersive forces, as calcd. by London (*C. A.* 24, 5597) and to an effect due to the fact that the electrically charged ions of the crystal lattice induce an elec. moment in the adsorbed noble-gas atom. For a polar gas like  $\text{CO}_2$  dipole and quadrupole attraction must also be considered. The adsorption isotherms of A, Kr and  $\text{CO}_2$  were detd. on finely pulverized  $\text{KCl}$ ,  $\text{KI}$ ,  $\text{LiF}$ ,  $\text{CsCl}$  and  $\text{CaF}_2$  by means of a hot-wire manometer at low pressures. From the temp. dependence of the adsorption isotherms the heat of adsorption was calcd. Expt. and theory agree well in view of the simple assumptions.

G. M. M

**Absorption of hydrogen by palladium black at high pressure.** V. V. Ipat'ev, Jr. and V. G. Tronev. *J. Gen. Chem.* (U. S. S. R.) 3, 78-86(1933).—The soln. of  $\text{H}_2$  by Pd black was studied in a specially designed app. (illustrated) at  $15^\circ$ ,  $25^\circ$ ,  $100^\circ$  and  $300^\circ$  and 1-25 atm. pressure. Twelve references.

Chas. Blanc

**Monomolecular films of fatty acids on glass.** Katherine B. Blodgett. *J. Am. Chem. Soc.* 56, 495(1934).

C. J. West

**Factors in sedimentation analysis.** E. Wayne Gallihir. *Am. J. Sci.* 26, 564-8(1933).—Proper dispersion is most important in sedimentation analysis. Either  $\text{Na}_2\text{C}_2\text{O}_4$  or Na citrate is a more efficient dispersing agent than  $\text{NH}_4\text{OH}$ . Danger of flocculation by chemicals from micro organisms is discussed. Sterilization with toluene may be necessary.

Alden H. Emery

**Measurement of concentration and dispersity of suspensions by the photoelectric cell. III.** M. Matsui, T. Noda and S. Iwai. *J. Soc. Chem. Ind., Japan* 36, Suppl. binding 691-2(1933); cf. *C. A.* 27, 1798.—Measurements of suspensions of  $\text{CaCO}_3$ ,  $\text{ZnO}$ ,  $\text{PbO}$ ,  $\text{Fe}_2\text{O}_3$ , and C black are given as functions of concns. in cc./l. vs.  $\log I_0/I$  and  $(I' - I_0)/I$ , where  $I_0$ ,  $I$ ,  $I'$  and  $I_0'$  are the resp. intensities of light that is incident, transmitted, scattered by suspensions and scattered by suspension medium only.

K. Kammermeyer

Recent advances and applications of colloid chemistry. Giuseppe Bruni. *Giorn. chim. ind. applicata* 15, 481-94 (1933).—A summary. A. W. Contieri

The electrical double layer in colloids. II. Double layer and stability of undialyzed silver iodide sols. E. J. W. Verwey and H. R. Kruyt. *Z. physik. Chem.* A167, 137-48 (1933); cf. *C. A.* 23, 1035.—In freshly pptd. AgI particles changes of structure take place. These differ from the usual aging phenomena. A decrease in the degree of dispersion takes place which is due to the formation of particles with a more perfect lattice formed from the incomplete particles of the sol. The double layer does not cover the particles regularly but collects upon a few points of the surface. III. Double layer and stability of dialyzed silver iodide sols. *Ibid.* 149-63.—Very stable neg AgI sols are prepd. in a high state of purity and in a highly concd. form by dialysis and electrodecantation. Adsorption measurements of the I ion show that the charge of the double layer varies linearly with the logarithm of the concn. of free I ion in the sol. The double layer is centered in a few active places on the surface and its magnitude depends on the degree of aging. The zero point of charge is at  $e_{Ag^+} = -10^{-4}$ . A systematic absorption due to this fact arises in the electrometric AgI titration of the order of 0.1%. G. M. Murphy

Factors that determine the formation of red gold sols. Raúl Wernicke. *Anales soc. cient. Argentina* 116, 196-224 (1933).—Minute traces of impurities are necessary to stabilize colloidal Au preps. If the water used is purified by distn. out of contact with air it becomes unsuitable for use but may be made usable by adding a few g. of Na<sub>2</sub>S or exposing to the air for a few weeks. The essential impurities are evidently of a reducing nature. F. Saunders

Highly polymerized compounds. LXXXV. The molecular weight of methylcellulose. H. Staudinger and H. Scholz. *Ber.* 67B, 84-91 (1934); cf. *C. A.* 28, 1015'.—The authors present the results of a viscosity study of methylated cellulose, in comparison with acetylated cellulose in various solvents. The theory of polymeric homologs and analogs is developed and its relation to viscosity measurements is discussed. Di- and tri-acetylated cellulose failed to give concordant results with methylcellulose when the sp. viscosities were compared. This discrepancy is attributed to the formation of oxonium complexes with solvent mols. on the part of the methylcellulose. Attempts to find a solvent that does not give this solvation effect failed. If the solvation effect is taken into consideration, recalcd. results for the mol. wt. of methylcellulose are in fair agreement with that predicted on the basis of no chain cleavage during the deacetylating and methylating process. This agreement, and the paralleling agreement with the mol. wts. reported by Harworth and Machamer obtained by another method, are cited as evidence to prove the existence of polymeric homologs and analogs, in the cellulose series. Solvents used include *m*-cresol, water, AcOH and pyridine. LXXXVI. The validity of the viscosity-molecular weight relationship. H. Staudinger. *Ibid.* 92-101; cf. *C. A.* 27, 4790. Viscosity measurements are compared with other standard methods for detg. mol. wts. of highly polymerized compds. The viscosity-mol. wt. relationship is defended, and shown to be in very fair agreement with results obtained by other methods when all complicating factors are taken into consideration. The work of Büchner and Santwell (*C. A.* 27, 2031), Kraemer and van Natta (*C. A.* 27, 1800), Carothers, and others in this field is critically reviewed. G. H. Young

The swelling of casein. W. Mohr and J. Moos. *Milchwirtschaft. Forsch.* 15, 384-9 (1933).—Freshly prepd. casein was dried and ground. The finely ground material was sifted to give a uniform size. The casein placed in solns. of a no. of acids with  $p_H$  values up to 4.5 was allowed to stand and the increase in diam. noted. Max. swelling was observed between  $p_H$  2 and 2.3. G. R. Greenbank

The solubility of potassium ferrocyanide and of sodium ferrocyanide in aqueous solutions of ammonia. A. Tettamanzi. *Gass. chim. ital.* 63, 575-9 (1933).—The latter to unpublished fact that the addn. of aq. NH<sub>3</sub> to aq.

K<sub>4</sub>Fe(CN)<sub>6</sub> ppts. K<sub>4</sub>Fe(CN)<sub>6</sub>·3H<sub>2</sub>O led to a systematic study of the systems: K<sub>4</sub>Fe(CN)<sub>6</sub>·NH<sub>3</sub>·H<sub>2</sub>O, Na<sub>4</sub>Fe(CN)<sub>6</sub>·NH<sub>3</sub>·H<sub>2</sub>O and Li<sub>4</sub>Fe(CN)<sub>6</sub>·NH<sub>3</sub>·H<sub>2</sub>O, at 18°. The solubilities of K<sub>4</sub>Fe(CN)<sub>6</sub> and of Na<sub>4</sub>Fe(CN)<sub>6</sub> diminish progressively with increase in the concn. of NH<sub>3</sub> until the salts become practically insol. On the other hand, the soly. of Li<sub>4</sub>Fe(CN)<sub>6</sub> is not affected by NH<sub>3</sub>. Contrary to Briggs (*C. A.* 5, 3018), there was no evidence of isomers or of different states of hydration of K<sub>4</sub>Fe(CN)<sub>6</sub>·3H<sub>2</sub>O and of Na<sub>4</sub>Fe(CN)<sub>6</sub>·10H<sub>2</sub>O. Electrolytic laws do not apply to the phenomenon in view of the absence of common ions and in view of the high concns. C. C. Davis

Polyiodides. I. The solubility of iodine in potassium iodide solution and hydration of the iodide ion. S. I. Raikhshtein, L. Eventov and I. A. Kazarnovskii. *Z. anorg. allgem. Chem.* 216, 1-9 (1933).—The soly. of I<sub>2</sub> in KI solns. from 0.05 to 6.250 *N* was accurately detd. at 25° and found to agree with the best detns. in the literature. The d. of the solns. was also detd. and the mol. vols. were calcd. In the concd. solns. these approached that of I<sub>2</sub> in solid polyiodides. Thus the mol. vol. of I<sub>2</sub> in satd. KI soln. was 59.96 as compared with 57.3 in solid CsI<sub>2</sub>. To explain the fact that the ratio I/KI increases with the concn. of KI, the following equil. was assumed: I<sup>-</sup>(H<sub>2</sub>O)<sub>n</sub> + I<sub>2</sub> ⇌ I<sub>3</sub><sup>-</sup>(H<sub>2</sub>O)<sub>m</sub> + nH<sub>2</sub>O. Thus, anything that decreased the activity of the H<sub>2</sub>O should increase the soly. of the I<sub>2</sub>. To test this the soly. of I<sub>2</sub> was detd. in solns. of KI satd. with sucrose. It was found that sucrose actually did increase the soly. of I<sub>2</sub> in solns. up to 2.659 *N*, but lowered it in more concd. solns. Tests showed that sucrose had no effect on the soly. of I<sub>2</sub> in H<sub>2</sub>O. The action of sucrose is explained by assuming 2 opposing tendencies: reduction of the activity of the H<sub>2</sub>O, and formation of complex ions with I<sup>-</sup>. I/KI is a linear function of the concn. of sucrose when the concn. of KI is const. in both dl. and concd. KI solns. John E. Milbery

The solubility of potassium acid tartrate. I. In tartaric acid and dipotassium tartrate solutions. D. C. Carpenter and G. L. Mack. *J. Am. Chem. Soc.* 56, 311-13 (1934).—The soly. of K acid tartrate (I) in solns. of tartaric acid (II) and dipotassium tartrate (III) was detd. at 0°, 10°, 25° and 0°, 5°, 10°, 15°, 20° and 25°, resp., in a concn. range of 0-1% and found to decrease with increasing concns. of I and II, II having the greater effect. The soly. of I in H<sub>2</sub>O follows the equation  $C_1 = k + at + bt^2$ , where  $k = 0.2305$ ,  $a = 0.010018$ ,  $b = 0.0002564$  at  $t$  temp. The soly. of I in solns. of II and III follows  $C_1 = kC_{II}^{-n}$  and  $C_1 = a + b \log C_{III}$ , resp., where  $k$ ,  $n$ ,  $a$  and  $b$  are consts. at a given temp. II. In various sugar solutions. D. C. Carpenter and J. J. Kučera. *Ibid.* 324-7. The soly. of K acid tartrate (I) in solns. *d*-fructose, invert sugar, *d*-glucose and sucrose in various concns. was detd. at 0°, 5°, 10°, 15° and 20° and found to follow the equation  $C_1 = K - kC_{sugar}^a$ , where  $C_1$  and  $C_{sugar}$  represent the concn. in mg. per 100 g. of soln. of I and sugar,  $K$  is the soly. of I in H<sub>2</sub>O and  $k$  and  $a$  are consts. depending on the temp. and the kind of sugar. The soly. of I decreases with increasing sugar concn. in the order given above. Calcd. on the basis of a fixed amt. of H<sub>2</sub>O as a solvent the soly. of I increases with increasing concn. of sugar, except with sucrose, by which it is practically unchanged. J. Kučera

Kinetic demonstration of the law of Berthelot and Jungfleisch on the distribution of a substance between two immiscible solvents. A. Sconzo. *Gass. chim. ital.* 63, 525-6 (1933).—A further study of the kinetic demonstration of the law of distribution already published (cf. *C. A.* 27, 3870) leads to certain corrections, which are given in detail mathematically. C. C. Davis

Stationary, checked and other states of osmotic systems. II. F. A. H. Schreinemakers. *Proc. Acad. Sci. Amsterdam* 36, 717-23 (1933).—S. extends the work previously reported (cf. *C. A.* 27, 4463) to systems in which the membranes are permeable to more than one substance. He concludes that when a stationary liquid is (1) "enclosed," const. vol., its quantity, pressure and compn. are defined; (2) "open," const. pressure, ( $a$ ) with one or

more non-diffusing substances, its quantity and compn. are defined, (b) with diffusing substances only, its compn. is defined but its quantity will increase or decrease continuously and only accidentally remain const. III. *Ibid.* 779-85.—A continuation of the above with an application to the biol. process, the functioning of a gland.

E. R. Schierz

**Selectivity as exhibited by certain osmotic diaphragms.** Laurie L. Burgess. *J. Am. Chem. Soc.* 56, 414-19 (1934).—Diaphragms are described that exhibit selective osmotic action with respect to the various ions or mols. in the soln. When either Na alginate or soap was used in constructing the diaphragm, the selective action favored K and retarded Na ions, or their corresponding salt mols. The alginate diaphragms also favored bromide at the expense of chloride ions and to a much smaller extent favored sulfate over chloride ions and Ca over Mg and Na ions. When casein was used as the diaphragm material, the selective action was reversed with respect to Na and K compds. Ca also appeared to be greatly retarded. All materials that were found to exhibit a selective osmotic action were colloidal in their behavior and properties. This phenomenon may be attributed to adsorption of the various ions or mols. at the surface of the diaphragm.

C. J. West

**Index of refraction and refractivity of dilute solutions of electrolytes. II. Improvement of the interferometric method and measurements with thallium chloride and thallium nitrate.** A. I. Brodskii and N. S. Filippova. *Z. physik. Chem.* B23, 399-411(1933); cf. *C. A.* 26, 11.—The earlier calibration method for the Haber-Loewe interferometer was improved. Monochromatic light (He 5875 and Hg 4358 Å.) was used. Error in the detn. of the zero point was obviated. Results are given for the difference in  $n$  between  $H_2O$  and  $TlCl$  and  $TlNO_3$  solns., between 0.001 and 0.01 and 0.001 and 0.1  $M$ , resp., as well as dispersion and temp. coeff. The ratio  $\Delta n/c$  is linear in  $c$ , the concn. in this region. III. Index of refraction and refractivity of potassium chloride, potassium bromide, potassium nitrate and sodium chloride. A. I. Brodskii and I. M. Shershever. *Ibid.* 412-27.—The difference in  $n$  between  $H_2O$  and solns. of  $KCl$ ,  $KNO_3$ ,  $NaCl$  and  $KBr$  between 0.001 and 0.1  $M$  at various temp. was measured. The ratio  $\Delta n/c$  increases linearly with concn. except for  $NaCl$ . Molar refraction was calcd. between 0 and 0.1  $M$  for  $KCl$ ,  $KBr$  and  $NaCl$ . Results are discussed from the standpoint of the Debye-Hückel theory. G. M. Murphy

**Concentration dependence of the molar refraction of electrolytes. Remarks on the preceding work of A. I. Brodskii and I. M. Shershever.** K. Fajans and W. Gefick. *Z. physik. Chem.* B23, 428-30(1933).—Discrepancies between the results of Brodskii and Shershever and Gefick and Kruis (*C. A.* 28, 953<sup>a</sup>) on the concn. dependence of the  $n$  of  $NaCl$  must be due to systematic errors in the work of B. and S. G. and K. used other methods to remove such errors. G. M. Murphy

**The dispersion formula for an ionized medium.** D. R. Hartree. *Nature* 132, 929-30(1933).—The disagreement of Tonks [cf. *Nature* 132, 101, 710(1933)] with the use of the Lorentz dispersion formula relating the ionization density  $N$  and refractive index  $\mu$  of an ionized medium for waves of frequency  $p/2\pi$  is discussed by H. who presents arguments equally to justify the Lorentz formula.

Calvin Brous

**Electrochemical and cryoscopic investigation of triple systems: aluminum bromide-bromides of lithium, copper, and silver and solvents benzene, toluene and xylene.** V. A. Plotnikov, I. A. Sheka and V. A. Yankelevich. *J. Gen. Chem.* (U. S. S. R.) 3, 481-99(1933).— $C_6H_6$  and  $PhMe$  solns. of  $LiBr-AlBr_3$ ,  $CuBr-AlBr_3$ , and  $AgBr-AlBr_3$  conduct current. The max. cond. of  $LiBr$  in  $C_6H_6$  soln. of  $AlBr_3$  is  $K = 5.72 \times 10^{-3}$ . The cond. of  $AgBr$  in the same soln.:  $K = 5.80 \times 10^{-3}$ ; the cond. of  $CuBr$ :  $K = 4.96 \times 10^{-3}$ . In  $PhMe$  solns. for  $LiBr-AlBr_3$ ,  $K = 5.28 \times 10^{-3}$ ; for  $AgBr-AlBr_3$ ,  $K = 5.50 \times 10^{-3}$ ; and for  $CuBr-AlBr_3$ ,  $K = 4.86 \times 10^{-3}$ . With increase in concn. of bromides of Li, Cu and Ag, the cond. increases and changes abruptly when the molar ratio corresponds to complexes of

the compn.:  $LiBr \cdot 2AlBr_3$ ,  $CuBr \cdot 2AlBr_3$ , and  $AgBr \cdot 2AlBr_3$ . The cond. in  $C_6H_6$  and  $PhMe$  solns. is:  $AgBr > LiBr > CuBr$ . During electrolysis in  $C_6H_6$ ,  $PhMe$  and  $C_6H_5Me_3$ , Cu and Ag sep. on the cathode from the systems  $CuBr-AlBr_3$  and  $AgBr-AlBr_3$ , and Al from the system  $LiBr-AlBr_3$ . The best ppts. are obtained from  $C_6H_5Me_3$ . The decompn. potential in  $C_6H_6$  soln. of  $AlBr_3$  for  $CuBr$  is 1.13 v., for  $AgBr$  1.35 v., for  $LiBr$  1.60 v.; in  $PhMe$  soln. of  $AlBr_3$ , the decompn. potential for  $CuBr$  is 1.40 v., for  $AgBr$  1.14 v. and for  $LiBr$  2.00 v. Cryoscopic investigation of  $LiBr \cdot 2AlBr_3$ ,  $AgBr \cdot 2AlBr_3$ , and  $CuBr \cdot AlBr_3$  in  $C_6H_6$  showed that the complexes are very much assocd. and the degree of assocn. increases with concn. Addn. of  $CuBr$ ,  $LiBr$  or  $AgBr$  to the  $C_6H_6$  soln. of  $AlBr_3$  raises the f. p.; this indicates a further assocn. of  $AlBr_3$  during the formation of complex compds. W. P. Ericks

**The dissociation constants of organic acids. VII. Acetic acid: a correction. The solvent correction for salts of weak monobasic acids.** George H. Jeffery, Arthur I. Vogel and Hugh V. Lowry. *J. Chem. Soc.* 1933, 1637-43; cf. *C. A.* 27, 1563.—Full details are given of the water correction for solns. of salts of weak monobasic acids, valid above a concn. of about 0.0005  $N$ , made with equil. water, and the method was applied to previous measurements with  $NaOAc$  and  $KOAc$  (*C. A.* 27, 1563). A new method is described for accurate measurement of the cond. of salts of weak acids. It involves the addn. of 20-40% excess over the calcd. quantity of  $Ba(OH)_2$  required to react with all the  $H_2CO_3$  (assumed to be the only impurity) in the water used. When applied to  $NaOAc$  and  $KOAc$  at 25°, this method gives 40.62 for the limiting mobility of the acetate ion at 25°. Corrected values for the classical and the thermodynamic dissoc. consts. of  $HIOAc$  are  $1.824 \times 10^{-8}$  and  $1.764 \times 10^{-8}$ , resp.

Geo. Calingaert

**Relation between complex formation, solvation and formation of an electrically conducting system. II. Ebullioscopic investigation of the system: dimethylpyrone-halides of the elements of the 5th group-benzene.** V. S. Finkelshtein and P. V. Kurnosova. *J. Gen. Chem.* (U. S. S. R.) 3, 121-33(1933); cf. *C. A.* 24, 5587; 27, 2616.—Dimethylpyrone (I) in  $C_6H_6$  showed normal mol. wt. In all 4 systems the formation of an electrically conductive complex was demonstrated.  $SbCl_3$  and  $SbBr_3$  showed auto-solvation with subsequent dissocn. on addn. of I to the soln. Interpretation: The unionized mols. become ionized in a medium with a low dielec. const. ( $C_6H_6$ ) on addn. of I, the mols. of which evidently possess, in common with  $R_3O$ , a dipolar moment sufficient to penetrate within the mols. of the halides of As and Sb and create an ionic complex, which in the case of Sb is capable of being solvated by mols. of the same halides as long as the soln. contains an insufficient no. of I mols. Such a complex, even in a medium of low dielec. const., is ionized and has the properties of an electrolyte. Thus the basic cause of the formation of an electrically conducting medium in this and other cases is the formation of a complex produced by the chem. affinity of the separate parts of a mol. of a halide for the dipolar mol. of I. It is possible that the halides investigated have both homeopolar and heteropolar mols. with a resulting state of equil.:  $AsCl_3 \rightleftharpoons As^{+++}(Cl^-)$ ,  $\rightleftharpoons As^{+++} + 3Cl^-$ , or, if a complete dissocn. is accepted, the center stage drops out. According to the hypothesis of isomeric forms, it is possible that the action of the solvating agent proceeds with I binding first the existing ions of  $As^{+++}$  (or  $Sb^{+++}$ ) and the resulting shifting of the equil. in the above formulation to the right, etc. Such a scheme is not in conflict with the theory proposed. Chas. Blanc

**Electrochemistry of ether solutions. XI. Viscosity of the system: sulfuric acid-ethyl ether.** L. Sabinina. *J. Gen. Chem.* (U. S. S. R.) 3, 87-90(1933); cf. *C. A.* 27, 2365.—By analogy with  $H_2O$  the mixts. of  $Et_2O$  and  $H_2SO_4$  show high elec. cond. (Plotnikov) and form the compds.  $H_2SO_4 \cdot Et_2O$  and  $H_2SO_4 \cdot 2Et_2O$ , whereby the thermal effect of the formation of the monoetherate is equal to that of monohydrate (Chelintzev and Kozlov, *C. A.* 9, 1749). The viscosities of mixts. of different proportions of abs.  $Et_2O$  and 100%  $H_2SO_4$  were detd. at 0°, 10°, 20° and 30° in

the Ostwald viscometer. The tabulated results show that with the increasing addn. of  $\text{Et}_2\text{O}$  to  $\text{H}_2\text{SO}_4$  the viscosity at first sharply drops, then gradually rises, reaching at 63% the value obtained at 92%  $\text{H}_2\text{SO}_4$  and finally drops again, while the d. continuously decreases. Thus also in relation to viscosity the systems  $\text{H}_2\text{SO}_4$ - $\text{Et}_2\text{O}$  and  $\text{H}_2\text{SO}_4$ - $\text{H}_2\text{O}$  act analogously. Chas. Blanc

Thermodynamics of solid solutions. I. Perfect solutions. Harry Seltz. *J. Am. Chem. Soc.* 56, 307-11 (1934).—A graphic method is developed for detg., from the fugacities or activities of the components in the 2 phases, the liquidus and solidus curves for binary systems which solidify with the formation of solid solns. Equations are derived for calcg. the liquidus and solidus curves from the temps. and heats of fusion of the 2 pure solids and the assumption that both solns. are perfect. F. D. R.

Chemistry of calcium cyanamide. IV. Azotization equilibrium of the alkaline earth carbonates with ammonia and alkaline earth oxides with hydrocyanic acid. H. Heinrich Franck and Helene Bank. *Z. anorg. allgem. Chem.* 215, 415-26 (1933); cf. *C. A.* 27, 4991.—The equil.  $\text{Me}^{II}\text{CN}_2 + 3\text{H}_2\text{O} = \text{Me}^{II}\text{CO}_3 + 2\text{NH}_3$  was measured for Ca, Sr and Ba. The equil.  $\text{Me}^{II}\text{O} + 2\text{HCN} = \text{Me}^{II}\text{CN}_2 + \text{CO} + \text{H}_2$  was measured for Ca and Mg from both sides and good agreement obtained. From this equil. the conventional chem. const. for HCN was found to be  $i = 3.5$ . H. Stoertz

The equilibrium  $\text{H}_2\text{SO}_4 + \text{HF} \rightleftharpoons \text{HSO}_3\text{F} + \text{H}_2\text{O}$  and the effect of strong acids upon it. Willy Lange. *Z. anorg. allgem. Chem.* 215, 321-32 (1933); cf. *C. A.* 27, 5624.—With increasing HF,  $[\text{HSO}_3\text{F}]$  at first increases and then falls rapidly to 0. If the  $\text{H}_2\text{O}$  concn. is continuously increased,  $[\text{HSO}_3\text{F}]$  decreases more rapidly than the mass-action law would indicate. Addn. of strong acids favors  $\text{HSO}_3\text{F}$  formation, probably because of hydrate formation with equil.  $\text{H}_2\text{O}$ , displacing the equil. to the right. This is independent of the strength of the acid. H. Stoertz

Sulfonation reaction. I. S. Ioffe. *J. Gen. Chem.* (U. S. S. R.) 3, 437-47 (1933).—Sulfonation is a reversible reaction. The strength of the spent  $\text{H}_2\text{SO}_4$  depends upon the ratio between the substance that sulfonates and the substance being sulfonated and therefore is not const. Sulfonation with fuming  $\text{H}_2\text{SO}_4$  takes place with the free  $\text{SO}_3$  at a considerably higher rate than with  $\text{H}_2\text{SO}_4$  and proceeds according to a second-order reaction. II. Equilibrium between  $\alpha$ - and  $\beta$ -naphthalenesulfonic acids. *Ibid.* 505-12.—The const. ratio between  $\alpha$ - and  $\beta$ -isomers is reached only during a long duration of the reaction at  $100^\circ$  or  $110^\circ$ . Thus it is seen that in sulfonating naphthalene at  $100^\circ$  or  $110^\circ$  for several days, an unchanging ratio between the isomers, i. e. equil. of the system, is not attained. W. P. Bricks

Reaction velocity of halogen-substituted benzene compounds with sodium methylate. E. A. Kryuger and M. S. Bednova. *J. Gen. Chem.* (U. S. S. R.) 3, 67-77 (1933).—The relative activities of halogens in cyclic compds. were studied by the interaction of equimol. mixts. of  $\text{MeONa}$  and the following compds.:  $\text{PhCl}$ ,  $\text{PhBr}$ ,  $\text{PhI}$ ,  $o$ - and  $p$ - $\text{C}_6\text{H}_4\text{Cl}$ ,  $p$ - $\text{C}_6\text{H}_4\text{Br}$ ,  $\text{C}_6\text{Cl}_6$ ,  $\text{C}_6\text{H}_5\text{Cl}$ ,  $o$ - and  $p$ - $\text{MeC}_6\text{H}_4\text{Cl}$ ,  $o$ - and  $p$ - $\text{MeC}_6\text{H}_4\text{Br}$ ,  $m$ - and  $p$ - $\text{ClC}_6\text{H}_4\text{OH}$ ,  $o$ -,  $m$ - and  $p$ - $\text{ClC}_6\text{H}_4\text{NO}_2$ ,  $m$ - and  $p$ - $\text{BrC}_6\text{H}_4\text{NO}_2$ ,  $o$ -,  $m$ - and  $p$ - $\text{ClC}_6\text{H}_4\text{NH}_2$ ,  $o$ - and  $m$ - $\text{BrC}_6\text{H}_4\text{OMe}$ ,  $p$ - $\text{BrC}_6\text{H}_4\text{NH}_2$ ,  $\alpha$ - $\text{C}_{10}\text{H}_7\text{Br}$ , dibromoanthracene, bromocamphor and  $\text{ClCH:CHCl}$ . The reaction mixts. were sealed in glass tubes and heated a definite time at  $150^\circ$ ; the reaction products were then washed with 30 cc. alc. and 100 cc. hot  $\text{H}_2\text{O}$ , and the unchanged  $\text{MeONa}$  was directly titrated with  $\text{HNO}_3$  and methyl orange, and Na halides were detd. in the filtrate with  $\text{AgNO}_3$ . With compds. reacting 70-80% at  $150^\circ$ , the expts. were repeated at  $100^\circ$ . The compds. with  $\text{NO}_2$  group in  $o$ - and  $p$ -position and with 2-6 halogen atoms produced the best results at  $18$ - $20^\circ$ . The tabulated results show: the activity is  $\text{I} > \text{Br} > \text{Cl}$  and increases with the no. of halogens in the ring; the presence of  $\text{NO}_2$  group increases the mobility of halogen in  $o$ - and  $p$ - and less in  $m$ -position;  $\text{MeO}$  group does not always increase the reactivity of halogen and only to a small degree, while  $\text{Me}$ ,  $\text{OH}$  and  $\text{NH}_2$  decrease it; the activity of halogen in

cyclic satd. compds. is greater than in the  $\text{C}_6\text{H}_5$  ring, and increases with addn. rings ( $\text{C}_{10}\text{H}_7$  and  $\text{C}_{14}\text{H}_{13}$ ). Of interest is the greater activity of halogen in  $\text{ClCH:CHCl}$  than in  $\text{C}_6\text{H}_5$  compds. Eleven references. C. Blanc

Kinetics of certain reactions of the alkyl halides in hydroxylic solvents. E. A. Moelwyn-Hughes. *J. Chem. Soc.* 1933, 1576-80.—The velocity of the reaction between  $\text{C}_2\text{H}_5\text{I}$  and  $\text{Na}_2\text{S}_2\text{O}_8$  in water was studied. Although a complicated side reaction between  $\text{C}_2\text{H}_5\text{I}$  and water interferes, the main reaction is bimol. The energy of activation is 21,430 cal. Since this value is very close to the energy of activation of a no. of reactions between  $\text{C}_2\text{H}_5\text{I}$  and various anions in hydroxylic solvents, it is suggested that the process of activation involves chiefly the bond between the alkyl group and the halogen. E. J. Rosenbaum

Oxidation of phosphorus with water at elevated pressures and temperatures. V. N. Ipat'ev and Carl Freitag. *Z. anorg. allgem. Chem.* 215, 388-414 (1933).—At elevated temps. and pressures P reacts with  $\text{H}_2\text{O}$  as follows:  $\text{P}_4 + (3 + n)\text{H}_2\text{O} = \text{P}_2\text{O}_5 \cdot n\text{H}_2\text{O} + 2\text{PH}_3$ ;  $\text{P}_2\text{O}_5 \cdot n\text{H}_2\text{O} + 2\text{H}_2\text{O} = \text{P}_2\text{O}_5 \cdot (n+1)\text{H}_2\text{O} + 2\text{H}_2$ ;  $2\text{PH}_3 + (5 + n)\text{H}_2\text{O} = \text{P}_2\text{O}_5 \cdot n\text{H}_2\text{O} + 8\text{H}_2$ . With considerable time only  $\text{H}_3\text{PO}_4$  and H are formed as follows— $\text{P}_4 + (10 + 2n)\text{H}_2\text{O} = 2\text{P}_2\text{O}_5 \cdot n\text{H}_2\text{O} + 10\text{H}_2$ . The dependence of the reaction upon various variables was studied between  $175^\circ$  and  $420^\circ$  and between 20 and 530 atm. The velocity of all the reactions increases with rise in temp. In the absence of catalysts, temps. above  $280^\circ$  are essential for the oxidation of  $\text{P}_2\text{O}_5$ , the first reaction being the fastest. Metallic compds., especially those of Ni and Co, but also Ag, Cu and Fe compds., show marked catalytic action. Small quantities of  $\text{Ni}(\text{NO}_3)_2$  will take the reaction to completion in a short time at  $200^\circ$ . H. Stoertz

A method of determining the rate of gas reactions of atomic hydrogen. E. Cremer, J. Curry and M. Polanyi. *Z. physik. Chem.* B23, 445-68 (1933).—A stream of  $\text{H}_2\text{O}$  vapor contg. a small amt. of atomic H flows through a nozzle into a space contg. a gas that reacts readily with H. The following measurements were made:  $N$ , the no. of H atoms in the reaction zone, which was detd. by measuring the rate of conversion of para H;  $n$ , the no. of H atoms introduced into the reaction chamber per sec. and  $c$ , the concn. of the reacting compd. The rate const. is given by  $k = n/Nc$ . The method is capable of detg. the upper and lower limits of the heat of activation but is applicable only between 2800 and 7200 cal. at present, although modifications may extend the range.  $\text{MeCl}$  reacts too slowly to follow by this method.  $\text{CH}_3\text{Cl}$ ,  $\text{CHCl}_3$  and  $\text{CCl}_4$  react more rapidly with upper limits for the heat of activation,  $Q$  of 5800, 4300 and 3200 cal., resp.  $\text{MeBr}$  reacts more rapidly than  $\text{MeCl}$  with  $Q$  less than 3200 cal. The mechanism of this reaction is not clear. For  $\text{EtI}$  and  $\text{HBr}$ , the upper limit for  $Q$  is 4500 and 3000 cal., resp. Comparison of similar reactions with Na vapor shows agreement within 1000 cal. G. M. Murphy

The crystallization of eutectic melts. G. Tammann. *Z. Metallkunde* 25, 236-8 (1933).—The ends of the 2 kinds of crystal fibers crystg. from a eutectic melt advance in a front perpendicular to the direction of heat flow. The more rapid the cooling the thinner are these fibers. The decrease in fiber thickness results from the necessity for sepn. of the 2 components under the condition of more rapid cooling but const. diffusion velocity. Since one component envelops the other, the diffusion conditions remain uniform. The necessity for sepn., requiring diffusion, greatly decreases the apparent crystn. velocity for binary eutectics and more greatly for ternary eutectics. These observations, made primarily on nonmetallic systems, are valid also for metallic systems. R. F. M.

Vapor-liquid equilibria in the system nitrogen-water. Arthur W. Saddington and Norman W. Krase. *J. Am. Chem. Soc.* 56, 353-61 (1934).—The system  $\text{N}_2$ - $\text{H}_2\text{O}$  was studied up to temps. of  $250^\circ$  and 300 atm. The soly. of  $\text{N}_2$  in  $\text{H}_2\text{O}$  passes through a min. at  $70$ - $80^\circ$ . The increase in soly. with pressure deviates widely from that calcd. by Henry's law. The concns. of  $\text{H}_2\text{O}$  in the vapor phase are much higher than those calcd. by Poynting's equation, the

deviations increasing with temp. and pressure. A method is given for detg. the vapor phase  $d$ . and compressibility. Calcn. of the latter by an additive rule holds up to 150°.

Michael Fleischer

A study of solutions of methanol in cyclohexane, in water and in cyclohexane and water. E. Roger Washburn and Howard C. Spencer. *J. Am. Chem. Soc.* 56, 361-4(1934); cf. *C. A.* 25, 5822; 27, 651.—Soly. curves and the lines were detd. for the ternary system at 24.8°. The f. ps. of cyclohexane—MeOH solns. indicate that MeOH is highly assocd. in cyclohexane. M. Fleischer

Phase equilibria in the systems titania, titania-silica and titania-alumina. E. N. Bunting. *Bur. Standards J. Research* 11, 719-25(1933)(Research Paper No. 619).—The stable form of  $TiO_2$  above 400° is rutile, m. 1825°. It forms no compds. with  $SiO_2$  but gives a eutectic with 89.5 wt. %  $SiO_2$  at 1540°. With  $Al_2O_3$  a compd.,  $TiO_2 \cdot Al_2O_3$ , is formed, m. 1860°. This compd. forms a eutectic with  $Al_2O_3$  at 62%  $Al_2O_3$  and 1850°. H. A. Smith

The mechanism of heterogeneous catalysis. Étienne Audibert. *Ann. combustibles liquides* 8, 1003-82(1933); cf. *C. A.* 28, 960.—A comprehensive treatise which reviews the structure of solids, the adsorption of gases by solids, the activation of chem. reactions, the various tentative theories for the mechanism of heterogeneous catalysis and the interpretation of exptl. observations. Experience shows that many solids can present local irregularities in crystn. that exist essentially in a crystal lattice which apparently exhibits a vol. greater than normal. All exptl. observations can be interpreted if the following assumptions are made: (1) solid catalysts are substances that present local irregularities in crystn.; (2) in the neighborhood of these irregularities, which are superficial, adsorbed gaseous mols. are subjected to more intense forces than at other points of the field of absorption; and (3) when the irregularity in the lattice is sufficiently pronounced, these forces can become strong enough to activate certain mols. upon which they act.

Karl Kammermeyer

The physical state of solid catalysts. Étienne Audibert and André Raineau. *Ann. combustibles liquides* 8, 1147-9(1933); cf. preceding abstr. and *C. A.* 28, 29.—From observations of x-ray diffraction patterns the authors conclude that, in order to show catalytic activity, a solid substance must have local irregularities in its crystal structure that are essentially characterized by a dilation of the lattice.

Karl Kammermeyer

The effect of ignition temperature on the catalytic activity of zinc oxide. P. Ya. Ivannikov, A. V. Frost and M. I. Shapiro. *Compt. rend. acad. sci. U. R. S. S.* 1933, 124-6(in German 126).—The activity of  $ZnO$  as catalyst for the decompn. of MeOH vapor decreased sharply with rise in ignition temp. of the hydrate from which the  $ZnO$  was formed. The hexagonal lattice remained unchanged between 110° and 1300° and had the following parameters:  $a = 3.248 \pm 0.002$  A. U.;  $c/a = 1.602 \pm 0.002$ . The size of the crystallites remained unchanged from 110° to 500°; a rapid increase began at 770°. A comparison of the changes in activity and crystal size showed that the decrease in activity began sooner and proceeded more rapidly than the decrease in surface caused by sintering.

Louise Kelley

The hydrogenation of naphthalene. A. Maillard. *Compt. rend.* 197, 1422-4(1933).—If  $C_{10}H_8$  is hydrogenated above 180° in the presence of Ni, C is deposited and  $CH_4$  is formed up to 90% by vol. The proportion of  $CH_4$  increases as the initial pressure of H is lowered. At 20°, only the reaction  $C_{10}H_8 + 5H_2 \rightarrow C_{10}H_{18}$  occurs. Above 60° successive reactions take place:  $C_{10}H_8 + 2H_2 \rightarrow C_{10}H_{12}$  and  $C_{10}H_{12} + 3H_2 \rightarrow C_{10}H_{18}$ .

Rachel Brown

Heat-capacity curves of the simpler gases. IV. Extension of the "free energy" formula of Giauque and Overstreet to yield reliable approximation formulas for the calculation of entropy and of heat capacity from spectroscopic data. Entropy and heat capacity of carbon monoxide and of nitrogen from nearly zero absolute to 5000°K. Herriek Johnston and Clyde O. Davis. *J. Am.*

*Chem. Soc.* 56, 271-6(1934); cf. *C. A.* 27, 4158.—Values of  $E^\circ$ ,  $E^\circ$ ,  $C_p^\circ$ , and  $S^\circ$  are calcd. for the range 50-5000°K. Rotational heat capacity curves for CO and  $N_2$  show maxima at about 2° and 5°K., resp. The existence of ortho and para rotational states in  $N_2$  produce heat-capacity curves similar to those for the ortho, para, equi. and nonequil. forms of  $H_2$ . The distribution of CO and  $N_2$  mols. among their resp. vibrational levels is tabulated as a function of the temp. from 300° to 5000°K. F. D. R.

The heat capacities at low temperatures of the alkaline earth carbonates. C. Travis Anderson. *J. Am. Chem. Soc.* 56, 340-2(1934); cf. *C. A.* 27, 4997.—From measurements of the heat capacities from 55° to 300°K., the following values of the entropy at 298.1°K., in cal. per mol. per degree were calcd.:  $CaCO_3$  (calcite, coarse),  $22.24 \pm 0.4$ ;  $CaCO_3$  (calcite, fine, 0.5 micron),  $22.40 \pm 0.4$ ;  $CaCO_3$  (aragonite),  $21.18 \pm 0.3$ ;  $SrCO_3$  (strontianite),  $23.21 \pm 0.4$ ;  $BaCO_3$  (withelite),  $26.75 \pm 0.5$ . F. D. Rossini

The specific heats of  $CaO$ ,  $Al_2O_3$ ,  $CaO \cdot Al_2O_3$ ,  $3CaO \cdot Al_2O_3$ ,  $2CaO \cdot SiO_2$ ,  $3CaO \cdot SiO_2$ , and  $2CaO \cdot Al_2O_3 \cdot SiO_2$  from 20° to 1500°. H. Elsner v. Gronow and H. E. Schwiete. *Z. anorg. allgem. Chem.* 216, 185-95(1933).—Results are discussed with relation to Kopp's law. F. D. Rossini

Estimation of the heat of dehydration of kaolin at 450° H. Elsner v. Gronow and H. E. Schwiete. *Z. anorg. allgem. Chem.* 216, 109-12(1933).—If a salt dehydrates at a relatively high temp., the difference between the heats of soln. of the hydrate and anhyd. salt at room temp. is not the true heat of dehydration because of the difference in the sp. heats of the hydrate and anhyd. salt +  $H_2O$ . Thus the value, 135 cal./g., detd. by Klever and Kordes (*C. A.* 24, 3618) for the heat of dehydration of kaolin is much in error. One of the authors detd. the av. sp. heat of kaolin between 20° and 450° to be 0.280 and that of anhyd. kaolin to be 0.238. By means of these values K. and K.'s value was corrected and the true heat of dehydration of kaolin found to be 213 cal./g.

Electronic flow in problems of several electrons. J. Winter. *J. phys. radium* [7], 4, 646–9(1933).—To a first approximation it is necessary to add the corrective terms introduced by Pauli's principle to the expression for the flux density in wave mechanics. P. S. R.

The transmutation of the atom. Lord Rutherford. *Sci. Monthly* 38, 15–23(1934). E. H.

Hydrogen-like atoms in the old quantum theory. P. Copel. *J. phys. radium* [7], 4, 638–45(1933).—Two-body quantization in the classical and relativistic quantum mechanics is simplified. P. S. Roller

Electron interference experiments on active beryllium oxide. R. Fricke and J. Lüke. *Z. physik. Chem.* B23, 330–37(1933).—Electron interference expts. on the BeO samples prepd. as previously described (cf. C. A. 28, 1586) show that the intensity first increases and then decreases with increasing temp. of prepn. The products prepd. at low temp. show a very poor lattice formation, but those at high temp. possess particle thickness too great for electron interference. G. M. Murphy

Prediction of the photoelectric power of certain compounds from a structural number connected with the formula of the compound. H. Spindler and R. Coustal. *Compt. rend.* 197, 982–4(1933). Howard A. Smith

The thermoelectric effects of the alkalis. A. Sommerfeld. *Phys. Rev.* 45, 65–6(1934).—An extension of one phase of the treatment of the electron theory of metals given in *Handb. d. Physik* 24, 2. Math. A formula gives the correct order as well as the order of magnitude of the Thomson coeff.  $\mu$  for the alkali metals.

Secondary and tertiary particles produced by cosmic rays. J. H. Sawyer, Jr. *Phys. Rev.* 44, 241–5(1933).—Three Geiger counters are used to study the ionizing cosmic-ray particles. The first ionization is due to secondaries, which when produced in air have an absorption coeff. of 0.5 in Pb; the Pb tertiaries have a coeff. of 2.58. L. S. Kassel

Atomic disintegration by cosmic radiation. W. Messerschmidt. *Physik. Z.* 34, 896(1933); cf. C. A. 27, 3394; 28, 381.—The effect of cosmic radiation was observed on Pb, Fe, Al and C. The max. of the frequency-intensity curve of the showers is displaced toward smaller quantities of ions with decreasing at. wt. With an absorber consisting of approx. equal thicknesses of Al and Fe, the observed max. was halfway between the max. for Al and that for Fe. A long-range process produces the showers

in the lower absorbing layers. The size of the at. nucleus det. the magnitude of the shower. Very large showers can be understood if the energy of the primary radiation particle is sufficiently large so that under the influence of at. nuclei it is split into a sufficient no. of pos. and neg. electrons. E. J. Rosenbaum

Radiation appearing on disintegration of lithium. A. Eckardt, R. Gebauer and H. Rausch von Traubenber. *Naturwissenschaften* 21, 694(1933).—Disintegration of Li by protons gives rise to  $\gamma$ -rays. By alternate irradiation of Fe (inert) and Li with H canal rays the differential effect was measured. The principal component of the secondary Li radiation is soft (intensity halved by 0.3 mm. Pb). For a canal ray tube potential of 58 kv., current 1 ma., Pb absorber 1 mm. thick and a distance of 48 mm., 3 quanta were observed per min. in a Geiger-Müller tube. Complications arise from possible neutron emission of the Li. The no. of quanta measured increases again for increasing Pb layer (several cm.). B. J. C. van der Hoeven

Long-range fragments of boron from bombardment with protons. F. Kirchner and H. Neuert. *Physik. Z.* 34, 897–8(1933); cf. C. A. 27, 4729.—Cloud chamber tracks of B fragments were photographed. A slit was used which permitted only those fragments to enter the cloud chamber which were moving approx. parallel to the photographic plate, so that the length of track could be obtained directly from the photograph. Track lengths between 28 and 48 mm. were obtained. A broad max. in the frequency-length curve was observed at 45 mm. It had a width of 6 mm. This max. is consistent with the assumption of a homogeneous group of B fragments. R. J. Rosenbaum

$\gamma$ -Rays from lithium bombarded with protons. C. C. Lauritsen and H. R. Crane. *Phys. Rev.* 45, 63–4(1934); cf. *Ibid.* 44, 783.—Measurements of neutrons made in an ionization chamber with and without a paraffin lining indicated that when LiCl was bombarded with H ions, a considerable part of the ionization was due to  $\gamma$ -rays. Energy calcs. for  $\alpha$ -particles from Li bombarded by protons also suggest accompanying  $\gamma$ -rays. The intensity of  $\gamma$ -rays from Ra Th, LiF and Ra is plotted against the thickness of Pb. The  $\gamma$ -radiation and the short-range  $\alpha$ -particles of Li are apparently assoc. G. M. P.

The use of liquid air in the purification of radon. Nella Mortara. *Atti. accad. Lincei* 17, 1069–72(1933).—The temp. of liquid air may vary from that of liquid N<sub>2</sub> (77.5° K.) to that of liquid O<sub>2</sub> (90.96° K.), this difference being enough to cause the amt. of Rn condensed to vary from 90% in N<sub>2</sub> to 58.2% in O<sub>2</sub>. A. W. Conter

Radioactivity of soil gases. Lynn G. Howell. *Bull. Am. Assoc. Petroleum Geol.* 18, 63–8(1934).—A typical line survey over 9 miles in the Gulf Coast region is given. It shows large variations in radioactivity of the gases in the soil. Alden H. Emery

The relative abundance of the lithium isotopes. G. P.

- Harnwell and Walker Bleakney. *Phys. Rev.* 45, 117 (1934).—The ratio  $\text{Li}^7/\text{Li}^6$  is 8.4. Measurements were made with a mass spectrometer. Gerald M. Petty
- Isotopic nomenclature. J. B. Ficklen. *Science* 79, 140 (1934). E. H.
- Nomenclature for the isotopes of hydrogen (proto- and deuto-hydrogen) and their compounds. Wm. D. Harkins. *Science* 79, 138-40 (1934). E. H.
- Fractionation of the hydrogen isotopes by the addition of sodium to water. Clyde O. Davis and Herrick L. Johnston. *J. Am. Chem. Soc.* 56, 492-3 (1934).— $\text{H}_2\text{O}$  (889.2 g.) with  $\Delta$  sp. gr. (p. p. m.) of 149, on treatment with Na, burning the evolved  $\text{H}$  and distn. of the  $\text{H}_2\text{O}$  from the NaOH, gave 332.3 g. with  $\Delta$  sp. gr. of 168 and 57.3 g. with 50; corresponding values for  $\Delta T$  were 0.532, 0.601 and 0.179. The sepn. coeff.  $\alpha$  in the equation  $d \ln n_p = \alpha d \ln n_D$ , where  $n_p$  and  $n_D$  are the no. of protium and deuterium atoms in the undecompd.  $\text{H}_2\text{O}$  or soln., is 2.5, which compares with the electrolytic sepn. coeffs. ranging from 5 to about 7. C. J. West
- Possibility of interchange between deuterium gas and hydrogen in compounds. Austin J. Gould and Walker Bleakney. *J. Am. Chem. Soc.* 56, 247-8 (1934).—The concn. of deuterium-H mixts. in contact with  $\text{H}_2\text{O}$  in clean vessels remains const. if precautions are taken to avoid preferential soly., diffusion and the presence of metallic surfaces. C. J. West
- Designation of heavy hydrogen. Harold C. Urey, F. G. Brickwedde and G. M. Murphy. *Nature* 133, 173 (1934). E. H.
- The  $M$ -series of the elements bromine (35) and rubidium (37). Manne Siegbahn and T. Magnusson. *Arkiv Mat. Astron. Fysik* 24B, No. 4, 5 pp. (1933).—The  $M$ -series of Br and Rb have been photographed with a concave grating spectrograph. All the lines except one, resulting from permitted transitions between the  $N$  levels and the  $5 M$  levels, have been observed. Their wave lengths, lying between 57 Å. and 193 Å., and values for  $\nu/R$  for the  $M$  and  $N$  levels are given. C. C. Kiess
- Apparatus for x-ray fine-structure analysis. W. E. Schmid. *Z. physik. Chem.* B23, 347-57 (1933).—A very compact and easily adjustable app. for obtaining Debye-Scherrer x-ray photographs is described. The exposure time has been shortened by a special arrangement of the x-ray tube. Four exposures can be made simultaneously. G. M. Murphy
- The colored centers of alkali halide crystals. Erich Mollwo. *Z. Physik* 85, 56-67 (1933).—Absorption measurements of colored KCl, NaCl, KI, KBr, KF, RbCl, RbI and NaBr between  $-53^\circ$  and the m. p. of the crystal lead to the following conclusions: The min. concn. of color centers depends solely on temp. and is detd. by the vapor pressure of the cation metal at the temp. considered. The course of the absorption curve agrees with the classical theory of dispersion. Egon Bretscher
- Connection between chemical constitution and x-ray  $K$  absorption spectra. XII. Investigation of x-ray  $K$  absorption spectra of stereoisomeric compounds. I. Otto Stelling. *Z. physik. Chem.* B23, 338-46 (1933); cf. *C. A.* 26, 3435.—X-ray study of compds. of the type  $\text{MA}_4\text{VCIX}$ , where  $M = \text{Co}$  or  $\text{Cr}$  shows that if  $Y = \text{Cl}$  or  $\text{Br}$  the spectra for trans and cis forms are different, but if  $Y$  is a group coordinated with  $N$  the spectra are the same. G. M. Murphy
- Multiple Laue spots. Carleton C. Murdock. *Phys. Rev.* 45, 117-18 (1934).—Double and triple Laue spots may occur when thick crystals composed of atoms of low at. no. are used. Triple spots are explained by assuming that the crystal is ideally perfect except near the 2 surfaces; double spots by assuming that the crystal is made up of small mosaic blocks. Such perfect blocks within a crystal may be located and surveyed. G. M. P.
- The hyperfine structure of spectral lines. W. E. Curtis. *Science Progress* 28, 420-38 (1934).—A review, with a description of the methods of research. J. S. H.
- The measurement of spectral intensities applied to problems of atomic and molecular physics. L. S. Ornstein. *J. phys. radium* [7], 4, 613-24 (1933).—The probability of emission, activation and excitation of an atom colliding with an electron is discussed. The laws of spectral intensity for complicated line and band spectra are indicated. Recent results based on intensity measurement are given for the accommodation coeff. of gases, the proportion of isotopes, the Raman effect and the phenomena of the elec. arc. P. S. Roller
- The nature of the "forbidden" lines in the Pb I spectrum. J. Blaton and H. Niewodniczański. *Phys. Rev.* 45, 64-5 (1934); cf. *C. A.* 28, 707<sup>9</sup>.—The line 4618.0 Å. is explained by magnetic dipole radiation, rather than by electrically perturbed dipole radiation. If this is correct, the lines 4659.4 and 5312.7 Å. are pure quadrupole lines and the line 7330 Å. is due to mixed magnetic dipole and quadrupole radiation. G. M. P.
- Infra-red grating spectra and spectral laws (Al II, Al I, He I and II, Zn II, Zn I). F. Paschen and R. Ritschl. *Ann. Physik* 18, 867-92 (1933).—Infra-red spectra were photographed to 11,000 Å. with a Rowland grating and sensitized plates. Spectral terms were detd. and used to correct wave lengths in the visible and ultra-violet region. The fine structure of the Al spectrum was studied. It results from a nuclear spin of  $1/2$ . The theory of Goudsmit and Bacher (*C. A.* 27, 4166) is in agreement with the data. E. J. Rosenbaum
- The identification of europium and three lines of extreme sensibility. G. Piccardi. *Atti accad. Lincei* 17, 1092-4 (1933).—Among the lines present in both the arc and spark spectra of Eu are the lines  $\lambda$  4205.03 and 4129.72, the latter being the most persistent in the spectrum. These lines are very close to 2 lines in the spectrum of Ga, i. e., 4150.39, and 4204.84, so that this element interferes unless a spectroscope of high resolving power is used. However, in studying spectra of mixts. of Nd-Sm-Gd-Eu, 3 equidistant lines of notable intensity were found, 4661, 4627, 4594. All 3 lines belong to the spectrum of Eu, and no other lines of this element appear. These 3 lines appeared even when Sm with only a trace of Eu was examd. Thus these 3 exactly equidistant ( $\Delta = 33.0$  Å.) lines are characteristic for Eu, at low excitation. They were also noted by King (*C. A.* 25, 639). A. W. C.
- The interstellar cloud of gas. Otto Struve. *Scientia* 55, 1-10 (1934).—Evidence for the existence of a highly attenuated cloud of ionized Ca in interstellar space is discussed. L. E. Gilson
- Polarization of fluorescence radiation. Irving S. Lowen and G. Breit. *Phys. Rev.* 45, 120 (1934).—The Dirac theory of light quanta is used to investigate the case where light from a radiator raises a scattering atom from the ground state  $\alpha_0$  to the state  $\gamma$ ; it falls to another level through the intermediate state  $\beta$ , emitting the light quanta  $\rho$  and  $\delta$ . The intensity of the fluorescence radiation  $\rho$  polarized in a given direction was examd. G. M. P.
- The emission and fluorescence spectra of sulfur dioxide. H. D. Smyth. *Phys. Rev.* 44, 690 (1933).—The emission and absorption spectra of  $\text{SO}_2$ , discussed by Chow (*C. A.* 28, 709<sup>9</sup>) are compared with the fluorescence spectrum reported by Lotmar (*C. A.* 27, 4734); the results obtained are in agreement. A. B. F. Duncan
- The transparency of the atmosphere and the absorption by oxygen. J. Duclaux. *J. phys. radium* [7], 4, 625-37 (1933).—Near the surface of the earth, and especially in winter, the atm. may be very transparent and the visibility extend to several hundred km. The coeff. of absorption is then at least equal to that deduced from Rayleigh's law of scattering. Ordinary air shows a scattering caused by suspended ultramicroscopic particles. These particles consist in part of  $\text{NH}_4$  nitrate and nitrite and Na chloride and perchlorate. The air near the earth's surface may be purer than that at higher altitudes because of the cleansing effect of rain. Based on these considerations, there is no proof that the disappearance of the solar spectrum beyond the ozone bands is due to continuous absorption by  $\text{O}_3$ . Between 1850 and 1865 Å. the absorption spectrum of  $\text{O}_3$  is found to consist of a complicated series of primary and secondary bands. In order to establish continuous absorption of the solar

spectrum by  $O_2$ , it will be necessary to make absorption measurements on air of the highest transparency. P. S. R.

**Internal temperatures of stars.** G. Gamov and L. Landau. *Nature* 132, 567(1933).—Expressions for the rate of the reaction  $Li^+ + H^+ = 2He^+$  and the diffusion coeff. from interior to exterior of a star are given. The mean free path decreases from  $10^{11}$  cm. at  $10^8$  to 1 cm. at  $10^6$ . Either Li is present on the star surfaces in very small amount or star temps. are not higher than a few million degrees. Gregg M. Evans

**Atomic transmutation and the temperature of stars.** A. S. Eddington. *Nature* 132, 639(1933); cf. preceding abstract.—Circulating currents in meridian planes due to rotation could account for a sufficiently rapid movement of Li (about 60 m./year) to enable astronomically derived temps. to be accepted. Gregg M. Evans

**Simultaneous presence of the bands of carbon and of titanium oxide in sun spots.** P. Swings. *Bull. sci. acad. roy. Belg.* 19, 1071-3(1933).—It is shown, from the theory of dissociative equil., that there are approx. equal nos. of  $C_2$  and TiO mols. in the atms. of sun spots; this accounts for the appearance of both the  $C_2$  and TiO bands in the spot spectrum. C. C. Kiess

**Some stellar spectra presenting simultaneously the emission lines of H, He I, He II, C III (O III), the nebular lines and the absorption bands of TiO.** P. Swings. *Bull. sci. acad. roy. Belg.* 19, 1074-7(1933).—The simultaneous appearance in the spectra of the variable stars AX Persei, RW Hydrae and CI Cygni of emission lines of H, He, C, O and N, which are characteristic of very hot stars, and of the absorption bands of TiO, characteristic of relatively cool stars, suggests that the observed spectra are due, in each case, to the close assocn. of 2 stars, one very hot, of class O, and the other a cooler one of Class K, with a high concn. of Ti. C. C. Kiess

**The bands of scandium oxide observed in the spectra of cool stars.** P. Swings. *Bull. sci. acad. roy. Belg.* 19, 1078-95(1933).—The development of the ScO bands in stars belonging to the F-G-K-M sequence, as described by Bobrovnikoff (*C. A.* 27, 3667), is here accounted for by the theory of dissociative equil. C. C. Kiess

**The band spectrum of barium oxide.** P. C. Mahanti. *Proc. Phys. Soc. (London)* 46, 51-61(1934); cf. *C. A.* 27, 2879.—New wave-length measurements have been made for the BaO band heads between 4268 and 7905 Å. These have been arranged into a single system representing a  $^3\Sigma \rightarrow ^1\Sigma$  transition and given by the formula:  $\nu = 16,815.89 + [495.36 (\nu' + \frac{1}{2}) - 1.12 (\nu' + \frac{1}{2})^2] - [671.48 (\nu'' + \frac{1}{2}) - 2.20 (\nu'' + \frac{1}{2})^2]$ . Several of the individual bands have been measured in detail to secure data for a rotational analysis from which values for the mol. consts. are derived. C. C. Kiess

**Polyatomic molecules—structure and activation of the benzaldehyde.** I. Absorption of ultra-violet rays by gaseous benzaldehyde. F. Almasy. *J. chim. phys.* 30, 528-47(1933).—The different methods for detg. the structure of polyatomic mols. such as x-ray patterns, electronic patterns, elec. moments, optical properties, moments of inertia, infra-red absorption, Raman spectra and ultra-violet absorption are discussed briefly. The present work is concerned with the analysis of the structure of the diverse properties of the carbonyl group. The absorption spectrum of BzH is studied between 2340 and 3747 Å. The absorption spectrum was divided into 3 regions, the first between 3747 and 3163 Å., the second between 2963 and 2509 Å., the third from 2428 to 2340 Å. In the first group are 159 measurable bands, in the second 51 and in the third 6. The magnitude of the shifts, their intensities and the change in quantum nos. corresponding to the shifts are indicated. James H. Hibben

**Spectral differentiation of pure hydrocarbons—a near infra-red absorption study.** Urner Liddel and Charles Kasper. *Bur. Standards J. Research* 11, 599-618(1933) (Research Paper No. 610).—Absorption spectra in the region 5500-9000  $cm^{-1}$  obtained with an automatic recording infra-red glass spectrograph are given for the following compds. (sp. absorptive indexes plotted against wave nos.):  $C_6H_6$ , PhMe, EtPh, *o*-, *m*-, *p*-Me $_3$ C $_6$ H $_5$ ,

1,2,3-, 1,2,4-, 1,3,5-Me $_3$ C $_6$ H $_3$ ; cyclohexane, methylcyclohexane, methylcyclopentane, 2 isomers of 1,2-dimethylcyclopentane; normal pentane, hexane, heptane, octane, nonane, decane, undecane, dodecane; isopentane, 2-methylpentane, 3-methylpentane, 2,3-dimethylbutane, 2,3-dimethylpentane, 2,4-dimethylpentane, 3,3-dimethylpentane, 2,2-dimethylpentane, 2,2,3-trimethylbutane, 3-ethylpentane, 3-methylhexane, 2-methylhexane, 2,2,4-trimethylpentane. Correlations of the spectra are made in 3 regions. In the high-frequency region the absorptions of the aromatic and aliphatic linkages are widely sepd. and variations in type of absorption indicate the manner of binding. The other 2 regions confirm this but are more complex. The positions of certain max. seem to show the presence of primary, secondary and tertiary hydrocarbon linkages. Janet E. Austin

**An infra-red band of arsine.** Will V. Norris and Hilbert J. Unger. *Phys. Rev.* 45, 68(1934).—A weak band of AsH $_3$  at 1.63  $\mu$  is analyzed. Gerald M. Petty

**Depolarization of Raman radiation by liquids.** L. S. Ornstein and P. Stoutenbeck. *Z. Physik* 85, 754-60(1933).—A beam of parallel light from a Hg arc passes an absorption tube contg. the liquid. The scattered light illuminates a horizontal slit, which is placed in the focus of an achromatic lens, followed by a Wollaston prism and a spectrograph with the slit perpendicular. The direction of observation is exactly at a right angle to the primary ray. The degree of depolarization  $\rho = I_{\perp}/I_{\parallel}$ , in which  $I_{\perp}$  and  $I_{\parallel}$  are, resp., the intensities parallel and perpendicular to the plane of the incident light. The following  $\rho$  values were found for Raman lines CCl $_4$ : frequency shift  $\Delta\nu = 211, \rho = 1.0$ ; 314, 1.0; 400, 0.0; 770 790, 1.0; 211, 1.0; 314, 1.0; 400, 0.0. The last three lines are anti-Stokes. The results with CCl $_4$  have been used to calibrate Wood's device and the degree of depolarization of  $C_2H_2Cl_2$  is detd. with this app.  $\Delta\nu = 277, \rho = 0.45$ ; 653, 0.55; 752, 0.66; 957, 0.44; 3000, 0.85. The method of Daure (*C. A.* 24, 1292) was used for purification of the liquids and no continuous background was found. Egon Bretschner

**Raman spectra in inorganic chemistry.** James H. Hibben. *Chem. Rev.* 13, 345-478(1933).—A review of the interpretation, development and application of Raman spectra in the field of inorg. chemistry, with some analysis of the data upon which the interpretations and applications are predicated. Numerous references are given. Louise Kelley

**Raman spectrum of heavy water.** R. W. Wood. *Science* 79, 35(1934).—The Raman spectra of 80 and 18% heavy water are contrasted. A water mol. with 2 atoms of heavy H gives one band with a frequency difference of 2517, while one with one atom each of heavy and of light H gives 2 bands with frequency differences of 2623 and 3500. Ordinary water gives a band with the frequency difference of 3445. Howard A. Smith

**Raman spectra of some cyclanones.** L. Piaux. *Compt. rend.* 197, 1647-8(1933).—Spectra have been obtained with Schott's GG $_2$  and UG $_2$  filters for cyclopentanone, and its  $\alpha$ - and  $\beta$ -Me derivs., cyclohexanone and its *o*-, *m*- and *p*-Me derivs. The absence of lines between 1600 and 1700  $cm^{-1}$  is attributed to the presence of enolic forms in the ketones studied, except with cyclopentanone, in which there is no initial enolization. W. J. Peterson

**Photochemical reaction of ammonia with oxygen.** H. E. Bacon and A. B. F. Duncan. *J. Am. Chem. Soc.* 56, 336-40(1934).—The reaction of NH $_3$  and O, when these gases are irradiated by Zn spark radiation in the region near 2080 Å., was studied. N, H, H $_2$ O and NH $_4$ NO $_3$ , with small amts. of NH $_4$ NO $_3$ , were found as products. The following equation fits the data best:  $8NH_3 + 7O_2 \rightarrow 2N_2 + 2NH_4NO_3 + 8H_2O$ . Probable side reactions and the reaction mechanism are discussed. The values of the quantum yield detd. are unreliable because of the formation of a mist of nitrate soln. which absorbs and scatters radiation. The absorption of NH $_3$  in the region 2080 Å. is represented by  $\log I/I_0 = \alpha p^2$ , in which  $\alpha = 0.010098$ ,

$\kappa = 0.76$ ,  $p$  is the pressure in mm. and  $t$  is the thickness in cm. E. J. Rosenbaum

**Mechanism of the photopolymerization of acetylene.** W. Kamula and St. Mrazek. *Z. physik. Chem.* B23, 358-60 (1933).— $C_2H_2$  was illuminated with quartz Hg lamps and a continuous H tube used to obtain the absorption spectra from time to time to follow the course of the reaction. After short exposure the gas pressure falls and a solid substance forms. The reaction rate drops because of the strong absorption of this solid. From the absorption spectra the presence of  $C_2H_4$ ,  $C_2H_2$  deriva. and other reaction products is evident. Analysis of the gas phase indicates small amts. of  $C_2H_4$  and  $C_2H_2$  (less than 0.25%). The presence of H was not proved. Hg vapor has no effect on the reaction. A reaction mechanism is proposed. G. M. Murphy

**Photochemical reaction of the combination of hydrogen with chlorine at great light intensities.** V. Kokochashvili. *Z. physik. Chem.* B23, 431-44 (1933).—The photochem. reaction between H and Cl was studied with a Mg flash of great intensity and of about 0.08 sec. duration. A glass membrane manometer was used as a recording instrument to follow the reaction. The results are discussed from the standpoint of chain reactions. G. M. M.

**Photochemistry of phosgene.** Louis S. Kassel. *J. Am. Chem. Soc.* 56, 243 (1934). Comments on the work of Montgomery and Rollefson (*C. A.* 28, 45<sup>9</sup>). C. J. W.

**Photodecomposition of chlorine dioxide.** J. W. T. Spinks and J. M. Porter. *J. Am. Chem. Soc.* 56, 264-70 (1934); cf. *C. A.* 27, 905.—The photodecompn. of moist and dry  $ClO_2$  was studied with light of wave lengths 3650 and 4360 Å. The reaction of moist gas is more regular than that of dry gas because of the removal of active groups by the water present. One mole disappears from the gas phase for each mole of  $ClO_2$  decompd. and no Cl is formed. Quantum efficiencies for the decompn. of moist  $ClO_2$  are 3.7 at 3650 Å. and 3.1 at 4360 Å. The rate of decompn. is proportional to the light intensity for  $ClO_2$  concn. below 8%. In the aq. soln. were found  $ClO^-$ ,  $ClO_2^-$  and  $ClO_3^-$ . When Br is added to  $ClO_2$ , a sensitized reaction takes place at 5460 Å. with a quantum efficiency the same as that for 3650 Å. With dry  $ClO_2$  at 17°  $Cl_2O_4$  is formed and condenses on the walls, undergoing subsequent photodecompn. At 31° the thermal decompn. of  $Cl_2O_4$  is rapid, forming Cl and O. Mechanisms for all these reactions are discussed. E. J. R.

**Primary photochemical processes. III. Absorption spectrum and photochemical decomposition of ketene.** Ronald G. W. Norrish, H. Gordon Crone and Olive Saltmarsh. *J. Chem. Soc.* 1933, 1533-9; cf. *C. A.* 27, 2383.—When ketene vapor is irradiated by the light of a Hg lamp, decompn. occurs with the formation of 2 vol. of CO and 1 vol. of  $C_2H_4$ . The absorption spectrum of ketene vapor consists of a series of regularly spaced diffuse bands in the range 3700-2600 Å. with max. absorption at 3100 Å. This indicates that light is first absorbed by the carbonyl group and that this energy can be transferred to the olefin group with consequent rupture. The addnl. energy required for rupture may come from a change in the at. state of C from a quadrivalent to a bivalent form. The potential-energy diagrams involved are discussed. E. J. Rosenbaum

**Photochemical reaction between bromine vapor and platinum.** Joseph Urmston and Richard M. Badger. *J. Am. Chem. Soc.* 56, 343-7 (1934).—The photochem. reaction of Br with finely divided Pt was studied with light of wave length shorter than 5000 Å. and light of wave length longer than 5300 Å. The thermal reaction at 0° and 25° was also studied. The data for both thermal and combined reactions can be fitted by an expression of the form:  $dp/dt = k_1p/(k_2 - p)$ . The Br atom

each. is too small to account for the thermal reaction. From the similarity of the photochem. reaction when blue light is used with that when yellow light is used, it appears that in both cases the initial step is the production of Br atoms and that a considerable fraction of Br mols. excited by yellow light dissociate without a collision.

E. J. Rosenbaum  
**Piperidine metavanadate, a new light-sensitive compound.** Oskar Baudisch and F. L. Gates. *J. Am. Chem. Soc.* 56, 373-4 (1934).—Piperidine reacts with vanadic acid to form piperidine metavanadate  $C_4H_{11}N \cdot HVO_3$ , a white solid, stable in the dark, sol. in alc., insol. in acetone, ether, benzene,  $CHCl_3$  and  $CCl_4$ . When this compd. is irradiated with ultra-violet light, it turns black and piperidine is liberated. When the black product stands in the dark in the presence of piperidine and oxidizing agents, piperidine metavanadate is formed again. Absorption coeffs. were detd. E. J. Rosenbaum

**Liberation of ions from glass and quartz vessels under the influence of radium rays.** A. Fernau. *Physik. Z.* 34, 899-900 (1933).—When cond. water in glass or quartz vessels is exposed to the  $\beta$ - and  $\gamma$ -rays of Ra for lengths of time in the range 18-82 days, the sp. cond. of the water increases. The quantity of  $H_2O_2$  produced in the water by the Ra was detd. and was found to be too small to account for all of the increased cond. of the water.

COLIN G. FINE

**Furnaces for high temperatures, especially for ceramic purposes, melting and forging.** H. Masukowitz. *Elektro-*

*technische* 4, 15-18 (1934).—Construction details and operating data are given for furnaces which are equipped with a

new design of heating unit as described by Junker. *Elektrowärme*, July 1933, 218; cf. C. A. 27, 3170. This unit is like a ribbon with a reinforcing rib in the middle and permits of an almost uniform surface heating of the walls and roof. A brass-melting furnace for a 100-kg. crucible, with 8-9 castings every 8 hrs., consumed only 300 kw. hrs. per ton of brass when in continuous operation. M. H.

Recent developments in electric bright-annealing furnaces. Tamele. *Elektrowärme* 4, 3-8(1934).—Box-type and continuous furnaces with and without protective atm. for the material are described, and construction details are illustrated. M. Hartenheim

Electric heat and fused-salt electrolysis. H. Kirchth. *Elektrowärme* 3, 368-71(1933).—Electrolytic production of Na, Al and Mg from their molten salts is discussed and calcn. of required heat explained; phys. and chem. data are given. M. Hartenheim

Decomposition voltages of fused salts. I. Method of its determination and the decomposition voltage of zinc chloride. Yoshio Konishi. *J. Soc. Chem. Ind., Japan* 36, Suppl. binding 677(1933).—The voltage was measured by means of 3 graphite electrodes, consisting of anode, cathode and neutral electrode. The sum of the voltages for anode-neutral and neutral-cathode checked well with the voltage for anode-cathode. Decompn. voltages for fused  $ZnCl_2$  were 1.94, 1.89 and 1.83 v. for 408°, 450° and 489° (±2), resp. The calcd. figures were 1.902, 1.880 and 1.843 v. for a heat of formation of 97.21 kg. cal. and a sp. heat of 0.1362. Karl Kammermeyer

Purification of electrolytes in copper refining. E. S. Bardwell and R. J. Lapee. *Am. Inst. Mining Met. Engrs., Tech. Pub.* No. 512, 12 pp.(1933).—Purification of electrolytes at the Cu refinery of the Anaconda Copper Mining Co., at Great Falls, Mont., is described. Daily a certain vol. of electrolyte is sent to the purification plant. It is boiled down to 46°Bé. and most of the Cu crystd. out as  $CuSO_4$ . The last of the Cu and most of the As and Sb are removed by passing through insol. anode cells. Next it may be returned to the cell room, or boiled to 55°Bé. and the Fe and Ni salts crystd. out before returning to the circuit. The av. analysis of electrolyte for 1932 was, in g. per l.: acid 213, Cu 34.5, As 8.7, Sb 0.60, Fe 2.5, Ni 8.0 and Cl 0.028. The sludge from the anode tanks analyzed Cu 29.9, Zn 0.03, Pb 2.7, As 31.2, Sb 1.93,  $SeO_4$  0.004, Te 1.8, Ni 1.7, Fe 0.2, S 4.1, insol. matter 0.5%, Bi traces and Ag 14.1 oz. and Au 0.13 oz. per ton. The sludge from the last purification step contained Ni 12.8 and Fe 3.9%. Roasting this at 650° for 2 hrs. rendered 99% of the Ni and 14% of the Fe  $H_2O$ -sol. After leaching with boiling  $H_2O$  and pptn. of the Fe with milk of lime, the  $NiSO_4$  soln. could be filtered off and evapd. The compn. of anodes for various periods is given, and the effect of the varying compn. on the purification problem is discussed.

Alden H. Emery  
The rate of displacement of copper from solutions of its sulfate by cadmium and zinc. Cecil V. King and Martin M. Burger. *Trans. Electrochem. Soc.* 65, 8 pp. (preprint)(1934).—The rate of displacement of Cu from dil.  $CuSO_4$  soln. by Cd and Zn has been measured and compared with previous expts. and with the rate of soln. of Zn in acids. The rate is controlled, up to peripheral speeds of the metal surface of at least 44,000 cm./min., by diffusion and electrolytic transport of the  $Cu^{++}$  ion to the surface of the more active metal and the Cu already deposited. There is no indication that the chem. reaction rate is slow enough to be a controlling factor at any stirring speed studied. C. G. F.

Electric conductivity of electrolyte mixtures. V. K. Semenenchenko and V. V. Serpinski. *J. Gen. Chem.* (U. S. S. R.) 3, 470-7(1933).—The elec. conductivities were studied of KCl in the concn. interval 0.000125-2.0 N, of  $NaNO_3$  0.001-1.0 N, of  $NaBr$  0.000125-0.005 N, of  $MgSO_4$  0.000166-2.0 N; of mixts. KCl +  $NaNO_3$  at total concns. of 0.1 and 0.001 N with ratios of components 3:1, 1:1 and 1:3; KCl +  $MgSO_4$  at total concns. of 0.001, 0.01, 0.1 and 2.0 N in the same ratios of components; KCl +  $NaBr$  +  $MgSO_4$  at total concns. of 0.005

and 0.0005 with ratios of components 1:1:1 and 1:1:2. Data on the double and triple mixts. in small concns. are in good agreement with the elec. cond. values calcd. on the basis of additivity of sp. cond. W. P. Bricks

Rhodium plating. Osvaldo Macchia. *Ind. meccanica* 15, 621-2(1933).—A brief review of Rh in electroplating, covering the published researches and the proposed baths. F. D. Rossini

Industrial chromium plating. D. A. Nemes. *Iron Age* 133, No. 5, 14-15, 76, No. 6, 18-20(1934).—A review. E. H.

Chromium plating in the cold. O. Macchia and D. Raffaelli. *Ind. meccanica* 15, 793-5(1933).—A discussion of the problem of plating chromium at 30-50° as contrasted with that at 16-20°. Conclusion: Plating in the cold is entirely practicable and possesses the following advantages over the heated-bath method: The heating app. and its expense of operation are eliminated; a smaller c. d. may be used, in consequence of which a smaller investment in the generating plant and its operation is required; the app. required for ventilation on account of harmful vapors is reduced to a min. F. D. Rossini

Chromium-plating literature. XXI. L. H. Decke. *Platers' Guide* 30, Jan. 13-15(1934); cf. C. A. 28, 976<sup>1</sup>. W. H. Boynton

Platinum plating. Alan E. W. Smith. *Metal Ind.* (London) 43, 201-2(1933).—Corrosion tests on electroplated Pt were made as follows: Brass metal strips were Ag-plated and then plated with Pt. These strips were used as lab. spatulas for 5 months. The spatulas were then dipped into an  $(NH_4)_2S$  soln. to test for broken coatings; none was found. Pt plate is appreciably harder than Ni plate. Other test specimens were exposed to acid fumes,  $H_2S$ , steam and gas-furnace fumes, 10% HCl, a dil. Lysol soln., and out-of-doors atm. After 1 month all these specimens showed some pitting; the one exposed to  $H_2S$  was the worst. In all cases the Pt itself was not attacked. The base metals were corroded because of pinholes in the deposit. Ni, Pt and Cr were plated on steel specimens and subjected to the action of a 2% soln. of  $I_2$  in alc. The Ni was eaten through in 1 day. The Pt showed signs of pinholing, the Cr signs of cracking at the edges in 2 days. Ag- and Pt-coated reflectors were tested for resistance to temp. The Ag reflector failed below 300° and the Pt reflector failed between 400° and 500°. Pt reflects only 65% while Ag reflects 92% of visible light rays. H. E. Messmore

Plating on aluminum. W. Krause. *Mitt. Forschungsinst. Probieramt Edelmetalle* 7, 87-9(1933).—The best method for obtaining a deposit on Al that adheres well is to roughen the surface first with a sand blast and then nickel-plate it. Any other metal deposit can then be made on the Ni (cf. Work, C. A. 27, 1829). M. H.

Theory of metallic overvoltage. N. Thon. *Compt. rend.* 197, 1312-14(1933).—The extension of the theory of activation to highly cryst. metals such as Pb, Zn, Cd, Bi, Cu and Ag seems unreasonable. Ions probably enter special locations in the lattice without the necessity of activation. In the Fe-Ni group, however, the activation energy is utilized in discharging either a hydrated or a colloidal preliminary state. In the case of gaseous cathodes the absence of any especially active centers imposes the necessity for that increase of discharge potential called overvoltage. Gregg M. Evans

The relation between oxygen overvoltage and catalysis. Allen D. Garrison and Johnny Fay Lilly. *Trans. Electrochem. Soc.* 65, 15 pp. (preprint)(1934).—O overvoltages on polished electrodes of Ni, Co, Fe, Ir, Pt and Au have been measured by a refinement of the direct method, and, almost simultaneously, the rates of depolarization of O gas have been measured at the same electrodes. The overvoltages have been found to increase in the order in which the metals have been named, while the rates of depolarization of O have been found to decrease in the order named. The statistical method has been applied to the data, and the following general equation was found to apply for the relation between the O ionization rate ( $\sqrt{}$ ) and the overvoltage (O. V.):  $\ln \sqrt{ } = A (O. V.) + B$ ,

where  $A$  and  $B$  are constants. This quant. relation is discussed in its bearing on the general catalytic theory of overvoltage, on the problem of electrolytic corrosion in  $O$  and on  $O$  electrodes in general. C. G. F.

**Electrolysis of acetates in absolute methanol.** Fr. Fichter and Robert E. Meyer. *Helv. Chim. Acta* 16, 1408-12 (1933).—The electrolysis of a soln. of  $NaOAc$  in abs.  $MeOH$  and  $HOAc$  produces 3% more  $C_2H_4$  and 1.4% more  $CO_2$  than that of a similar soln. in  $H_2O$  and  $HOAc$  under identical conditions. This is evidence that the Kolbe hydrocarbon synthesis takes place through the formation of the diacyl peroxide. Even in abs. alc.,  $O$  is evolved at the anode and true electrochem. oxidations may take place. In the electrolysis of aq. solns. of  $KOAc$  the max. yield (91.3%) of  $C_2H_4$  is obtained when the salt concn. is 1.44  $N$ . At lower concns. the yield of  $O$  and  $C_2H_4$  increases. H. F. Johnstone

**Standard quinhydrone electrode.** Frank Hovorka and Wm. C. Dearing. *J. Am. Chem. Soc.* 56, 243-4 (1934).—The potential difference between the H and quinhydrone electrodes in standard acid mixt. (0.01  $N$   $HCl$  + 0.09  $N$   $KCl$  with 2 series of acid mixts.) was 0.69903 and 0.69-898 = 0.00002 v. at 25 = 0.01°; because of its reproducibility and constancy the standard quinhydrone electrode excels either the 0.1  $N$  or satd. calomel electrode. C. J. West

**Metallized-glass quinhydrone electrodes.** E. Newberry. *Trans. Electrochem. Soc.* 65, 7 pp. (preprint) (1934).—The following electrodes have been examined with regard to their suitability for use as quinhydrone electrodes in various solns. of  $HCl$ ,  $AcOH$ , soil ext. and  $CuSO_4$ : bright wires of (1) Pt; and (2) Au; bright deposits on glass of (3) Pt; (4) Au; (5) Au-Pt alloy; (6) Ag; (7) Pd; and (8) Pt black; and (9) gray Pt on glass. Of these electrodes, 6 and 7 were found to be quite unsuitable; 5 is doubtful, sometimes working well but at other times appearing too slow; 2 is troublesome to prepare and too sensitive to impurities; 8 and 9 are quite satisfactory, especially 9, but are not better than 3 and require more prep.; 1 is good but is expensive and must be flamed before use, and this involves risk of cracking the glass holder, such cracks being sources of serious error; 3 and 4 are the best all-round electrodes for the purpose, being remarkably low in cost, rapid in action, easily prep'd., easily flamed or recoated with little danger of cracks, and less sensitive to impurities than any of the others. C. G. F.

**Some general properties of liquid organic dielectrics.** Vladimir Karapetoff. *Trans. Electrochem. Soc.* 65, 12 pp. (preprint) (1934).—The following properties of and phenomena in liquid dielectrics are briefly discussed: range of resistivities, dielec. const., mol. structure, miscibility, capillarity, surface tension, viscosity, soly., gas absorption, colloidal structure, oxidation, d. c. cond., behavior with a. c., motions in an intense elec. field, chem. changes in a strong field, ionization, and elec. breakdown. C. G. F.

**Luminous discharge lamps, improvements in construction and characteristics.** Clifford C. Paterson. *Electrician* 112, 104-5 (1934).—A review (Na and Hg vapor). C. G. F.

**Coating iron and steel [electrically]** (Brit. pat. 398,685) 9. Making rubber objects by electrophoretic deposition (Ger. pat. 587,700) 30. Silvering glass surfaces (U. S. pat. 1,942,686) 19. Coking of coal residue for electrode manuf. (Nikolskij, Stepanenko) 21. Kolbe hydrocarbon synthesis in liquid  $NH_3$  (Fulton, Bergstrom) 10.

**Handbuch der Experimentalphysik.** Edited by W. Wien and F. Harms. Bd. XII. Elektrochemie Tl. 2. Edited by K. Fajans and E. Schwartz. Leipzig: Akad. Verlagsges. 483 pp. M. 40. Cf. C. A. 27, 1282.

**Primary cells.** Charles H. Vince, Jr. Brit. 399,561, Oct. 9, 1933. A cell consists of strips of Al (alloy) and another metal, e. g., Cu, wound together in spiral form with intervening absorbent material, e. g., paper, cotton-

Wool, capable of being impregnated with electrolyte, which may consist of  $NaOH$  soln. or granular  $NaOH$  sprinkled on the absorbent material.

**Dry cells.** Otto K. Reinhardt (to Bend Electric Corp.). Brit. 398,701, Sept. 21, 1933.

**Dry-cell electrolytes.** Jaroslav J. Pála. Brit. 398,638, Sept. 21, 1933. An electrolyte which becomes gelatinous on addn. of  $H_2O$  without application of heat is made by mixing the exciting salts with (substances contg.) starch, adding  $H_2O$ , kneading the mixt. and drying at a temp. below which starch dextrinizes. In an example flour is mixed with  $NH_4Cl$  and made into dough which is divided into small pieces which are dried below 60°.

**Dry-cell batteries.** The Ever Ready Co. (Great Britain) Ltd. Brit. 397,068, Aug. 17, 1933. Correction of C. A. 28, 715<sup>a</sup> in which the patent no. was incorrectly given as Brit. 39,068.

**Method and apparatus for closing the seams of and insulating the bottom of shell cups of dry batteries.** Alfred Schulz. Brit. 398,662, Sept. 21, 1933.

**Storage batteries.** George C. Appel, Robert W. Vicarey and John D. Wanvig, Jr. (to Globe-Union Mfg. Co.). U. S. 1,942,350-1, Jan. 2. Structural features.

**Storage batteries.** Robert Bosch, A.-G. Brit. 398,630, Sept. 21, 1933 and 398,772, Sept. 21, 1933, addn. to 398,630.

**Storage batteries.** Accumulatoren-Fabrik A.-G. (to Britannia Batteries Ltd.). Brit. 398,814, Sept. 19, 1933. The frames, lugs, etc., of the pos. plates which are made of Pb-Sb alloy and are not covered with active material are provided with an insulating-coating of rubber, applied from an aq. rubber dispersion by spraying, immersion, etc., and solidified by drying, coagulating and vulcanizing, to avoid gassing after the charge.

**Storage batteries.** Robert J. Plummer and Ceag Ltd. Brit. 398,957, Sept. 28, 1933.

**Storage batteries.** Accumulatoren-Fabrik A.-G. (to Britannia Batteries Ltd.). Brit. 399,061, Sept. 28, 1933. A battery in which air is drawn over the surface of the electrolyte to remove gases is provided with a check valve to close the air entrance when the suction fan stops and prevent gases escaping into the battery room.

**Storage batteries.** Frederick Temple. Brit. 399,882, Oct. 16, 1933. Structural features.

**Storage-battery electrodes.** Karl Ackermann (to I. G. Farbenind. A.-G.). U. S. 1,942,791, Jan. 9. In a porous, ferrous electrode body such as a porous iron sinter plate the walls of the pores are coated with Ni or Co and the pores are provided with an active material such as Ni hydroxide. Ni or Co alloys contg. Cu or Cr also may be used. Cf. C. A. 28, 1281<sup>a</sup>.

**Storage-battery separator.** Edward W. Smith (to Elec. Storage Battery Co.). U. S. 1,942,667, Jan. 9. Separators are formed comprising a sheet of material such as perforated hard rubber on the surface of which is provided a layer formed from Na silicate and a siliceous powder for contact with the active pos. plate material. U. S. 1,942,668 relates to the use of a similar layer on separator sheets such as those formed of glass wool. Cf. C. A. 27, 234.

**Storage-battery vent plug.** Joseph L. Woodbridge (to Elec. Storage Battery Co.). U. S. 1,942,630, Jan. 9.

**Vent plug for storage batteries.** Ernest Graf (to Elec. Storage Battery Co.). U. S. 1,942,643, Jan. 9. U. S. 1,942,645 also relates to a vent plug.

**Depolarizing electrodes for electric batteries.** Martin L. Martus and Edmund H. Becker. U. S. 1,941,869, Jan. 2. A body of Cu oxide is molded about a metallic conductor to make an electrode article, which is then baked, sprayed with a molten metal such as Cu or Zn on its outer surface and joints, and then heated at an annealing temp.

**Machine for pasting storage battery and other grids.** Monark Battery Co., Inc. Brit. 398,450, Sept. 14, 1933. Divided on 398,328 (C. A. 28, 1281<sup>a</sup>).

**Machine for wrapping yarn, twine, etc., around the dollies of the carbon electrodes of primary batteries.** Wilhelm Hasse. Brit. 399,824, Oct. 5, 1933.

**Electrolytic condenser.** Howard J. Tyndall (to Electro Formation, Inc.). U. S. 1,941,726, Jan. 2, 1933. Structural details.

**Electrolytic condensers.** N. V. Philips' Gloeilampenfabrieken. Brit. 399,400, Oct. 5, 1933. See Fr. 782,023 (C. A. 28, 716<sup>9</sup>).

**Electrolytic condensers.** N. V. Philips' Gloeilampenfabrieken. Brit. 399,762, Oct. 12, 1933. Addn. to 382,916 (C. A. 27, 5008). The electrolyte of a condenser according to 382,916 has an acid, *e. g.*, citric, added thereto to render it acid within defined limits. An example gives glycerol 1 l.,  $\text{KH}_2\text{PO}_4$  40 g., citric acid 40 g.

**Electrolytic cells usable particularly as condensers.** Richard Jahre (trading as Richard Jahre, Spezialfabrik für Kondensatoren). Brit. 399,037, Sept. 28, 1933.

**Electrodeposition of metals.** Charles E. Yates (to Anaconda Copper Mining Co.). Brit. 398,759, Sept. 21, 1933. Sheet Cu, etc., is produced continuously by deposition on a partially immersed cathode drum. Between stripping and reimmersion the cathode surface is subjected to the action of a pad comprising graded abrasive particles, *e. g.*, of SiC, embedded in a soft rubber compd., the rubber being in amt. sufficient to exert a smoothing action, *e. g.*, abrasive 20, rubber 80 parts before vulcanization.

**Electrodeposition of chromium.** Colin G. Fink and Charles H. Eldridge (to United Chromium, Inc.). U. S. 1,942,356, Jan. 2. The object to be plated is heated to the temp. of the bath before beginning the electrodeposition. Thus preheating serves to promote good adherence of the deposited Cr.

**Chromium plating.** George E. Barber (to Timken-Detroit Axle Co.). U. S. 1,942,469, Jan. 9. A ratio of  $\text{CrO}_3$  to  $\text{H}_2\text{SO}_4$  of less than 40:1 is maintained in a bath contg. trivalent Cr and hexavalent Cr in the proportion of not less than 1 to 10.

**Dies.** Alexander G. Russell (to Electrical Research Products, Inc.). Brit. 399,451, Oct. 5, 1933. The working surface of a die for pressing and stamping phonograph records, etc., is coated with Pd. The sound impression is taken in a layer of recording wax located in a recess in a metal disk, which is then inverted and clamped to the  $\text{H}_2\text{O}$ -cooled cover of a sputtering chamber. Insulated within the chamber are an annular anode and disk-shaped cathode, the latter formed by covering a glass sheet with a Pd sheet. The surface of the wax becomes evenly coated with Pd on applying a suitable potential to cause a glow discharge and evacuating the chamber. The coated wax is then Cu-plated by electrodeposition and the product used as the working surface after the wax has been melted away and the plate trimmed and cleaned.

**Electrolytic cells.** Karl Kaisser. Brit. 398,751, Sept. 21, 1933. A screen having a no. of apertures adapted to be (partially) closed by deformation of elastic members is used instead of a diaphragm. Electrolysis may be interrupted by complete closure.

**Diaphragm for electrolytic cells.** Helmuth Müller (to A. Wacker Ges. für Elektrochemische Industrie, G. m. b. H.). U. S. 1,942,183, Jan. 2. A diaphragm suitable for use in cells such as those for producing Cl and alkali contains finely divided  $\text{BaSO}_4$  together with a binder of org. glutinous character such as rubber, and may also contain asbestos, glass powder, etc.

**Diaphragms for pressure electrolyzers.** Alfred Mentzel. Brit. 398,673, Sept. 21, 1933. The diaphragms are of asbestos board or paper or material having a similar degree of uniform fine porosity as distinguished from asbestos fabrics having larger-scale apertures. A porosity of 30% is suitable. Binding agents not attacked by the electrolyte and generated gases are used in their manuf.; solns. of Et or benzyl cellulose in  $\text{C}_2\text{H}_5$  are suitable.

**Electrolytic apparatus for producing sponge lead.** Paul Gamichon. U. S. 1,942,208, Jan. 2. Structural details.

**Electrolysis of water.** Alexander T. Stuart. U. S. 1,941,816, Jan. 2. In electrolyzing water, the gases are taken off and the electrolyte in the cell is subjected to a cyclic circulation by returning anolyte and catholyte,  $\text{H}_2\text{O}$  of O and H, from the top to the bottom of the cell,

they being intermixed for restoring the electrolyte to and maintaining it at substantially uniform strength throughout the cell (the speed of the circulation being regulated for ensuring the offtake of pure gases). App. is described.

**Electrolytic production of refined aluminum.** Julius Weber, Alfred von Zeerleder and Wm D. Treadwell. U. S. 1,942,522, Jan. 9. With anodes of impure material to be refined, solid cathodes are used such as Al, with an electrolyte bath composed of halides of Al and other metals such as alkalis or alk. earths having a lower point of fusion than that of the electrodes, and there is supplied to the electrolyte, besides the Al compds., small quantities of heavy metals more electropos. than Al such as Fe, Mn, Pb, Cd or Ni which serve to prevent "growing out" of the cathode deposit.

**Aluminum.** Metallgesellschaft A.-G. Ger. 587,802, Nov. 9, 1933 (Cl. 40c. 6.04). Al or Al alloys are prepd. by the electrolysis of alumina which has been atomized in a gas while fused and chilled by contact with water, the particles being of about 3 mm. size.

**Recovery of metals such as gold and platinum from ores, etc., by electrochemical treatment.** Richard Rodrian (one-half to Herman H. Buttermann). U. S. 1,941,914, Jan. 2. The material is subjected to an "unlocking" treatment as by electrolysis with  $\text{Na}_2\text{CO}_3$  soln., the "unlocked" material is then treated with  $\text{HNO}_3$ , the residue is treated with aqua regia to dissolve metals such as Au and Pt,  $\text{H}_2\text{SO}_4$  is added to the clear aqua regia metal soln. and this soln. is electrolyzed for pptn. of the metals with an iron electrode as anode, this leaving the Fe in the soln.

**Palladium.** W. C. Heraeus G. m. b. H. Ger. 587,737, Nov. 7, 1933 (Cl. 40c. 7). Pd is deposited as a durable plating by the electrolysis of a neutral or weakly acid soln. contg. an excess of Cl ions over Pd at 20° and with a current of 1 amp. per sq. dm. Crude Pd may be used as the anode and NaCl soln. as the anolyte if a diaphragm is used. The electrolyte may consist of a soln. of  $\text{Na-PdCl}_4$  and NaCl.

**Copper wire.** Pierre Fustier and Soc. anon. J. Bocuze & Cie. Brit. 399,685, Oct. 12, 1933. See Fr. 745,667 (C. A. 27, 4178).

**Melting metal scrap.** Detroit Electric Furnace Co. Brit. 399,569, Oct. 12, 1933. Metal is produced continuously from turnings, borings, etc., by subjecting them to radiant heat from an elec. arc in a furnace oscillated 2-4 times per min., periodically pouring a portion of the charge and periodically charging fresh scrap to maintain a const. vol. of bath.

**Coating metals.** Philip R. Coursey, Clifford H. Marcus and Dubilier Condenser Co. (1925) Ltd. Brit. 398,825, Sept. 18, 1933. Insulating-coatings are produced on Al, etc., by electrolytic treatment in 2 stages, the 1st. at low voltage, *e. g.*, 20-30 v. and the 2nd at high voltage, *e. g.*, 750-1000 v. in a different electrolyte. Dil.  $\text{H}_2\text{SO}_4$  may be used in the 1st stage and a soln. of  $\text{NH}_4$  borate in the 2nd. App. is described.

**Electric resistance furnaces.** Soc. anon. des manufactures des glaces et produits chimiques de St.-Gobain, Chauny et Cirey. Brit. 399,708, Oct. 12, 1933.

**Electric resistance furnace with two superposed heating chambers suitable for various purposes.** Rudolf Schmitz. U. S. 1,942,981, Jan. 9. Structural features.

**Induction furnaces with acid or basic linings of fireproof materials.** Deutsche Edelstahlwerke A.-G. Ger. 586,791, Oct. 26, 1933 (Cl. 31a. 6.01).

**Apparatus for electrical precipitation of suspended particles from gases.** Georg Grave (to International Precipitation Co.). U. S. 1,943,070, Jan. 9. Structural and elec. details.

**Electrical precipitation of dust from gases.** Richard Heinrich (to International Precipitation Co.). U. S. 1,941,861, Jan. 2. For pptg. poorly conducting dust from gases, the gas contg. such dust in suspension is passed between discharge and collecting electrodes at a velocity in excess of 10 m. per sec. so as to cause the deposited dust to form a dense uniform layer on the

- collecting electrode and suppress the tendency for elec. discharge to occur from the dust.
- Electrically driven rotary viscometer.** Charles E. Fawkes (to De Vilbiss Co.). U. S. 1,942,920, Jan. 9. Mech. features of an app. suitable for testing the viscosity of paints, lacquers, etc.
- Electric feed-control system for centrifugal separators.** Gustav M. Meer (to Albert T. Otto & Sons). U. S. 1,943,098, Jan. 9. A float and assocd. counterweight serve to control an elec. system which in turn controls an inlet valve.
- Mercury-vapor rectifiers.** Allmanna Svenska Elektriska Aktiebolaget. Brit. 399,973, Oct. 19, 1933.
- Cooling system for mercury-vapor rectifiers.** The General Electric Co. Ltd. and Enrico Gallizia. Brit. 399,582, Oct. 12, 1933.
- Method for igniting the arc in a metal-vapor rectifier.** Aktiengesellschaft Brown, Boveri & Cie. Brit. 399,275, Oct. 5, 1933.
- Polyphase mercury-arc rectifier.** Felix Baron von Kleist (to Westinghouse Elec. & Mfg. Co.). U. S. 1,942,317, Jan. 2. Structural features.
- Anode shields and grids of metallic-vapor electric discharge devices.** Camil Alek Sabbah (to The British Thomson-Houston Co. Ltd.). Brit. 399,498, Sept. 27, 1933.
- Acetylene by electric arc treatment of gases comprising methane.** Paul Baumann, Helmut Tanneberger and Heinrich Schilling (to I. G. Farbenind. A.-G.). U. S. 1,942,131, Jan. 2. The gaseous mixt. from the arc treatment is contacted with a solvent for  $C_2H_2$  such as EtOH or acetone, which has a temp. below the triple point of  $C_2H_2$  and the solvent is then slowly heated.
- Electrically heated apparatus suitable for use with**
- cone bottom stills, etc.** Edgar C. Britton (to Dow Chemical Co.). U. S. 1,942,382, Jan. 2. Structural features.
- High-tension electrical conductor.** George A. Burnham (to Condit Electrical Mfg. Corp.). U. S. 1,941,463, Jan. 2. A conductor such as a high-tension bus is covered with insulating material such as oil in a casing and with solid-discrete non-combustible insulating particles such as sand.
- Electric incandescent lamps.** Egysült Izzólámpa és Villamosági R. T. Brit. 399,715, Oct. 12, 1933. A gas-filled lamp with a spiral shaped incandescent element contains a proportion of dry solid or vaporous I to prevent arc discharges therein. Dry I may be produced within the lamp itself, e. g., by coating the leading-in wires with a compd., e. g.,  $PI_3$ , from which the vapor is liberated upon operation of the lamp.
- Electric incandescent lamps.** The General Electric Co. Ltd., Bernard P. Dudding and Albert E. Woolgar. Brit. 398,994, Sept. 28, 1933. To prevent portions of the glass filament supports nearest to the filament from becoming unduly heated they are protected by screens made of a refractory metal, e. g., Mo.
- Incandescent vapor lamps.** Ehrich & Graetz A.-G. Brit. 399,115, Sept. 28, 1933.
- Flash-light lamps.** I. G. Farbenind. A.-G. Brit. 398,734, Sept. 21, 1933. The lamp comprises a bulb of glass, cellulose acetate, regenerated cellulose or other noncombustible material which contains loose Mg foil of not exceeding 0.01 mm. thickness or Mg wire of not exceeding 0.1 mm. diam. and communicates with the atm. through an opening covered with a wire net or tissue through which an elec. or mech. ignition device projects into the bulb.

## 5- PHOTOGRAPHY

R. P. WIGHTMAN

- Color photography.** A. H. Johnson & Co. (Paper), Ltd., and Michele Martinez. Brit. 399,151, Sept. 21, 1933. In processes of color photography in which a colored colloid, e. g., gelatin, film is differentially hardened in proportion to the Ag content of an image in, under, over or brought into contact with the film by treating the film in the presence of the image with a bath such as used in the ozobrome process, the general hardening action of the dye on the colloid, which occurs mainly when the dye is in aq. soln., is avoided by forming the film from colloid that has been colored in aq. soln. with a dye which has been sepd. in a finely divided state from an alc. soln. and remains undissolved in the  $H_2O$  of the colloid film. In an example, an aq. soln. of indigo carmine is mixed with an aq. soln. of auramine and the resulting suspension added to a soln. of gelatin. If a colloid film thus colored is coated on a photographic sensitive emulsion on a paper base a print may be made from a black and white negative, the light affecting the emulsion being mainly that passing through the interspaces between the dyed particles; development, fixing and treatment with the ozobrome bath yield a pos. print in colored gelatin.
- Color photography and cinematography.** Ernest D. Cooper and John Davies. Brit. 399,786, Oct. 10, 1933. A group of component color record images prepd. from negatives taken through 2 or more complementary color filters is projected in superimposition onto a screen, all the images or part of them being projected through a filter colored by treatment in a soln. of esculin (I) or of  $\beta$ -naphtholdisulfonic acid (II) and part through a different filter. The filter may comprise rose bengal and patent blue addnl. to I or II.
- Float-controlled apparatus for regulating the concentration of photographic fixing solutions or the like.** Kenneth C. D. Hickman (to Eastman Kodak Co.). U. S. 1,942,859, Jan. 9. Various structural and operative details are described.
- Photographic emulsion.** Leslie G. S. Brooker (to Eastman Kodak Co.). U. S. 1,942,854, Jan. 9. A cyanine dye contg. a thiazoline nucleus is used in a photographic gelatino-Ag halide emulsion as a sensitizer. Numerous examples are given.
- Photographic emulsions.** I. G. Farbenind. A.-G. Fr. 754,746, Nov. 13, 1933. Ag halide emulsions are sensitized by carbocyanines which contain the same or different substituents in the 5- and 6-positions of one or both  $C_6H_4$  rings. Several compds. and their sensitizing properties are mentioned, of the formula

where Z and Y represent O, S, Se,  $-CH_2CH_2-$  and

- $R'' - C - R'''$  ( $R''$  and  $R'''$  are alkyl or aryl);  $R^1, R^2, R^3$  and  $R^4$  are alkyl, alkoxy, thioalkyl, selenoalkyl, aryl or aryl-oxo;  $R^5$  is alkyl;  $R^6$  is H, alkyl, alkoxy, aryl, thienyl; and X is Cl, Br, I,  $SO_3CH_3$ ,  $ClO_4$  or other acid radical.

**Photographic reliefs.** Michele Martinez. Brit. 399,269, Oct. 5, 1933. Addn. to 390,881 (C. A. 27, 5285). The method of 390,881 is modified by using 2 supports, 1 of which may be a film or paper bearing a layer contg. a reducible light-sensitive compd., e. g.,  $FeCl_3$ ,  $Fe_2(SO_4)_3$ , ferric  $NH_4$  citrate or oxalate,  $K_2Fe(CN)_6$ ,  $HgCl_2$ ,  $HgCl$ , etc., and the other a film, paper, glass, linoleum, metal, etc., bearing a layer contg. the colloid and an org. acid, or salt thereof, e. g., oxalic, citric, tartaric, formic, malic, lactic, exposing the 1st layer to light to produce a latent image, bringing it into damp contact with the 2nd layer to produce by chem. contact action a latent image therein and heating the 2nd layer, e. g., to 90-130°, before

or after removal of the 1st layer, to develop in the colloid a relief corresponding to the image. Alternatively, the 1st layer may contain also an org. acid or salt thereof and the 2nd layer may contain also a light-sensitive metal compd., in which case both layers are exposed to light to produce a latent image, whereafter they are placed in contact so that the image in the 1st may reinforce that in the 2nd. The 2nd layer may contain  $\text{NaH}_2\text{PO}_4$  also.

Developing gelatin reliefs and making metal casts from them. Alexander Murray (to Eastman Kodak Co.). U. S. 1,942,872, Jan. 9. A light-sensitive element adapted to be developed into a relief by heat alone and to have a metal cast made from it comprises a support such as paper, a sensitive layer contg. gelatin, and a ferric salt such as ferric- $\text{NH}_4$  oxalate with a thin overlying coating of a lacquer such as one contg. cellulose nitrate.

Photographic gelatin film. Johannes Brunken (to Agfa Ansco Corp.). U. S. 1,941,852, Jan. 2. Hardened films of good stability are formed contg. gelatin together with a condensation product of gelatin with a dialdehyde such as glyoxal and also a deriv. of the dialdehyde such as glyoxal- $\text{NaHSO}_3$  or glyoxal-tetraacetate.

Anti-halation layers. I. G. Farbenind. A.-G. Brit. 399,713, Oct. 12, 1933. See Fr. 751,692 (C. A. 28, 722<sup>2</sup>).

Anti-halation and filter layers for photographic plates and films. I. G. Farbenind. A.-G. Brit. 399,387, Oct. 5, 1933. Addn. to 399,721 (C. A. 27, 2160). The layers are formed by condensing a substituted aromatic aldehyde with a quaternary  $\text{NH}_4$  compd. of a heterocyclic base having a reactive  $\text{CH}_2$  group, the aldehyde and (or) the base contg. an atom grouping known to impart substantivity toward cotton. Such groupings are, e. g., biphenyl, 3,3'-dimethoxybiphenyl, carbazole, azoxybenzene and diphenylurea. Examples are given of condensing (1) quinaldinemethyl sulfate and 4,4'-diphenyldialdehyde in pyridine (1), (2) quinaldinemethyl sulfate and azoxybenzalaniline in 1, (3) bisbenzoxazoledimethyl sulfate and

dimethylaminobenzaldehyde (II) in  $\text{Ac}_2\text{O}$  and (4) *p*-phenylquinaldinedimethyl sulfate and II in alc. and piperidine.

Nonhalation backing for photographic films. Albert A. Young (to Eastman Kodak Co.). U. S. 1,942,852, Jan. 9. See Brit. 379,984 (C. A. 27, 3414).

Coloring photographs. Harold Fillery. Brit. 399,841, Oct. 13, 1933. Photographs in monochrome are colored by first bringing to a cold brown tone and then applying transparent dye solns. in a particular sequence. A swelling agent, e. g., a mixt. of saliva and alc. or an alc. soln. of Na glyco-oleate, with or without a small quantity of glycerol, may be applied prior to applying the dye solns. A Ag gaslight or bromide print is first bleached in a  $\text{K}_2\text{Fe}(\text{CN})_6$  bath, washed and toned brown in a  $\text{Na}_2\text{S}$  bath, the final cold brown tone being obtained in a bath of  $\text{CuSO}_4$ ,  $\text{NH}_3$ ,  $\text{AcOH}$  and  $\text{H}_2\text{O}$ . For sepia or red-toned photographs the  $\text{Na}_2\text{S}$  bath is omitted. After washing and drying, the swelling bath is applied and the photograph is tinted with aniline dye solns. ordinarily used for tinting photographs in particular strengths and in the order, crimson, yellow, green, orange, grey (a mixt. of blue and violet), blue, brown, crimson, scarlet, violet, indigo (a mixt. of blue, scarlet and crimson) and black (a mixt. of crimson, scarlet, yellow, blue and brown). The earlier colors may overlap but the darker colors should be restricted to the areas concerned.

Leaching coloring substances from dyed cellulose acetate or nitrate film scrap, etc. Ernest R. Taylor and Charles E. Allen (to Eastman Kodak Co.). U. S. 1,942,848, Jan. 9. The scrap is agitated in a leaching bath such as hot alkali, and the bath is intermittently and rapidly drained from the scrap; the bath is distd., and condensed distillate is returned to an intermediate storage container whence it is supplied for further treatment of the scrap after drainage of the previous bath from it. App. is described.

## 6—INORGANIC CHEMISTRY

A. R. MIDDLETON

Progress in inorganic chemistry 1930 to 1933. I. Preparative results. Wilhelm Klemm. *Angew. Chem.* 47, 17-26(1934).—A comprehensive treatise including the following subjects: (1) rare elements: Re, Ge, Ga, In and rare earths, (2) halogen, S and N compds., and (3) carbonyl compds. and organo-Cr compds. Ninety-eight references.

Water in inorganic compounds. III. Relation between water content of Odo acid clay and its decolorizing power for rhodamine solution. Minoru Nakamoto. *J. Chem. Soc. Japan* 54, 772-93(1933); cf. C. A. 27, 5267.—The clay was heated at various temps. It showed the strongest decolorizing action when it was heated at 150°. T. K.

Chemistry of germanium. XIV. Properties of polygermenes ( $\text{GeH}_2$ )<sub>x</sub>. Paul Royen and Robert Schwarz. *Z. anorg. allgem. Chem.* 215, 295-309(1933); cf. C. A. 27, 3415.—The polygermenes possess a chain-like structure, similar to that of the polyoxymethylenes. Low volatility and insoly. in org. solvents point to a relatively high degree of polymerization. The properties of these compds. point to the union of the  $\text{GeH}_2$  groups through normal valence forces rather than to the presence of ring structures like the cycloparaffins. The end groups are possibly combined with  $\text{H}_2\text{O}$  or  $\text{HCl}$  as follows:  $\text{H}-\text{GeH}_2-\text{GeH}_2-$

$\text{GeH}_2$  (OH) (Cl). In the action of  $\text{NaOH}$  on

$\text{GeH}_2$  the main reaction is  $\text{GeH}_2 + 2\text{NaOH} = \text{Na}_2\text{GeO}_3 + 2\text{H}_2$ , but as intermediate products red oxypolygermenes are formed which show a color deepening with increasing no. of OH groups. It is possible to obtain an alkali-free, red oxygermene if the polygermene is heated with  $\text{H}_2\text{O}$  for a few hrs. upon a boiling water bath in a sealed tube. The existence of definite oxidation steps between polygermene and  $\text{Ge}(\text{OH})_4$  is not to be expected. The oxida-

tion equiv. (as detd. by titration with Br in  $\text{HCl}$  soln.) falls with increasing depth of color from 6 to nearly 2. Polygermenes can reduce Cu, Ag, Au and Pd salts to metal, but the reduction effect is less than that obtained with similar, unsatd. Si compds. On treatment with  $\text{HCl}$ , oxygermenes yield corresponding halogen products:

Treatment with I in  $\text{C}_6\text{H}_6$  produces  $\text{GeI}_4$ , orange-yellow crystals, m. 144°. Continued action of  $\text{HCl}$  leads finally to the formation of  $\text{GeCl}_4$ , but the H liberated acts upon  $\text{GeH}_2$  groups to break the chain compd. and form  $\text{GeH}_4$ ; in an analogous manner  $\text{Ge}_2\text{H}_6$ ,  $\text{Ge}_3\text{H}_8$ , etc., are formed:  $(\text{GeH}_2)_x + \text{HCl} \rightarrow \text{GeCl}_4 + \text{GeH}_4 + \text{Ge}_2\text{H}_6 + \text{Ge}_3\text{H}_8 + \dots \text{H}_2$ . About 16.2% of the Ge is found as normal hydrides and 69.5% as  $\text{GeCl}_4$ . Destructive distn. of polygermene from 120-190° leads to the decompn.:  $(\text{GeH}_2)_x \rightarrow \text{Ge} + \text{GeH}_4 + \text{Ge}_2\text{H}_6 + \text{Ge}_3\text{H}_8 + \dots \text{H}_2$ . Unstable  $(\text{GeH})_x$  may also be formed. H. Stoertz

The appearance of lower valences among the halides of the rare earths. G. Jantsch and W. Klemm. *Z. anorg. allgem. Chem.* 216, 80-4(1933); cf. C. A. 24, 1810; 27, 1289.—A theoretical discussion. J. E. M.

Halides of the rare earths. VIII. Comparative investigation of the action of hydrogen upon the chlorides of the rare earths. G. Jantsch, N. Skalla and H. Grubitsch. *Z. anorg. allgem. Chem.* 216, 75-9(1933); cf. C. A. 27, 4184.—Comparative reduction expts. are made with  $\text{YCl}_3$ ,  $\text{LaCl}_3$ ,  $\text{NdCl}_3$ ,  $\text{GdCl}_3$ ,  $\text{TmCl}_3$ ,  $\text{LuCl}_3$ . The lowest temps. at which effective reduction occurs are: 880°, 880°, 840°, 820°, 650° and 750°, resp. In each case

the metal is formed, because of decompn. of the dichloride at the high temp. With Y, La and Nd, only slight reduction occurs because of the great volatility of their trichlorides above 950°. Where reduction occurs below 650°, the dichloride is obtained, as in the case of Sm, Eu and Yb.

H. Stoertz

**Reactions between chlorine and solid carbonates.** I. Reaction between chlorine and sodium carbonate. Fusao Ishikawa, Toyosaku Murooka and Hiroshi Hagisawa. *Science Reps. Tohoku Imp. Univ.*, Series 1, 22, 1179-96 (1933).—The reaction between  $\text{Cl}_2$  and  $\text{Na}_2\text{CO}_3$  was studied over the temp. range 150° to 600°. The  $\text{Na}_2\text{CO}_3$  prepd. by heating  $\text{NaHCO}_3$  at 350° reacted at a lower temp. than that prepd. at 500°. The main reaction was  $2\text{Na}_2\text{CO}_3 + 2\text{Cl}_2 = 4\text{NaCl} + 2\text{CO}_2 + \text{O}_2$ . A small amt. of  $\text{NaClO}_4$  was formed. II. Reaction between chlorine and carbonates of potassium, lithium and magnesium. Fusao Ishikawa and Hiroshi Hagisawa. *Ibid.* 1197-206.—The reaction between  $\text{Cl}_2$  and  $\text{K}_2\text{CO}_3$  was studied over the temp. range 200° to 600°. The main reaction was  $2\text{K}_2\text{CO}_3 + 2\text{Cl}_2 = 4\text{KCl} + 2\text{CO}_2 + \text{O}_2$ . The  $\text{K}_2\text{CO}_3$  prepd. by heating  $\text{KHCO}_3$  at 350° was much more reactive below 450° than that prepd. at 500°. This difference is explained by assuming 2 different modifications of the carbonate.  $\text{Cl}_2$  reacted less readily with  $\text{Li}_2\text{CO}_3$  and  $\text{MgCO}_3$  than with  $\text{K}_2\text{CO}_3$ . III. The velocity of decomposition of sodium and potassium perchlorates. *Ibid.* 1207-28.—Measurements were made of the thermal decompn. of  $\text{NaClO}_4$  and  $\text{KClO}_4$  in the pure state and when mixed with the resp. carbonates. The presence of the carbonate accelerates the decompn. of the perchlorates. P. T. N.

**Formation of basic alkaline earth halides by means of ethylene oxide.** W. Ziese. *Z. anorg. allgem. Chem.* 216, 196-202 (1933); cf. Maass and Boomer, *C. A.* 16, 3423.—Alk. earth hydroxides are pptd. by excess  $\text{C}_2\text{H}_4\text{O}$ . By control of the amt. of  $\text{C}_2\text{H}_4\text{O}$  the following definite basic halides are obtained:  $\text{Ca}[\text{3Ca}(\text{OH})_2]\text{Cl}_2 \cdot 11\text{H}_2\text{O}$ ;  $\text{Ca}(\text{OH})\text{Cl}$ ;  $\text{Ca}[\text{3Ca}(\text{OH})_2]\text{Br}_2 \cdot 11\text{H}_2\text{O}$ ;  $\text{Ca}[\text{3Ca}(\text{OH})_2]\text{I}_2 \cdot n\text{H}_2\text{O}$ ;  $\text{Sr}(\text{OH})\text{Cl} \cdot 4\text{H}_2\text{O}$ ;  $5\text{Sr}(\text{OH})_2 \cdot \text{SrCl}_2$ ;  $\text{Sr}(\text{OH})\text{Br} \cdot 4\text{H}_2\text{O}$ ;  $\text{Ba}(\text{OH})\text{Br} \cdot 2\text{H}_2\text{O}$ ;  $\text{Ba}(\text{OH})\text{I} \cdot 4\text{H}_2\text{O}$ , as well as  $\text{Sr}(\text{OH})_2 \cdot 8\text{H}_2\text{O}$  and  $\text{Ba}(\text{OH})_2$ . Foster Dee Snell

**The mutual action of the chlorides and bromides of phosphorus.** I. A. Renc. *Kocsniki Chem.* 13, 454-63 (1933); cf. *C. A.* 28, 1293°.—Varying proportions of  $\text{PCl}_4$  and  $\text{PBr}_3$  were heated to 135° in sealed tubes constricted at one end. Mixts. obtained after the reaction was over fell into 3 classes: (a) From the starting mixts. corresponding to  $\text{PCl}_{4.5}\text{Br}_{1.5}$  to  $\text{PCl}_{2.5}\text{Br}_{2.5}$  were obtained red crystals analyzing from  $\text{PCl}_{2.5}\text{Br}_{1.5}$  to  $\text{PCl}_{2.5}\text{Br}_{1.7}$  and a clear red liquid; (b) starting mixts.  $\text{PCl}_{2.5}\text{Br}_{2.5}$  and  $\text{PCl}_2\text{Br}_3$  yielded a dark red liquid corresponding to  $\text{PCl}_{2.5}\text{Br}_3$  and  $\text{PCl}_{2.5}\text{Br}_{2.7}$  and a clear red liquid; (c) starting from  $\text{PCl}_{2.5}\text{Br}_{1.5}$  to  $\text{PCl}_{4.5}\text{Br}_{0.5}$  gave yellow crystals of from  $\text{PCl}_{4.5}\text{Br}_{0.5}$  to  $\text{PCl}_{4.5}\text{Br}_{0.25}$ , a deep red liquid from  $\text{PCl}_{4.5}\text{Br}_{0.25}$  to  $\text{PCl}_{4.5}\text{Br}_{0.1}$ , and a clear red liquid. The crystals were best sepd. by centrifuging (560 r. p. m.). C. T. Ichniowski

**Polythionates.** II. Polythionate formation from thiosulfates and acid in the presence and absence of arsenic compounds. Christian J. Hansen. *Ber.* 66B, 1000-8 (1933); cf. *C. A.* 27, 5268.—The explanation of this reaction offered by Foerster and Stühmer (cf. *C. A.* 26, 4267) based on hydrolysis of the complex  $\text{As}(\text{S}_2\text{O}_3)_2^{---}$  primarily formed and interaction of the products is untenable, since conditions which favor the formation of polythionates are those which retard hydrolysis, as a very large excess of thiosulfate. The above primarily formed complex ion decomposes to give  $\text{AsS}^+$ , sulfite ion, and 2 mols. of "thio-monothionate,"  $\text{S}_2\text{SO}_3\text{O}^-$ . Two of the last then combine to form the tetrathionate ion. Part of the  $\text{AsS}^+$  formed decomposes to yield  $\text{H}_2\text{S}$  and  $\text{As}$  ion, which again forms a thiosulfate complex. If the acid is sulfurous, 4 bisulfite ions will react with 1  $\text{H}_2\text{S}$  to form thiosulfate, water, and trithionate. All the reactions which explain the formation of the tetra- and trithionates are summed up in the equation:  $2\text{S}_2\text{O}_3^{---} + 3\text{SO}_3 = \text{S}_4\text{O}_6^{---} + \text{S}_2\text{O}_3^{---}$ . The ratio here of 2 mols. of polythionate to 5 mols. of thiosulfate (the  $\text{SO}_3$  is from its decompn.)

1 holds almost quantitatively, regardless of the no. of S atoms per mol. of the polythionates. Formation of higher polythionates is explained by the addn. of 1 or more S atoms to the "thio-monothionate," forming  $\text{S}_2\text{SO}_3\text{O}^-$ , etc. This latter ion combines with a "thio-monothionate" to form a pentathionate, with another like itself to form a hexathionate. If an acid stronger than  $\text{H}_2\text{SO}_3$  is present, the concn. of  $\text{HSO}_3^-$  will be far lower and the yield in trithionates decreased. Also some of the  $\text{SO}_3$  formed by  $\text{HSO}_3^-$  decompn. will react with  $\text{H}_2\text{S}$  (whose concn. is increased by acid) to make more free S available for formation of higher thionates. Results presented in tables verify the conclusion that a higher ratio of acid to thiosulfate favors the production of polythionates contg. more S. No evidence is obtained for the formation of  $\text{SO}_3$ , as claimed by Foerster and Stühmer. In the absence of As, the reaction takes place in the same mol. ratio but at a much slower rate. H. offers an entirely different mechanism, based on the fact that the coördination no. of S is 4. In the acid soln. some of the bisulfite decomposes to yield  $\text{SO}_3$ , and addn. products of the two then react:  $\text{O.SO}_2\text{S.SO}_3^{---} + \text{SO}_3 \rightarrow \text{O.SO}_2\text{S.SO}_3^{---}$  and  $\text{O.SO}_2\text{S.SO}_3^{---}$

4  $\text{SO}_3$   
polythionates in alkaline and acid solutions. *Ibid.* 1009-11.—The decompn. of all polythionates is explained on the basis of an initial splitting off of  $\text{SO}_3^{---}$  and formation of  $\text{S}(\text{OH})_2$ . Trithionate in acid soln. is an exception, splitting off sulfate rather than sulfite. The tetra- and higher thionates are distinguished from the lower by their stability toward acids and their great instability toward alkalis. Thus traces of alkali decompose the pentathionate thus:  $\text{S}_5\text{O}_6^{---} + 2\text{OH}^- = 2\text{SO}_3^{---} + 2\text{S} + \text{S}(\text{OH})_2$ . The  $\text{S}(\text{OH})_2$  reacts with 2 more  $\text{OH}^-$  to form thiosulfate ion and water. If all the mol. S reacts with sulfite, then the total equation becomes:  $2\text{S}_5\text{O}_6^{---} + 6\text{OH}^- = 5\text{S}_2\text{O}_3^{---} + 3\text{H}_2\text{O}$ . The formation also of tetrathionate according to the equation:  $\text{S}_5\text{O}_6^{---} + \text{SO}_3^{---} = \text{S}_6\text{O}_{11}^{---} + \text{S}_2\text{O}_3^{---}$  is evidence of the sulfite decompn. The tetra compd. thus formed decomposes in the same manner to yield trithionate, and if the soln. is not too alk. sulfate will be formed by the decompn. of the latter. Polythionic acids are classified as (a) dithionic acid, which always gives sulfate (along with sulfite) on decompn., (b) trithionic acid, which gives sulfate in acid and weakly alk. soln. and sulfite in solns. more alk. than 1 N, and (c) the higher or true polythionates, which always decompose to give sulfite. M. G. Moore

**Transformation of thiosulfuric acid into polythionic acids with the aid of catalysts.** III. Conditions governing the precipitation of arsenic or antimony sulfide. A. Kurtzacker and Elizabeth Fürstendau. *Z. anorg. allgem. Chem.* 215, 257-70 (1933); cf. *C. A.* 24, 2368.—As or Sb solns. are treated with  $\text{Na}_2\text{S}_2\text{O}_3$  soln. in the presence of varying quantities of acid, and the pptd. sulfides are detd. by direct weighing or by conversion into  $\text{Mg}_3\text{As}_2\text{O}_7$  in the case of As. Pptn. of  $\text{As}_2\text{S}_3$  is quantitative only with 8-10.5 N  $\text{H}_2\text{SO}_4$ , hot, but from 13-16 N  $\text{H}_2\text{SO}_4$  98-99% of the As is pptd.  $\text{Sb}_2\text{S}_3$  is more completely pptd. from weak acid solns. than is  $\text{As}_2\text{S}_3$ , quantitative yields of  $\text{Sb}_2\text{S}_3$  being obtained in AcOH concns. of 0.17 to 1.0 N. H. Stoertz

**Active oxides.** LXX. Addition compounds between zinc oxalate and organic materials. Anton Zörner and Gustav F. Hüttig. *Z. anorg. allgem. Chem.* 216, 145-58 (1933); cf. *C. A.* 28, 396°.—Addn. of  $\text{ZnC}_2\text{O}_4$  to concd. aq.  $\text{NH}_3$  soln. nearly to satn. and evapn. to dryness gives  $\text{ZnC}_2\text{O}_4 \cdot 2\text{NH}_3 \cdot 2\text{H}_2\text{O}$  (I). In contact with  $\text{H}_2\text{O}$  it decomposes to give  $\text{ZnC}_2\text{O}_4 \cdot 2\text{H}_2\text{O}$ .  $\text{ZnC}_2\text{O}_4$  and excess  $\text{EtNH}_3$  on evapn. of  $\text{EtNH}_3$  give  $\text{ZnC}_2\text{O}_4 \cdot 2\text{EtNH}_3$ , which is unstable in moist air, forming  $\text{ZnC}_2\text{O}_4 \cdot \text{EtNH}_3 \cdot \text{H}_2\text{O}$ . The same hydrate is obtained by evapn. or pptn. by alc. of a satd. soln. of  $\text{ZnC}_2\text{O}_4$  in a 1:1 mixt. of  $\text{H}_2\text{O}$  and  $\text{EtNH}_3$ .  $\text{ZnC}_2\text{O}_4$  combines with  $\text{PrNH}_3$  to form  $\text{ZnC}_2\text{O}_4 \cdot 2\text{PrNH}_3$ , which (nearly pure) is also formed from  $\text{ZnC}_2\text{O}_4 \cdot 2\text{H}_2\text{O}$ , in both cases after evapn. of excess  $\text{PrNH}_3$ . Alc. pptn. of  $\text{ZnC}_2\text{O}_4$  in a 1:1 mixt. of  $\text{H}_2\text{O}$  and  $\text{PrNH}_3$  or evapn.

of the soln. gives  $\text{ZnC}_2\text{O}_4 \cdot \text{PrNH}_2 \cdot \text{H}_2\text{O}$ .  $\text{ZnC}_2\text{O}_4 \cdot 3\text{C}_2\text{H}_5\text{(NH}_2\text{)}_2$  is recovered unchanged from aq. soln., but by alc. pptn.  $\text{ZnC}_2\text{O}_4 \cdot 3\text{C}_2\text{H}_5\text{(NH}_2\text{)}_2$ ,  $\text{ZnC}_2\text{O}_4 \cdot 2\text{H}_2\text{O}$  is obtained.  $\text{ZnC}_2\text{O}_4$  and  $\text{C}_2\text{H}_5\text{(OH)}_2$  or  $\text{ZnCl}_2$  in  $\text{C}_2\text{H}_5\text{(OH)}$ , mixed with  $\text{H}_2\text{C}_2\text{O}_4$  in  $\text{C}_2\text{H}_5\text{(OH)}$ , give  $\text{ZnC}_2\text{O}_4 \cdot \text{C}_2\text{H}_5\text{(OH)}_2$ . Pptn. of an aq. soln. of  $\text{ZnC}_2\text{O}_4 \cdot 3\text{C}_2\text{H}_5\text{(NH}_2\text{)}_2 \cdot 2\text{H}_2\text{O}$  by alc. gives  $\text{ZnC}_2\text{O}_4 \cdot \text{C}_2\text{H}_5\text{(NH}_2\text{)}_2 \cdot \text{H}_2\text{O}$ . Addn. of alc.  $\text{H}_2\text{C}_2\text{O}_4$  instead of plain alc. gives  $\text{ZnC}_2\text{O}_4 \cdot 3[\text{C}_2\text{H}_5\text{(NH}_2\text{)}_2 \cdot \text{H}_2\text{C}_2\text{O}_4] \cdot 2\text{H}_2\text{O}$ ;  $\text{Zn(OAc)}_2 \cdot 3\text{C}_2\text{H}_5\text{(NH}_2\text{)}_2 \cdot 2\text{H}_2\text{O}$ ;  $\text{ZnCl}_2 \cdot 3\text{C}_2\text{H}_5\text{(NH}_2\text{)}_2 \cdot 2\text{H}_2\text{O}$ ;  $\text{ZnSO}_4 \cdot 2\text{C}_2\text{H}_5\text{(NH}_2\text{)}_2$ ;  $\text{C}_2\text{H}_5\text{(NH}_2\text{)}_2 \cdot \text{H}_2\text{C}_2\text{O}_4$ .  $\text{ZnC}_2\text{O}_4$  and  $\text{PhNH}_2$  give I. Pptn. of hot alc.  $\text{ZnCl}_2 \cdot 2\text{PhNH}_2$  with hot alc.  $\text{H}_2\text{C}_2\text{O}_4$  or of hot alc. ( $\text{PhNH}_2$ )<sub>2</sub>  $\cdot \text{H}_2\text{C}_2\text{O}_4$  with hot alc.  $\text{ZnCl}_2$  gives  $2\text{ZnC}_2\text{O}_4 \cdot (\text{C}_2\text{H}_5\text{NH}_2)_2 \cdot \text{H}_2\text{C}_2\text{O}_4 \cdot 2\text{H}_2\text{O}$ . Others obtained by pptn. are  $2\text{ZnC}_2\text{O}_4 \cdot (\text{C}_2\text{H}_5\text{NH}_2)_2 \cdot \text{H}_2\text{C}_2\text{O}_4 \cdot 2\text{H}_2\text{O}$ ;  $2\text{ZnC}_2\text{O}_4 \cdot (\text{C}_2\text{H}_5\text{N})_2 \cdot \text{H}_2\text{C}_2\text{O}_4$ ;  $2\text{ZnC}_2\text{O}_4 \cdot (\text{C}_2\text{H}_5\text{N})_2 \cdot \text{H}_2\text{C}_2\text{O}_4 \cdot 2\text{H}_2\text{O}$ ; and  $2\text{ZnC}_2\text{O}_4 \cdot (\text{C}_2\text{H}_5\text{N})_2 \cdot \text{H}_2\text{C}_2\text{O}_4$ . Pptn. of  $\text{ZnCl}_2$  in  $\text{Me}_2\text{CO}$  with  $\text{H}_2\text{C}_2\text{O}_4$  in  $\text{Me}_2\text{CO}$  gives  $\text{ZnC}_2\text{O}_4$  with only 0.4 mole of  $\text{H}_2\text{O}$ , either at room temp. or when combined at  $-60^\circ$ . Debye diagrams of several compds. are given. Thus in addn. to types  $\text{ZnC}_2\text{O}_4 \cdot 2\text{X}$  and  $\text{ZnC}_2\text{O}_4 \cdot 5\text{X}$ , a new type  $\text{ZnC}_2\text{O}_4 \cdot 3\text{X}$  is formed.

Foster Dee Snell

The oxidation of ferrous hydroxide. A. Quartaroli. *Gass. chim. ital.* 63, 669-78(1933).—By the incomplete oxidation of  $\text{Fe(OH)}_2$  under certain definite conditions, there is obtained a voluminous black hydroxide (I), which is only slightly magnetic, and which is transformed by  $\text{H}_2\text{O}_2$  into  $\text{Fe(OH)}_3$ . After an incubation period of more than 0.5 hr., I is transformed rapidly by an autocatalytic reaction into another black hydroxide, which has a small vol., is strongly magnetic, and is not oxidized to  $\text{Fe(OH)}_3$ . This transformation is inhibited or at least retarded by small proportions of Ni or Mg compds., which prolong the period of incubation. The simultaneous pptn. of  $\text{Fe(OH)}_2$  and  $\text{Fe(OH)}_3$  from an equimol. mixt. of ferrous and ferric salts yields much more rapidly, though not instantaneously, unoxidizable magnetic hydroxide. In this case too, Mg and Ni compds. act as inhibitors. When oxidized with  $\text{H}_2\text{O}_2$ ,  $\text{Fe(OH)}_2$  gives a form of  $\text{Fe(OH)}_3$  which is less voluminous and more strongly magnetic than that formed by direct pptn. from a ferric salt. Addn. of  $\text{H}_2\text{O}_2$  several hrs. later yields a  $\text{Fe(OH)}_3$  of small vol. and enormous susceptibility (cf. Q., C. A. 11, 3167). This phenomenon is analogous to the difference in the behavior of  $\text{Fe(OH)}_2$  when freshly pptd. and after standing, and is also related to the concepts of Kohlschütter on the influence of the structure of a solid substance upon another substance formed from it without passage of the former into soln.

C. C. Davis

The amphoteric behavior of metallic hydroxides. II. Zincates. R. Scholder and H. Weber. *Z. anorg. allgem. Chem.* 215, 355-66(1933); cf. C. A. 27, 2645.—In the system  $\text{ZnO} \cdot \text{NaOH} \cdot \text{H}_2\text{O}$ , low NaOH concns. favor the formation of mixed crystals of  $[\text{Zn(OH)}_2] \cdot \text{H}_3\text{BO}_3$  and  $[\text{Zn(OH)}_2] \cdot \text{Na}_2\text{CO}_3$ , while with higher NaOH concns. mixed crystals of  $[\text{Zn(OH)}_2] \cdot \text{Na}_2\text{CO}_3$  and  $\text{NaOH} \cdot \text{H}_2\text{O}$  are formed. Tetra- and hexahydrozincates of Ba and Sr are prepd.

H. Stoertz

Hydration of tricalcium aluminate. W. D. Foster. *Cement and Cement Manuf.* 6, 97-104(1933).—In presence of  $\text{H}_2\text{O}$ ,  $3\text{CaO} \cdot \text{Al}_2\text{O}_3$  partly dissociates, re-forming  $3\text{CaO} \cdot \text{Al}_2\text{O}_3 \cdot n\text{H}_2\text{O}$ , which ppts. in amorphous form and later crystallizes. Sol. Ca salts tend to retard hydration and also to inhibit crystn., though with a mixt. of  $\text{CaCl}_2$  and gypsum the effect is not additive, but more nearly is an av. of the effect of the sep. salts. This retarding action disappears before the complete hydration of  $3\text{CaO} \cdot \text{Al}_2\text{O}_3$ , possibly by reason of the formation of complex compds. The problem is considered in relation to the setting of portland cement.

B. C. A.

Reaction of calcium oxide and silicic acid in the solid state. K. Hild and G. Trömel. *Z. anorg. allgem. Chem.* 215, 333-44(1933).—The reaction  $\text{CaO} + \text{SiO}_2$  was studied at  $1000^\circ$  in the mol. ratio of 1:1, x-ray and microscopic examn. being made. The orthosilicate  $2\text{CaO} \cdot \text{SiO}_2$  ( $\beta$ -form) always forms first. This reacts with free  $\text{SiO}_2$  still present to form wollastonite,  $\beta\text{-CaO} \cdot \text{SiO}_2$ . An unstable intermediate product,  $3\text{CaO} \cdot 2\text{SiO}_2$ , is also

formed. With a short reaction time (5 min.) it is possible that the unstable  $\alpha$ -form of  $\text{CaO} \cdot \text{SiO}_2$  is formed.

H. Stoertz

Trivalent manganese. VIII. Determination of true  $\text{MnO}_2$  content in pyrolusite by thermal decomposition to  $\text{Mn}_2\text{O}_3$ . Walter Franke and Alfred Freitag. *Z. anorg. allgem. Chem.* 215, 105-10(1933); cf. C. A. 24, 1591.—All types of pyrolusite are converted into anhyd.  $\text{Mn}_2\text{O}_3$  by heating at  $1100^\circ$ . No generally suitable temp. can be given for converting  $\text{MnO}_2$  to  $\text{Mn}_2\text{O}_3$ . Thus is lost the possibility of giving a universally suitable method for detn. of  $\text{MnO}_2$  in pyrolusite. Total Mn should be detd., as well as active O, to calc. the content of  $\text{Mn}^{II}$  and have a true picture of the value of the sample for tech. use.

H. Stoertz

The non-existence of a higher nickel carbide. Jürgen Schmidt. *Z. anorg. allgem. Chem.* 216, 85-98(1933).—Since Fe forms a higher carbide and since H. Tutiyu (*Bull. Inst. Phys.-Chem. Research (Tokyo)* 10, 951(1930)) had reported detecting a higher Ni carbide, by x-ray analysis, S. attempted to prep. it. CO was passed over Ni (reduced by  $\text{H}_2$ ) for 240-465 hrs. at  $240-250^\circ$ . All samples of carbide thus obtained contained 0.4-1.3% free C and 6.8-7.8% combined C. Although the latter was higher than the theoretical (6.37%) for  $\text{Ni}_3\text{C}$ , this was the only compd. detected by x-ray studies. As all the possible places for C in the space lattice of  $\text{Ni}_3\text{C}$  are not filled, S. assumes that the excess C takes some of these places without distorting the crystal. The d. of  $\text{Ni}_3\text{C}$ , computed from crystal data, is 7.880 g./cc.; the exptl. value ( $d_x^{22}$ ) was found to be 7.957 g./cc. The excess C in the crystal may help account for the difference. The products of decompn. with acids were  $\text{CH}_4$ ,  $\text{C}_2\text{H}_2$ ,  $\text{C}_2\text{H}_4$  and  $\text{H}_2$ , all being evolved in varying proportions. The results of decompn. were not reproducible. When  $\text{CH}_4$  was passed over Ni, C was formed but no carbide.  $\text{C}_2\text{H}_2$  gave  $\text{Ni}_3\text{C}$  and much C. Bibliography.

John E. Milbery

Rhenium tribromide. Harro Hagen and Adolf Sieverts. *Z. anorg. allgem. Chem.* 215, 111-12(1933).— $\text{ReBr}_3$  is prepd. by action of Br vapor upon Re at  $500^\circ$ . O must be excluded.  $\text{ReBr}_3$  sublimes slowly at  $450^\circ$  to give a dark sublimate of greenish black crystals. In the presence of O it is converted into a dark blue compd., probably an oxybromide, at  $400^\circ$ .

H. Stoertz

Preparation and autoxidation of the blue bivalent ruthenium solution. W. Manchot and Hans Schmid. *Z. anorg. allgem. Chem.* 216, 104-8(1933); cf. C. A. 22, 1113.—This soln. is needed in the prepn. of univalent Ru. 0.5 g. of  $\text{RuCl}_3$  in 40 cc. of 4 N HCl was reduced electrolytically with a smooth Pt cathode, a C anode, and a c. d. of 0.133 amp./sq. cm. The electrolysis was carried out at  $2^\circ$  and was complete in about  $1\frac{1}{4}$  hrs. Prolonged electrolysis pptd. the metal. The soln. is fairly stable in the air and has much weaker reducing powers than univalent Ru. CO has no action on the blue soln. NO slowly oxidizes it, but unlike  $\text{FeCl}_2$ ,  $\text{RuCl}_2$  does not form  $\text{RuCl}_2 \cdot \text{NO}$  in soln.  $\text{RuCl}_2$  gives a dark brown ppt. of  $\text{Ru(OH)}_2$  with NaOH. This can absorb  $\frac{1}{4}$  mol. of  $\text{O}_2$  to form black  $\text{Ru(OH)}_2$ , but does not oxidize to  $\text{RuO}_2$ .

J. E. M.

The similarity of ruthenium to iron: Nitric oxide compounds of bivalent ruthenium. W. Manchot and Hans Schmid. *Z. anorg. allgem. Chem.* 216, 99-103(1933).—Bivalent Ru compds., unlike ferrous compds., are not acted on directly by NO. However, by using the carbonyl compds. described by Manchot and König (C. A. 19, 1544) the nitrosyl derivs. were obtained thus:  $\text{RuX}_2(\text{CO})_2 + \text{NO} \rightleftharpoons \text{RuX}_2\text{NO} + 2\text{CO}$ . The orange-red  $\text{RuI}_2(\text{CO})_2$  begins to darken at  $180^\circ$  in a stream of NO and becomes black at  $230^\circ$ . By continuing the treatment for 40 hrs. at  $230^\circ$  and pulverizing the solid every 8 hrs., analytically pure  $\text{RuI}_2\text{NO}$  was obtained. It was a velvet black powder, insol. in  $\text{H}_2\text{O}$ , MeOH, EtOH, and  $\text{Me}_2\text{CO}$  and sol. in  $\text{CHCl}_3$  only in traces. It is stable in warm dil.  $\text{H}_2\text{SO}_4$ , but the concd. acid evolves NO. The above equil. was shown to be entirely reversible by passing CO over  $\text{RuI}_2\text{NO}$  at  $230^\circ$ .  $\text{RuBr}_2\text{NO}$ , prepd. in the same way, is a dark brown powder with similar properties.  $\text{RuCl}_2\text{NO}$  was not prepd. pure because of difficulty in prepd.  $\text{RuCl}_2$ .

(CO)<sub>2</sub>. However, a small sample of the latter darkened when NO was passed over it. The NO is probably not ionically linked in the mol., since it always causes a deepening in color when it enters, as contrasted with the colorless hyponitrite ion.

John E. Milbery

The formation of green manganous sulfide. III. Influence of salts on the transition of the red sulfide to the green. Georg Landesen and Maria Reistal. *Z. anorg. allgem. Chem.* 216, 113-26(1933); cf. *C. A.* 25, 2656.—The effects of NH<sub>4</sub> oxalate, arsenite, chloride, perchlorate and thiosulfate on the rate of transformation of red to green MnS were studied. The effects depend on the order in which the reagents are added and on the nature of the pptg. agent. The oxalate definitely accelerates the transition; the arsenite decreases the rate when NH<sub>4</sub>HS is the precipitant; the chloride accelerates when (NH<sub>4</sub>)<sub>2</sub>S is used, and the perchlorate retards when NH<sub>4</sub>HS is used but accelerates when the yellow polysulfide is the source of the S ion.

H. F. Johnstone

A selenium compound of high thermoelectric strength. M. A. Levitakaya and V. Ya. Dlugach. *Compt. rend. acad. sci. U. R. S. S. [N. S.]*, 1933, 106-8 (in German 109-10).—Cu<sub>2</sub>Se (I), obtained by fusing Se with Cu, is dark gray, without the luster of Se, and resembles graphite. It appears to be porous and absorbs non-colloidal liquids. Its sp. gr. is 6.2. It does not permit the usual soldering; it does not adhere to Sn and adheres only slightly to other metals. Its sp. heat is 0.105. Its heat cond. was compared with that of Pb and found to be of the order of 10<sup>-3</sup>. It does not soften at 900-1000°. On continued heating it seems to give off Se. Its sp. resistance,  $\rho$ , at room temp. =  $1.5 \times 10^{-3}$  cm., that is, it is  $< 1/100$  of the value found by Bellati and Lussana (*Atti. ist. Veneto* 6, 189(1888)). It is pos. in a thermocouple with Cu. The authors recommend its use in thermocouples where the temp. of the junction is not too high and no appreciable c. d. is required, e. g., for measurements of radiation and static tension.

Louise Kelley

Preparation and constitution of the thioannates. I. Sodium ortho- and meta-thioannates. Edwin E. Jelley. *J. Chem. Soc.* 1933, 1580-1.—The apparent difference between the covalency of Sn in the 2 classes of thioannates, meta, M<sub>2</sub>SnS<sub>3</sub>·xH<sub>2</sub>O, and ortho, M<sub>2</sub>SnS<sub>4</sub>·yH<sub>2</sub>O, was investigated. Results uphold the 6-covalency of Sn.

The existence of some ammoniates of double salts. G. Spacu and P. Spacu. *Z. anorg. allgem. Chem.* 214, 113-42(1933).—See *C. A.* 27, 5671.

H. G.

Reaction mechanism of silane formation. III. Robert Schwarz and Paul Royen. *Z. anorg. allgem. Chem.* 215, 288-94(1933).—Silane formation proceeds according to the following reactions:  $Mg_2Si + 2H_2O = (MgOH)_2SiH_2$ ;  $(MgOH)_2SiH_2 + 4HCl = 2MgCl_2 + SiH_4 + 2H_2O$ ;  $2(SiH_4) + H_2O = SiH_4 + SiH_2O$ ;  $3(SiH_4) + H_2O = Si_2H_6 + SiH_2O$ . This explains the formation of higher silanes in the decompn. of a single silicide. In the hydrolysis of the polymeric  $(SiH_3)_x$  1 mol. of *prosiloxane* is formed and the H liberated acts upon the SiH<sub>3</sub> groups to form a homologous series of silanes. With increasing no. of Si atoms, instability of the silane rapidly increases, lower members of the series and H being formed. Decompn. of Si<sub>4</sub>H<sub>10</sub> gives SiH<sub>4</sub>, Si<sub>2</sub>H<sub>6</sub>, Si<sub>3</sub>H<sub>8</sub>, and H.

Equilibrium in the system NH<sub>4</sub>NO<sub>3</sub>-NaNO<sub>2</sub>-H<sub>2</sub>O. E. A. Nikitina. *J. Gen. Chem. (U. S. S. R.)* 3, 513-18 (1933).—A systematic study of the systems: NH<sub>4</sub>NO<sub>3</sub>-NaNO<sub>2</sub>-H<sub>2</sub>O, NH<sub>4</sub>NO<sub>3</sub>-H<sub>2</sub>O and NaNO<sub>2</sub>-H<sub>2</sub>O, in the temp. interval 0-98°. The results are compared with those of other investigators.

S. L. Madorsky

The ternary systems KIO<sub>3</sub>-KBr-H<sub>2</sub>O and NaIO<sub>3</sub>-NaBr-H<sub>2</sub>O. John E. Ricci. *J. Am. Chem. Soc.* 56, 290-5(1934).—Soly. and d. detns. were made at temps. varying between 5° and 50° of the ternary systems: KIO<sub>3</sub>-KBr-H<sub>2</sub>O and NaIO<sub>3</sub>-NaBr-H<sub>2</sub>O, involving salts found

1 in the caliche of Chile. The first system studied at 5°, 25° and 50° showed no double-salt formation. The second system was examd. at 5°, 15°, 25°, 35°, 45° and 50° and showed the presence of 2 double salts: 2NaIO<sub>3</sub>·3NaBr·15H<sub>2</sub>O existing up to about 40° and 2NaIO<sub>3</sub>·3NaBr·10H<sub>2</sub>O existing at higher temps. from a little below 40°.

H. S. v. K.

Compound formation between sodium iodate and sodium iodide. John E. Ricci. *J. Am. Chem. Soc.* 56, 295-9 (1934); cf. preceding abstr. and *C. A.* 27, 1565.—The ternary system NaIO<sub>3</sub>-NaI-H<sub>2</sub>O was reexamd. and the existence (between 20° and 55°) established of 3 double salts: 2NaIO<sub>3</sub>·3NaI·20H<sub>2</sub>O, 2NaIO<sub>3</sub>·3NaI·15H<sub>2</sub>O and 2NaIO<sub>3</sub>·3NaI·10H<sub>2</sub>O. The results are compared with those obtained for aq. solns. of NaIO<sub>3</sub> with NaNO<sub>3</sub>, NaCl, NaBr and NaI, resp. The possibility of finding other series of similarly constituted double salts is pointed out.

H. S. v. K.

Ternary systems involving alkali bromates. John E. Ricci. *J. Am. Chem. Soc.* 56, 299-308(1934).—Soly. and d. detns. were made for aq. solns. of NaBrO<sub>3</sub> and KBrO<sub>3</sub> between 5° and 50° and for the Na-salt pairs: NaBrO<sub>3</sub>-NaCl (at 10° and 25°), NaBrO<sub>3</sub>-NaBr (at 10°, 25° and 45°), NaBrO<sub>3</sub>-NaI (at 25°) and NaBrO<sub>3</sub>-Na<sub>2</sub>SO<sub>4</sub> (at 25°). The following K-salt pairs were studied at 25° only: KBrO<sub>3</sub>-KBr, KBrO<sub>3</sub>-KI, KBrO<sub>3</sub>-KNO<sub>3</sub> and KBrO<sub>3</sub>-K<sub>2</sub>SO<sub>4</sub>. In none of these systems was any evidence found of double-salt formation. A comparison is made with systems involving NaIO<sub>3</sub> and KIO<sub>3</sub> studied previously (cf. preceding abstr.).

H. S. v. K.

Changes in sulfur in the air at low temperatures. R. Dubrisay. *Chimie & industrie* 30, 767-9(1933); cf. *C. A.* 26, 379; 27, 5705.

A. Papineau-Couture

The use of phosphoric oxide as a drying agent for hydrochloric acid. Fred Fairbrother. *J. Chem. Soc.* 1933, 1539-41.—Expts. show clearly that no reaction occurs when dry HCl is passed over pure P<sub>2</sub>O<sub>5</sub> at ordinary temps., but the presence of appreciable amts. of moisture or of metaphosphoric acid causes a reaction. P<sub>2</sub>O<sub>5</sub> is not a suitable drying agent for HCl unless followed by condensation and fractionation.

M. McMahon

New salts of perhenic acid. E. Wilke-Dörfurt and Th. Gunzert. *Z. anorg. allgem. Chem.* 215, 369-87 (1933).—Various new *perhenates* were prepd. to show the analogy between perhenic acid and the O acids of the other elements in group VII of the Periodic Table, particularly HClO<sub>4</sub> and HMnO<sub>4</sub>.

6 Hexammine *perhenates* of Co<sup>III</sup> and Cr<sup>III</sup> were prepd. by treatment of solns. of the hexamminochlorides or nitrates with an excess of warm concd. soln. of HReO<sub>4</sub>. [Co(NH<sub>3</sub>)<sub>6</sub>](ReO<sub>4</sub>)<sub>3</sub>·2H<sub>2</sub>O is obtained as orange-yellow, doubly refracting prisms, poorly sol. in H<sub>2</sub>O (0.469 g./l.), d<sub>25</sub><sup>20</sup> = 3.329, mol. vol. = 285. The anhyd. salt has a d. of 3.506, mol. vol. 260. The Cr salt is obtained as citron-yellow prisms, d. of dihydrate = 3.280, mol. vol. = 287.5; of anhyd. salt d. = 3.408, mol. vol. = 265.5. *Chromic hexaurea perhenate* [Cr(CO(NH<sub>3</sub>)<sub>5</sub>)<sub>3</sub>](ReO<sub>4</sub>)<sub>3</sub>, prepd. in a similar manner, is obtained as green needles, much more sol. in H<sub>2</sub>O (17.86 g./l.), sol. in alc. (6.67 g./l.), d<sub>25</sub><sup>20</sup> = 2.652, mol. vol. = 438.5. This salt more closely resembles the permanganates, perchlorates, borofluorides and fluosulfonates, except for soly. in alc. The *tetrammine perhenates* of Zn, Cd, Co<sup>II</sup> were prepd. by action of concd. NH<sub>4</sub>OH on the *perhenates* of these metals, and are described as follows: [Zn(NH<sub>3</sub>)<sub>4</sub>](ReO<sub>4</sub>)<sub>3</sub>, white, cubic crystals, sol. in concd. NH<sub>4</sub>OH (1.852 g./l.), d<sub>25</sub><sup>20</sup> = 3.608, mol. vol. = 175.75; [Cd(NH<sub>3</sub>)<sub>4</sub>](ReO<sub>4</sub>)<sub>3</sub>, colorless, well formed, regular cubes, sol. in concd. NH<sub>4</sub>OH (0.37 g./l.), d<sub>25</sub><sup>20</sup> = 3.714, mol. vol. = 183.5; [Co(NH<sub>3</sub>)<sub>4</sub>](ReO<sub>4</sub>)<sub>3</sub>, beautiful, purple-red crystals, decompd. by H<sub>2</sub>O into a green basic *perhenate*. To prep. [Ni(NH<sub>3</sub>)<sub>4</sub>](ReO<sub>4</sub>)<sub>3</sub>, the hexammine was first obtained, but it quickly loses H<sub>2</sub>O to form the bright blue tetrammine. AgReO<sub>4</sub> dissolves in NH<sub>4</sub>OH to form [Ag(NH<sub>3</sub>)<sub>2</sub>](ReO<sub>4</sub>)<sub>3</sub>, colorless, monoclinic prisms, sol. in concd. NH<sub>4</sub>OH (16.18 g./l.), d. = 3.901, mol. vol. = 100.5. The *tetrapyridine perhenates* of Cu<sup>II</sup>, Ag, were prepd.: [Cu(C<sub>4</sub>H<sub>9</sub>N)<sub>4</sub>](ReO<sub>4</sub>)<sub>3</sub>, blue, monoclinic crystals, sol. in H<sub>2</sub>O (5.555 g./l.), d. = 2.338, mol. vol. = 376.5

[Ag(C<sub>2</sub>H<sub>3</sub>N)<sub>2</sub>]ReO<sub>4</sub> easily loses C<sub>2</sub>H<sub>3</sub>N to form the tripyridine perchlorate, which is likewise very unstable. If a stream of dry NO is passed into a concd. soln. of HReO<sub>4</sub>, (NO)ReO<sub>4</sub> is obtained as a colorless cryst. powder, very hygroscopic and instantly decompd. by H<sub>2</sub>O. Efforts to prep. tetra-, penta- and hexahydrates of these salts met with little success, as the perchlorates tend to form lower hydrates.

H. Stoertz  
Combinations of lime and titanate acid. I. Pargapondal and K. Bergt. *Tonind.-Ztg.* 57, 976-7, 1000-1 (1933).—See C. A. 28, 61<sup>4</sup>. Karl Kammermeyer

The decomposition of permanganic acid in the presence of other acids. Jaroslav Chloupek. *Chem. Listy* 27, 217-22, 246-51, 270-5 (1933).—The decompn. rate of permanganic acid studied by means of a König-Martens spectrophotometer, gasometrically and titrimetrically at room temps. in concd. acids diminished in the order H<sub>2</sub>SO<sub>4</sub> > AcOH > H<sub>3</sub>PO<sub>4</sub> > H<sub>3</sub>AsO<sub>4</sub>; in the last acid the rate of decompn. was equal to zero. The end products are quadrivalent Mn compds. or compds. corresponding to Mn<sub>2</sub>O<sub>3</sub>; the solns. are completely stable after its appearance providing that the original solns. were made from pure substances. In higher concns. of H<sub>2</sub>SO<sub>4</sub> the anhydride of HMnO<sub>4</sub> formed; the change becomes manifest in the spectrophotometer. The solns. of permanganates can be detd. directly in acids of high concns. by a potentiometric titration of Fe<sup>++</sup> salts with a normal electrode of HgSO<sub>4</sub> as the indicating electrode; the results agreed with the visual titration.

Frank Maresh

Physicochemical studies of complex formation involving weak acids. VII. Hydroferrocyanic acid, and the precipitation of ferrocyanides of silver, lead, copper, zinc, cadmium, cobalt, nickel and manganese. H. T. S. Britton and Eric N. Dodd. *J. Chem. Soc.* 1933, 1543-6; cf. C. A. 27, 1587.—H<sub>2</sub>Fe(CN)<sub>6</sub> is slightly weaker than H<sub>2</sub>SO<sub>4</sub>, 33.7% ionized in 0.00936 M soln. (cf. Malaprade, C. A. 24, 287). Metal salt solns. were titrated conductimetrically with K<sub>4</sub>Fe(CN)<sub>6</sub> by means of the glass electrode, and curves are given. Ag gives a normal salt, which further precipitant converts into KAg<sub>2</sub>Fe(CN)<sub>6</sub>. Cu, Zn, Cd, Co, Ni and Mn form normal salts, which are converted by further precipitant into M<sub>2</sub>Fe(CN)<sub>6</sub>.xK<sub>4</sub>Fe(CN)<sub>6</sub>, in which the values of x are fractions less than 1. The combination may be either chemical or physical.

Foster Dee Snell

Dipyridyl- and phenanthroline-containing complex salts of bivalent metals. P. Pfeiffer and Fr. Tappermann. *Z. anorg. allgem. Chem.* 215, 273-87 (1933).—Complex compds. of α-dipyridyl (dip) and o-phenanthroline (phen) with salts of bivalent metals differ from similar compds. contg. amines in combining with large quantities of H<sub>2</sub>O. Among metal salt hydrates of the 2 types [Me dip]<sub>2</sub>.xH<sub>2</sub>O and [Me phen]<sub>2</sub>.xH<sub>2</sub>O, only one individual contains less than 6H<sub>2</sub>O. This is [Ni dip]<sub>2</sub>(SCN)<sub>2</sub>.3H<sub>2</sub>O. The following β-naphthalenesulfonates were prepd.: [Ni phen]<sub>2</sub>(O.SO<sub>2</sub>.C<sub>10</sub>H<sub>7</sub>)<sub>2</sub>.6H<sub>2</sub>O, and corresponding salts with Co, Fe, Zn and Cd, and the following higher hydrates: [Ni phen]<sub>2</sub>Cl<sub>2</sub>.10H<sub>2</sub>O, [Ni phen]<sub>2</sub>Br<sub>2</sub>.10H<sub>2</sub>O, [Ni phen]<sub>2</sub>(NO<sub>3</sub>)<sub>2</sub>.9H<sub>2</sub>O, [Ni phen]<sub>2</sub>(SO<sub>4</sub>)<sub>2</sub>.14H<sub>2</sub>O and [Ni dip]<sub>2</sub>(O.SO<sub>2</sub>.C<sub>10</sub>H<sub>7</sub>)<sub>2</sub>.6 (or 7)H<sub>2</sub>O. It is concluded that the H<sub>2</sub>O mols. belong to a complex pos. radical, as follows: [Me-phen<sub>2</sub>(OH)<sub>2</sub>]<sub>2</sub>.x. Thus about the central metallic atom there is a shell of 6 N atoms and about this a 2nd shell of 6 O atoms. With an excess of H<sub>2</sub>O mols., these are perhaps bound to the neg. radical. With Cu and Mn only 2 mols. of the base are combined as follows: [Cu phen]<sub>2</sub>(O.SO<sub>2</sub>.C<sub>10</sub>H<sub>7</sub>)<sub>2</sub>.H<sub>2</sub>O, Mn phen<sub>2</sub>Cl<sub>2</sub>, Mn phen<sub>2</sub>(SO<sub>4</sub>)<sub>2</sub>.6H<sub>2</sub>O, Mn phen<sub>2</sub>(O.SO<sub>2</sub>.C<sub>10</sub>H<sub>7</sub>)<sub>2</sub>.2H<sub>2</sub>O, except in case of the compd. with bromocamphorsulfonic acid, which has the compn. Mn phen<sub>2</sub>(O.SO<sub>2</sub>.C<sub>10</sub>H<sub>7</sub>OB<sub>2</sub>)<sub>2</sub>.6 (or 8)H<sub>2</sub>O. Ni dip<sub>2</sub>Cl<sub>2</sub> is obtained by heating rose-red [Ni dip]<sub>2</sub>Cl<sub>2</sub>.6H<sub>2</sub>O. It is grass-green in color and is stable in air, but cannot be recrystd. from H<sub>2</sub>O. Ni phen<sub>2</sub>(SO<sub>4</sub>)<sub>2</sub> and Ni phen<sub>2</sub>Cl<sub>2</sub> were also prepd. The anhyd. Ni salts are green, but the hydrates are blue; this is thought to indicate that the blue salts are diaqua salts [Ni phen<sub>2</sub>(OH)<sub>2</sub>]<sub>2</sub>.x, and the green compds. diacid bodies [Ni phen<sub>2</sub>X<sub>2</sub>], similar to

the relationship between chromates and dichromates.

H. Stoertz

New color reactions of cuprous salts. G. Tartarini. *Gazz. chim. ital.* 63, 597-600 (1933).—A preliminary note. Treatment of the complex compds. of Blau (*Monatsh.* 19, 683 (1898)), formed by the reaction of cupric salts with α,α-dipyridyl (I) and o-phenanthroline (II), with reducing agents such as NaHSO<sub>3</sub>, H<sub>2</sub>NOH and NH<sub>2</sub>NH<sub>2</sub> (III) gives intense color reactions varying from orange-yellow to red to blue to violet. This is attributed to the formation of complex compds. contg. univalent Cu united to the I or II mol. They can be prepd. easily either by treating a cupric salt in NH<sub>4</sub>OH with III and adding I or II, or by grinding together moist CuCl, CuBr, CuI or CuSCN with I or II. Since all complex cuprous compds. contg. NH<sub>2</sub> or an org. base which are so far known are either colorless, pale yellow or pale green, it was of interest to study the reaction mentioned above to det. whether the cuprous ion can be detected in the presence of the cupric ion and other metal ions. Addn. of I to ammoniacal CuSO<sub>4</sub> and III gives a brown-red soln. which does not change when heated. Addn. of cold KI ppts. an amorphous yellow compd., while when hot the ppt. is a cryst. orange compd. Similar compds. are obtained with KSCN. Under the same conditions, II gives a brown-red soln., which with excess II turns violet. Addn. of KI or KSCN to the brown-red soln. gives yellow ppts., while addn. to the violet soln. gives violet-blue ppts. A similar blue ppt. is formed by addn. to the violet soln. of excess NaClO<sub>4</sub>. This reaction is a much more sensitive one for Cu than is that with NH<sub>3</sub>, e. g., addn. of 1 drop of NH<sub>4</sub>OH, 1 drop H<sub>2</sub>NNH<sub>2</sub>, a little II and a few drops of NaClO<sub>4</sub> soln. to 1 cc. of 0.001 N CuSO<sub>4</sub> gives a blue ppt. It also makes possible the distinguishing of I and II, which is not possible by other color reactions. The blue compd. pptd. by NaClO<sub>4</sub> could not be isolated pure because of oxidation in air. Better results were had with the compds. pptd. with KI and KSCN. To obtain pure cryst. compds. it is convenient to start with the complex cupric compd. and reduce hot with NaHSO<sub>3</sub> in slightly acid medium, rather than with ammoniacal H<sub>2</sub>NNH<sub>2</sub>.HCl. Thus aq. CuSO<sub>4</sub>, KSCN and I form a ppt. which with NaHSO<sub>3</sub> in boiling water ppts. on cooling the complex compd. CuSCN.C<sub>10</sub>H<sub>7</sub>N<sub>2</sub>, orange; its solns. in alc. I are dark red (a compd. of CuSCN with more than 1 mol. of I is probably present). Prepd. similarly, except for II in place of I, the complex compd. CuSCN.C<sub>10</sub>H<sub>7</sub>N<sub>2</sub> is orange-yellow, turning blue on treatment with excess aq. II. Aq. NH<sub>3</sub>-CuSO<sub>4</sub> reduced with H<sub>2</sub>NNH<sub>2</sub>.HCl, boiled with excess I, and treated with KI yields the complex compd. CuI.C<sub>10</sub>H<sub>7</sub>N<sub>2</sub>, red; its solns. in alc. I are dark red. II (2 mols.) and KI added to aq. CuSO<sub>4</sub> give a yellow ppt., which in boiling NaHSO<sub>3</sub> ppts. the complex compd. CuI.2C<sub>10</sub>H<sub>7</sub>N<sub>2</sub>, violet-blue; its alc. solns. are brown-red.

C. C. Davis

Complex bromo compounds of antimony. Walter Petzold. *Z. anorg. allgem. Chem.* 215, 92-102 (1933).—Cryst. complex Br compds. of Sb are prepd. in which Sb has a valence of more than 3. These are derived from the hypothetical parent compds. SbBr<sub>3</sub>, SbBr<sub>4</sub>, Sb<sub>2</sub>Br<sub>7</sub>, SbBr<sub>5</sub> and SbBr<sub>6</sub>, and they are all easily obtained by treating strong HBr solns. of SbBr<sub>3</sub> and an org. substituted NH<sub>4</sub>Br with Br. The following compds. were prepd.: [(CH<sub>3</sub>)<sub>2</sub>N]Sb<sub>2</sub>Br<sub>11</sub>, (C<sub>2</sub>H<sub>5</sub>NH)<sub>2</sub>Sb<sub>2</sub>Br<sub>11</sub>, [(CH<sub>3</sub>)<sub>2</sub>NH]<sub>2</sub>Sb<sub>2</sub>Br<sub>11</sub>, [H<sub>2</sub>N-C(C<sub>2</sub>H<sub>5</sub>)NH]<sub>2</sub>Sb<sub>2</sub>Br<sub>11</sub>, [(C<sub>2</sub>H<sub>5</sub>)<sub>2</sub>NH]<sub>2</sub>Sb<sub>2</sub>Br<sub>11</sub>, [(C<sub>2</sub>H<sub>5</sub>)<sub>2</sub>N]<sub>2</sub>SbBr<sub>5</sub>, [C<sub>2</sub>H<sub>5</sub>(CH<sub>3</sub>)<sub>2</sub>NH]<sub>2</sub>SbBr<sub>5</sub>, [(CH<sub>3</sub>)<sub>2</sub>NH]<sub>2</sub>SbBr<sub>5</sub>, [C<sub>2</sub>H<sub>5</sub>(CH<sub>3</sub>)<sub>2</sub>NH]<sub>2</sub>SbBr<sub>5</sub>, [C<sub>2</sub>H<sub>5</sub>(CH<sub>3</sub>)<sub>2</sub>NH]<sub>2</sub>SbBr<sub>5</sub>, [C<sub>2</sub>H<sub>5</sub>(CH<sub>3</sub>)<sub>2</sub>NH]<sub>2</sub>SbBr<sub>5</sub>, and (C<sub>2</sub>H<sub>5</sub>CH<sub>2</sub>NH)<sub>2</sub>SbBr<sub>5</sub>. The structure of these compds. is discussed. In no case is pure Sb<sup>V</sup> believed to be present. They are partly pure *perbromides* and partly transitional stages between "bromo salts" and perbromides.

H. Stoertz

Complex bromo compounds of quadrivalent arsenic. Walter Petzold. *Z. anorg. allgem. Chem.* 214, 365-8 (1933).—If strong HBr solns. of (CH<sub>3</sub>)<sub>4</sub>NBr and AsBr<sub>3</sub> are treated with free Br, a finely cryst., dark red powder is obtained with the compn. [(CH<sub>3</sub>)<sub>4</sub>N]<sub>2</sub>As<sub>2</sub>Br<sub>11</sub> (I). Recrystn. from hot soln. gives deep, carmine-red, hexagonal plates, short hexagonal bipyramids and very long hexagonal prisms. In a similar manner [(CH<sub>3</sub>)<sub>2</sub>NH]<sub>2</sub>As<sub>2</sub>Br<sub>11</sub>

(II) and  $(C_6H_5NH)_2As_2Br_{11}$  (III) are prepd. These are obtained as brick-red crystals. II and III slowly give up Br on standing in air, but I is quite stable, even on heating up to  $210^\circ$ . Aq. solns. of these substances are gradually decolorized, the clear colorless solns. contg.  $As^{III}$  and  $As^V$  in the ratio 1:1. The hypothetical basis of these substances is  $As_2Br_7$  and they probably represent a transitional stage between "bromo salts" and "perbromides". H. Stoertz

Complex chloro and bromo compounds of trivalent arsenic. Walter Petzold. *Z. anorg. allgem. Chem.* 214, 355-64 (1933).—Complex As compds. of the following types were prepd.:  $R_2AsCl_3$ ,  $R_2As_2Cl_3$ ,  $RA_2Cl_3$ ,  $R_2As_2Cl_{11}$ ,  $R_2As_2Br_3$ ,  $RA_2Br_3$ ,  $RA_2Br_7$  and  $RA_2Br_{11}$  (?), in which R represents such as  $(C_2H_5NH_2)$ ,  $(CH_3NH_2)$ ,  $[H_2NC(NH)NH_2]$ ,  $[(C_2H_5)_2NH_2]$ ,  $(C_6H_5NH_2)$ ,  $[(CH_3)_2NH]$ ,  $(C_2H_5NH)$ ,  $[(CH_3)_2N]$ . The chlorides were easily obtained pure and well crystd. from strong HCl solns. of their components. They are colorless, immediately decompd. in  $H_2O$ , in alc., and on heating. The bromides are yellow but similar otherwise. The following individual compds. were prepd.:  $(C_2H_5NH_2)_2As_2Cl_3$ ,  $(CH_3NH_2)_2As_2Cl_3$ ,  $[H_2NC(NH)NH_2]_2As_2Cl_3$ ,  $[(CH_3)_2N-H]_2As_2Cl_3$ ,  $[(C_2H_5)_2NH_2]_2As_2Cl_3$ ,  $(C_2H_5NH)_2As_2Cl_3$ ,  $[(CH_3)_2N-H]_2As_2Cl_{11}$ ,  $(C_2H_5NH)_2As_2Cl_{11}$ ,  $H_2O$ ,  $(NH_4)_2As_2Br_3$ ,  $(C_2H_5NH_2)_2As_2Br_3$ ,  $[(C_2H_5)_2NH_2]_2As_2Br_3$ ,  $[(CH_3)_2NH]_2As_2Br_3$ ,  $(C_2H_5NH)_2As_2Br_3$ ,  $[(CH_3)_2N]_2As_2Br_7$  (I) and perhaps  $[(CH_3)_2N]_2As_2Br_{11}$  (II). I was prepd. only once; efforts to prep. it a 2nd time led to the formation of a compd. with higher As and Br contents, with the possible formula as represented by II. The structure of these compds. is discussed. H. Stoertz

Complex platinum compounds with trivalent and quinquavealent platinum. VI. Prafulla Chandra Ray and Nripendra Nath Ghosh. *Z. anorg. allgem. Chem.* 215, 201-4 (1933); cf. C. A. 27, 2899.—By the action of various org. bases upon  $PtBr(C_2H_5)_3$  the following compds. were obtained:  $Pt_2Br_3(C_2H_5)_3S_2 \cdot 2C_2H_5N$  (I),  $Pt_2Br_3(C_2H_5)_3S_2 \cdot 2C_2H_5N$  (II),  $Pt_2Br_3 \cdot 3(C_2H_5)_3S_2 \cdot (C_2H_5)_2NH_2$  (III),  $Pt_2Br_3 \cdot 5(C_2H_5)_3S_2 \cdot 2C_2H_5NH_2$  (IV),  $Pt_{10}Br_3 \cdot 9(C_2H_5)_3S_2 \cdot 2C_2H_5NHNH_2$  (V),  $Pt_{10}Br_3 \cdot 9(C_2H_5)_3S_2 \cdot N(C_2H_5)_3$  (VI). In I and II Pt is trivalent, in III the 2 addnl. atoms are trivalent and quinquavealent, in IV 2 of the Pt atoms are quinquavealent and 4 trivalent. I and II show sharp m. ps. and well-defined cryst. structure, but like the others are insol. in all ordinary solvents. H. Stoertz

Pyridine complex salts of copper, cobalt, nickel, zinc and cadmium fluosilicates. Kimio Mochizuki. *J. Chem. Soc. Japan* 54, 894-7 (1933); cf. Ten Broeck and van der Meulen, C. A. 25, 5862.—There were obtained 3 new pyridine complex salts,  $Ni(C_5H_5N)SiF_6 \cdot 5H_2O$ ,  $Ni(C_5H_5N)SiF_6 \cdot 2H_2O$  and  $Co(C_5H_5N)SiF_6 \cdot 3H_2O$ . The detns. of Ten Broeck of the crystal system and  $n$  of  $Cu(C_5H_5N)SiF_6 \cdot H_2O$  are corrected. T. Katsurai

Silver halide complexes of the carboxylic acids. Charles Prevost. *Compt. rend.* 197, 1661-3 (1933).—The complex  $(RCO_2)_2AgI$  reacts with  $R'CH:CHR'$  in  $C_6H_6$  to give  $RCO_2CHR' \cdot CHR'CO_2R$ . The complex  $(AcO)_2AgI$  reacts less readily than the dibenzoate because of the formation of iodoacetates and of the relative insolv. of  $AcOAg$  in  $C_6H_6$ . With ethylenic compds. capable of cis-trans isomerism the trans addn. predominates. Fixation of 2 benzyloxy groups seems general. W. J. Peterson

Decomposition of thiosulfato-pentacyano-cobaltic acid and the isomerism of thiosulfuric acid. Priyadarajan Ray. *J. Indian Chem. Soc.* 10, 631-5 (1933).—A quant. study of the hydrolytic decompn. of Ray's postulated  $\alpha$ - and  $\beta$ -thiosulfuric acids was made. The results were interpreted as confirming their existence. F. U.

Dithiosulfato-diethylenediamine cobaltates. Priyadarajan Ray and Sailendra Nath Maulik. *J. Indian Chem. Soc.* 10, 655-8 (1933).—Na, K and Tl dithiosulfato-diethylenediamine cobaltates were prepd. F. U.

Thiosulfato-tetrammine-cobaltic series. II. Constitution of Duff's salt. Bhabesh Chandra Ray and Pulin Bihari Sarker. *J. Indian Chem. Soc.* 10, 625-30 (1933); cf. C. A. 25, 1754.—*cis*- and *trans*-Dithiosulfato-diethylenediamine sodium cobaltate, and thiosulfato-aquo-diethylenediamine cobaltic nitrate, sulfate, iodide and

thiocyanate were prepd. The brottide (Duff's salt) was prepd. from *trans*-thiosulfato-aquo-tetrammine cobaltic bromide. Frank Urban

Isomeric palladium diammines. A. A. Grinberg and V. M. Shulman. *Compt. rend. acad. sci. U. R. S. S. [N. S.]*, 1933, 215-20.—The following isomers of Pd diammines were prepd. by the action of  $NH_4OAc$  or pyridinium acetate on aq. solns. of  $K_2PdCl_4$  or  $K_2PdBr_4$ :  $Pd(NH_3)_2Cl_2$ ,  $Pd(NH_3)_2Br_2$ ,  $PdPy_2Cl_2$  and  $PdPy_2Br_2$ . These isomers differ from the ones obtained previously in color, cryst. structure, soly. and elec. cond., as well as in their behavior with KI and HCl. Their color has a more brownish shade, and their solns. gradually ppt.  $AgCl(AgBr)$  when treated with  $AgNO_3$ . Their behavior is quite similar to that of the corresponding Pt compds., and hence they should be considered *cis* forms. They have the structure I as compared with the known compds. of the structure II.

The *trans* isomer is more sol. in  $CHCl_3$  than the *cis* isomer. The new isomers are more active with HCl than the old ones, and they acquire a red coloring upon the addn. of a few drops of KI to their soln. in acetone. *cis*- $Pd(NH_3)_2Cl_2$ , like the bromide, reacts with KI but to a smaller extent. The same reaction is characteristic for *cis*- $PdPy_2Cl_2$  and *cis*- $PdPy_2Br_2$  in  $CHCl_3$ , in which case the upper (aq. layer) acquires a red color. The numerical data for the soly. and elec. cond. of various *cis* and *trans* isomers are tabulated. A. A. Boettingk

The apparent stereoisomerism of the ferrous tetrapyridine-dithiocyanates. G. Spacu. *Z. anorg. allgem. Chem.* 216, 165-72 (1933); cf. Rosenheim, et al., C. A. 26, 5025.—S. presents a review of his papers (C. A. 9, 180; 10, 2175) to show that he had the compd. claimed and that Rosenheim's compd. is an incompletely reduced mixt. Reply. Arthur Rosenheim. *Ibid.* 173-5 (1933).

Salts of iron carbonyl hydrogen. F. Feigl and P. Krumholz. *Z. anorg. allgem. Chem.* 215, 242-8 (1933).—The following salts of the acid  $Fe(CO)_4H_2$  were prepd.:  $[Fe(CO)_4][Cd(NH_3)_4]$  (I), by treating  $Cd(C_2H_5O)_2$  with concd.  $NH_4OH$  and  $Fe(CO)_5$  in an atm. of N, filtering, washing with dil.  $NH_3$ , with  $Et_2O$ , and drying in a vacuum. It is obtained as colorless prisms which slowly turn brown in the air, are sol. in  $AcOH$ , and are decompd. by mineral acids to give  $Fe(CO)_4H_2$ . Heating converts it into yellow  $[Fe(CO)_4]Cd$ .  $[Fe(CO)_4][Cd(Py)_4]$ , prepd. in a similar manner, is obtained as yellowish prisms, more stable than I, which react in a similar manner with acids.  $[Fe(CO)_4][Ni(NH_3)_4]$ , yellowish brown, is obtained by treating  $NiCl_2$  with  $NH_3$  and  $Fe(CO)_5$  for 6 hrs. It is decompd. by  $H_2O$ ,  $AcOH$  and mineral acids to form  $Fe(CO)_4H_2$  and  $[Fe(CO)_4]_2$ .  $[Fe(CO)_4]_2H_2$ ,  $[Fe(CO)_4]_2[Fe(phen)_3]$  is prepd. by dissolving *aa'*-phenanthroline and  $FeSO_4$  in  $H_2O$  and adding  $NH_3$  and  $Fe(CO)_5$ . After 1 hr., bright red crystals are obtained, stable in air, sol. in  $MeOH$  and acetone, decompd. by acids to give  $Fe(CO)_4H_2$  and red sol. *ferrous phenanthroline*.  $[Fe(CO)_4]Cd$  is only decompd. in air after many days, is much more stable to acids than the other salts, and heated in the absence of air gives  $Fe$ ,  $CO$  and  $Cd$ . I in  $Et_2O$  reacts as follows— $Fe(CO)_4Cd + 2I_2 \rightarrow Fe(CO)_4I_2 + CdI_2$ , and  $Py$  reacts with this to form  $Fe(CO)_4Py_2I_2$ . The structure of these salts is discussed. H. Stoertz

## 7—ANALYTICAL CHEMISTRY

W. T. HALL

**Quinaldic acid as an analytical reagent. Determination and separation of copper, zinc, cadmium and uranium. Colorimetric determination of iron.** Priyadarajan Ray and Mukul Kumar Bose. *Z. anal. Chem.* 95, 400-14 (1933).—Just as 8-hydroxyquinoline has been used for detg. Mg, Al, Cu, Cd, Zn, etc., the Na salt of  $\alpha$ -quinaldic acid can be used for the quant. pptn. of Cu, Cd, Zn and UO<sub>2</sub>, and for the sepn. of Cu from Cd, P, As, Pb, Ni, Co, Mn, etc. In the absence of Fe and Zn, it is sp. toward Cu and can be used for detecting Cu in the presence of all cations except Fe. Important seprns. of Zn from other elements can also be accomplished with this reagent. With Fe<sup>++</sup> a dark red fairly sol. ppt. is formed in the cold but it changes over, particularly with rising temp., to a less sol. bluish violet modification. Possibly this is a case of cis-trans isomerism. To det. Cu, add 2-5 ml. of 2 N H<sub>2</sub>SO<sub>4</sub> to the soln. contg. 10-50 mg. of Cu in a vol. of about 150 ml. Heat to boiling and add dropwise the 3.5% soln. of the reagent in water. Filter through a Gooch crucible, dry at 125° and weigh as Cu(C<sub>10</sub>H<sub>6</sub>NO<sub>2</sub>)<sub>2</sub>·H<sub>2</sub>O. The ppt. is green and cryst. Cd can be detd. similarly except that the soln. must be neutralized with NH<sub>4</sub>OH or NaOH after the addn. of the reagent. Zn gives a similar ppt. The excess acid should be neutralized with NH<sub>4</sub>OH and 2-5 ml. of dil. AcOH added. UO<sub>2</sub> can be detd. in the same way after 5-7 g. of NH<sub>4</sub>Cl has been added to the neutral soln. Filter-paper pulp may be necessary in filtering. Cu can be sepd. from Cd, Pb, Mn, Ni and Co by adding dil. AcOH or H<sub>2</sub>SO<sub>4</sub> before adding the reagent. Zn can be sepd. from Mn, Ca and Ba by adding AcOH before pptg. Fe<sup>++</sup> can be detd. colorimetrically by adding in succession 1 ml. of 5% NH<sub>4</sub>OH·HCl soln. (to reduce Fe<sup>+++</sup>), 1 ml. of 1% soln. of the reagent and 1 ml. of 10% KCN (to intensify the color). The reagent can be recovered from solns. by forming the Cu salt, satg. with H<sub>2</sub>S, filtering off the CuS, expel the filtrate to dryness and recrystg. from glacial AcOH.

**Electrocapillary method of qualitative analysis.** S. I. D'yachkovskii, V. Ustinakova and Mitropolskii. *J. Gen. Chem. (U. S. S. R.)* 3, 478-80(1933).—A method for detg. ion mobility in filter paper which has been impregnated with gelatin or agar-agar is being developed. If crystals of KI and K<sub>2</sub>CrO<sub>4</sub> are placed in the path of Pb<sup>++</sup>, Ag<sup>+</sup> and Hg<sup>+</sup> ions which are being absorbed by the capillarity of the paper, PbI<sub>2</sub> forms first, then Ag<sub>2</sub>CrO<sub>4</sub> and finally Hg<sub>2</sub>CrO<sub>4</sub>; this indicates that the ion mobility of Pb<sup>++</sup> > Ag<sup>+</sup> > Hg<sup>+</sup>.

W. P. Ericks

**Industrial application of chemical emission spectral analysis to the examination of commercial products.** H. Moritz. *Z. Ver. deut. Ing.* 77, 1321-6(1933).—A brief summary is given of the theory of spectral analysis and of the practical application to the detection of small quantities of impurities in metal products.

W. T. II.

**Spectroanalytical examination of commercial and very pure metals. III. Aluminum.** Walther Gerlach and Hans Riedl. *Sitzber. math. naturw. Abt. bayer. Akad. Wiss. München* No. 2, 227-36(1933); cf. *C. A.* 27, 5271.—Spectrograms in the region 3000-4300 Å. are given for Al from several sources. All the impurities can be detected. Chem. analyses for Fe and Si in the purer sorts agree well with the spectral detn. but not for the impure samples. Ga was found in considerable quantities in nearly all samples. Se but no Ca was found in Al from the Am. Aluminum Co. The relative amts. of Ag, Cr, Cu, Fe, Ga, Mn, Ni, Pb, Se, Si, Sn, Ti, V and Zn are estd. in each sample.

Janet E. Austin

**Determination of admixtures of crystalline odoriferous**

substances with the quartz lamp. E. Ekmann and A. Samyschayewa. *Riechstoff-Ind.* 8, 221-2(1933).—The fluorescent effects of the following pure substances and combinations are reported: (1) c. p. piperonal, com. piperonal alone and in combination with 10% terpinol hydrate, (2) vanillin and each of its combinations with 10% acetanilide, 1% salicylic acid, 10% BzOH, 10% coumarin, 10% terpinol hydrate, 20% MgSO<sub>4</sub> and 10% sucrose, (3) coumarin and coumarin combined with 10% terpinol hydrate, 20% MgSO<sub>4</sub> and 10% acetanilide, (4) menthol and menthol with acetanilide.

H. M. Burlage

**Conditions for the potentiometric titration of copper with sodium sulfide and a platinum electrode.** Jang Bahadur Jha. *J. Indian Chem. Soc.* 10, 643-7(1933).—In the potentiometric titration of Cu with Na<sub>2</sub>S soln. Hg has been used as reference electrode, but Pt can be used instead. Good results are obtained in the presence of the proper quantity of AcOH. In the analysis of a soln. of Cu dissolved in HNO<sub>3</sub> the excess HNO<sub>3</sub> is removed by evapn., the soln. is neutralized with NaOH until a slight ppt. is produced, the ppt. is dissolved in AcOH and 1 cc. of 0.4 N AcOH is added in excess for 25 ml. of soln. If considerable Cu is present more AcOH should be added.

W. T. H.

**Determination of the copper content of commercial minium.** H. Blumenthal. *Mitt. deut. Materialprüfungsanstalt., Sonderheft* 22, 41(1933).—Make a paste in a 1. flask of 100 g. sample and 100 ml. water. To the paste add 170 ml. of 6 N HNO<sub>3</sub>. Dissolve all the Pb<sub>3</sub>O<sub>4</sub> by cautious addn. of 20% KNO<sub>3</sub> soln., carefully avoiding an excess. About 60-70 ml. is usually required. Expel any HNO<sub>3</sub> by boiling 10 min., add 3-4 drops of 15% H<sub>2</sub>O<sub>2</sub> and boil 10 min. more. Neutralize with 20% Na<sub>2</sub>CO<sub>3</sub> until a slight permanent ppt. of PbCO<sub>3</sub> is formed and dissolve this in 6 N HNO<sub>3</sub>, adding about 0.5 ml. in excess. Boil again to expel CO<sub>2</sub> and add 10-20 ml. of cold satd. H<sub>2</sub>S water. Shake well and heat to boiling. Filter, wash with hot water and wash the ppt. into a 200-ml. Erlenmeyer flask. Add 5 ml. of concd. H<sub>2</sub>SO<sub>4</sub> and boil until dense fumes of SO<sub>2</sub> are evolved. Cool, add 50 ml. of water, heat to boiling, cool again and filter off the PbSO<sub>4</sub> ppt. Wash the ppt. with dil. H<sub>2</sub>SO<sub>4</sub>. To the filtrate add H<sub>2</sub>S water, heat until sulfides settle, filter and wash with hot water. Burn the filter in a porcelain crucible and dissolve the ash in hot 6 N HNO<sub>3</sub>. Make ammoniacal and filter off any ppt. that may form. In the filtrate det. the Cu colorimetrically. If the Cu content is below 0.001% take a larger sample. No results are given.

W. T. II.

**A new method for the volumetric estimation of lead.** Mia-Nan Lu. *J. Chinese Chem. Soc.* 1, 139-42(1933).—PbO<sub>2</sub> is formed by the action of NaOCl in alk. soln., and the ppt. is titrated iodometrically.

Wm. H. Adolph

**Determination of the lead content of tinned containers.** E. Wohnlich. *Z. Untersuch. Lebensm.* 66, 453-60(1933). A discussion of methods.

F. L. Dunlap

**Determination of magnesium in aluminum-magnesium alloys containing manganese.** H. Blumenthal. *Mitt. deut. Materialprüfungsanstalt., Sonderheft* 22, 42-3(1933).—Take enough of the alloy to furnish about 2 milli-equiv. of Mg. Dissolve the Al in hot NaOH soln. using 3 g. NaOH for each g. of alloy. Filter off the residue and wash it with hot water. Dissolve it in HCl with a little HNO<sub>3</sub>. Add 20 ml. of 50% tartaric acid soln., a sufficient quantity of (NH<sub>4</sub>)<sub>2</sub>HPO<sub>4</sub> soln. and 5 g. of NH<sub>4</sub>Cl. Dil. to about 160 ml. and add NH<sub>3</sub> soln. until most of the free acid is neutralized. Heat the clear soln. to 70° and pour it

quickly into 50 ml. of 10%  $\text{NH}_3$  soln., washing out the beaker with hot water. After a cryst. ppt. of  $\text{MgNH}_4\text{PO}_4 \cdot 6\text{H}_2\text{O}$  has formed, add 30 ml. of 25%  $\text{NH}_3$  soln. and allow to stand some hrs. Filter, wash with dil.  $\text{NH}_3$  and ignite to pyrophosphate. Det. the Mn content of the weighed pyrophosphate by dissolving it in  $\text{HCl}$ , neutralizing with  $\text{ZnO}$  and titrating with  $\text{KMnO}_4$  by the Volhard method. The Mn content will be lower than the total Mn in the alloy. W. T. H.

**Microanalytical determination of palladium by means of dimethylglyoxime, methylbenzoylglyoxime and salicylaldioxime.** II. Holzer. *Z. anal. Chem.* 95, 392-400 (1933).—A hot aq. soln. of dimethylglyoxime added in slight excess to a  $\text{Pd}^{++}$  soln. gives a ppt. which yields Pd upon ignition in  $\text{H}_2$ . If Pt is present, a few drops of perhydrol should be added before introduction of the precipitant. Good results were obtained in detg. 1-4 mg. of Pd in the presence of 3-6 mg. of Pt. Methylbenzoylglyoxime can be substituted for the dimethylglyoxime and is somewhat better. Similarly, if a slightly acid soln. of  $\text{Pd}^{++}$  is treated with a hot, satd., filtered soln. of salicylaldioxime in water an egg-yellow ppt. is obtained which can be washed with water and cold 30% alc., dried at  $110^\circ$  and weighed. It contains 28.17% Pd. W. T. H.

**A titrimetric micro method for the determination of potassium.** L. Jendrasik and J. Szél. *Biochem. Z.* 267, 124-7 (1933).—The  $\text{K}_2\text{Na}[\text{Co}(\text{NO}_2)_6]$  ppt. is collected on asbestos and dissolved in  $\text{H}_2\text{SO}_4$ , the liberated  $\text{HNO}_3$  is oxidized with  $\text{KMnO}_4$  and its excess is detd. iodimetrically. S. Morgulis

**Volumetric determination of uranium in highly ferriferous ores.** Wallis R. Bennett. *J. Am. Chem. Soc.* 56, 277-80 (1934).—Large quantities of Fe can be deposited electrolytically upon a Hg cathode and thus sepd. from small quantities of U, Ti and V. U cannot be detd. accurately when Ti is present by reduction with Zn and titration with  $\text{KMnO}_4$ . The method recommended consists in decomg. the ore with  $\text{H}_2\text{SO}_4$  and HF, taking up the residue in dil.  $\text{H}_2\text{SO}_4$ , fusing any unattacked mineral with  $\text{KHSO}_4$ , pptg. the Fe, Ti, Al,  $\text{UO}_2$ , etc., with  $\text{NH}_4\text{OH}$ , dissolving the ppt. in  $\text{H}_2\text{SO}_4$ , pptg. the Fe electrolytically and the Ti with cupferron, evapg. to  $\text{H}_2\text{SO}_4$  fumes and decomg. excess cupferron with the aid of  $\text{HNO}_3$ , removing excess  $\text{HNO}_3$  by strong fuming, dilg., reducing with a Jones' reductor and titrating with  $\text{KMnO}_4$ . W. T. H.

**Spectral method for control in the preparation of malleable iron.** G. S. Landsberg, S. L. Mandelstam, S. M. Raikil. *J. Tech. Phys. (U. S. S. R.)* 3, 771-9 (1933).—This is a rapid visual method for detg. the quantity of Si in malleable iron, varying from 0.75 to 1.5%. The red Fe line  $\lambda = 6400 \text{ \AA}$ , and the red Si line  $\lambda = 6346.7 \text{ \AA}$  are employed. Variation in the self-induction of the arc circuit causes unequal variation in the intensity of the 2 lines. Their intensities are visually equalized by varying the self induction. From the analysis of a no. of known samples a curve is constructed, in which self-induction at equal intensity is plotted against Si content, and the content of an unknown may be directly read off the curve. Rino Hanninen

**Determination of mercury content of the air.** Alfred Stock and Friedrich Cuenel. *Ber.* 67B, 122-7 (1934). S. believes that it is injurious to health to breathe continuously air contg. a few thousandths of 1 mg. of Hg per cu. m., as is likely to be the case in the offices of dentists or in labs. where gases are confined over Hg. Three methods of detg. such small quantities of Hg are described and shown to give good results: (1) The air can be passed through a tube chilled by liquid air, the deposited Hg dissolved in  $\text{Cl}$  water and deposited electrolytically on Cu wire, the deposit volatilized and the vol. of the condensed Hg measured under the microscope. (2) Instead of using liquid air, liquid N can be used. Instead of cooling and using  $\text{Cl}$  water Moldavski's method (C. A. 25, 1179) of mixing  $\text{Br}_2$  with the vapor and absorbing the  $\text{HgBr}_2$  in water can be used. W. T. H.

**Microdetermination of phosphorus by means of the Winkler photometer.** M. Glani. *Giorn. chim. ind.*

1 *applicata* 15, 432-5 (1933).—The color reaction of Fiske and Subbarow (C. A. 20, 1092-3) is used in detg. P by means of the Pulfrich photometer. To 5 cc. of phosphate soln. contg. 0.002-0.064 mg. P add 1 cc. of 2.5%  $(\text{NH}_4)_2\text{MoO}_4$  in 3 N  $\text{H}_2\text{SO}_4$ , then 0.4 cc. of a 0.25% soln. of 1,2,4-aminonaphtholsulfonic acid. Dil. to 10 cc., shake, let stand 10 min., and compare the blue color. A. W. C.

**Application of potentiometric analysis in the steel plant laboratory.** VI. Determination of sulfur in iron, steel, ferrous alloys, slags and ores. G. Thanheiser and J. Dickens. *Mitt. Kaiser-Wilhelm Inst. Eisenforsch., Düsseldorf* 15, 255-62 (1933); cf. C. A. 27, 242.—The difficulties encountered in the combustion method (burning in an O current) by Holthaus are eliminated in a potentiometric method in which  $\text{H}_2\text{SO}_4$  is titrated with  $\text{NaOH}$  immediately on formation; smaller samples and more dil. solns. can be used. S in steel and pig iron could be easily detd. by burning the samples in a current of O. Slags and ores can be treated in the same way when a small amt. of electrolytic Fe or an Fe with very little S is added to the sample. In the presence of P this test cannot be made, but the titration of the  $\text{H}_2\text{SO}_4$  must be made with an iodide solution instead of  $\text{NaOH}$ . Otherwise the presence of any other usual element (Cr, V, Al, etc.) had no influence on the efficacy of the method, which can be carried out in 5 minutes. Nine references. M. Hartenhein

**Analysis of copper-nickel-plated steel materials.** F. Deiss and H. Blumenthal. *Mitt. deut. Materialprüfungsanstalt, Sonderheft* 22, 32-7 (1933).—Methods depending upon dissolving the plated metal away from the steel are usually defective, as the coating penetrates into the steel. The following procedure is recommended. Take 1/1.5 g. of sample and dissolve most of the plate by treatment with a mixt. of 3 parts  $\text{HNO}_3$  (d. 1.4) and 1 part  $\text{HCl}$  (d. 1.52). As soon as the evolution of nitrous fumes stops, the solvent action is over. Pour off the acid into a porcelain evapg. dish and wash the metal several times with water. Evap. on the water bath, moisten the residue with 6 N  $\text{HNO}_3$ , dil. with hot water and det. Cu electrolytically after neutralizing with  $\text{NH}_3$ , adding 7 ml. of concd.  $\text{HNO}_3$ , 5 ml. of concd.  $\text{H}_2\text{SO}_4$  and water to make 150 ml. After the Cu is all deposited, evap. the soln. on the sand bath till  $\text{H}_2\text{SO}_4$  fumes are evolved. Cool, dil. with water and sat. with  $\text{H}_2\text{S}$  to ppt. any residual Cu, filter and det. the Cu colorimetrically. Expel  $\text{H}_2\text{S}$  from the filtrate, oxidize with  $\text{Br}_2$ , make ammoniacal and filter off hydrated  $\text{Fe}(\text{OH})_3$ . Det. Ni electrolytically in the strongly ammoniacal soln. Now take the undissolved steel from the first treatment, cover it with 60 ml. of a cold soln. of 13 ml.  $\text{Br}_2$  in 1 l. of 6 N  $\text{HCl}$ . After about 10 min. with frequent shaking, pour off the acid and wash the metal with water. Boil off the excess  $\text{Br}_2$  and sat. with  $\text{H}_2\text{S}$  to ppt. Cu and det. the Cu colorimetrically after dissolving the  $\text{CuS}$  by itself. Det. the Ni in the filtrate by the dimethylglyoxime method, after boiling off  $\text{H}_2\text{S}$ , oxidizing with  $\text{HNO}_3$  and adding tartaric acid. Digest the undissolved steel for another 5 min. with  $\text{HCl} + \text{Br}_2$  in order to make sure that all Cu and Ni have been removed. W. T. H.

**Antimony trichloride method for determining the lead dioxide content of minium.** H. Blumenthal. *Mitt. deut. Materialprüfungsanstalt, Sonderheft* 22, 40 1 (1933). Weigh out 0.7 g. of  $\text{PbO}_2$  or 2 g. of  $\text{Pb}_3\text{O}_4$  in a 300-ml. Erlenmeyer flask contg. 8 g. of  $\text{NaCl}$  and 50 ml. of a standardized soln. contg. about 15 g.  $\text{SbCl}_3$  dissolved in 300 ml. of concd.  $\text{HCl}$  and dilid. with water to make 1 l. (This soln. is standardized by taking 25 ml. of it, adding 15 ml. of concd.  $\text{HCl}$  and 25 ml. of water, heating to boiling and titrating with 0.1 N  $\text{KBrO}_3$  to an end point with methyl orange.) Heat the soln. to boiling while rotating the contents of the flask, and when all the  $\text{Pb}_3\text{O}_4$  has been dissolved, titrate the excess  $\text{SbCl}_3$  with  $\text{KBrO}_3$  soln. Standardize the  $\text{KBrO}_3$  soln. against metallic Sb. No analytical results are given. W. T. H.

**Reactions for distinguishing red and yellow mercuric oxide.** I. C. Ritsema. *Pharm. Weekblad* 71, 58-63 (1934).—Fifteen tests are described for distinguishing between red and yellow  $\text{HgO}$ . The following are recommended: (1) Shake 0.25 g. of the sample with 10 cc. of

10%  $(\text{NH}_4)_2\text{SO}_4$ , allow to settle for 2 min., decant about 5 cc., add 5 cc.  $\text{H}_2\text{O}$  and boil. With yellow  $\text{HgO}$  the soln. becomes turbid on cooling, with red  $\text{HgO}$  the soln. remains clear. (2) Shake 0.05 g. of the sample with 25 cc. of freshly prepd. 0.02%  $\text{K}_4\text{Fe}(\text{CN})_6$  and 5 cc. of 5%  $\text{NaHCO}_3$ , place in the dark for 15 min., decant 10 cc. and acidify this with  $\text{HCl}$ . The soln. becomes blue with yellow  $\text{HgO}$ , but remains colorless with red  $\text{HgO}$ . (3) Shake 0.05 g. sample with 5 cc. of 10%  $\text{NH}_4\text{OH}$  and allow to settle. The supernatant liquid is turbid (Millon's base) with yellow, clear with red  $\text{HgO}$ . (4) To 0.2 g. sample add 1 drop of phenolphthalein soln. and 5 cc. of 0.2%  $\text{MgCl}_2$  and shake. Yellow  $\text{HgO}$  gives a rose or red color to the soln., red  $\text{HgO}$  gives no color. (5) Shake 0.1 g. of the sample with 5 cc. of 2%  $\text{NH}_4\text{SCN}$ . Yellow  $\text{HgO}$  gives a microcryst. ppt. of basic  $\text{Hg NH}_4$  thiocyanate, red  $\text{HgO}$  gives no ppt. (6) To 10 cc. of a hot soln. of 20%  $\text{Na}_2\text{CO}_3 \cdot 10\text{H}_2\text{O}$  and 10 drops of formalin add 0.1 g. of the sample and heat to boiling. Yellow  $\text{HgO}$  imparts a brownish green or black color (reduction to  $\text{Hg}$ ). (7) Shake 0.05 g. sample with 0.05 g. acetylsalicylic acid in 5 cc. of 5%  $\text{NH}_4\text{OH}$ . Yellow  $\text{HgO}$  gives a turbidity, red  $\text{HgO}$  none. (8) Shake 0.05 g. sample with 0.15 g. acetylsalicylic acid in 5 cc. of 1%  $\text{NH}_4\text{OH}$ . Allow to settle, decant  $\frac{1}{2}$  of the soln., dil. with 5 cc.  $\text{H}_2\text{O}$  and boil. Yellow  $\text{HgO}$  gives a cloudy soln. on cooling, red  $\text{HgO}$  a clear soln. A. W. Dox

**Volumetric determination of chlorate by induced reduction in the presence of osmium tetroxide as a catalyst.** Karl Gleu. *Z. anal. Chem.* 95, 385-92(1933).—To the equiv. of 10 ml. of 0.1  $N$   $\text{KClO}_3$  in 100-150 ml. of  $N$   $\text{H}_2\text{SO}_4$  add an excess of 0.1  $N$   $\text{As}_2\text{O}_3$  soln. Add 4 small portions of  $\text{NaHCO}_3$  (2.3 g. in all) from a spatula in order to replace  $\text{CO}_2$  with  $\text{CO}$ . Add 3 drops of 0.01  $M$   $\text{OsO}_4$  soln. and 3 drops of ferroin indicator soln. (*o*-phenantroline- $\text{Fe}^{++}$  complex) and titrate with 0.1  $N$   $\text{Ce}(\text{SO}_4)_2$  soln. till the color of the soln. changes from red to colorless. Then, to make sure that sufficient arsenite was used, add 5 ml. of  $\text{As}_2\text{O}_3$  soln. and see whether the end point is obtained again with 5 ml. of  $\text{As}_2\text{O}_3$  soln. Values obtained are about 0.2% too high. The procedure succeeds in the presence of any quantity of perchlorate, but if much  $\text{Cl}^-$  is present, enough  $\text{Hg}(\text{ClO}_4)_2$  soln. must be added before expelling air to make sure that all  $\text{Cl}^-$  is present as undissocd.  $\text{HgCl}_2$ . W. T. H.

**Iodometric microchemical determination of iodate and dichromate in small concentrations. Use of silver catalysts** S. Kuhnelt. *Z. anal. Chem.* 95, 414-18(1933).—As reagents use 0.01  $N$   $\text{Na}_2\text{S}_2\text{O}_3$  prepd. from an aged 0.1  $N$  soln. by diln. with  $\text{CO}_2$ -free and redistd. water. Keep under  $N$  gas. Prep. 0.005  $N$   $\text{KIO}_3$  from 0.1  $N$  soln. by diln. with redistd. water. To standardize  $\text{Na}_2\text{S}_2\text{O}_3$ , take 10 ml. of standard  $\text{KIO}_3$  soln., add 10 ml. of 4  $N$   $\text{H}_2\text{SO}_4$  and 10 ml. of 0.001  $N$   $\text{As}_2\text{NO}_3$  prepd. with redistd. water. To the mixt. add 70 ml. of redistd. water and pass a stream of  $\text{CO}_2$  through the soln. for 30 min. to remove  $\text{O}$ . *Work in orange or red light*, add 1 g. of pure  $\text{KI}$ , rotate the liquid till the solid has all dissolved and allow the reaction to take place for 5 min. in the dark. Then add 3 ml. of starch soln. and titrate with  $\text{Na}_2\text{S}_2\text{O}_3$ . For comparison of the end point use the same vol. of another soln. contg. the same quantity of  $\text{AgI}$ . To analyze for chromate or iodate proceed exactly as just described, or treat with  $\text{KI}$  and acid, distil off the  $\text{I}_2$  into  $\text{KI}$  soln. which has been freed from  $\text{O}$ , and to the  $\text{KI}$  soln. add  $\text{AgNO}_3$ ,  $\text{H}_2\text{SO}_4$  and starch and titrate with  $\text{Na}_2\text{S}_2\text{O}_3$ . The results indicate that the method is reliable. W. T. H.

**Comparative investigations on methods for nitrate determination.** F. Alten and H. Weiland. *Z. Pflanzenernähr., Düngung Boden.* 32A, 337-48(1933).—The phenolsulfonic acid methods (I) were not investigated, as their characteristics are well known. The  $\text{Ph}_2\text{NH}$  method of Fillmans and Suthoff (cf. *C. A.* 5, 3211) was fairly accurate for 1-2.5 p. p. m. nitrate and is not affected by chloride. The brucine method of Autenrieth and Funk (cf. *C. A.* 7, 3027) gave variable results at different times; the use of a reagent preserved with  $\text{CHCl}_3$  was especially unfavorable. The 2,4-xyleneol method of Blom and

Treschow (cf. *C. A.* 23, 4994) has the theoretical advantage over I that but one nitration product is likely to be formed. The tests indicated that it is capable of good results under favorable conditions, which include absence of org. matter as from plant exts., Pb, Mn or halide salts, although small amts. of  $\text{AcOH}$ ,  $(\text{COOH})_2$ ,  $\text{H}_3\text{PO}_4$ , and  $\text{EtOH}$  were harmless. The following modification of the original method is recommended: Evap. the alk. sample soln. to dryness in a flask, add 0.2 ml. 2,4-xyleneol and 50 ml. cold dil.  $\text{H}_2\text{SO}_4$  (5 vol. concd. acid with 3 vol.  $\text{H}_2\text{O}$ ); or, omit the evapn., adding concd.  $\text{H}_2\text{SO}_4$  in proper ratio with cooling during the addn.; if  $\text{N}_2\text{O}_5$  exceeds 10 mg., use more acid mixt. in proportion. Stopper and shake until the evapn. residue is detached from the flask. Keep on the sand bath at  $50^\circ$  with frequent shaking for 4 hrs. or overnight. Cool before opening the flask, pour into a 500-750-ml. distg. flask and rinse the nitrating flask with dil.  $\text{NaOH}$  and  $\text{H}_2\text{O}$  to 400 ml. vol. Distil with a low flame into a 250-ml. volumetric flask contg. 25 ml.  $N$   $\text{NaOH}$  kept cold. When the receiver is nearly filled, arrange the app. and allow the condenser to heat, to drive over any nitro compd. adhering. Make up to vol. at  $20^\circ$  and compare in a colorimeter with about the same quantity of nitrate standard carried through the process. The use of the 5-nitro-2,4-xyleneol standard of B. and T. gave inconst. results, only 70-80% of theory. C. J. Schollenberger

**Speedy methods of determining the moisture in a substance.** S. Stanworth. *Trans. Ceram. Soc.* 32, 443-52 (1933).—A weighed sample is mixed with  $\text{CaCl}_2$  in a closed container fitted with a pressure gage. The  $\text{H}_2\text{O}$  content is measured by the pressure produced by  $\text{C}_2\text{H}_6$ . H. F. K.

**A general analytical procedure for the toxicological detection of the metallic elements, including thallium, uranium and vanadium.** L. Sánchez Guisande. *Arch. med. legal* 3, 205-18(1930). The tissues are treated with  $\text{H}_2\text{SO}_4$  and  $\text{HNO}_3$ . The fat is sepd. out and the  $\text{HNO}_3$  removed by evapn. The insol. residue is examd. for  $\text{AgCl}$  and sulfates of Ba, Sr and Pb. Groups I and II are pptd. by  $\text{H}_2\text{S}$ , the filtrate is tested for TI with  $\text{KI}$ , then  $\text{Na}_2\text{S}$  is added to ppt. Ni, Co, Fe, Mn, U, Zn, Al, Cr and V. The remainder of the procedure is according to the usual methods of qual. analysis. L. E. Gilson

**The determination of organic halogen by the method of O. Gasparini.** Kurt Heller and G. Patzelt. *Ann. chim. applicata* 23, 391-6(1933).—Polemical with Illari (cf. *C. A.* 27, 3420). A. W. Contieri

**Convenient micro method for estimating sulfur in organic compounds—modification of ter Meulen's method.** Harish Chandra Goswami and Pulin Bihari Sarkar. *J. Indian Chem. Soc.* 10, 611-15(1933).—The ter Meulen method (*C. A.* 16, 2094), which depends upon heating the substance in a stream of  $\text{H}$  in the presence of a catalyst, whereby all S is converted into  $\text{H}_2\text{S}$ , absorption of the  $\text{H}_2\text{S}$  in  $\text{NaOH}$  and titration of the sulfide iodometrically in the usual way, has been adapted to the detn. of small quantities of S. W. T. H.

**New method for the microchemical determination of methanol in the presence of important quantities of its homologs.** Michel Manry. *Compt. rend.* 198, 94-7 (1934).—Contrary to the prevailing opinion,  $\text{MeOH}$  to some extent is present in all fermented materials. The method here proposed is capable of detecting  $\text{MeOH}$  when only about 0.1%  $\text{MeOH}$  is present in a sample of alc. It is not a colorimetric method but is based upon the transference of the primary alc. into an iodide, the regeneration of the  $\text{MeOH}$  by treatment with aq.  $\text{AgOAc}$  and the measurement of the reducing power of the alc. All primary alcs. have the  $\text{OH}$  group replaced by one atom of  $\text{I}$ , and fractional distn. of the regenerated alc. results in volatilization of all  $\text{MeOH}$  and some  $\text{EtOH}$  with practically none of the higher homologs. Then  $\text{MeOH}$  is oxidized to  $\text{CO}_2$  and the other alcs. to  $\text{RCO}_2\text{H}$ , 1.5 times as much  $\text{O}_2$  being required to form the  $\text{CO}_2$  from  $\text{MeOH}$  as to form the carboxylic acids from the homologs. The iodization takes place advantageously in the app. of Zeisel-Fanto at  $105^\circ$  with  $\text{CaCO}_3$  in the wash bottle. The iodides are collected in aq.  $\text{AgOAc}$  soln. at  $43-50^\circ$  and a current of  $\text{CO}_2$  at 30 bubbles per min. is passed through the app. for

95 min. Then, after 2 hrs., there will be complete regeneration of MeOH and EtOH, and the soln. is then distilled into a 50-ml. measuring flask. For the detn. of the reducing power, 5 ml. of distillate is poured into 10 ml. of a mixt. of 20 mg.  $K_2Cr_2O_7$  and 5 ml. of concd.  $H_2SO_4$ . After 15 hrs. at room temp. the excess oxidant is detd. iodometrically. This gives the reducing power of the alc. mixt. The residue of salts remaining in the distg. flask is treated with dil.  $HNO_3$  and the residual AgI weighed. This gives a measure of the quantity of I required to form MeI and some EtI. From the AgI formed and the reducing power of the alc. it is easy to compute how much MeOH is present, because 2 mols. MeOH require 3 mols. of O, and 2 mols. of EtOH require 2 O<sub>2</sub>. W. T. H.

The determination of lactic acid. B. J. Krijgsman. *Arch. néerland. physiol.* 18, 503-13(1933).—A comparison of the colorimetric method of Mendel and Goldscheider (*C. A.* 20, 1252) for the detn. of lactic acid with the method of Dische and Laszlo (*C. A.* 21, 3641). The veratrole method is somewhat more exact than the hydroquinone method. F. L. Dunlap

Acid titration of betaine in acetone. K. Linderström-Lang. *Biochem. Z.* 267, 45-6(1933).—Contrary to Rodor's claim that betaine in acetone takes up no HCl (*C. A.* 27, 2702), this can be titrated (97.3-100%) with naphthyl red as indicator. S. Morgulis

Iodometric determination of mono- and disaccharides. K. Szálkender. *Pharm. Monatsh.* 14, 281-3(1933).—The method proposed depends upon the fact that these substances are quantitatively oxidized to  $H_2C_4O_4$  by NaOBr under the influence of a beam of light. Into a 250-cc.

glass-stoppered Erlenmeyer flask introduce 50 cc. 0.1 N  $KBrO_3$  and add 1 g. KBr; after it has dissolved, add 5 cc. of 25% HCl to liberate  $Br_2$  and follow this immediately with 10 g. of NaOH. Stopper the flask at once and dissolve by shaking and cooling under running water. Add this soln. to the sugar (10-35 mg. in water, max. amt. 30 cc.), mix and subject to a beam of light (15 min. for monosaccharides, 20 min. for disaccharides), keeping at a temp. of 16-17°. Add KI and HCl and titrate with  $Na_2S_2O_3$  soln. The results appear to be accurate. H. M. Burlage

Preparation of solutions of invertase for the determination of sucrose. J. Lehoucq. *J. pharm. chim.* 18, 292-3(1933).—If thymol water is used in the prepn. of invertase soln. (Bourquelot, *C. A.* 2, 1463), only 97% of sucrose is hydrolyzable. With a 0.1% soln. of *o*-hydroxyquinoline *K II* sulfate ("sulfoquinol") as a preservative, a 100% inversion is obtained, and invertase solns. so treated remained active and limpid at the end of 3 months. S. Waldbott

## 8—MINERALOGICAL AND GEOLOGICAL CHEMISTRY

EDGAR T. WHERRY AND J. F. SCHAIKREK

A note on the minerals cooperite and braggite occurring in platiniferous concentrates from the Transvaal. H. R. Adam. *J. Chem. Met. Mining Soc. S. Africa* 34, 132-6(1933).—The history of the discovery and final identification of cooperite and braggite is given, with the compn. of each. Alden H. Emery

Crystal habit of uraninite from Cardiff Township, Ontario. A. L. Parsons. Univ. Toronto Studies, *Geol. Series No. 32*, 17-18(1932).—A combination of cube and octahedron is most frequent; other forms and twins (fluorite law) are rare. Alden H. Emery

Twinned beryl from Lyndoch Township, Renfrew County, Ontario. A. L. Parsons. Univ. Toronto Studies, *Geol. Series No. 32*, 23-4(1932).—The twin-plane is (112). Alden H. Emery

A topaz deposit in Topsham, Maine. Charles Palache. *Am. J. Sci.* 27, 37-48(1933).—Solns. rich in Na and Li built up layered albite and lepidolite in the bottom of a cavity. Microcline and albite were coated with a dense layer of sericite. Beneath this layer the feldspar was dissolved or kaolinized and lithia tourmaline grew into the spaces so formed. Beryl and topaz were attacked by a soln. indifferent to quartz and albite; the Be and F combined to produce hercynite, although the source of Ca and  $H_2PO_4$  is unknown. Alden H. Emery

Two new types of interpenetration twins on gypsum. A. L. Parsons. Univ. Toronto Studies, *Geol. Series No. 32*, 25-6(1932).—(101) and (500) are the twin-planes. Alden H. Emery

Mineral industry of Alaska in 1932. Philip S. Smith. U. S. Geol. Survey *Bull.* 857-A, 1-91(1934). E. H.

Iron ores at Itabira, Brazil. Bernard H. Sanders. *Bull. Inst. Mining Met.* No. 351, 20-32(1933); cf. *C. A.* 27, 4756; 28, 769.—Discussion. Alden H. Emery

The geology of the iron deposits of the Sierra de Imataca, Venezuela. Guillermo Zulouga. *Am. Inst. Mining Met. Engrs. Tech. Pub.* No. 516, 36 pp.(1933).—A highly ferruginous sandstone was first formed. A granitic intrusion caused migration of the Fe, and a norite caused replacement of metamorphosed quartzite and some granite by magnetite and hematite. The Fe was not derived

from the norite, but Fe in the itabirite was concd. by solns. accompanying the intrusion. The ore is exceptionally pure, 64-69% Fe. Plotted analyses of 21 Fe ores shows that the Brazilian ores are similar and that with the Venezuelan ores are in a class by themselves, contg. <1% SiO<sub>2</sub> and not participating in the const. SiO<sub>2</sub>-Mn ratio of the other ores. Alden H. Emery

Overhanging salt on domes of Texas and Louisiana. Sidney A. Judson and R. A. Stamey. *Bull. Am. Assoc. Petroleum Geol.* 17, 1492-520(1933).—Various theories for salt overhangs are reviewed, including the action of soln. processes. Alden H. Emery

Conversion of fatty and waxy substances into petroleum hydrocarbons. W. P. Seyer. *Bull. Am. Assoc. Petroleum Geol.* 18, 143-8(1934); cf. *C. A.* 28, 3001; Barton, *C. A.* 25, 1305.—Naphthene-base oils are young, paraffin-base oils are old. The gravity and cloud points for many analyses are plotted against geologic age. If the A. P. I. gravity of the 250-75° key cut is 40° or more, the base is paraffinic, 30-70° for intermediate base, and <30° if the base is hybrid or naphthenic. The A. P. I. gravity increases at approx. 2.25° per geologic period for the Tertiary and Cretaceous crudes, but shows no change or very slight increase for crudes of Cretaceous to Ordovician. Wax is present and the base is hybrid if the cloud test of the 200-25° cut is 5°F. or above. The cloud test shows an increase through the Tertiary and Cretaceous and only slight irregularity from the Cretaceous to the Ordovician. The same gravity and cloud points were plotted against depth. The correlation coeff. is  $0.75 \pm 0.06$  for an increase of the A. P. I. gravity from 26.4° at 500 ft., at the rate of 2.15° per 1000 ft. to a gravity of 38.4° at 6000 ft. and (theoretically) 40° at 6800 ft. All samples from <3250 ft. had a cloud test <5°F.; all from >3350 ft. had a cloud test of >20°F. Conclusion: Protoperoleum is naphthenic, and the evolution is toward the paraffin series. Alden H. Emery

Origin of the white quartz sands of northern Puerto Rico. James Thorp and Leslie R. Smith. *J. Puerto Rico Dept. Agr.* 17, 157-70(1933).—The largest areas lie near the seacoast in assocn. with Tertiary limestones, but

unconformable with them. The soln. of limestones in the San Juan formation has left these deposits, podsol leaching probably accounting for the whiteness of the sands.

## 9—METALLURGY AND METALLOGRAPHY

D. J. DEMOREST, OSCAR E. HARDER AND RICHARD RIMBACH

Influence of pulp classification upon flotation. V. I. Trushlevich and I. M. Akxev. *Tsvetnue Metal.* 1933, No. 1, 26-43.—The authors investigated the influence of dry and wet classification of pulp on flotation, and studied the economic factors and schemes of the most profitable grinding with classification, both in lab. and com. ore-dressing plants. Flotation of classified pulp ground to 65 mesh and coarser gave results superior to flotation of material through 200 mesh.

B. N. Daniloff

Kursk Magnetic Anomaly (KMA) ores and their chemical composition. P. P. Demchuk and B. A. Spevakov. *Domes* 1933, No. 9, 4 20.—About 500 KMA ore samples, taken from various borings, were analyzed with the following av. results: S 0.2-0.5, P 0.080-0.096, As 0.033-0.035, Fe 52-58.5, SiO<sub>2</sub> 6.5-9.4, CaO + MgO 1.95-3.3, K<sub>2</sub>O + Na<sub>2</sub>O 0.45-0.7, Al<sub>2</sub>O<sub>3</sub> 1.47-4.5 and loss ignition 6.6-10.34%. Numerous tables and diagrams, also a map, are given.

S. L. Madorsky

Petrographic and mineralogical nature of the iron ore of Staro-Oskol'sk District in Kursk Magnetic Anomaly (KMA) region. I. I. Tanatar. *Domes* 1933, No. 9, 20 9.—The Staro-Oskol'sk deposit is situated in the southeastern part of KMA region. Samples taken from 42 borings were subjected to petrographic and mineralogical analysis. T. agrees with previous investigators that the deposit is of hydrothermal nature, but disagrees on other points. He states (1) that it was the Turingian Schist and not the ferruginous quartzite which first underwent a metasomatic replacement; (2) that the process of pyritization precedes the process of sideritization instead of being simultaneous with it; (3) that the process of converting martite into limonite proceeded not only from the periphery of the grain but also from the nucleus; (4) that the analogy of the process of deposition should be drawn between the Staro-Oskol'sk District and KMA region in general, on one hand, and the northern part of Krivorog, instead of the central and southern, on the other.

S. L. Madorsky

Nature of KMA ores as to their physical properties. S. M. Meerov. *Domes* 1933, No. 9, 20-36.—Porosity, gas permeability, resistance to mech. breaking up and to cracking at ordinary and elevated temps., and to crushing under pressure, were investigated. A screen analysis of the fine ore is given.

S. L. Madorsky

Reducibility of KMA ores. S. T. Rostovtzev, F. S. Taranov and J. E. Ponyukhno. *Domes* 1933, No. 9, 36-57.—The method for testing reducibility of Kursk magnetite consisted in first heating the ore for 1/2-1 hr. at 850° to remove volatile matter, then crushing to a size 0.27 mm. and passing H<sub>2</sub> over 2 g. of the granular ore at a rate of 8 l./hr. at 850° for 30 min. The outflowing gas was tested every 10 min. for H<sub>2</sub>O. Loss of wt.

of sample was detd. at the end of the expt. Altogether 500 samples, representing various localities and depths of the deposit, were tested. The av. reducibility varied between 86.3 and 94.0%.

S. L. Madorsky

An investigation of KMA (Kursk Magnetic Anomaly) ores in regard to Bell's reaction. S. K. Trekalo. *Domes* 1933, No. 9, 57-65.—The reaction  $2CO \rightarrow C + CO_2$ , as catalyzed by the KMA ore, was studied. About 3-g. samples, 3-5 mm. in size, were placed in a boat and kept in an elec. furnace at 500°, while a mixt. of CO + CO<sub>2</sub>, in the ratio of 4:1, was passed through the furnace at a rate of 5 l./hr. Results were calcd. as the wt. of C deposited on the ore, expressed in percentage of the wt. of the ore. This deposit varied with various samples of ore between 1.47 and 15.41%. Thus in regard to Bell's reaction the KMA ores resemble those of Krivorog and Ural dense brown and magnetic ores. Because of its great density, small porosity and large sideritization, it causes a much smaller deposition of C than the Ural red or the ordinary brown ores. Deposition of C takes place more in the pores of the ore particles than on the surface.

S. L. Madorsky

Blast-furnace-charge calculations for the smelting of iron from the ore of Korobkovsk sector of Staro-Oskol'sk District in KMA. A. N. Pokhvisnev, P. P. Demchuk and S. M. Meerov. *Domes* 1933, No. 9, 66-71.—Calculations are given on the basis of 53-55% Fe and 8-13% volatile substances in the ore. On account of the high P content only cast and open-hearth iron can be prepd. from this ore. While the ore is characterized by low porosity and gas permeability at low temps., the reverse is true at high temps. Per 100 kg. of iron produced, the requirements are 74-76 kg. slag and 90-100 kg. coke. This rather large consumption of slag and coke is due mainly to the high S content (0.3-0.5%). Conclusion: The KMA ore can be melted more easily than Krivorog ore.

S. L. M.

Kursk Magnetic Anomaly (KMA). A. N. Pokhvisnev. *Domes* 1933, No. 9, 2-4.—The KMA deposits are estd. at about 200 billion tons of magnetite iron ore carrying an av. of 30-40% Fe. As a potential source it is of extreme importance, being almost equal to the known world deposits (243 billion tons). Most of the ore is too poor to be used without preliminary magnetic sepn., although in some cases the ore carried 50-60% Fe which is high enough to be used directly. A map showing location of deposits is given.

S. L. Madorsky

Grinding ores by explosion. W. Luyken. *Metal u. Erz* 31, 8-11 (1934).—Ores are disintegrated by heating with steam at a pressure of 15 atms. This is particularly suited to dense ores such as sedimentary Fe ores.

H. S.

Decomposition of iron ores such as oölitic, oölitic and pea ore. W. Luyken and L. Kraeber. *Mitt. Kaiser-*

**Wilhelm Inst. Eisenforsch. Düsseldorf 15, 197-203 (1933).**—The difficulties in prep. and dressing oolitic iron ores are discussed; they consist mostly in the fact that the Fe-rich oolites are crushed also when the rocky mass is crushed, which is not desirable. Three different processes were tried of which crushing in mills with rubber-covered bars did not give satisfactory results, while reducing to small pieces by dropping seems only a lab. solution. Blasting offered the most promising results as the ore was neatly sepd. from the other mass. Seven references. M. H.

**Physical and thermal basis of sinter roasting.** Helmut B. Wendeborn. *Metall u. Erz* 31, 1-8 (1934).—A prerequisite for the suction blast process is gas permeability of the charge, as the air which is sucked through the ore bed must not only maintain combustion but also serve to carry heat to the inner part of the ore layer. The high heat efficiency of the process leads to low fuel consumption in the sintering of oxidic ores, but requires the addn. of combustible material in the roasting of sulfidic ores such as pyrites, blendes and galena. H. Stoertz

**The presence of platinum in sulfur ores.** O. E. Zvyagintzev, V. V. Lebedinskii and A. N. Filippov. *Compt. rend. acad. sci. (U. R. S. S.) [N. S.]*, 1933, 165-9.—Pt was detected in various ores and final products by spectroscopic means. Up to 50 mg. per kg. was found in ores from Ridder, Allaverdui, Buron and Karabash contg. Cu, Pb, Zn, Fe, SiO<sub>2</sub>, Se, As, S, Al<sub>2</sub>O<sub>3</sub>, CaO, MgO, Au and Ag. Electrolytic mud, waste from concentrates, etc., contained Pt. A. A. Boehlingk

**Dissolving velocities of graphite in liquid iron.** E. Piwowsky. *Arch. Eisenhüttenw.* 7, 431-2 (1934).—When taking time-temp. curves with different types of cast iron it could be observed that graphite dissolves in the melt in a comparatively small temp. range even at very high heating velocities. Cast iron rods which were dipped with one end in a melting bath of Ni or Cu for only a few seconds showed clearly that eutectic graphite crystallizes directly from the melt, and not from decomp. cementite on account of lack of time. M. Hartenheim

**Symposium on cast iron.** H. Bornstein, et al. *Proc. Am. Soc. Testing Materials* 33, Part II, 115-273 (1934). G. G.

**Special processes for making cast iron of high mechanical qualities.** Le Bruly. *Rev. fonderie moderne* 27, 337-8 (1933).—Some modern processes of producing a high-quality cast iron by retarding and diminishing graphitic sepn. during and immediately after solidification (i. e., in a state of still sufficient plasticity for formation of coarse graphite crystals) are briefly described. They are: (1) The pearlitic process of Lanz in which the metal is cooled very slowly by as small a temp. difference between metal and mold as practically possible; C + Si vary from 4.80 to 3.50%; molds are heated to about 500°; tensile strength is about 26-30 kg./sq. mm. (2) The Emmel process which is based on low C content of the charge, small percentage of coke for fusion and consequently rapid melting with strong blast; C + Si is about 5%; tensile strength is about 30-40 kg./sq. mm. (3) The Krupp process which is essentially the same as 2. (4) The Corsalli process which retards and limits recarburation of the metal in the cupola by reducing the reaction of the coke by immersing the latter in milk of lime. The C content is 2.6-3.0%; tensile strength is 34-40 kg./sq. mm. (5) Some other processes are briefly mentioned based on quality of pig iron rather than on compn. of the charge.

**The study of pourability of cast iron.** R. Berger. *Bull. assoc. tech. fonderie* 7, 489-506 (1933).—Pourability or castability of a metal is defined as the facility with which it completely fills the mold; the principal factors are: temp. of metal in pouring, viscosity of the liquid metal at the pouring temp. and condition and shape of the mold. Cast irons with less than 0.5% Si improve their casting quality with increasing Si content; between 0.75 and 0.95% Si a sudden drop in castability occurs and from this point on castability improves gradually again until the Si content for the eutectic C concn. is reached; for higher Si contents castability again diminishes. The sudden drop

is explained by an endothermal reaction which is due to the initial Si content from the pig iron, a "hereditary" phenomenon. The tests are described in detail by diagrams taken from different C and different Si contents. The formula of Portevin considering all influences  $A = \alpha [cd (\theta - F) / (F - \theta_1) + \beta Ld / (F - \theta_1)]$ , where  $A$  = castability,  $\alpha$  and  $\beta$  = coeffs. depending on the nature of mold and viscosity of metal,  $d$  = density of metal,  $F$  = freezing temp. of metal,  $c$  = sp. heat of liquid metal,  $\theta$  = pouring temp.,  $\theta_1$  = temp. of the mold,  $L$  = latent heat of freezing of the metal, represents fairly well the results obtained in the expts. M. Hartenheim

**The copper refinery at Prescott.** D. W. Aldridge. *Metal Ind. (London)* 43, 605-8, 631-3; 44, 9-12, 87-90 (1933-34). E. H.

**The action of brines on Mansfeld copper schist and sulfide copper ores.** F. Krüll. *Chem. Erde* 8, 490-503 (1933).—Mixed concd. solns. of K, Na, Mg and Ca chlorides and Mg sulfate at temps. of 30° and 60° were allowed to act on Cu schist, bornite, chalcocite and chalcocyanite for 14-90 days, and at boiling for 1 hr. The concn. of Cu in the brine varied from 0.009 to 0.11%, averaging only 0.05%. Conclusions: The penetration of brines into Cu schist is not responsible for the secondary metal displacement, and a reaction of the type  $\text{CuS} + \text{MgCl}_2 = \text{MgS} + \text{CuCl}_2$  is not to be assumed. P. S. Roller

**Separation of copper from complex copper-lead-tin-antimony alloys.** N. N. Murach. *Tsvetnue Metal.* 1933, No. 1, 99-100.—Lab. expts. showed that Cu can be removed almost completely from complex Cu-Pb-Sn alloys by melting with large amts. of PbO. B. N. D.

**Production of pure chromium.** P. P. Alexander. *Metals & Alloys* 5, 37-8 (1934).—Cr<sub>2</sub>O<sub>3</sub> prepd. from distd. CrO<sub>3</sub> was reduced to metallic Cr having a purity of the order of 99.95% by means of the hydrides of both Ta and Ca. Downs Schaaf

**Manufacture of magnesium.** A. Dumas. *Rev. met.* 30, 511-19 (1933).—A brief description of processes for prepn. of anhyd. MgCl<sub>2</sub> and for production of metallic Mg. J. D. G.

**Impurities in commercial zinc.** Werner Frölich. *Metal Ind. (London)* 43, 559-60, 589-90 (1933). E. H.

**Sedimentometric analysis of slimes.** N. Lubman. *Tsvetnue Metal.* 1933, No. 1, 44-61.—Expts. conducted by L. indicated that the dispersion analysis, as developed by G. Wiegner and Sven-Oden for soil investigations, can be utilized also for quant. control of highly dispersed phases in ore flotation. The investigation showed, however, that to obtain a true picture of the state of dispersion as the result of grinding, it is necessary to stabilize the suspension. It was proved that with complete stabilization the distribution of slime particles is independent of viscosity and other mol. properties of the liquid medium. The process of stabilization of hydrophilic and hydrophobic minerals in water and hydrocarbon media of varying viscosities was investigated. The most suitable stabilizers were found to be alizarin red in aq. alkali media, and oleic acid in hydrocarbon media. The sedimentometric methods and technic, however, are not sufficiently developed to be adopted for practical use. B. N. Daniloff

**Some practical applications of sand tests.** G. Henon. *Bull. assoc. tech. fonderie* 7, 506-13; *Usine* 42, No. 51, 31 (1933).—The advantage of testing foundry sands is discussed, and it is shown by a no. of examples that great practical advantages can be derived in molding and obtaining good castings. Measurements to be made should extend to tests of elementary properties, i. e., fineness and regularity of grains and amt. of dust, and of properties of application, i. e., permeability, cohesion and thermal qualities. Instruments for testing these properties are briefly described and diagrams developed which show in a convenient way the characteristics of a sand. American and French practice is compared. Five references. M. Hartenheim

**Developments in foundry refractories.** E. J. Crowley. *Foundry Trade J.* 50, 71-2, 77 (1934). D. S.

**Oxidation and reduction of chromium in the open-**

hearth furnace. N. Inshakov. *Stal* 3, No. 6, 24-33 (1933).—Analyses made during heats contg. 0.25-1% Cr show that the behavior of Cr parallels that of Mn, the Cr being oxidized at the beginning and reduced at the end of the heat.

Pins and bolts for high-temperature roasting furnaces. A. G. Arend. *Chemistry & Industry* 1934, 94-5. E. H.

Theoretical considerations in the use of oxygen-enriched air in the blast furnace. N. A. Kostuilev. *Domes* 1933, No. 8, 1-19.—The advantages resulting from the addn. of 18-22.5% O<sub>2</sub> to the air in the blast furnace are: the use of the cold blast, a colder hopper, a smaller vol. of dust in the flue gas, due to reduced velocity of gas through the furnace, and a saving of 10-12% in the coke consumption. However, the last advantage is offset by the necessity of burning the limestone to lime before feeding it into the furnace, because of the blast being cold.

S. L. Madorsky.  
The Balz furnace and its suitability for roasting ore for zinc electrolysis. Otto Kühle. *Metallwirtschaft* 12, 683-8(1933).—The construction and operation of the Balz furnace are described in detail and its advantages over other types of furnaces for roasting zinc blende enumerated. Its features are compact construction with low muffles, location of the driving mechanism on the outside removed from the heat and chem. attack, and temp. regulation of the air used to burn the sulfides. Part of the air entering the furnace is cold to prevent fusing of the charge at the start of the roasting, while preheated air is introduced near the end to obtain a completely roasted product. The operating costs are lower than for other types of furnaces. At 840° the ore is roasted in 8 hrs. with a resulting sulfide S content of 0.4% or less and high Zn soly. with the formation of very little ferrite and silicate compds. Samples from 8 lots of Zn blende from various sources which had been roasted in a Balz furnace were leached in H<sub>2</sub>SO<sub>4</sub> according to the Anaconda and Linton processes, and the Zn soly. and the ferrous Fe content were detd. The Zn soly. was 92-9% and 96-9%, resp., and the ferrous Fe content averaged 0.05% and 0.16%.

C. E. Macfarlane.  
Furnaces for heat treatment. W. A. Thain. *Aircraft Eng* 6, 13-19(1934).—A review is made of the requirements of all types of furnace for aircraft factories, and some of the general principles governing their development. Descriptions are given with illustrations of a modern gas-fired furnace with automatic-proportioning burning equipment; of a nitriding furnace of the semi-continuous type utilizing the exhaust NH<sub>3</sub> from a container undergoing treatment; of some elec. furnaces for Al alloys, and of some self-regulating induction furnaces. Illustrated descriptions are given of some modern furnaces.

A. W. Furbank.  
Heat treatment of metallurgical products. A. Portevin. *Aciers spéciaux* 7, 242-56, 282-97, 318 28, 393 412(1932); 8, 2-18, 203-22, 231(1933).—The essential laws and notions of the problem of heat-treating the metallurgical products are given. The following are discussed: (1) methods of qualitative and quantitative study of the transformation points of steel, transformation points of carbon steel; (2) ordinary steels, preliminary treatment, homogeneity, overheating; (3) special steels, phenomena and characteristics of tempering; (4) characteristic curves of tempered steel; (5) classification of steel in four groups according to their heat treatment; (6) annealing; (7) malleable iron.

G. T. Motok.  
Further investigations into the metallurgical course of the Thomas process. P. Bardenheuer and G. Thanheiser.

*Mitt. Kaiser-Wilhelm-Inst. Eisenforsch. Düsseldorf* 15, 311-14(1933); cf. *C. A.* 27, 4504.—To get an insight into the metallurgical principles of steel production by the Thomas process the changes of concn. in melt and slag during the time of blasting were detd. in 9 Thomas melts. The degree of basicity was measured by analysis of the slag of reaction which was freed from free lime, and the transition of the original acid into the basic slag was followed up by detg. the equil. const. for the Mn reaction  $K_{Mn}$  which was found to be between 685 and 1055. The general course of the Thomas process can be represented as follows: the O blown into the melt with the air oxidizes at first a part of the Fe to FeO; other elements as Si, P, Mn, C, etc., are oxidized essentially over FeO. Si, Ti and V and a great part of Mn burn at the beginning of the melting process with very great velocity. The silicic acid formed thereby can form very liquid compds. with simultaneously formed FeO and MnO which sep. quickly from the steel melt. V and Ti are accumulated at the beginning of the reaction in the slag. The burning of C does not begin until after all these elements have been burnt. During the whole time of burning of C the O content of the melt is low in spite of the great amt. of air supplied. Dephosphorization takes place when the slag has become basic.

M. Hartenhein.  
New (permissible) limits of deviation in rolled steel. B. I. Panchenko. *Domes* 1933, No. 8, 32-36.—In view of the enormous demand for rolled steel in Russian industries, the limits of deviation set for profiles are changed so as to effect economy of material.

S. L. Madorsky.  
An investigation of cast iron rolls with hardened surfaces. V. N. Gridnev and E. V. Panchenko. *Domes* 1933, No. 8, 19-27.—Chem. analysis, phys. tests and macro- and micrographic investigations were made of 2 rolls and 14 disks cast from a cupola furnace.

S. L. M.  
A metallographic method for determining furnace-temperature uniformity. E. H. Dix, Jr., and A. C. Heath, Jr. *Metals & Alloys* 5, 10(1934).—Just as the softening of a conglomerate of certain substances such as Al<sub>2</sub>O<sub>3</sub> and feldspar, etc., in a Seger cone denotes a certain temp. in a ceramic kiln, so the authors use the m. p. of a binary eutectic of Al and a 2nd phase, either an intermetallic compd. or a pure element, for detg. furnace-temp. uniformity.

Downs Schaaf.  
The magnetic method for the discovery of flaws in metal products. K. V. Grigorov and M. N. Mikhcev. *J. Tech. Phys.* (U. S. S. R.) 2, 190 9(1932). F. H. R.

The behavior of metallic materials with static and dynamic loading. P. Ludwik. *Z. Metallkunde* 25, 221-8 (1933).—A review, chiefly of L.'s work. R. F. Mehl.  
Tantalum as a construction material. S. Ganswindt and K. Mathies. *Chem. Fabrik* 1933, 521-3.—Data are given on its chem. and phys. properties and resistance to corrosion by acid and alk. solns., and several cuts of app. are shown.

J. H. Moore.  
Status of pressure die casting. W. Brunckow. *Z. Metallkunde* 25, 190-4(1933).—A review of methods, mech. properties, and structure of die castings, limitations, and economics.

R. F. Mehl.  
Influence of silver on the softening of cold-worked copper. H. C. Kenny and G. L. Craig. *Am. Inst. Mining Met. Eng., Inst. Metals Div., Tech. Pub.* 525, 8 pp. (1934).—A small fraction of 1% of Ag in high-cond. tough-pitch Cu increases the softening temp. of the cold-worked material. The Ag is effective in raising the softening temp. both for very short anneals and for heating times of months. The softening temp. increases rapidly until the Ag content reaches 10 oz./ton (0.034%), and then slowly with further increase in Ag content. Cold-worked Cu contg. almost no Ag is completely softened on heating for a few days at 150°, while Cu of the same hardness contg. over 10 oz./ton (0.034%) of Ag is not greatly softened when maintained at this temp. for a year. As much as 40 oz./ton (0.14%) of Ag has no adverse effect on the mech. properties, nor does it lower the elec. cond. appreciably.

C. L. Mantell.  
Hardening processes in silver-copper single crystals. P. Wiest. *Z. Metallkunde* 25, 238-41(1933).—The age-

hardening of single crystals of a 5% Ag Cu-Ag alloy was studied by measurements of hardness on a given crystal face and by x-ray detns. of  $a_0$ , the side of the unit face-centered cell. Aging curves were taken (after quenching) at 350°, 375°, 400°, 420°, 425°, 445° and 470°. These hardness measurements showed the aging to take place in 3 stages, the aging curves at the higher temps. showing 3 maximums. The aging times at which these maximums obtain shorten greatly with increasing temp. No change in  $a_0$  was found during aging until the second max. was encountered. At 350° aging for 36 hrs. sufficed to pass the first max., during which period no change in  $a_0$  was found, nor any noticeable broadening of the x-ray diffraction lines. Polycryst. alloys of the same compn. showed a more rapid aging at all temps. and showed the occurrence of but one max. in hardness. R. F. Mehl

The behavior of graphitic silicon in aluminum at elevated temperatures. C. Schaarwächter. *Z. Metallkunde* 25, 250-1(1933).—It is shown by microscopic observations (that the Si pptd. from the solid soln. of Si in Al (graphitic Si) redissolves in Al on reheating with extreme slowness and that only at temps. in the neighborhood of the eutectic temp., 577°, is the soln. process rapid enough to be observed. R. F. Mehl

Work of data committee on aluminum conductors. H. Schmitt. *Z. Metallkunde* 25, 170-2(1933).—A report on the behavior of Al conductors installed on the island Sylt over a period of 5 yrs. The conditions of construction and of exposure are described. These conductors consisted of Cu; Aldrey; Al, 99.8; Al, 99.2, annealed at 350°; Al, 99.2, annealed at 500°; "test alloy No. II." Photographs show the progressive change in surface appearance of the cables, and graphs show the change in breaking load, corrected breaking load, and elec. resistance over the 5-yr. period. The Al conductors showed good behavior in comparison with Cu. R. F. Mehl

Studies on the deep-drawing of sheet as measured by the Erichsen method. Fr. Dorge. *Z. Metallkunde* 25, 165-8, 210-14(1933).—The interpretation of the Erichsen test for deep-drawing capacity of sheet metal is discussed. Penetration-load curves for Al, Cu, brass, and bronze sheets are given and discussed mathematically. Conclusion: The drawing test is essentially similar to a simple tensile test. R. F. Mehl

Inception and development of hard metal carbides. Karl Schroeter. *Iron Age* 133, No. 5, 27-9(1934).

Light metal rivets. K. Guler. *Z. Metallkunde* 25, 214-17(1933).—A discussion of the behavior of high-strength Al alloy rivets: duralumin, Avional (Al 94.4, Si 0.3-0.6, Fe 0.3, Mn 0.5, Mg 0.55, Cu 3.8%) and Anticorodal (Al 97.25, Si 1.0, Fe 0.3, Mn 0.75, Mg 0.65, Cu 0.1%). Duralumin of German specification 681a and Avional had high resistance to sea-water corrosion, whereas duralumin 681n corroded rapidly (shown by photographs). The tensile properties of Avional and Anticorodal are given in tables and graphs; also the hardening curves as measured by Brinell hardness, shearing strength and tensile strength. Avional hardens on room-temp. aging, whereas Anticorodal must be artificially aged. R. F. M.

Repeated hardening of duralumin rivets and the influences of the hardening temperature. Martin Abraham. *Z. Metallkunde* 25, 203-6(1933).—The claim that the interruption of the hardening process with immediate re-hardening leads to more rapid hardening is shown to be unimportant, the effect small and of no practical significance. The course of hardening with repeated hardening remains the same if the rivets are not treated for 5 days between the soln. heat treatments. The influence of temp. of aging upon the rapidity of aging is much greater; a temp. difference of 20° can produce a difference of 4 kg./sq. mm. shearing strength after a two-hour aging. The limit of working for rivets of duralumin wire of the German specification 681 ZB is around 25 kg./sq. mm. shearing strength. This strength is reached on a ten-hour aging at 8°. The data are given largely in the form of graphs, drawn from tests on duralumin alloys 681 A and 681 ZB. R. F. Mehl

Report of subcommittee XV on impact testing. J. T. MacKenzie, et al. *Proc. Am. Soc. Testing Materials* 33, Part I, 87-129(1934). G. G.

The torsion impact test. G. V. Luerssen and O. V. Greene. *Proc. Am. Soc. Testing Materials* 3, Part II, 315-27(1934). G. G.

An "overnight" test for determining endurance limit H. F. Moore and H. B. Wishart. *Proc. Am. Soc. Testing Materials* 3, Part II, 334-40(1934). G. G.

The determination of the initial ball impression hardness. E. Franke. *Z. Metallkunde* 25, 217-19(1933).—The initial ball impression hardness,  $H_A$ , is detd. by taking a series of Brinell impressions at different applied loads, (giving Brinell hardness no.,  $H$ ), then detg. the Shore scleroscopic hardness pos. of the work-hardened layer ( $S$ ) at the bottom of the impression and also of the unstrained sample ( $S_0$ ), and applying the relationship  $H_A = H \cdot S_0 / S$ . A similar treatment may be applied if pendulum hardness is used instead of scleroscopic hardness. The values of initial hardness obtained in this way are thus independent of work-hardening effects and are more representative of the original material. The method is simple enough to be used in practice. R. F. Mehl

Crystalline structure in relation to failure of metals, especially by fatigue. Herbert J. Gough. *Proc. Am. Soc. Testing Materials* 33, Part II, 3 114(1934); cf. C. A. 27, 5285.—A lecture. G. G.

Fatigue tests of galvanized wire under pulsating tensile stress. S. M. Shelton and W. H. Swanger. *Proc. Am. Soc. Testing Materials* 33, Part II, 348-60(1934). G. G.

The fatigue properties of light metals and alloys. R. L. Templin. *Proc. Am. Soc. Testing Materials* 33, Part II, 364-80(1934). G. G.

The annealing of duralumin wire. S. D. Tzipurdeev. *Metallurg* 8, No. 6, 50-2(1933).—The best results are obtained by heating to 370-400° for 2-3 hrs., cooling in the furnace to 250-70° and then cooling in air. This gives a tensile strength of 22-3 kg. per sq. mm. and an elongation of 17-8%. H. W. Rathmann

Studies upon the Widmanstätten structure. V. The gamma-alpha transformation in pure iron. Robert F. Mehl and Dana W. Smith. *Am. Inst. Mining & Met. Engrs., Tech. Pub.* No. 521, 7 pp.(1934); cf. C. A. 27, 3180.—The Widmanstätten figure in drastically quenched pure Fe delineates the [111] octahedral, planes in  $\gamma$ -Fe. The orientations of the  $\alpha$ -phase with respect to the parent  $\gamma$ -phase shows a satisfactory agreement with the relationships previously found in martensite and slowly cooled hypoeutectoid steels. Alden H. Emery

The linear thermal expansion and  $\alpha$ - $\gamma$ -transformation temperature of pure iron. J. B. Austin and R. H. H. Pierce, Jr. *Physics* 4, 409-10(1933); cf. C. A. 27, 4201.—With a rise in temp. the expansion coeff. increases, passes through a max. at about 450° and falls to a min. at or near the Curie point, then increases to the  $\alpha$ - $\gamma$  transformation. Between 600° and 900° the thermal expansion is sensitive to small differences in compn. or previous treatment. The temp. of the transformation from  $\alpha$  to  $\gamma$  structure appears to be very sensitive to even small amts. of impurity; 928° is thought to be near the true value. The expansion cannot be calcd. for temps. near the Curie point. A. M. Brant

Some investigations and observations principally on the strength properties of cast iron. J. E. Hurst. *Metalurgia* 8, 179-80, 9, 17-19, 43-5(1933).—Data are cited to show that both the compn. and properties of cupola iron vary markedly from cast to cast. The modulus of elasticity, or more properly the  $E/N$  value, varies from 5 to 30 million lb./sq. in. in cast irons. It is influenced by structure, white irons having the higher value. Properties of some centrifugally cast piston rings are given. Superheating iron for these did not improve the properties. J. L. Gregg

An x-ray study of the diffusion of chromium into iron. Lawrence C. Hicks. *Am. Inst. Mining Met. Engrs., Contribution* No. 58, 10 pp.(1933).—The concn. of Cr falls off gradually for a considerable distance, then drops

very abruptly. The percentage of Cr at the break (14-15 atomic %) is somewhat greater than that indicated by Adcock's diagram as the limit of the  $\gamma$ -solid soln. range at 1200°. The mechanism of the diffusion process is that proposed by Bannister and Jones. A. H. E.

The passivity of iron and aluminum. W. H. Cone and H. V. Tartar. *J. Am. Chem. Soc.* 56, 48-52(1934).—With these metals in  $\text{HNO}_3$  no abrupt change was noted between the active and passive states. Phosphates and sulfates accelerate soln. of Fe and Al in  $\text{HNO}_3$  and make them more electroneg. with respect to the soln. This action is attributed to adsorption of these anions at the O film-soln. interface. The passivity of an air-exposed Fe to concd. chromic acid soln. may be destroyed by reduced pressure, a H atm., or wetting with solns. of electrolytes. A. M. Brant

The application of metallography to the study of boiler failures. Robert Stumper. *Chaleur & ind.* 14, 511-14(1933).—A discussion of the principles of ferrous metallography with photomicrographs of various types of steel used in boiler construction. K. K.

Residual austenite in hardened steels. S. S. Shteinberg and V. I. Zyuslin. *J. Tech. Phys.* (U. S. S. R.) 2, 35-46 (1932).—Residual austenite increases with the C content, with slowness of cooling (with the exception of 1.8 % C steel) and with increase of hardening temp. up to 1000°; above that it decreases. Gray pearlite is found with a low residual austenite content. F. H. R.

Upper critical temperature ( $A_c$ ) of steel as affected by various elements. Robert R. Abbott. *Iron Age* 132, No. 26, 7-11(1933).—Quant. relations have been detd. between the amts. of the usual elements in steel and the elevation or depression of the crit. point. This point can be calcd. from the chem. analysis of the steel by the equation: temp. of  $A_c = 908 - 2.237 \text{ C} + 0.4385 \text{ P} + 0.3049 \text{ Si} + 0.3792 \text{ V} - 0.3443 \text{ Mn} - 0.23 \text{ Ni} + 2(\text{C} - 54 + 0.06 \text{ Ni})$ , where all the elements are expressed in hundredths of a % except P, which is in thousandths. If the quantity in the last bracket is neg. it is omitted. Tables are given for the rapid detn. of the upper crit. point from the chem. analysis. A. M. Brant

The effect of time and temperature on the embrittlement of steels. A. M. McKay and R. N. Arnold. *Engineering* 136, 623-5, 647-9(1933).—Ten alloy steels of representative character were tested after soaking for periods at temps. from 300° to 650°. The tabulated results indicate that the ultimate degree of embrittlement is independent of the temp. but the rate of change is more rapid as temp. is increased. Working stresses seem to play no part in the embrittlement. The steels showed a considerable decrease in impact resistance. The hardness and ultimate tensile strength varied within small limits during embrittlement, and the structures did not change appreciably. It is thought that the change in the embrittled steel is of a submicroscopic nature, the material striving to attain a condition of equil. by the pptn. of unstable constituents. A. M. Brant

Effects of columbium in chromium-nickel steels. Frederick M. Becket and Russell Franks. *Am. Inst. Mining and Met. Engrs., Tech. Pub.* No. 519, 14 pp.(1934).—Presence of approx. 4 times as much Cb as C in austenitic Cr-Ni steels diminished the range of temp. through which these steels were attacked at the grain boundaries. When the ratio was increased to 7, a marked improvement resulted; 10 times as much Cb as C yielded steel that failed to disintegrate between 300° and 850°. This probably is related to the normal expansion and contraction during heating and cooling of the Cb-bearing steels, while the ordinary Cr-Ni steels show breaks in the curves. Fully softened steels contg. up to about 2% Cb possess good phys. characteristics, exhibit excellent resistance in the salt-spray test during exposure of 750 hrs. and give satisfactory results in boiling 65%  $\text{HNO}_3$ . A. H. E.

Shearing properties and Poisson's ratio of structural and alloy steels. Inge Lyse and H. J. Godfrey. *Proc. Am. Soc. Testing Materials* 3, Part II, 274-85(1934). G. G.

Chemically resistant iron and steel alloys. W. Ackermann. *Chem.-Ztg.* 57, 901-3(1933).—Alloying elements

forming a series of solid solns. are important for obtaining acid-resisting material, as chances for local elements and potential differences are reduced. Study of space lattice conditions and the formation of protective films are also important factors. Low-C steels contg. 8% Cr show corrosion resistance, but for complete resistance 12% Cr must be exceeded; addn. of 2% Ni improves the mech. properties. For protection against the nonoxidizing acids higher alloying percentages must be used; the 18-8 Cr-Ni alloys are most important. Addn. of 2-3% Mo gives increased resistance. Rust-free Cr steels are martensitic and have heterogeneous structure after heat treatment; a change of hardness can be produced by quenching and tempering. The more resistant Cr-Ni steels are austenitic, a homogeneous solid soln. of  $\gamma$ -iron-Fe<sub>3</sub>C-Cr-Ni. The austenitic steels are occasionally attacked by an intercryst. corrosion. Investigation has shown that pptn. of small amts. of carbide at the grain boundaries causes this condition. Long annealing at the crit. temp., 800-700°, and increasing C content favor this condition. Heating above 1100°, where carbide particles dissolve, and addn. of Si, Mo or V prevent intercryst. corrosion of austenitic steels. Rust-free Cr steels (about 14%) are resistant to air,  $\text{H}_2\text{O}$ , HCl and sufficiently resistant to a few fruit acids such as acetic, malic, citric and tartaric acids. Acid-resistant Cr-Ni (18-8) steels are resistant to the same agents, especially against cold  $\text{H}_2\text{SO}_4$  and  $\text{H}_3\text{SO}_4$ , phosphoric acid, lactic acid, cold formic acid, milk, oxalic acid, ammonia, NaOH, KOH, soda and salt solns., light metal chlorides and sulfates. These alloys show little or no resistance to hot  $\text{H}_2\text{SO}_4$ , heavy metal chlorides, Br, I, Cl, liquid Al, Zn and Sn. The usual Cr steels are made more weather resistant by the addn. of a few tenths of a % of Cu. Addn. of Ni, Cr and Cu to cast iron increases the resistance, especially if an austenitic structure is secured. An alloy cast iron of the following compn.: Ni 12-15, Cu 5-7, Cr 1.5-4, Mn 1-1.5, total C 2.75-3.1, Si 1.25-2, S 0.04-0.13 and P 0.04-0.30% has numerous applications in the chem. and mech. industries. Si is an important alloy element for cast irons; 12% gives good acid resistance and 18% gives complete acid resistance. Rust-free Cr alloys are scale resistant up to 800°; the austenitic Cr-Ni steels, up to 1000°. Addn. of Al greatly increases the scale resistance, but decreases the corrosion resistance and the workability of the alloy. C. B. J.

Structure of an alloy steel. Owen W. Ellis. *Iron Age* 132, No. 18, 21-4(1933); cf. *C. A.* 27, 5288.—Each of a series of 10 samples was heated to 1035°, allowed to cool to a predetd. temp. and quenched. The quenching temp. ranged from 700° to 475°. Cooling curves were made and structural changes were studied. Transformation of face-centered solid soln. commences at 675-650°, and transformation of those parts of the face-centered solid soln. in close proximity to the body-centered soln. which has already formed occurs within 625-600°. The latter phenomenon results in the formation of a conglomerate structure. C. B. Jenni

Alloys and alloy steel in 1934. Charles Longenecker. *Blast Furnace Steel Plant* 22, 61-2(1934). E. H.

The study of constitution (of alloys) by magnetic methods. I. Dia- and paramagnetic measurements. A. Kussmann. *Z. Metallkunde* 25, 259-66(1933).—A review, under the following headings: fundamental quantities, general behavior (of metals), methods of measurement, relationship with constitution (of alloys), kinetics of transformation, lattice distortion, tests for the presence of Fe, soly. relationships, aging, influence of cold deformation. R. F. Mehl

Effect of sulfur dioxide gas on alloys. G. H. McGregor and J. W. Stevens. *Paper Trade J.* 97, No. 18, 40-1 (1933).—Results are given and discussed of the exposure of 50 samples of ferrous and nonferrous alloys at 200-20° in  $\text{SO}_2$  of 17-18% concn. for 30-day periods up to 10 months. The 16-18% Cr, low-Mn alloys showed considerable pitting and general disintegration. In the 18%-Cr 8%-Ni alloys, high C tends toward rapid corrosion. The 23-11, 20-10 and 28-10 Cr-Ni alloys are about as resistant as the low-C 18-8 alloys. The 20-20 alloys and

high-Cr very high-Ni alloys are quite resistant; the low-Cr high-Ni alloys are readily attacked. The resistance of the non-Cr high-Ni alloys varies considerably according to the presence and amts. of other metals, highest resistance having been observed with: Ni 85, Cu 5, Si 10. All the cast irons and steel controls were readily and extensively attacked. The 18-8 Cr-Ni alloys are somewhat more resistant than bronze, which is more or less the standard metal for sulfite digester fittings, and which in turn is more resistant than brass. A. P.-C.

**Influence of heavy metals upon aluminum alloys.** P. Röntgen and W. Koch. *Z. Metallkunde* 25, 182-5(1933).—A micrographic study of the solid soly. of Ni, Cr and Mo in Al at 560°, and of the effect of these elements on the solid soly. of Cu in Al. The solid solubilities are: Ni, 0.01-0.02; Cr, 0.02; Mo, 0.02; the solid soly. of Cu in Al is not increased by addns. of Ni, Cr and Mo.

R. F. Mehl

**The so-called incubation in the hardening of duralumin.** W. Fraenkel and R. Hahn. *Z. Metallkunde* 25, 185-9 (1933).—Tensile tests and measurements of elec. cond. and Brinell hardness were performed on a series of alloys of the duralumin type during aging at room temp. It was found that the incubation period, i. e., that period at the beginning of aging during which little or no change occurs, is dependent chiefly upon grain size, increasing in degree as the grain size increases. Very pure materials are in general less inclined to incubation than com. materials; impurity of Fe seems to favor the occurrence of an incubation period.

R. F. Mehl

**The alloying of gallium with aluminum.** N. A. Pushin and V. Stajić. *Z. anorg. allgem. Chem.* 216, 26-8(1933); cf. C. A. 27, 934.—The complete phase diagram of the system Ga-Al was investigated by thermal analysis. Three compds. were found: AlGa<sub>3</sub>, m. 281°; AlGa, m. 374°; Al<sub>3</sub>Ga, m. 467°. The last compd. showed 2 modifications:  $\beta$ , stable at 467-447° and  $\alpha$ , stable below 447°.

H. H. Rowley

**Beryllium heavy-metal alloys.** W. Hessenbruch. *Z. Metallkunde* 25, 245-9(1933).—Cu-Be alloys can best be melted under a fused chloride flux but Be alloys with Ni, Co, Cr are best melted (and cast) in a vacuum; this provides an alloy with excellent forging qualities. Binary Be alloys are too expensive for wide use and attempts have been made to prepare ternary alloys requiring less Be but with pronounced age-hardening properties. This is possible because most metals (not Ni) lower the solid soly. of Be in Cu, and age-hardening thus obtains at lower Be contents. Cu with 1% Be shows very little hardening after quenching from 850° and aging at 350°, whereas the addns. 3% Ti, 5% Ag, 5% Si, 5% Mn, 10% Fe, resp., cause marked hardening, roughly up to 260 Brinell hardness no. (BHN). These elements without Be give little hardening, and the effect is to be ascribed chiefly to Be. Cold-working after quenching but before aging increases the rate of aging and the max. hardness. The Cu-Ag-Be alloy shows good elec. cond., 22.10 reciprocal ohms. Ni with 1% Be and 4, 6 and 8% Mo, resp., gives similar results, both on normal aging and aging after cold work (aging at 500°), with BHN up to 450. Ni with Be and Cr shows similar behavior, though Cr appears to form a compd. with Be; results are given for an alloy with 80% Ni, 20% Cr, with 1.2% added Be, quenched from 1000° and aged at 400-500°; BHN approaches 460. The acid- and heat-resisting alloy "Contracid" (60% Ni, 15% Cr, 7% Mo, residue Fe with small amts. of Mn and Si) may be made susceptible to age hardening with 0.6% Be. In the quenched state this alloy may be worked (BHN 200); aging at 500-550° develops a hardness no. of 300; cold working followed by aging gives a hardness no. of 500. This hardness is permanent over a wide temp. range; at 600° no loss of hardness obtains during 60 hrs. This high-temp. stability is greater than that in pure Ni-Be alloys. The resistance to creep (Rohn test) is high. Fe is added to Co to suppress the  $\alpha$ - $\beta$  transformation; 2% Be gives an age-hardening alloy; further addns. of Cr, W, Mo and Fe lead to higher hardness values. A Co-Be-Cr-Fe alloy which has a BHN of 200

in the quenched state develops hardness of 650-700 on aging followed by cold-rolling; this alloy must be cold-rolled after aging whereas the previously described alloys are cold-rolled before aging. The effect of cold-rolling before aging on alloys of Cu + 2.5% Be, Ni + 1.7% Be, Contracid + Be, is shown in a series of graphs (as are the other data in this paper). A table shows values for yield point, breaking strength, elongation, Young's modulus, BHN, notch impact for these 3 alloys after (1) quenching, (2) quenching and aging, (3) cold-rolling and (4) cold-rolling and aging. Special uses for these alloys are discussed.

R. F. Mehl

**Copper-lead anti-friction alloys.** M. P. Slavinskii, A. E. Vol, I. V. Gutman, G. T. Fomin and L. R. Edelson. *Metallurg* 8, No. 4-5, 91-109; No. 6, 3-21(1933).—Cu-Pb alloys with small addns. of Ni, Sn, Zn and P are homogeneous above the m. p., but sep. into 2 layers below the m. p. of Cu with pure Cu freezing out separately. With larger addns. layers of Cu contg. Pb and of Pb contg. Cu are formed. If considerable Ni is present, Pb is evenly distributed in the solid state. Addns. of 1-15% Ni and 1-18% Zn to a 10% Sn bronze contg. 10, 20 and 30% Pb show that Ni raises the m. p. and causes equal distribution and fineness of the Pb particles and decreases the  $\delta$ -constituent. Up to 10% Ni increases the hardness but larger amts. decrease the hardness. Zn causes unequal distribution, decreases hardness and increases plasticity. P also causes unequal distribution of the Pb. A list is given of 18 Cu-Sn-Pb-Ni-Zn alloys probably suitable for bearings.

H. W. Ratlimann

**The elastic properties of the solid solution series Au-Cu and Au-Pd and the alloys of Cu<sub>3</sub>Pt, Cu<sub>3</sub>Pd and CuPd.** H. Röhl. *Ann. Physik* 18, 155-68(1933); cf. C. A. 27, 4457.—The elastic moduli of several alloys and solid solution series were detd. to form conclusions concerning the elastic behavior in superlattice formation. For control of the degree or rearrangement of the atoms in the crystal lattice of the alloys exhibiting the superlattice, measurements of sp. resistance were made. Reflectivity of the Au-Pd series in the region of the visible wave lengths was also detd. The alloys Cu<sub>3</sub>Pt and Cu<sub>3</sub>Pd show the same superlattice effect as Cu<sub>3</sub>Au. CuPd has elastic properties similar to those of CuAu, i. e., smaller modulus in the superlattice, greater in statistical atom distribution. From resistance measurements, the system Au-Pd may be interpreted as a ternary alloy above 35 atomic % Pd consisting of Au, and Pd in the <sup>1</sup>S<sub>2</sub> and <sup>3</sup>F states. Absorption of H by Au-Pd alloys decreases the elastic modulus. The reflectivity of Au-Pd alloys as a function of the compn. is similar to that of Au-Ag alloys.

**Alloys for malleable iron.** Rebecca Hall. *Iron Age* 132, No. 25, 8-9, 60(1933).—Collected information concerning the effect of Al, Sb, B, Ce, Cr, Co, Cu, Mo, Ni, Ti, V, La, Se, Te, U, Bi, V and Zr in malleable Fe.

Downs Schaaf

**An x-ray study of the gold-iron alloys.** Bric-R. Jette, Willard L. Bruner and Frank Foote. *Am. Inst. Mining Met. Eng., Inst. Metals Div., Tech. Pub.* 526, 6 pp. (1934).—The Au-Fe system has been studied by x-ray methods, particularly at temps. below the  $\alpha$ - $\gamma$  transformation of Fe. It has been established that in this range of temps. only the 2 limiting solid soln. phases occur. The limits of these solid solns. have been detd. at several temps. The ferromagnetic character of the solid solns. contg. 10-15% by wt. of Fe has been noted. A series of expts. is reported, which shows that pptn.-hardening of the alloys high in Au is possible.

C. L. Mantell

**Iron-nickel alloys.** O. Dahl and J. Pfaffenberger. *Z. Metallkunde* 25, 241-5(1933).—Permalloy and related alloys develop high permeability when quenched from above 600°, but low when reheated to lower temps. or slowly cooled; these changes can be very conveniently followed by changes in elec. resistance. This behavior may be explained by (1) pptn. of impurities from solid soln. in the neighborhood of 500°; (2) redistribution of the Fe and Ni atoms from a random state at a high temp. to a regular distribution at the lower temp.; (3)-(2) inducing (1). Widely varying O contents were found not

to influence the effect, though widely varying C contents changed the effect in degree. The effect was markedly present in an essentially C-free sample. Data are given for elec. cond., coercive force, permeability and hardness for a series of alloys: 75% Ni, 25% Fe, with addns. of Si up to 5%; 73% Ni, 27% Fe; 73% Ni, 27% Fe with addn. of 5% Si; 60% Ni, 40% Fe, with addn. of 15% Cu; these properties are given for alloys first annealed at 900° or 1000° for 1 hr., air cooled (or quenched), and reheated to increasing temps. for 1-hr. periods. Two % Si eliminates the resistance decrease at 500°, but more than this causes a resistance increase at the same temp., suggesting that Si initiates a process opposite in effect to that occurring in Si-free alloys. Although the evidence seems in favor of a pptn. of phase change, occasionally no change in hardness obtains (alloy with 15% Cu). R. F. Mehl

**Production of ferrovanadium from calcium vanadate.** V. K. Sokovnin. *Metallurg* 8, No. 6, 35-6(1933); cf. C. A. 28, 731<sup>1</sup>.—Expts. show that the simplest and cheapest method of producing ferrovanadium involves pptn. of Ca vanadate and subsequent reduction by Si. Ca vanadate can be substituted for V<sub>2</sub>O<sub>5</sub> in refining. H. W. R.

**Alloys of lithium. II. X-ray analysis of the system lithium-cadmium.** A. Baroni. *Atti accad. Lincei* 18, 41-4(1933); cf. C. A. 27, 1601.—The system Li-Cd has been studied by means of the x-ray with the powder method with a Cu anticathode. The compd. LiCd has thus been shown to have a monometric structure of the type CsCl, the unit cell having a side  $a$  3.32 Å, and coordinates Cd(0, 0, 0) Li( $\frac{1}{2}$ ,  $\frac{1}{2}$ ,  $\frac{1}{2}$ ). LiCd<sub>2</sub> is also monometric (probably) with unit cell  $a$  8.62 Å. The compd. Li<sub>2</sub>Cd found by the thermal analysis could not be identified. A. W. Contieri

**Manganese nickel its properties and technology.** P. I. Gradusov. *Metallurg* 8, No. 6, 46-9(1933).—The addn. of 2.5% Mn to Ni increases the tensile strength, decreases the ductility, and gives a finer microstructure. The alloy shows no noticeable grain growth when heated to 1100° for 5 hr.

**The diagram of state manganese-silicon.** Rudolf Vogel and H. Bedarff. *Arch. Eisenhüttenw.* 7, 423-5(1934).—Thermal and structural investigations showed that, as stated by Doerrnickel, there is no compd. Mn<sub>2</sub>Si but there is a compd. Mn<sub>3</sub>Si<sub>2</sub> with about 3% more Si as well as an inconspicuously melting compd. Mn<sub>2</sub>Si, which dissolves Mn in excess to a limited extent (about 1%). Both transformations of Mn at 1100° and 770° are displaced toward higher temps. with increasing Si content of the Mn-Si solid solns. The transformation equil.  $\beta$ -solid soln.  $\epsilon$  + Mn<sub>2</sub>Si-solid soln.  $k$  =  $\alpha$ -solid soln.  $u$  was detd. It was most pronounced at 900° with 10% Si. M. H.

**Crystal orientations developed by progressive cold-rolling of an alloyed zinc.** M. L. Fuller and Gerald Edmonds. *Am. Inst. Mining Met. Eng., Inst. Metals Div., Tech. Pub.* 524, 8 pp.(1934).—The crystal orientations developed by the progressive cold-rolling of a Zn alloy have been investigated. Cold-rolling yields 3 types of preferred orientation, one of which has not previously been reported in the literature. These structures have been rationalized with the fundamental mechanisms of the deformation of Zn crystals and the changes of form undergone by the metal during rolling. C. L. Mantell

**Modulus of elasticity of annealed  $\alpha$ -bronzes.** Leon Guillet. *Compt. rend.* 197, 1320-1(1933).—Tension, being homogeneous, offers a better medium for tests than either torsion or bending. Excessive precautions were taken to eliminate errors. Av. results were as follows for the ratios of Sn to Cu resp.: 1.92:97.97-12,600; 3.81:96.10 12,300; 6.05:93.85-11,970; 8.02:91.92-11,650; 9.90 90.05-11,260. Gregg M. Evans

**The critical interval in the deformation of melchior and aluminum bronze.** V. A. Bugakov. *J. Tech. Phys.* (U. S. S. R.) 2, 173-89(1933).—Twenty-one photomicrographs and 15 tables are given. The phys. properties and soly. show marked changes in the 20-30% deformation interval. Crystal size and axis ratio  $a/b$  increase rapidly above 20%. Results are similar to those for  $\alpha$ -brass. F. H. Rathmann

**Strength and aging characteristics of the nickel bronzes.** E. M. Wise and J. T. Eash. *Am. Inst. Mining Met. Eng., Inst. Metals Div., Tech. Pub.* 523, 25 pp.(1934).—The authors consider the alloys from 0-12.5% Sn and 0-15% Ni, outlining the methods for the production of test castings and the tensile properties of these castings. Ni leads to improved properties and decreased alloy cost. Max. properties in sand castings are obtained with 5% Sn and 8% Ni at const. cost. The aging characteristics of the sand-cast Ni-bronzes are studied in detail. Tensile strengths in excess of 90,000 lb./sq. in. with elongation of 15% are developed. The effects of various addns. to the 7.5% Ni-8% Sn alloy are reported. The fatigue strength of the sand-cast heat-treated alloy was 18,000 lb./sq. in. at 16,000 cycles. The production and aging characteristics of the wrought Ni bronzes are given. These have tensile strengths of 135,000 lb./sq. in. for annealed and aged alloys and 170,000 lb./sq. in. for the hard rolled and aged alloys. The phys. properties of several Ni bronzes and their interrelation are discussed. C. L. M.

**Superconductivity of alloys from the viewpoint of phase theory.** C. Benedicts. *Z. Metallkunde* 25, 197-202 (1933).—A discussion built largely upon the work of Meissner, Franz and Westermhoff (C. A. 26, 4221). The crit. temp. at which supercond. obtains in alloys on cooling is plotted theoretically against compn. for Roozeboom's 5 types of  $t$ - $x$  diagrams. The effect of heterogeneity upon the crit. temp. is derived from the extreme concns. which may occur on quickly freezing a solid-soln. alloy; this effect gives a range of temps. at which the crit. temp. may occur. Within a range of solid solns. the crit. temp. varies with compn. on a smooth curve; across heterogeneous fields it is stepped, the position of the step depending upon the mode of distribution of the constituents in the alloy. Data on the crit. temps. in the systems In-Pb, Hg-Pb, Bi-Pb, Sn-Tl, In-Tl and Pb-Tl (in which the 5 types  $t$ - $x$  diagrams are represented) are given and found to conform to the general rules laid down. Thus solid solns. can show supercond. Both solid solns. and intermetallic compds. can show a higher crit.-temp. (more easily superconducting) than pure metals. These observations indicate that electrons may readily pass from one atom to an atom of a different kind. R. F. M.

**Equilibrium diagram of iron-aluminum system.** Atomi Ōsawa. *Science Repts. Tōhoku Imp. Univ., First Ser.* 22, 803-23(1933).—The equil. diagram of the Fe-Al system was investigated by means of microscopic examn. and x-ray analysis. A new diagram was constructed from the results. Four compds., (FeAl)<sub>3</sub>, FeAl<sub>2</sub>, Fe<sub>2</sub>Al<sub>3</sub> and FeAl<sub>4</sub>, exist. The first 3 are formed by peritectic reactions, while FeAl<sub>4</sub> solidifies directly from the melt showing a max. m. p. on the liquidus curve. The crystal structure of each phase was detd. by x-ray analysis. C. B. Jenni

**The system copper-beryllium.** H. Tanimura and G. Wassermann. *Z. Metallkunde* 25, 179-81(1933).—The solid soly. of Be in Cu was detd. by precision x-ray measurements of  $a_0$ , the side of the unit face-centered cubic cell. This soly. amounts to 2.1 wt. % Be at the max. (800°), decreasing to less than 1% Be at temps. below 200°. The  $\gamma$ -phase was recognizable on the photograms at temps. as low as 150°.  $a_0$  varies approx. linearly from 3.608 Å. in pure Cu to 3.566 Å. in an alloy with 2.1 wt. % Be. R. F. Mehl

**X-ray studies on the nickel-chromium system.** Eric R. Jette, V. H. Nordstrom, Bernard Queneau and Frank Foote. *Am. Inst. Mining Met. Eng., Inst. Metals Div., Tech. Pub.* 522, 11 pp.(1934).—The equil. diagram of Ni-Cr alloys of a high degree of purity has been studied by x-ray methods of investigating crystal structure. It has been shown that at temps. below 1150° this system consists of 2 terminal solid solns. with an intervening 2-phase area. On the Cr side of the system the soly. of Ni in Cr is low but increases rapidly at temps. above 900°. The soly. of Cr in Ni increases at a rapid but fairly uniform rate as the temp. increases. The soly. found at 1113° is nearly 53 wt. % Cr, which is beyond the eutectic point as detd. by thermal analysis. Reasons for this discrepancy are discussed. No structures were found other than

the body-centered Cr lattice, the face-centered Ni lattice and occasionally the rhombohedral structure of  $\text{Cr}_2\text{O}_3$ . The latter substance has been isolated as inclusions from high-Cr alloys.

C. L. Mantell  
The theories of corrosion. O. A. Knight. *Mineral Ind.*, Penna. State Coll. 3, No. 2, 2, 4; No. 3, 2, 4 (1933); No. 4, 3-4 (1934); cf. C. A. 28, 861.—K reviews the following theories of corrosion: the acid, film, peroxide, direct O attack, colloidal, biol. and electrochem. Soil corrosion and methods for combating atm. corrosion are discussed.

Report of subcommittee V on total-immersion [corrosion] tests. F. B. Olcott, et al. *Proc. Am. Soc. Testing Materials* 33, Part I, 144-6 (1934); cf. Speller, et al., C. A. 27, 3427.

G. G.  
Resistance (to corrosion) of black metals in solutions of barium chloride. M. V. Borodulin. *Khimstrof* 5, 2500-7 (1933).—The weighed metal plates were suspended in the autoclave and heated with stirring (200 r. p. m.) in the solns. in 4 intervals of 10-12 hrs. each (total submersion of 95 hrs.) at 150° and 3 atm. pressure. The losses of wt. were computed in g. per sq. m. per hr. for the 1st and each succeeding interval. With the mixt. of 20%  $\text{BaCl}_2$  and 5%  $\text{CaCl}_2$ , boiler plate showed 0.53, 0.26, 0.19, 0.15; steel, 0.46, 0.23, 0.17, 0.13; cast iron, 0.18, 0.15, 0.11, 0.09; welded iron, 0.35, 0.20, 0.17, 0.14. With the mixt. of 30%  $\text{BaCl}_2$  and 7.5%  $\text{CaCl}_2$ , boiler plate showed 0.32, 0.21, 0.17, 0.15; steel, 0.95, 0.55, 0.37, 0.26; cast iron, 0.22, 0.15, 0.10, 0.08; welded iron, 0.40, 0.22, 0.20, 0.23. Thus with each succeeding interval the corrosion is decreased.

Chas. Blanc  
Corrosion studies on Hydronalium. P. Brenner. *Z. Metallkunde* 25, 252-8 (1933).—The behavior of Hydronalium (Al + 7-8% Mg) in a 3% aq. soln. of NaCl and in sea water was studied in comparison with duralumin and pure Al (99.5% Al), by inspection on the surface and by measurement of tensile strength and elongation upon progressive corrosion. The tensile strength and elongation of Hydronalium in both the hard and soft states are only very slightly affected by corrosive attack by the 3% NaCl soln. in a period of 6 months, whereas both decrease markedly for duralumin and pure Al; similar results were found for corrosion in sea water. Although the present price of Hydronalium is high, the superior corrosion resistance and the ease of welding promise wide application. Addnl. data are given in a discussion.

E. H.  
The corrosion of iron. E. Toporescu. *Compt. rend.* 197, 1040-1 (1933).—From expts. on the rusting of Fe in  $\text{H}_2\text{O}$  and in NaCl solns., T. concludes that oxidation is not due to differential aeration but is assocd. with surface-tension effects.

J. B. Austin  
Corrosion of steel by gases containing traces of hydrogen sulfide: effect of pressure and moisture conditions. John M. Devine, C. J. Wilhelm and Ludwig Schmidt. *Bur. Mines, Tech. Paper* 560, 20 pp. (1933).—Results are given of a study of corrosion of steel by natural gas contg. 12 g. or less of  $\text{H}_2\text{S}$  per 100 cu. ft. of gas. A method for estg.  $\text{H}_2\text{S}$  content of gases and a testing app. for detg. in the field the comparative corrosiveness of a gas at various pressures are described. Traces of  $\text{H}_2\text{S}$  may cause severe corrosion if  $\text{O}_2$  and  $\text{H}_2\text{O}$  are present. Two forms of corrosion have been identified: (a) a less serious form in which no pptd.  $\text{H}_2\text{O}$  is present on the surface of the metal, although the gas may be satd. with  $\text{H}_2\text{O}$  vapor; (b) a severe form in which pptd.  $\text{H}_2\text{O}$  is present on the surface of the metal. Pressure accelerates the reaction, especially in b; also, it may ppt.  $\text{H}_2\text{O}$  on the metal and change a to b. The corrosion threshold concn. of  $\text{H}_2\text{S}$  is lower for b than a. a has the characteristics of chem. attack; b appears to be the result of an electrochem. reaction. The corrosion rate with b increases with a decrease in the thickness of the moisture film on the metal, but with continued reduction the reaction finally loses its electrochem. character and becomes a; b can occur in the absence of  $\text{H}_2\text{S}$  if  $\text{O}_2$  is present. In natural gas pipe lines b is more im-

portant than a. Corrosion losses can be reduced by: (1) removal of  $\text{H}_2\text{S}$  (for pressures up to 300 lb. per sq. in.  $\text{H}_2\text{S}$  should be 0.10 grain or less per 100 cu. ft.), (2) reduction of  $\text{O}_2$  content, (3) control of humidity. A. H. E.

Comparative results on the measurement of corrosion. Jean Cournot and Henri Fournier. *Compt. rend.* 197, 1409-11 (1933).—Several metals after having been exposed to the corrosive action of salt water mist for 2 months were tested by stamping to det. the changes in properties due to the corrosion. Armco iron lost 10% in wt., while the alloys suffered no appreciable loss. By the method of Siebel and Pomp, the Armco iron after corrosion ruptured at a decrease in tensile strength of 9.9%, had an elongation of 26% and sagged 15%. The austenitic steel which contained 18% Cr and 8% Ni, ruptured at its original load and exhibited very little elongation and sag. The ferro-Ni ruptured at a tensile strength 6% less, and exhibited a slight neg. elongation and sag. The duralumin ruptured at a diminution of 53% in tensile strength and gave an elongation of 55 and 33% sag. The Monel metal and brass exhibited quite similar properties, the change in tensile strength and elongation, being quite similar to these properties before corrosion. All metals were tested in the form of sheets, the brass being 2 mm. and the others 1 mm. in thickness. H. E. Messmore

Corrosion tests on weld deposits. F. R. Hensel and C. S. Williams. *Metals & Alloys* 5, 11-16 (1934).—Relative performance of weld metal produced by 4 different types of electrode rods was measured by the ability of the deposited weld metal, obtained from each rod, to resist the action of HCl and NaCl solns. in an alternate-immersion type of corrosion test app.

Mineral-flotation apparatus. Arthur C. Daman. U. S. 1,942,803, Jan. 9. Structural and mech. features. Impact pulverizing apparatus for ores. Alvah D. Hadael. Brit. 399,475, Oct. 2, 1933.

Sintering ores, etc. Fried. Krupp Grusonwerk A.-G.

Brit. 399,383, Oct. 5, 1933. In sintering fine ores or metallurgical products, e. g., flue dust, particularly in blast app., Fe sponge, mixed with the raw ore, etc., is used wholly or in part as the fuel. In sintering poor Fe ores a portion thereof may be worked into sponge by reduction and magnetic sepn. and the remainder sintered with the sponge.

**Roasting pyrites fines.** Raymond F. Bacon and Wilber Judson. U. S. 1,941,592, Jan. 2. In a process for treating pyrites-bearing material in which the material is heated to distil the volatile S of the pyrites and produce a gaseous product contg. elemental S vapor and to convert the pyrites substantially to the monosulfide of Fe which is then roasted to produce a gaseous product contg. SO<sub>2</sub>, the distn. and roasting are carried out while the material is in a gaseous suspension. App. is described.

**Chloridizing ore.** Ralph F. Meyer (to The Meyer Mineral Separation Co.). Can. 337,841, Dec. 12, 1933. Oxidized Fe ore is heated with a carbonaceous reducing agent to form FeO, cooled with the exclusion of O, treated with a Cl-contg. gas at 175–300° to form Fe chlorides, oxidized with a restricted amt. of air, and then the accompanying metals are chloridized. The rate of addn. of the Cl-contg. gas is regulated to maintain the ore at the desired temp. by the heat of the reaction.

**Decomposing ores such as those of aluminum or other metals.** George A. Macready. U. S. 1,941,609, Jan. 2. A charge of ore is blown in mech. suspension in a current of hot CS<sub>2</sub> vapor through a heated passage from which air is excluded to promote chem. reaction between the ore and vapor, and resulting products such as Al sulfide, etc., are sepd. by gravity and temp. control. U. S. 1,941,610 relates to a process in which a charge of ore and C is agitated by a current of hot CS<sub>2</sub> vapor and the products formed are recovered.

**Preparation of iron ore.** Ralph F. Meyer (to The Meyer Mineral Separation Co.). Can. 337,843, Dec. 12, 1933. Oxidized ore contg. Fe is heated at 300–750° with a combustible reducing agent in an atm. contg. SO<sub>2</sub> up to about 1%. The treated ore is cooled to normal temp. with exclusion of free O, to convert the Fe into a lower oxide that is stable toward moisture and highly active toward acidic gases. The ore is subsequently treated with acidic gases.

**Reducing iron ore.** Austin Gudmundsen (to A. O. Smith Corp.). U. S. 1,941,983, Jan. 2. A mixt. of ore and flux is heated to temps. below the sintering temp. of the ore; soft coal is added to the heated mixt. and the mixt. is heated to nearly the sintering temp. of the ore, unheated ore is added in an amt. substantially equal to the amt. of ore in the initial mixt., the heated and unheated ores are mixed, and the resulting mixt. is smelted. App. is described.

**Obtaining metals from siliceous rocks.** Ernst Wydler. U. S. 1,942,015, Jan. 2. See Swiss 159,661 (C. A. 27, 4639).

**Recovering nonferrous metals from melts containing oxides.** Wilhelm Witter (to Firma M. Lissauer & Cie.). U. S. 1,941,506, Jan. 2. Material contg. oxides such as those of Cu, Ni, Sn, Pb, Bi and Sb is melted, and reducing gases are passed through the molten material while it is heated in a furnace in which the heating gases are introduced from above the melt; the interaction between the reducing gases and the combustion gases is so regulated that a neutral to slightly reducing atm. obtains at the surface of the melt, to effect recovery of Cu and Ni present wholly, and Sn, Pb, Bi and Sb at least partly, in reguline form.

**Testing the character of metals such as coins by polarization.** Turner D. Bottomo. U. S. 1,942,040, Jan. 2. Various details of elec. app. and operation are described.

**Extraction of copper.** Edward Eisenhauer, Jr. (1/2 interest to Charles A. Palmer). Can. 337,202, Nov. 14, 1933. A crushed carbonate silicate ore is agitated with H<sub>2</sub>SO<sub>4</sub> and H<sub>2</sub>O for a time sufficient to dissolve the carbonates. HCl is then added and the pulp is agitated for a time sufficient to dissolve the silicates. The leached Cu is recovered.

**Treating copper and its alloys to prevent tarnishing.** Clarence E. Irion (to Battelle Memorial Institute). U. S. 1,942,923, Jan. 9. The metal is treated with a soln. contg. a sol. salt of hydroferrocyanic acid, such as K<sub>4</sub>FeC<sub>6</sub>Na. HOAc or hypophosphorus acid also may be used.

**Mixing molten lead with lighter metallic materials such as calcium, sodium or magnesium.** Ralph F. Cohn. U. S. 1,942,202, Jan. 2. Various details of app. and operation are described.

**Apparatus for producing slag sand or foam free from water and iron.** Bernhard Busch. Ger. 587,690, Nov. 7, 1933 (Cl. 80b. 5.05).

**Molds for casting metals.** Wm. H. Walter. U. S. 1,942,583, Jan. 9. Molds are faced with mold sand treated with a soln. of celluloid in a solvent such as acetone.

**Crucible furnace for smelting metals.** Allgemeine Elektrizitäts-Ges. Ger. 587,729, Nov. 8, 1933 (Cl. 31a. 3.01).

**Metallurgical apparatus suitable for use as a copper converter.** Charles R. Kuzell (to United Verde Copper Co.). U. S. 1,941,606, Jan. 2. A molten bath receptacle is formed with a monolithic lining made from a mixt. comprising magnesite and a binder in which about 13–20 % of the bonded particles are minus 80-mesh, the remaining particles are plus 80-mesh, and the major proportion of the minus 80-mesh particles are minus 200-mesh (the binder, such as molasses being used in the mixt. to about 0.5–10% of its wt.). Cf. C. A. 27, 2274.

**Copper converters.** Zinnwerke Wilhelmsburg G. m. b. H. Ger. 587,735, Nov. 7, 1933 (Cl. 40a. 29). In operating converters for Cu stone, etc., a small amt. of oil is blown in with the air.

**Reducing dust losses from shaft furnaces.** Georg Eichenberg and Nikolaus Wark. U. S. 1,941,545, Jan. 2. See Brit. 349,092 (C. A. 27, 938).

**Rotary furnaces and procedures for the distillation of readily volatile metals, e. g., zinc, cadmium.** Fried. Krupp Grusonwerk A.-G. Brit. 398,573, Sept. 21, 1933, and 398,770, Sept. 21, 1933, divided on 398,573.

**Oil-fired forging furnace suitable for heating metal bars.** Arnold J. Nordenson (to Mahr Mfg. Co.). U. S. 1,942,515, Jan. 9.

**Device for centrifuging metals and alloys.** Emile Vroonen. Ger. 587,849, Nov. 9, 1933 (Cl. 40a. 15.20).

**Annealing.** The Mond Nickel Co., Ltd. Brit. 399,040, Sept. 28, 1933. Steels and alloys contg. Ni are treated by imparting a bright surface thereto, rendering said surface passive and then annealing several hrs. at 1650–2000°F. in a reducing atm., e. g., dry H<sub>2</sub>. The alloys may be washed before annealing. The surface of the steel is rendered passive by heating in HNO<sub>3</sub> soln. at 160–200°F. 15–60 min. Stainless steel contg. Cr 18 and Ni 14% or a Ni-Cr alloy contg. 88% Ni may be treated.

**Annealing and zinc-coating ferrous metals.** Wm. H. Potter. U. S. 1,942,121, Jan. 2. Before being coated with Zn, ferrous metal articles such as coiled wire and strip are introduced into a bath contg. Ca cyanamide which serves to facilitate the subsequent coating. App. is described.

**Heat treatment of metal plates, sheet bars or flat pieces.** Thomas J. Costello. U. S. 1,941,599, Jan. 2. Flat metal pieces or the like are passed through a heating chamber on edge, and their positions are reversed one or more times during their progress through the chamber. App. is described.

**Heat-treating multi-strand flexible cable shafting.** Ralph O. Helgeby (to A C Spark Plug Co.). U. S. 1,942,550, Jan. 9. For removing stiffness and internal friction from multi-strand wire flexible shafting for driving speedometers or the like, the material is passed through a heated furnace having a temp. of about 560° at its entrance, 510° at its middle and 570° at its end. App. is described.

**Heat-treating ferrous metals as in carbonizing iron or soft steels.** James A. Robertson and David Robertson (one-half to George F. McCandless). U. S. 1,942,937, Jan. 9. A mixt. of finely ground slow-burning carbon-producing material, such as sawdust, with charcoal,

Mn, Cr and borax is used as a packing for the articles treated; the temp. of the materials is raised to about 1000-1065° and successive combustion of the charcoal and the slow-burning carbon material is effected, to liberate gases which reduce the Si content and open the grain, and the temp. is maintained for a time sufficient to effect desired penetration of C, Mn and Cr into the grain of the metal.

**Cementation mixtures for ferrous metals.** Alexandre Folliet and Nicolas Sainderichin. U. S. 1,943,171, Jan. 9. An oxide of Ti, Mn, Ni, Cr or W is used with a chloride of the same metal and finely divided Al.

**Forming thin-walled seamless metal tubing.** Jerry J. Dunn and Peter C. Patterson (to National Tube Co.). U. S. 1,942,541, Jan. 9. Features of heat treatment and mech. operation are described.

**Woven wire cloth.** Elmer D. Reynolds (to Reynolds Wire Co.). U. S. 1,942,451, Jan. 9. Ferrous wire of a diam. less than 0.02 in. is woven into cloth of less than 12 mesh, and the cloth is heated to a temp. within the bluing range of steel for a sufficient time to relieve materially the strains in the wire.

**Articles such as manhole covers of ductile cast iron.** Frank A. Fahrenwald (to American Brake Shoe and Foundry Co.). U. S. 1,941,671, Jan. 2. Articles of integral section are produced by casting an unstable mixt. contg. C 2.5-3.5, Si 1.3-0.6% and Fe under chilling and nonchilling conditions, heating the article to about 870-1000° to produce in the chilled part of the article a brittle compn. contg. nodular graphite, quickly quenching the article through the crit. temp. to retain the graphite structure in the brittle compn., heating the article to a temp. below the crit. temp. to reduce the brittleness of the chilled part of the article and render this part tough, then cooling the article to atm. temp. (heating, quenching and cooling not materially affecting the unchilled part of the article).

**Cast iron brake shoes.** Frank A. Fahrenwald (to American Brake Shoe and Foundry Co.). U. S. 1,941,672, Jan. 2. For making a brake shoe suitable for railway service, a casting is first made in white iron contg. C 2.2-3.5 and Si 1.25-0.70%, and the portions of the shoe other than the wearing portion are then chilled, the shoe is subsequently maintained at a temp. of about 870-980° for a sufficient time to decompose the cementite in such portions, at least in part, with liberation of secondary graphite in nodular form, and the shoe is finally cooled through the crit. range.

**Brake drum.** John MacLennan (to Kelsey-Hayes Wheel Corp.). U. S. 1,943,224, Jan. 9. Various details of sheet-metal treatment by cupping, rolling, etc., are described to form a drum of stabilized metal within which a lining is then cast.

**Forming brake drums.** John W. White (to Kelsey-Hayes Wheel Corp.). U. S. 1,943,198, Jan. 9. An annular brake-engaging member is centrifugally cast from metal such as steel within a mold, to a back plate which may be formed of sheet metal, and the surface of the cast material is subjected to rolling while hot.

**Projectiles.** Aktiebolaget Bofors. Brit. 398,045, Sept. 7, 1933. Driving-bands for projectiles are made from Fe derived from Fe(CO)<sub>5</sub>, the powd. Fe thus obtained being converted into coherent form by sintering. C, O, Mn and other impurities should be as low as possible.

**Steel.** Wm. H. Lewis. U. S. 1,941,562, Jan. 2. Steel scrap is melted in a regenerative furnace, pig iron is added to the furnace, the entire charge is superheated to about 1600°, then transferred to a Bessemer converter and Bessemerized. App. is described.

**Steel.** Clarence I. Justheim. U. S. 1,942,173, Jan. 2. A steel-producing charge is melted in the presence of a siliceous slag, the slag is removed, and there is placed upon the metal a carbonaceous shale contg. 40-70% silica and the materials are heated to form a second clearing slag and to ppt. nascent Si into the steel; the melt is then deoxidized.

**Steel.** Canio Boichichio. Brit. 399,796, Oct. 4, 1933. See Fr. 738,517 (C. A. 27, 944).

**Steel for telephone transmission lines.** Frederick M. Crapo (to Indiana Steel & Wire Co.). U. S. 1,942,411, Jan. 9. Overhead telephone transmission lines are formed of a series of many spans of wire of hypo-eutectoid carbon steel contg. not less than 0.25% of C.

**High-silicon manganese steel.** Abner C. Jones (to Lebanon Steel Foundry). U. S. 1,941,556, Jan. 2. Steel scrap is melted under oxidizing conditions, ore is added to reduce the C content, silica sand is afterward supplied on the surface of the bath; C is permitted to react with oxide in the steel and the slag, more C is added, silico-Mn is added after the boiling has subsided, the temp is increased, and ferro-Si and more silico-Mn are added.

**Free-scaling and free-machining nickel alloy steel.** Herbert J. French and John W. Sands (to International Nickel Co.). U. S. 1,941,547, Jan. 2. An alloy steel is made contg. Ni about 1% to about 7%, the remainder being formed from "commercial" iron with incorporation of Zr sulfide in such amt. as to give a S content of about 0.05-0.15%, by which a free-scaling steel is produced which has easily detachable scale with a friable intermediate layer, which forms a greater amt. of scale when heated and requires a substantially lesser amt. of power to machine than an untreated low-Ni alloy steel.

**Alloy steel.** Hermann J. Schiffer. U. S. 1,942,779, Jan. 9. An alloy suitable for rolled, punched or forged products which are scale proof up to 800° comprises a low alloyed soft steel contg. Al about 2.8, Cr about 0.8, Mo about 0.1 and W about 0.1%, the balance being Fe except for usual nonmetallic constituents.

**Alloy steels.** Paul Kühn (to Vereinigte Stahlwerke A.-G.). Brit. 399,401, Oct. 5, 1933. Addn. to 369,258 (C. A. 27, 2127). In the process of 369,258 alloying metals, e. g., Cr, Mo, V, Ti, W, Cu, Ni, unless already present in the charge, are added to the slag in combined form, e. g., as ores, and are reduced from the slag in addn to the Mn present, passing into the steel bath.

**Steel alloys.** Hermann J. Schiffer. Brit. 398,680, Sept. 21, 1933. Heat-resistant steel alloys contg. Cr and Al contain also 0.06-1% P and less than 0.05% S. The alloys may contain Cr 2-24 and Al 0.2-4%, with or without Ni 0.2-10 and Si 0.2-4%. Up to 2% of any 1 of the metals Mn, Mo, V, Co, Ti, Cu, Be and Zr and up to 3% of a no. of them may also be present.

**Steel alloys.** Augustus B. Kinzel (to Electro Metalurgical Co.). Brit. 399,643, Oct. 12, 1933. Corresponds to Fr. 741,679 (C. A. 27, 2667), but gives addnl. information.

**Alloy.** Harry J. Lingal (to Westinghouse Electric & Manufacturing Co.). Brit. 399,695, Oct. 12, 1933. The alloy consisting of Ag 40 and W 60%, is used for the contacts of an elec. switch.

**Alloys.** Albert W. Jackson and Willoughby Baker. Brit. 398,663, Sept. 21, 1933. A phone consists of an alloy comprising Pb 95 and Sn 5%.

**Alloys.** Deutsche Edelstahlwerke A.-G. Brit. 399,318, Oct. 5, 1933. The bodies and (or) pole-pieces of permanent or electro-magnets are made by heating compressed powd. metal inductively to a sintering temp. by current in a coil of Cu tubing. A suitable compn. contains Co 5-50, W 1-20, Cr 0-5, Mo 0-15, C 0.5-7% and the remainder Fe.

**Sintered hard alloys.** Tool Metal Manufacturing Co. Ltd. Brit. 398,661, Sept. 21, 1933. The alloys contain at least 1 refractory nitride and at least 1 refractory boride or silicide, the total amt. of nitride, boride and silicide being at least 55%. The nitride and the sum of the boride and silicide should each exceed 10%. Up to 25% of lower-melting metals, e. g., Ni, Co, Cr and up to about 20% of refractory carbides may be contained. Cf. C. A. 27, 5301.

**Sintered hard alloys.** Fried. Krupp A.-G. Brit. 398,932, Sept. 28, 1933. Alloys applicable, e. g., for valves, cutting tools, rayon spinning nozzles, surgical instruments, etc., comprise about 30-97% of the double carbide 3Cr<sub>2</sub>C<sub>3</sub>W<sub>2</sub>C together with 1 or more metals of the Fe, Cr, V and Ti groups and with or without 1 or more carbides or carbonitrides of these metals.

**Electrode alloy.** Erwin F. Lowry (to Canadian Westinghouse Co. Ltd.). Can. 837,987, Dec. 19, 1933. An alloy for use as cathode material in a television tube consists of Ni 70, Co 20, Fe 8 and Ti 2%. These proportions may be varied and Zr or Th may be substituted for the Ti. Cf. C. A. 27, 3697.

**Refractory alloy.** John A. Heany (to The Sirian Lamp Co.). Can. 336,645, Oct. 24, 1933. An alloy of W and Y having the property of selective radiation at luminous temp. is specified.

**Alloy for surgical needles.** Wilhelm Rohn. U. S. 1,942,150, Jan. 2. An alloy is used comprising Ni together with Fe up to 25, Be 0.3-3.0, Cr 10-20, Mo 2-5, W 3-8 and Co 1-5%.

**Aluminum-base alloy.** Theodore W. Bossert (to The Aluminum Ltd.). Can. 227,970, Dec. 19, 1933. An Al alloy contains Mn 0.75-3.0, Mg 0.2-0.5%. The addn. of the Mg inhibits grain growth.

**Aluminum-silicon alloy.** Louis W. Kempf and Ivan R. Dawson (to The Aluminium Ltd.). Can. 337,971, Dec. 19, 1933. A comminuted mixt. of Al 10-80% and Si 20-90% is subjected to pressure to form a dense, homogeneous mass which is heat-treated above 300° and below the temp. at which the most fusible constituent of the alloy will melt. The addn. of Mg and Be decreases the sp. gr. without impairing the low thermal expansivity of the high compressive strength of the original mixt. Addns. of Fe, Mn and the like modify the properties of the compressed product for a variety of uses.

**Copper alloys.** Naraina Das-Chopra. Brit. 399,219, Oct. 2, 1933. See Fr. 753,562 (C. A. 28, 1013°).

**Hardening copper-zinc alloys.** Henry W. Brownson, Maurice Cook, Herbert J. Miller and Imperial Chemical Industries Ltd. Brit. 399,177, Sept. 25, 1933. Cu-Zn alloys, contg. Zn up to 37, Ni at least 2 and Al at least 0.5%, are heated to about 900°, rapidly cooled and reheated to about 300-500°. Cold-working may be interposed between the cooling and the reheating. The alloys preferably contain 1-3% Al and at least 3 times as much Ni.

**Iron alloys.** Maschinenfabrik Meier A.-G. Brit. 399,502, Oct. 10, 1933. A mold for casting steel ingots is formed of pig Fe contg. 0.1-0.5% Mo. The Fe may contain 3-4% C and the usual Mn, Si, P and S. The Mo is added as Fe-Mo to the fused Fe in the ladle.

**Low-thermal-expansion iron-base alloys.** Howard Scott (to Westinghouse Elec. & Mfg. Co.). U. S. 1,942,260, Jan. 2. Alloys which may be sealed into glass contain Fe together with Ni and Co to total of 43-55% to obtain inflection temps. above approx. 300° (the Co being at least about 12% to obtain low expansivity and the Ni at least 15%). U. S. 1,942,261 relates to low-expansion Fe-base alloys contg. a total of Ni and Co of 33-38% and small amts. up to the order of 1% of C and Mn, the amt. of Co being 2-8%, and the alloy being of reversible, low expansivity below about  $8 \times 10^{-6}$  expansivity.

**Ferrous alloys containing chromium, nickel and aluminum, etc.** Percy A. E. Armstrong. U. S. 1,941,648, Jan. 2. Alloys of malleable and machinable character and which are resistant to hot oxidation contain Fe together with Si present as a result of melting operations but not exceeding about 1% (the sum of the Si and any Mn present being below 3%), Cr 5-25, C not over 1.5, Ni 10 or less and Al about 0.3-4.5% (but in excess of the C).

**Nitriding ferrous alloys.** Soc. anon. Commentry, Fourchambault et Decazeville. Brit. 398,834, Sept. 14, 1933. Ferrous austenitic alloys contg. Ni (and Cr), in which the Fe is in the  $\gamma$  state and which contain C 0-1, Al 0-7, Cu 0-20, Si 0-5, W 0-10, Mo 0-10, V 0-2, Ti 0-2, Zr 0-2 and (or) B 0-4%, are nitrided at 550-950°, preferably at over 600°. They may be annealed in a vacuum and subjected to the treatments of Brit. 371,334 (C. A. 27, 2667). In an example an alloy contg. C 0.33, Si 0.88, Mn 1.28, Ni 30.52, Cr 15.22, Al 2.40 and Mo 0.45% is heated to 1000°, cooled 0.5 hr. in air and nitrided 48 hrs. at 650°.

**Alloys of lead with alkaline earth metals and magnesium.** Jesse O. Betterton (to American Smelting and Refining Co.). U. S. 1,941,534, Jan. 2. Particles of carbides of

the alloying metals are added to molten Pb, and the bath is covered with a protecting slag, which serves to dissolve undesired coatings and impurities from the surface of the carbide particles. U. S. 1,941,535 relates to a similar process and describes app. for vigorously agitating the molten bath and assocd. material.

**Magnesium alloys.** The Dow Chemical Co. Brit. 398,760, Sept. 21, 1933. See U. S. 1,918,260 (C. A. 27, 4769).

**Magnesium alloys containing tin, aluminum and manganese.** Robert T. Wood (to Magnesium Development Corp.). U. S. 1,942,041, Jan. 2. Alloys which have good strength, yield point and elongation contain Mg together with Sn 0.1-12.0, Al 0.5-6.0 and Mn 0.1-1.0%. Zn 0.1-5.0% also may be added for extrusion purposes.

**Ductile rolled products from magnesium-base alloys.** Robert D. Lowry and Fred L. Reynolds (to Dow Chemical Co.). U. S. 1,941,608, Jan. 2. In producing a ductile rolled product from a Mg-base alloy which has been previously rolled to about the final thickness at a temp. above about 315°, the metal is repeatedly passed between the rolls of a mill at a temp. between 5° and about 175° so as to produce a relatively small cumulative reduction in thickness, and the rolled metal is annealed.

**Silver alloys.** Hedley A. Sloman. Brit. 399,261, Oct. 5, 1933. Ag alloys contg. 90% or more Ag contain also 1.5% Be. An example consists of Ag 92.5, Cu 7 and Be 0.5%.

**Silver alloys.** Daniel Gray, Richard O. Bailey and William S. Murray (to Oneida Community Ltd.). Can. 338,197, Dec. 26, 1933. Tarnishing of articles formed of Ag or of alloys contg. Ag is retarded or inhibited by electrodepositing In on the article and thereafter diffusing the In through the Ag by the application of heat.

**Zinc alloy.** Leland E. Wemple and Floyd A. Warren. Can. 337,224, Nov. 21, 1933. Alloys are prepd. by adding Zn 100, Cu  $\frac{1}{4}$  to 2 parts and a small proportion of a metal or metals of the seventh horizontal series of the periodic system such as Ag. The alloys should be free from Al, Pb or Mg. The alloy has a higher tensile strength than Zn or known Zn-base alloys.

**Apparatus for use of solvent vapors such as gasoline or carbon tetrachloride for removing grease from metal articles.** Clarence F. Dinley (to Rex Products & Mfg. Co.). U. S. 1,942,355, Jan. 2. Various structural and operative details are described.

**Coating aluminum.** Frank M. Clark (to The Canadian General Electric Co. Ltd.). Can. 337,120, Nov. 14, 1933. Al to be coated is immersed, without the application of externally applied elec. energy, in a soln. contg. sodium silicate 2.5 to 12.0%, NaOH 2.0 to 6.0% and  $\text{NH}_3$  1.5 to 2.5% by wt. An adherent insulating coating is produced.

**Plating ferrous articles with aluminum or its alloys.** Erik H. E. Johansson. U. S. 1,941,750, Jan. 2. See Brit. 363,158 (C. A. 27, 1316).

**Coating iron and steel.** Curtin-Howe Corp. Brit. 398,685, Sept. 21, 1933. See U. S. 1,895,568 (C. A. 27, 2418) and Can. 334,903 (C. A. 27, 5267).

**Coating for iron and steel.** Leo P. Curtin and Bernard L. Kline (to The Curtin-Howe Corp.). Can. 338,010, Dec. 19, 1933. Iron or steel articles to be coated are immersed in a bath of ferric oxalate 50 and oxalic acid 25 parts per l. at a suitable temp., allowed to remain until a fine-grained, satiny coating is obtained, then withdrawn, washed and dried. The coating forms a bond for painting, etc.

**Improving aluminogenetic iron joints such as welded rail joints formed by the aluminothermic welding process.** Wilhelm Sander (to Th. Goldschmidt A.-G.). U. S. 1,942,004, Jan. 2. Tenacity and chem. resistance are improved by incorporating with the aluminogenetic iron a total of not more than 4% of Cr and either Co or Ni (the Co or Ni being used in 1 to 4 times the quantity of the Cr); the tensile strength, resistance to impact, tenacity and d. are improved by adding 3% or less of Ti and a total of not more than 2% W, Mo and V.

**Electric welding.** Willy Kreutz (to Felix Schull). U.

S. 1,943,123, Jan. 9. Contacting faces of material are subjected to the action of an elec. current at welding temp. without pressing the faces together, and, simultaneously, there is passed over the surface a flame contg. an excess of carbon for depositing carbon on the surfaces to be welded; the passage of the elec. current is continued after the m. p. of the material is reduced by the deposition of carbon, so that a weld is produced without ridges or slugs.

**Welding electrodes.** Arnold C. Rood (to Una Welding & Bonding Co.). U. S. 1,942,364, Jan. 2. An electrode for building up surfaces or joining metals contg. C comprises a steel rod carrying a coating contg. C in sufficient amt. to provide weld metal of about the same hardness as the metal to be built up or welded, deoxidizing agents such as Ti, V or Zr or their ferrous alloys also being used in only about sufficient amt. substantially to

1 prevent the gasification of C in the molten weld metal, so that a weld of desired C content is formed.

**Welding electrode and flux.** Louis G. Anastasiadis. Can. 837,746, Dec. 12, 1933. A welding electrode has a base rod of Al and a flux coating 0.025-0.045 in. thick. The flux consists of KCl, 55-65%, LiF 22-26%, Na Al fluoride 10-14%, NaF 2-5% and an alkali metal dichromate 0.1-1%. The m. p. of the flux is substantially the same as, or slightly higher than that of the base rod.

2 **Soldering irons.** The General Electric Co. Ltd. and John R. Hunt. Brit. 399,987, Oct. 19, 1933. A soldering iron, comprising a Cu bit slidable through a tube heated by an elec. heating element, has the surface of the bit in contact with the tube coated with a layer of less easily oxidizable material, Cu being a main constituent thereof. This may be effected by heating the bit to about 350° in Zn dust or 900° in Al dust.

## 10—ORGANIC CHEMISTRY

CHAS. A. ROULLER AND CLARENCE J. WEST

**Elementary organic reactions.** F. O. Rice. *J. Am. Chem. Soc.* 56, 488-90 (1934).—The following activation energies have been assigned to the reactions listed and the reason for such value is stated.  $H + CH_4 \rightarrow H_2 + Me > 20$ ;  $H + C_2H_4 \rightarrow H_2 + MeCH_3$  17;  $Me + H_2 \rightarrow CH_4 + H$  23;  $MeCH_3 + H_2 \rightarrow C_2H_6 + H$  25;  $Me + C_2H_4 \rightarrow CH_4 + MeCH_3$  20;  $Me + Me_2CO \rightarrow CH_4 + AcCH_3$  15;  $Me + Me_2O \rightarrow CH_4 + MeOCH_3$  15;  $Me + AcH \rightarrow CH_4 + MeCO$  15;  $CH_4 \rightarrow Me + H$  100;  $CH_4 \rightarrow CH_3 + H$  100;  $Me \rightarrow CH_3 + H$  100;  $C_2H_6 \rightarrow 2Me$  79.5;  $MeCH_3 \rightarrow C_2H_4 + H$  49;  $AcCH_3 \rightarrow CH_3CO + Me$  48;  $MeOCH_3 \rightarrow HCHO + Me$  38;  $MeCO \rightarrow CO + Me$  10.

C. J. West

**Thermal decomposition of organic compounds from the standpoint of free radicals.** V. The strength of bonds in organic molecules. F. O. Rice and Wm. R. Johnston. *J. Am. Chem. Soc.* 56, 214-19 (1934); cf. *C. A.* 27, 5713.—The activation energy of the decompn. of  $C_2H_6$ ,  $Me_2CO$ ,  $C_2H_6$ ,  $C_4H_{10}$ ,  $C_4H_{12}$ ,  $C_7H_{16}$ ,  $Me_2CO$ ,  $AcH$ ,  $EtOH$ ,  $Et_2O$ ,  $Me_2O$ ,  $(C_2H_5)_2O$ ,  $Me_2N$  and  $Me_2NH$  into free radicals has been measured by passing the compds. rapidly, at low pressures, through a furnace heated to different temps.; the extent of the decompn. into free radicals was detd. by means of the Paneth effect on metallic mirrors. The ether C—O bond is stronger than the C—C bond as shown by the activation energies for  $Me_2O$ ,  $C_2H_6$  and  $C_4H_{10}$  which are, resp., 81.1, 79.5 and 71.5 cal. The C—N bond is relatively weak, since the activation energy of  $Me_2N$  is only 50.8; the 3-membered ring compd.  $(C_2H_5)_2O$  is the least stable compd. examd., decompn. with an activation energy of only 44.0 cal. There seems to be a definite diminution in stability in passing from the lower to the higher members of a homologous series. VI. The mechanism of some chain reactions. F. O. Rice and K. F. Herzfeld. *Ibid.* 284-9.—A discussion of the reaction mechanism postulated by the theory of free radicals shows that the decompn. of  $C_2H_6$ ,  $Me_2CO$  and  $Me_2O$  must be of the 1st order, the disson. of  $AcH$  of the 1.5th order, while the formation of  $C_2H_6$  from  $C_2H_4$  and  $H_2$  of the 2nd order. The essential condition in the 1st order equation is that the chain shall be terminated by a reaction between the 2 different carriers of the chain. In  $AcH$  the 1.5th order results from the fact that the chain is terminated by the reaction of 2 Me groups. This difference is due to a difference in the heats of activation. The heats of activation can be detd. from the measured reaction rates with considerable certainty and it is seen that they fit the observed orders of the reaction, whereas assigning different values to the heats of activation might be expected to lead to a different order. Although there is as yet no exptl. evidence for the presence of reaction chains in these decompns. and, further, there has been no direct exptl. demonstration even of the presence of free radicals below 700°C. and above a few mm. pressure, nevertheless it is pointed out that the only way to avoid chain reactions as the

explanation of the measured rates would be to increase the heats of activation involved to quite improbable values.

C. J. West

4 **Number of structural isomers of the more important types of aliphatic compounds.** Henry R. Henze and Charles M. Blair. *J. Am. Chem. Soc.* 56, 157 (1934).—The structural isomerism of the more important types of aliphatic compds. has been considered and for each of these types (esters,  $NH_2$  compds., glycols and disubstituted paraffins ( $C_nH_{2n}XY$  and  $C_nH_{2n}X_2$ )) the no. of structural isomers, for certain C atom contents, have been calcd.

C. J. West

5 **Vapor-phase oxidation of hydrocarbons. I.** The amount and rate of oxidation of heptane as a function of temperature. Harold A. Beatty and Graham Edgar. *J. Am. Chem. Soc.* 56, 102-6 (1934).—The effect of temp. on the amt. and rate of autoxidation of a theoretically equiv. mixt. (2%) of heptane vapor in air has been studied by the flow method at atm. pressure in a clean Pyrex tube. As the max. temp. in the gas is increased, the oxidation proceeds in a series of well-defined stages, as follows: 150-250°, a very small amt. of reaction, possibly heterogeneous; 250-350°, with rapidly increasing velocity, a primary reaction, with 3 mols. of O per mol. of fuel input takes place and is terminated within the furnace; 350-470°, a subsequent reaction raises the O used to 4.70 mols. (42.7% of the theory), which remains const.; the velocity of both the primary and subsequent reactions decreases rapidly with increasing temps., the 10° temp. coeff. being about 0.85 from 380° to 470°; 470-510°, the velocity of the primary reaction continues to decrease, but the subsequent reaction now becomes accelerated and above 490° the final amt. of O used is increased; about 510° inflammation occurs. II. The relative oxidizabilities of heptane, 1-heptene, 3-heptene and heptane-2,2,4-trimethylpentane mixtures. *Ibid.* 107-11.—By means of a Pyrex furnace and the flow method, a comparative study has been made of the oxidation, at different temps., of theoretically equiv. (2%) mixts. in air of heptane (I), 1-heptene (II), 3-heptene (III), isooctane (2,2,4-trimethylpentane) (IV) and isooctane mixed with 1 or 3 vols. of I. The temp. of initial oxidation of the 2 olefins is the same for each and is 56° higher than that of I. The general course of the reaction and the max. O consumption (about 40% of the theory) are alike for these 3 hydrocarbons but the relative reaction velocities are distinctly different, increasing in the order: III, II, I. It appears that, under the conditions used, the oxidation of II and III does not begin at the double bond. IV, itself very inert toward O, when mixed with I exercises a slight inhibitory effect on the oxidation of the latter fuel and undergoes induced oxidation. There is evidence that this effect is much more pronounced at higher relative concns. of IV, resulting in a very low rate of reaction and in an induced oxidation of over 3 mols. of IV per mol. of I

oxidized, a behavior parallel to the antiknock characteristics of such mixts. From about 400° to 500° a marked neg. temp. coeff. of reaction velocity is observed for each fuel, with the exception of pure IV which undergoes only a trace of oxidation in this range. III. Chemiluminescence of heptane. *Ibid.* 112-14.—The autoxidation of a theoretically equiv. (2%) mixt. of heptane in air from the temp. of initial reaction (250°) to the point of inflammation (525°) emits a visible chemiluminescence, which appears as a steady, diffuse glow except at the "lower ignition point" (270-300°) where moving "cold flames" sweep along the furnace walls. By directing the fuel charge into the center of the furnace, the glow may be observed there, entirely removed from the walls. The autoxidation of 3-heptene emits a luminescence differing from that of heptane in a manner corresponding to the relative rates of reaction of the 2 fuels. C. J. West

Hydration of unsaturated compounds. I. The hydration rate of isobutene in dilute nitric acid. Howard J. Lucas and W. Ferdinand Eberz. *J. Am. Chem. Soc.* 56, 460-4 (1934).—The hydration of isobutene (I) is catalyzed by HNO<sub>3</sub> and at const. ionic strength the rate is 1st order with respect to both the I concn. and the HNO<sub>3</sub> concn. The rate at a given acid concn. is increased on the addn. of KNO<sub>3</sub>. This increase in rate is greater than the increase in the activity of I when detd. by means of distribution expts. in CCl<sub>4</sub>. In the presence of certain metallic ions, some of which have been stated to be catalysts for the hydration of alkenes in more concd. acids, the sp. reaction rate for the hydration of I in 0.20 N HNO<sub>3</sub> is substantially unchanged. Mixts. of the normal butenes are not hydrated at 25° in N HNO<sub>3</sub>. C. J. W.

The isolation of free methyl and ethyl by the reaction between sodium vapor and methyl and ethyl bromides. J. Horn, M. Polanyi and D. W. G. Style. *Trans. Faraday Soc.* 30, 189-99 (1934).—See C. A. 28, 1013<sup>a</sup>.

E. H.

Addition of hydrogen bromide to 4,4-dimethyl-1-pentene. M. S. Kharasch, Chester Hannum and M. Gladstone. *J. Am. Chem. Soc.* 56, 244 (1934).—The direction of addn. of HBr to 4,4-dimethyl-1-pentene is governed by the peroxide content of the material or reagent. If the reaction is carried out *in vacuo* 50% of 2-bromo-4,4-dimethylpentane, *b*<sub>24</sub> 59.4°, *n*<sub>D</sub><sup>20</sup> 1.4463, is obtained; in air or in the presence of peroxides the 2-Br deriv. is formed. C. J. West

Ozonolysis of purely aliphatic olefins. The behavior of the five simplest normal alkyl radicals in the dehydration of tertiary alcohols. James M. Church, F. C. Whitmore and R. V. McGrew. *J. Am. Chem. Soc.* 56, 176-84 (1934).—This study of ozonolysis was undertaken to make available methods for the detn. of mixts. of isomeric olefins as obtained by the dehydration of tert. alcs. The ozonides were prepd. from solns. of the olefins in a mixt. of paraffin hydrocarbons of boiling range 0-30°; usually the solvent was removed and the ozonides were decompd. by H<sub>2</sub>O and Zn in the presence of traces of Ag and hydroquinone. The olefins were prepd. from the tert. alcs. or by direct heating of the Grignard complexes; the products of the 2 methods were the same; heating the Grignard complex was shorter but the yields were lower. The dehydration of the alcs. by I was dependent on the temp. used, thus, *tert*-AmOH is not dehydrated by I at 102° but is readily dehydrated at 2 atm. and 128°; triamylcarbinol and I at 170° (reduced pressure) give 95% of 6-amy-5-undecene. From all of the dehydration results the conclusion is reached that the decreasing order of ease of supplying the H to go with the HO is as follows: Et, Bu, Am, Me; slight exceptions occur only with the carbinols R'R<sub>2</sub>COH and only when the alkyls involved are adjacent in the list. In some cases in which R contained 1 more C than R' the amt. of dehydration from the R groups was slightly more than twice that from the R' group. Full details are given of the technique of ozonolysis. Data are given for 24 carbinols (*b. p.* and *n*) and for the olefins produced (*b. p.* and *n*), also for the products isolated by the action of O<sub>3</sub> on the olefins, and from these data the results of dehydration of 22 of these alcs. Et-

COH, Pr<sub>2</sub>COH, Bu<sub>2</sub>COH and Am<sub>2</sub>COH give 100%, resp., of 3-ethyl-2-pentene, 4-propyl-3-heptene, 5-butyl-4-nonene and 6-amy-5-undecene; Me<sub>2</sub>EtCOH gives 22 and 78% of 2-methyl-1- and 2-butene; Me<sub>2</sub>BuCOH gives 55 and 45% of 2-methyl-1- and 2-hexene; Me<sub>2</sub>-AmCOH, 40 and 60% of 2-methyl-1- and 2-heptene; Et<sub>2</sub>MeCOH, mainly 3-methyl-2-pentene with a trace of 2-ethyl-1-butene; Et<sub>2</sub>PrCOH, 80 and 20% of 3-ethyl-2- and 3-hexene; Et<sub>2</sub>BuCOH, 90 and 10% of 3-ethyl-2- and 3-heptene; Et<sub>2</sub>AmCOH, 85 and 15% of 3-ethyl-2- and 3-octene; Pr<sub>2</sub>EtCOH, 50% of 3-propyl-2-hexene and 50% of 4-ethyl-3-heptene; Pr<sub>2</sub>AmCOH, 60 and 40% of 4-propyl-3- and 4-nonene; Bu<sub>2</sub>EtCOH, 40% 3-butyl-2-heptene and 60% 5-ethyl-4-nonene; Bu<sub>2</sub>PrCOH, 25% 4-butyl-3-octene and 75% of 5-propyl-4-nonene; Bu<sub>2</sub>-AmCOH, 60 and 40% of 5-butyl-4- and 5-decene; Am<sub>2</sub>MeCOH, 90% 6-methyl-5-undecene and 10% 2-amy-1-heptene; Am<sub>2</sub>PrCOH, 67% 6-propyl-3-undecene and 33% 4-amy-3-nonene; MeEtBuCOH, 15% 2-ethyl-1-hexene, 55 and 30% of 3-methyl-2- and 3-heptene; MeEtAmCOH, 20% 2-ethyl-1-heptene and 50 and 30% of 3-methyl-2- and 3-octene; MePrAmCOH, 20% 2-propyl-1-heptene and 50 and 30% of 4-methyl-3- and 4-nonene; MeBuAmCOH, 15% 2-butyl-1-heptene and 45 and 40% of 5-methyl-4- and 5-decene. C. J. West

Relative mobilities of organic radicals in the chlorosulfites. P. Carré. *Bull. soc. chim.* 53, 1075-84 (1933); cf. C. A. 27, 4211.—Alkyl chlorosulfites on heating decomp. to give SO<sub>2</sub> and alkyl chlorides. Aryl chlorosulfites also decomp. when heated, giving SO<sub>2</sub> with but little or no aryl chloride. Since the temp. of decompn. in the presence of a mol. of C<sub>6</sub>H<sub>5</sub>N varies with the alkyl or aryl group, it has been used as a basis to compare the relative mobilities of the various org. radicals. A series of 35 alkyl and 11 aryl chlorosulfites were thus studied. The relative electropositivities of the radicals found by this method show a few variations from those found by other methods. E. W. Scott

Chlorides of the alkyl- and arylsulfurous acids (alkyl and aryl chlorosulfites) and mixed sulfurous esters. P. Carré and D. Libermann. *Bull. soc. chim.* 53, 1050-75 (1933); cf. C. A. 27, 711, 3912.—The following alkyl chlorosulfites (ROSOCl) were prepd. by adding the alc. to a 10-20% excess of SOCl<sub>2</sub> at room temp., followed by 48 hrs. standing: Bu *b*<sub>11</sub> 88°, β-ClC<sub>2</sub>H<sub>4</sub> *b*<sub>20</sub> 100-1°, C<sub>7</sub>H<sub>15</sub> and C<sub>10</sub>H<sub>21</sub>, which decompd. on distn. Alkyl alc., PhCH<sub>2</sub>OH and substituted benzyl alcs. gave only the chloride when so treated. Sec. and tert. alcohols were dehydrated or converted to chlorides by the SOCl<sub>2</sub> unless first mixed with C<sub>6</sub>H<sub>5</sub>N, in which case some gave small yields of chlorosulfites. The following chlorosulfites were prepd. in good yields by treating a neutral sym. or mixed sulfite with SOCl<sub>2</sub>; allyl *b*<sub>20</sub> 32°, *iso*-Pr *b*<sub>11</sub> 71-3°, *sec*-Bu *b*<sub>20</sub> 75°, cyclohexyl, benzyl and *tert*-Bu, the last 3 being too unstable to distil. PhOH reacted with SOCl<sub>2</sub> to give nuclear-substituted products. The aryl chlorosulfites were prepd. by treating the neutral sulfites, formed from PhOH, C<sub>6</sub>H<sub>5</sub>N and SOCl<sub>2</sub> in CS<sub>2</sub>, with an excess of SOCl<sub>2</sub>. Mixed esters of H<sub>2</sub>SO<sub>3</sub> were prepd. by the reaction of a chlorosulfite with an alc. mixed with C<sub>6</sub>H<sub>5</sub>N. These mixed sulfites were Me Et *b*. 140-3°, Me Bu *b*<sub>11</sub> 86-8°, Pr Bu *b*<sub>11</sub> 102-4°, β-C<sub>2</sub>H<sub>4</sub>Cl Bu *b*<sub>20</sub> 149-52°, allyl Bu *b*<sub>11</sub> 92-4°, allyl β-C<sub>2</sub>H<sub>4</sub>Cl *b*<sub>21</sub> 103-5°, Pr C<sub>7</sub>H<sub>15</sub> *b*<sub>11</sub> 148-50°, Et C<sub>10</sub>H<sub>21</sub> *b*<sub>20</sub> 188-90°, Me PhCH<sub>2</sub> *b*<sub>11</sub> 137-8°, Et PhCH<sub>2</sub> *b*<sub>20</sub> 100-1°, *iso*-Pr Bu *b*<sub>11</sub> 99-101°, Pr cyclohexyl *b*<sub>20</sub> 175-8°, Pr *tert*-Bu *b*<sub>20</sub> 99-100°, Me Ph *b*<sub>20</sub> 128-30°, Et Ph *b*<sub>20</sub> 142-4°, Bu Ph *b*<sub>20</sub> 170-3°, Et *o*-tolyl *b*<sub>20</sub> 145-7°, Bu *o*-tolyl *b*<sub>11</sub> 170-3°, Me *o*-tolyl *b*<sub>11</sub> 137-40°, Et *o*-tolyl *b*<sub>20</sub> 147-50°, Bu *m*-tolyl *b*<sub>20</sub> 178-80°, Me *p*-tolyl *b*<sub>20</sub> 134-6°, Et *p*-tolyl *b*<sub>20</sub> 146-9°, Bu *p*-tolyl *b*<sub>20</sub> 175-7°, Et *p*-chlorophenyl *b*<sub>20</sub> 155-8°, Ph β-C<sub>2</sub>H<sub>4</sub>Cl *b*<sub>11</sub> 195-8°. Me *o*-tolyl sulfite and the alkyl α- and β-naphthyl sulfites decompd. when distd. E. W. Scott

The refraction constant of the CN group. P. Bruylants and R. Merckx. *Bull. sci. acad. roy. Belg.* 19, 1003-16 (1933).—The mol. refractions of the straight-chain hydrocarbons (C<sub>2</sub> to C<sub>12</sub>) are calcd. for H<sub>2</sub>, D and H<sub>2</sub> at 20° and 25° from the refractive indices (Shepard, Henne

and Midgley, *C. A.* 25, 2967; also those of the straight-chain nitriles ( $C_1$  to  $C_{12}$ ) at 15° and 30° (*C. A.* 27, 5056). From these values the following refraction consts. at 20° are calcd.:  $H_n$ , 1.026,  $CH_2$ , 4.617,  $CN$  5.434;  $D$ , 1.037,  $CH_2$ , 4.036,  $CN$  5.459. Janet E. Austin

Reduction of aliphatic cyanides and oximes with sodium and butyl alcohol. C. M. Suter and Eugene W. Moffett. *J. Am. Chem. Soc.* 56, 487 (1934).—A soln. of 1 mol. of aliphatic cyanide or oxime in 2300 cc. BuOH is treated with 161 g. (7 mols.) during 10–15 min. and refluxed until all the Na has dissolved; the yields of amines from a series of Me alkyl ketoximes varied from 69 to 86%; heptaldoxime gives 89%; BuCN and AmCN give 86 and 78%, resp., of the corresponding amines. C. J. West

Use of ethyl sulfonylbisacetate in the identification of aliphatic amines. John P. Alden and Bruce Houston. *J. Am. Chem. Soc.* 56, 413–14 (1934).—Details are given of the prepn. of sulfonylbisacetic acid and its Et ester. With the appropriate amine the following *N*-substituted amides of the acid,  $SO_2(CH_2CONHR)_2$ , were prepd., where R is: Me, m. 186°, 85% yield; Et, m. 178°, 78%; Pr, m. 184°, 85%; iso-Pr, m. 148°, 50%; Bu, m. 192°, 80%; iso-Bu, m. 155°, 65%; Am, m. 174°, 80%. No reaction could be obtained under similar or more drastic conditions with 2-aminobutane,  $Me_2NH$ ,  $Et_2NH$  or  $Pr_2NH$ . C. J. West

Hydrogenation of amides to amines. Homer Adkins and Bruno Wojcik. *J. Am. Chem. Soc.* 56, 247 (1934).—Amides are reduced to amines over Cu-Cr oxide under 100–300 atm. of  $H_2$  at 175–250°; dioxane is a good reaction medium. Lauramide, heptamide,  $\alpha$ -phenylbutyramide, furoamide and tetrahydrofuroamide give 40–70% of the corresponding primary amines and 25–50% of sec. amines. Various substituted amides, as *N*-laurylpiperidine, *N*-cyclohexyllauramide, etc., give 70–95% of sec. or tert. amines. C. J. West

Acyl peroxides and secondary amines. S. Gambarian and L. Kazarian. *J. Gen. Chem.* (U. S. S. R.) 3, 222–8 (1933).—Acyl peroxides react with secondary amines to give 1 mol. of a hydroxylamine deriv. of the type  $R_2NO-COR'$  and 1 mol. of acid.  $Ph_2NOBz$  and  $Ph_2NOAc$  are unstable and readily undergo isomerization (*C. A.* 4, 317) whereas the corresponding products from  $Et_2NH$ , iso-Bu $_2NH$ ,  $(PhCH_2)_2NH$  and piperidine (I) could be isolated (*C. A.* 20, 372; 21, 1638). G. and K. now report a study of the interaction of  $Bz_2O_2$ ,  $Ac_2O_2$  and  $Bz_2O_2Ac$  with  $Et_2NH$ ,  $Pr_2NH$  and I.  $Ac_2O_2$  gave 80% yields of the expected  $NH_2OH$  derivs. If cooling was not used and the action of  $Ac_2O_2$  was too much prolonged dialkylacetamides were formed.  $Bz_2O_2Ac$  gave  $BzOH$  and the *N*-Ac deriv. of  $NH_2OH$ . I reacted more rapidly than the other amines.  $PhNMe_2$ ,  $PhNEt_2$ , and  $Et_2NH$ , but not  $(PhCH_2)_2NH$ , also react with acyl peroxides, indicating that the unsatd. character of the N and not an active H is responsible for the reactivity of the amines.  $Et_2NH$  and  $Bz_2O_2$  gave  $Et_2NH$ . Addn. of 5.19 g.  $Et_2NH$  to 7.26 g.  $Bz_2O_2$  suspended in dry  $Et_2O$ , extrn. of the  $BzOH$  formed after 0.5 hr. with NaOH, drying of the reaction mixt. with  $CaCl_2$  after removal of the excess  $Et_2NH$  with HCl, and addn. of 2.7 g.  $H_2SO_4$  in  $Et_2O$  to the dry soln., gave a disulfate which was decompd. with  $Na_2CO_3$  and the resulting oil extrd. with  $Et_2O$ . Drying of the ext. with  $CaCl_2$ , removal of the  $Et_2O$  and fractional distn. at 0.12 mm. gave *O*-benzoyl-*N,N*-diethylhydroxylamine,  $b_{10-11}$  92°, yield 68.45%. Dropwise addn. of 10 g.  $Et_2NH$  to 11.8 g.  $Ac_2O_2$  in dry  $Et_2O$ , well-cooled, followed in 2 hrs. by addn. of HCl in  $Et_2O$  gave a colorless cryst. ppt. of HCl salts. These were washed with cold dry  $Et_2O$ , decompd. with  $Na_2CO_3$  soln., and the oil liberated from the resulting soln. by salting out with NaCl was extrd. with  $Et_2O$ . Removal of the  $Et_2O$  gave an oil from which *O*-acetyl-*N,N*-diethylhydroxylamine (II) was sepd. by fractional distn.,  $b_{10-11}$  32°; yield 64.88%. When the cooling was omitted the same quantities of  $Ac_2O_2$  and  $Et_2NH$  gave 5.1 g. of  $AcNEt_2$ ,  $Ac_2O_2Bz$  (13 g.) in 100 cc. of dry  $Et_2O$  was treated with 5.3 g.  $Et_2NH$  with cooling. Pptn. of the reaction mixt. with gaseous HCl, decompn. of the pptd. HCl salts with 0.1 *N*  $Na_2CO_3$ , salting out of the

resulting soln. with NaCl, extrn. of the liberated oil with  $Et_2O$ , removal of the  $Et_2O$  and fractionation of the residue gave 50.7% of II. 99.68% of the theoretical quantity of  $BzOH$  was recovered from the filtrate from the HCl salts. By similar procedures the following were prepd.: *O*-benzoyl-*N,N*-dipropylhydroxylamine,  $b_{10-11}$  95°, in 72.2% yield from 12.1 g.  $Bz_2O_2$  and 10.1 g.  $Pr_2NH$ ; *O*-acetyl-*N,N*-dipropylhydroxylamine (III),  $b_{10-11}$  40–1°, in 79.24% yield, from 12 g.  $Ac_2O_2$  and 10.1 g.  $Pr_2NH$ ; III in 59.75% yield from 18 g.  $Ac_2O_2Bz$  and 15.1 g.  $Pr_2NH$ ; *N*-benzoxypiperidine, in 65% yield, from 7.26 g.  $Bz_2O_2$  and 5.1 g. I, 6.66 g. *N*-acetylpiperidine from 11.8 g.  $Ac_2O_2$  and 10 g. I without cooling of the reaction mixt.; *N*-acetylpiperidine (IV),  $b_{10-11}$  50–1° in 81.47% yield, from 16 g.  $Ac_2O_2$  and 8.5 g. I, with cooling; 18 g.  $Ac_2O_2Bz$  and 17 g. I gave, in addn. to IV, 97.51% of  $BzOH$  either as the free acid or as piperidonium benzoate pptd. during the reaction.  $Et_2NH$  (5.8 g.) in 200 cc.  $Et_2O$  with 3.6 g.  $Bz_2O_2$  with cooling gave after 4 days upon the addn. of  $(CO_2H)_2$  in  $Et_2O$  2.75 g. diethylammonium oxalate (V), m. 212°, from MeOH. The free base  $b_{10-11}$  44°. The m. p. of the oxalate given in the literature is 220°. G. and K. found that the oxalate formed by neutralization of  $Et_2NH$  with  $(CO_2H)_2$ , as well as a mixt. of this with V, m. 212°

Lewis W. Butz

Chemistry of the triethylsilyl group. Charles A. Kraus and Walter K. Nelson. *J. Am. Chem. Soc.* 56, 195–202 (1934).— $Et_3SiH$  and  $KNH_2$  in liquid  $NH_3$  give the compd.  $(Et_3Si)_2NK$ ;  $H_2O$  gives  $(Et_3Si)_2O$ ;  $NH_4Br$  in liquid  $NH_3$  gives bis(triethylsilyl)amine,  $b_1$  100°; hydrolysis gives the oxide.  $Et_3SiH$  or  $Et_3SiBr$  and  $EtNH_2$  with Li give triethylsilyl ethylamine, with a very penetrating camphor-like odor; it hydrolyzes readily with the formation of triethylsilol.  $Et_3SiBr$  and  $Ph_3GeNa$  in  $C_6H_6$  give triphenylgermanyl triethylsilane, m. 93.5°, in 70–80% yields; Br gives  $Ph_3GeBr$  and  $Et_3SiBr$ . Li in  $EtNH_2$  gives  $Et_3SiLi$  and  $Ph_3GeLi$ , which could not be sepd. and identified as such but their existence was demonstrated by reaction of the mixt. with suitable reagents. Benzyltriethylsilane,  $b_1$  267–9° (cor.), does not freeze at –33°; it reacts with Li in  $EtNH_2$  but no definite products have been isolated. An improved method for the prepn. of  $Et_3Si_2$  is described. C. J. W.

$\delta$ -Hydroxyvaleraldehyde. R. Paul. *Compt. rend.* 197, 1652–4 (1933).—Dihydropyran (I), hydrolyzed with boiling  $N/70$  HCl, gives 1,5-epoxy-5-pentanol (II),  $b_{10-11}$  80–1°,  $d_{15}^{20}$  1.055,  $n_D^{20}$  1.45342. I in boiling MeOH gives the Me ether of II,  $b_1$  128–9°,  $d_{15}^{20}$  0.969,  $n_D^{20}$  1.42625. AgOH in  $H_2O$  oxidizes II to the Ag salt of  $\delta$ -hydroxyvaleric acid.

W. J. Peterson

Reactions of 2-halogen ethers. I. The action of magnesium on alkyl 2-bromoethyl ethers. Ralph C. Tallman. *J. Am. Chem. Soc.* 56, 126–9 (1934).—Phys. properties are reported for Me, Et, Pr, iso-Pr, Bu, iso-Bu, sec-Bu and Am 2-hydroxyethyl ethers (the sec-Bu deriv.  $b_{10-11}$  158.4–9.0°,  $d_{15}^{20}$  0.8966,  $n_D^{20}$  1.41606), and also for the 2-bromoethyl ethers: iso-Pr,  $b_{10-11}$  139.9–40.2°,  $d_4$  1.2609,  $n_D^{20}$  1.43922; iso-Bu,  $b_{10-11}$  56.5–7.0°,  $d_4$  1.1945,  $n_D^{20}$  1.43352; sec-Bu,  $b_{10-11}$  47–7.5°,  $d_4$  1.2216,  $n_D^{20}$  1.44384; Am,  $b_{10-11}$  75–6°,  $d_4$  1.1719,  $n_D^{20}$  1.44574. Mg and the 2-Br derivs. give  $C_{12}H_{26}$ , the alc. corresponding to the alkyl group of the Br ether and a small amt. of the dialkyl ether of butane-1,4-diol, the following percentage yields are given: Me 33, –, 17.9 (unchanged ether); Et 50.1, 46.3, 18; Pr 49.7, 47, 22.5; iso-Pr 47, 36.7, 17.2; Bu 40, 41.2, 24.8; iso-Bu 37.7, 36.8, 28.7; sec-Bu 35.9, 34, 29.9; Am 30.2, 28.5, 30.4. Butane-1,4-diol dialkyl ethers: Et,  $b_{10-11}$  59–60°,  $d_{15}^{20}$  0.8455,  $n_D^{20}$  1.40610; Pr,  $b_{10-11}$  94–5°,  $d_4$  0.8049,  $n_D^{20}$  1.41368; iso-Pr,  $b_{10-11}$  77–8°,  $d_4$  0.8310,  $n_D^{20}$  1.40954; Bu,  $b_{10-11}$  117–8°,  $d_4$  0.8392,  $n_D^{20}$  1.42064; iso-Bu,  $b_{10-11}$  107–8°,  $d_4$  0.8269,  $n_D^{20}$  1.41398; sec-Bu,  $b_{10-11}$  102–3°,  $d_4$  0.8238,  $n_D^{20}$  1.41370; Am,  $b_{10-11}$  134–5°,  $d_4$  0.8402,  $n_D^{20}$  1.42682. A mechanism for the reaction has been offered, based on the intermediate formation of chelate rings. C. J. W.

New general methods for condensation of ketones. V. Grignard and J. Colonge. *Roczniki Chem.* 13, 475–81 (1933) (in French).—See *C. A.* 28, 101<sup>1</sup>. C. T. I.

Introduction of deuterium atoms into acetone. J. O

Halford, Leigh C. Anderson and John R. Bates. *J. Am. Chem. Soc.* 56, 491-2 (1934).—When a soln. of  $\text{Me}_2\text{CO}$  in  $\text{H}_2\text{O}$  contg.  $\text{H}_2\text{O}$  and a little  $\text{K}_2\text{CO}_3$  is warmed, an exchange of H atoms occurs, with the introduction of  $\text{H}^1$  in the  $\text{Me}_2\text{CO}$ ; 1 sample showed an increase of 1.4° in the temp. of equal density.  $\text{H}_2\text{O}$  removes 54% of the  $\text{H}^1$ . The equil. const. for the formation of monodeuterioacetone and  $\text{H}_2\text{O}$  from  $\text{Me}_2\text{CO}$  and  $\text{HD}_2\text{O}$  is approx. 2, with equil. approached in both directions. The effectiveness of an alk. catalyst argues for a mechanism involving the postulated enol form of  $\text{Me}_2\text{CO}$ . C. J. West

Some properties of pite deutacetic acid [acetodeuterio acid]. Gilbert N. Lewis and Philip W. Schutz. *J. Am. Chem. Soc.* 56, 493-4 (1934).— $\text{CH}_3\text{CO}_2\text{H}^1$ , m. 13.3°, results from  $\text{H}^1\text{Cl}$  and  $\text{AcOAg}$  in the dark for 24 hrs. The vapor pressure in mm. was: 52.2° 66.1, 65.3° 117.8, 74.4° 172.7, 86.9° 272.9; the difference between this and  $\text{AcOH}$  is 7.5% at 50° and 3% at 90°. In the reaction there was no exchange of H in the Me group. C. J. West

Acid iodides. III. Addition of acetyl iodide to unsaturated hydrocarbons. Philip G. Stevens. *J. Am. Chem. Soc.* 56, 450-2 (1934); cf. C. A. 27, 956.— $\text{Me}_2\text{C}=\text{CHMe}$  and  $\text{AcI}$  after 26 days at 25° in the dark give a dark red oil contg. 40.4% I; after treating with  $\text{PhNMe}_2$  a small quantity of dimethylpentenone (I) was isolated. Cyclohexene gives cyclohexyl iodide and tetrahydroacetophenone. Thiophene gives some acetothienone. Unsaturated ketones were not obtained from 2-butene, isobutene, stilbene,  $\text{C}_6\text{H}_4$ , divinyl ether, furan and  $\text{C}(\text{ClH})_2$ ; cyclohexene is unchanged by  $\text{AcI}$  after 290 days at 25°.  $\text{Me}_2\text{CO}$  and butanone condense in the presence of  $\text{HCl}$  to form a mixt. of isomeric unsatd. ketones, one of which is I; I was also prepd. from  $\text{Me}_2\text{C}=\text{CHMe}$ ,  $\text{AcCl}$  and  $\text{SnCl}_4$ . C. J. West

Rule of shift (Verschiebungsgesetz). P. A. Levene and G. M. Meyer. *J. Am. Chem. Soc.* 56, 244-5 (1934).—The following rotations (max. mol.  $[\text{M}]_D^{25}$ ) are reported for the free acid, its Et and  $p\text{-O}_2\text{NC}_6\text{H}_4$  esters:  $\text{EtCH}(\text{MeCO}_2\text{H})$ , -18.0°, -22.9°, -52.5°;  $\text{BuCH}(\text{MeCO}_2\text{H})$ , 21.3°, -30.7°, -65.7°;  $\text{EtCH}(\text{MeCH}_2\text{CO}_2\text{H})$ , -10.4°, 11.5°, -20.0°;  $\text{PrCH}(\text{MeCH}_2\text{CO}_2\text{H})$ , 3.6°, 0.7°, 5°;  $\text{AmCH}(\text{MeCH}_2\text{CO}_2\text{H})$ , 8.1°, 4.2°, 11.2°. The 4th and 5th compds. behave differently from the 3rd on identical substitution; this is another case where the "rule of shift" fails. C. J. West

Mixed sulfonic anhydrides. I. Preparation of mixed acetosulfonic anhydrides. A. Baroni. *Atti accad. Lincei* 17, 1081 8 (1933); cf. C. A. 27, 3447.—The prepn. of mixed anhydrides of  $\text{AcOH}$  with sulfonyl chlorides, by using  $\text{AgOAc}$  and  $\text{NaOAc}$ , has been studied. With  $\text{AgOAc}$ , the reaction is highly exothermic starts at 120-50°, and gives the corresponding mixed anhydride with yields which increase on prolonged heating up to 40%, with 3 hrs. heating. With  $\text{NaOAc}$ , however, 200° and 8-10 hrs. heating is required, while lower yields result. Alky sulfonic acids give higher yields than aromatic sulfonic acids. Mixed anhydrides cannot be prepd. with  $\text{AcCl}$ , because of the volatility of this compd. at the high temp. required. Acetylbenzenesulfonic acid (I), acetyl- $p$ -toluenesulfonic acid (II), acetylmetanesulfonic acid (III) and acetyletanesulfonic acid anhydrides (IV) were prepd. I, prepd. with  $\text{AgOAc}$  (yield 40%),  $b_p$  160-1°; the others prepd. with  $\text{NaOAc}$  with 16, 25, 22% yields, resp.,  $b_m$  180 8° (II), 100-2° (III), 115-17° (IV). A. W. Contieri

Odor and constitution of several esters of heptanoic (enanthic) and isoeptanoic (5-methylhexanoic) acids. B. Rothstein. *Bull. soc. chim.* 53, 1106-7 (1933).—These esters were prepd. by action of the acid chlorides on the alcs. in  $\text{C}_6\text{H}_5\text{N}=\text{CHCl}$ . The b. ps., ns, and  $d_4$  of the heptanoates and the isoeptanoates, resp., are given with the name of the alc.:  $\text{PhCH}_2$ ,  $b_{16}$  157°, 1.4841<sup>30</sup>, 0.9719<sup>30</sup>;  $b_{18}$  160°, 1.4815<sup>30</sup>, 0.9602<sup>30</sup>;  $\text{PhCH}_2\text{CH}_2$ ,  $b_{16}$  167°, 1.4788<sup>30</sup>, 0.9570<sup>30</sup>;  $b_{17}$  167°, 1.4833<sup>30</sup>, 0.9622<sup>30</sup>;  $\text{Ph}(\text{CH}_2)_2$ ,  $b_{18}$  180°, 1.4840<sup>31</sup>, 0.95876<sup>31</sup>;  $b_{19}$  180°, 1.4835<sup>30</sup>, 0.9554<sup>30</sup>; hydriatropyl  $b_{17}$  172°, 1.4830<sup>30</sup>, 0.95556<sup>30</sup>;  $b_{18}$  172°, 1.4825<sup>30</sup>, 0.9534<sup>30</sup>; geraniol  $b_{18}$  171°, 1.4801<sup>30</sup>, 0.9522<sup>30</sup>;  $b_{17}$  172°, 1.4585<sup>30</sup>, 0.8891<sup>30</sup>; terpineol  $b_{18}$  170°, 1.4647<sup>30</sup>,

0.9244<sup>30</sup>;  $b_{18}$  170°, 1.4632<sup>31</sup>, 0.9223<sup>31</sup>. Their odors are faint, resembling those of the alcs. but having a faint fatty smell. The isoeptanoates possess slightly finer and more pleasing odors than the heptanoates.

E. W. Scott

Kolbe hydrocarbon synthesis in liquid ammonia. R. A. Fulton and F. W. Bergstrom. *J. Am. Chem. Soc.* 56, 167-8 (1934).—The K salts of the fatty acids of the  $\text{NH}_2$  system (acid amidines) all give satd. hydrocarbons when electrolyzed in concd. liquid  $\text{NH}_3$  solns. with high c. d. Only in the electrolysis of K acetamidine was any of the hydrocarbon obtained that might be expected from the equation representing the Kolbe synthesis,  $2\text{MeC}(\text{:NH})\text{-NHK} + 2\text{F} = \text{C}_2\text{H}_6 + \text{NH}_4\text{CN}$  (at anode) + 2K (at cathode). In all other cases, a mixt. of  $\text{CH}_4$  and  $\text{C}_2\text{H}_6$  resulted, probably because of thermal conditions at the anode which caused a rather deep-seated decompn. of the amidines. Resinous substances usually appeared at the anode in the electrolysis of K alkylamidines contg. more than 2 C atoms, this perhaps intensifying the over-heating of the electrode surface. A significant portion of the anode product was a blackish tar of high C content (93.7-94.9%), this possibly indicating the formation of C itself at the electrode. C. J. West

Methylene ether esters. Frederick Walker. *Plastic Products* 9, 187-8 (1933).—The following new alkoxy-methyl esters, which may be useful as solvents and plasticizers, have been prepd. in good yield by the interaction, first at 25°, then at 100°, of equiv. amts. of the appropriate Na salt and alkoxy-methyl chloride, made from the alc.,  $\text{CH}_3\text{O}$  and  $\text{HCl}$ . Butoxymethyl formate b. 154°, butoxymethyl acetate b. 169°, isobutoxymethyl acetate b. 161°, butoxymethyl butyrate b. 183°, isobutoxymethyl butyrate b. 178°, methoxymethyl benzoate b. 238°, isobutoxymethyl benzoate b. 256°, sym-ethylenedioxy-methyl acetate (ethylene glycol bis(acetoxymethyl) ether) (I) b. 230°, propoxypropyl acetate (II) b. 160°, methoxymethyl salicylate, propoxymethyl salicylate, bis(methoxymethyl) phthalate, bis(propoxymethyl) phthalate, bis(isobutoxymethyl) phthalate. The last 5 decomp. 180-200°. Ethylene glycol bis(chloromethyl) ether,  $b_p$  97-9°, required for I was made from glycol,  $\text{CH}_3\text{O}$  and  $\text{HCl}$ . Propoxypropyl chloride required for II was made from  $\text{PrOH}$ ,  $\text{EtCHO}$  and  $\text{HCl}$ . Approx. rates of hydrolysis (to alc., acid and  $\text{CH}_3\text{O}$ ) are given for the above and for other members of the series already prepd. (cf. C. A. 11, 1830; 19, 2930). Except for the aromatic esters, stability to hydrolysis increases with mol. wt. Arnold M. Collins

Duality of the dipropenyl glycol of Charon. Isolation of one of the crystalline constituents. Wiemann. *Compt. rend.* 197, 1654-6 (1933).— $\text{PhNCO}$  (25 g.) and dipropenyl glycol (15 g.), heated with ether in a sealed tube at 60° for 40 hrs., give 12 g. of a phenylurethan,  $\text{C}_{10}\text{H}_{11}\text{O}_2\text{N}$  (I), m. 190°. Sapon. of I with  $\text{BaO}$  in a sealed tube at 150° gives  $[\text{MeCH}:\text{CHCH}(\text{OH})]_2$ , m. 48°. W. J. P.

Preparation of the diaminobutanes. II. *dl*-1,3-Diamino-2-methylpropane; *dl*-1,3-diaminobutane; 1,4-diaminobutane. Erich Strack and Herbert Schwaneberg. *Ber.* 67B, 39-45 (1934); cf. C. A. 27, 5720.—The study of the prepn. of diaminobutanes by catalytic hydrogenation of nitriles has been continued. The yield of  $(\text{CH}_3)_2\text{CH}(\text{NH}_2)_2$  from 0.125, 0.5 and 1 vol.-% solns. of  $(\text{CH}_3)_2\text{CH}(\text{CN})_2$  hydrogenated 8 hrs. in 80% alc. with 4-8 parts of Pd catalyst was 76, 67 and 59%, resp.; in 96% alc. the yields are the same but the hydrogenation requires longer time. The  $\text{MeCH}(\text{CN})_2$  required for the prepn. of *dl*- $\text{MeCH}(\text{CH}_2\text{NH}_2)_2$  (I) is obtained pure only through a series of intermediate products but this is largely compensated by the smoothness of its catalytic hydrogenation. The best procedure is the following:  $\text{MeCHBrCO}_2\text{Et} + \text{KCN}$  in alc.  $\rightarrow \text{MeCH}(\text{CN})\text{CO}_2\text{Et}$  + concd.  $\text{NH}_4\text{OH} \rightarrow \text{MeCH}(\text{CN})\text{CONH}_2$  (yield, 41%) +  $\text{P}_2\text{O}_5 \rightarrow \text{MeCH}(\text{CN})_2$  (yield, 78%) + H and Pd in 98-99%  $\text{MeOH}$  contg. alc.  $\text{HCl} \rightarrow$  I. The yield of I in 0.125, 0.25 and 1 vol.-% soln. of the dinitrile is 92, 85 and 80%, resp.;  $\text{EtOH}$  slows up the hydrogenation and water decreases the yield (to 20, 30 and 50% in 0.125% soln. in 80%, 96% and abs. alc., resp.). Salts and *derivs.* of I: *dl*- $\text{HCl}$ ,

m. 201°; sulfate, does not m. 300°; chloroplatinate, orange, decomposes 237°; chloroaurate, yellow prisms or leaflets with 2 H<sub>2</sub>O, m. about 200° (in evacuated tubes it sinters 130°, runs together 138°, liquefies 142°); HgCl<sub>2</sub> compd., deliquesces 196-8°; picrate, bright yellow, sinters 249°, foams 252°, dissolves to the extent of 0.09% in water at 20° and 2.0% at the b. p.; picrolonate, bright yellow, foams 269-71°; di-Bz deriv., m. 145°; bis(m-nitrobenzoyl) deriv., m. 187°. *dl*-1,3-Diaminobutane (II) was prep'd. from MeC(:NH)CH<sub>2</sub>CN which was obtained in 50% yield from MeCN and pulverized Na in ether. The nitrile readily gives II (90%) with Na and abs. alc. For the catalytic hydrogenation, 98% MeOH is the best solvent, a 0.125 vol.-% soln. giving 93% II; water decreases the yield which in 80% MeOH is reduced to a few %. EtOH is an even poorer solvent; the max. yield with abs. alc. was 65%. *Salts and derivs. of II*: di-HCl, m. 177°; sulfate, very hygroscopic, does not m. 300°; chloroplatinate, orange-yellow, foams 250°; chloroaurate, yellow tables with 1 H<sub>2</sub>O, m. 208-10° (in sealed tubes it runs together 168°, m. 171°; the dried salt sinters 200°, m. 210-12°); HgCl<sub>2</sub> compd., runs together 200°; picrate, yellow, sinters 248°, decomposes 251°, sol. to the extent of 0.05% in water at 20° and 2.0% at 100°; picrolonate, bright yellow, darkens 245°, foams 260°, sol. to the extent of 0.02% in water at 20° and 0.3% at 100°; di-Bz deriv., m. 170°; bis(m-nitrobenzoyl) deriv., m. 201°.

*Synthesis of dl-mannitol, allodulcitol and dl-mannose.* R. Lespicaud and J. Wiemann. *Bull. soc. chim.* 53, 1107-10 (1933).—In 6 l. H<sub>2</sub>O are dissolved 100 g. divinyl glycol (of Griner), 118 g. AgClO<sub>4</sub> and 1 g. osmic acid; the soln. stands 3 months at room temp. AgCl is filtered off, the filtrate extd. with C<sub>6</sub>H<sub>6</sub> and concd. to a sirup below 50°; addn. of 4 vols. 95% alc. causes the sepn. of 11 g. cryst. *dl*-mannitol (I), m. 168° (from alc.), forming a *tribenzaldehyde acetal*, m. 192°. The mother liquor treated with much Et<sub>2</sub>O, ppts. a brown sirup, which, on being mixed with alc., deposits 15 g. allodulcitol (II), not previously described (39.49% C and 7.66% H), m. 149-50° and forming a *dibenzaldehyde acetal* (66.47% C and 6.01% H), m. 245-50° (from alc.). If the reaction is allowed to go more rapidly, less of the hexitols is obtained, and *dl*-mannose is sepd. from the mother liquor as its phenylhydrazone. The formation of these 2 hexitols is believed to result from the presence of 2 stereoisomers in Griner's glycol, a *dl*-form yielding I, and a *meso* form giving II.

*M. P. Benoy*  
**Polymerization and ring formation.** XXIII. *ε*-Caprolactone and its polymers. Frank J. Van Natta, Julian W. Hill and Wallace H. Carothers. *J. Am. Chem. Soc.* 56, 455-7 (1934); cf. C. A. 28, 743<sup>2</sup>.—A sample contg. 80% of *ε*-hydroxycaproic acid (I) on heating at 150-210° gives 63% of the monomeric *ε*-caprolactone (II), b<sub>2</sub> 98-9°, m. -5°, d<sub>4</sub><sup>20</sup> 1.0698, n<sub>D</sub><sup>20</sup> 1.4608, and about 1% of a dimer, m. 112-3°. On heating, II is converted to a polymer of high mol. wt.; the process is not easily reversible. The lactones and N<sub>2</sub>H<sub>4</sub>·H<sub>2</sub>O give the *hydrazide* of I, m. 114-5°. *ε*-Bromocaproic acid and EtONa in EtOH, refluxed 8 hrs., give 37% of the *Et ester* of I, b<sub>4</sub> 104-6°, d<sub>4</sub><sup>20</sup> 0.9944, n<sub>D</sub><sup>20</sup> 1.4381, and some of the dimer of II; the residue (41%) is a polyester of mol. wt. 1660-1980.

*C. J. West*  
**Electrometric titration curves of certain imino dibasic acids.** Anne Litzinger and Lucy W. Pickett. *J. Am. Chem. Soc.* 56, 124-6 (1934).—The electrometric titration curves of NH(CH<sub>2</sub>CO<sub>2</sub>H)<sub>2</sub>, NH(CHPhCO<sub>2</sub>H)CH(CH<sub>2</sub>-C<sub>6</sub>H<sub>4</sub>OH)CO<sub>2</sub>H, NH(CH<sub>2</sub>CO<sub>2</sub>H)CH(CH<sub>2</sub>C<sub>6</sub>H<sub>4</sub>OH)CO<sub>2</sub>H, NH(CHPhCO<sub>2</sub>H)CH(CH<sub>2</sub>Ph)CO<sub>2</sub>H and NH(CH<sub>2</sub>CO<sub>2</sub>H)CH(CH<sub>2</sub>Ph)CO<sub>2</sub>H have been detd. and found to be in close agreement, all showing the greatest change of p<sub>H</sub> at the point corresponding to the addn. of 1 equiv. of base. A comparison of these curves shows that while the introduction of a Ph group in the β-position is of minor importance, a Ph group in the α-position corresponds to a relatively greater acidity of the mono-K salts and a distinct break in the curve at the 2nd end point. The disocn. const. as calcd. agree closely and indicate that

all 5 substances are weak acids. A comparison of their diln. curves shows characteristic variations for each acid.

*C. J. West*  
**Intermediate oxidation product of cystine.** T. F. Lavine, G. Toennies and E. C. Wagner. *J. Am. Chem. Soc.* 56, 242-3 (1934).—An intermediate oxidation product of cystine is the disulfide.

*C. J. West*  
**Isomerization of hydroxy aldehydes.** V. Oxidative-reductive transformations of α-hydroxy-sobutyraldehyde. S. Danilov and E. Venus-Danilova. *Ber.* 67B, 24-35 (1934); *J. Gen. Chem.* (U. S. S. R.) 3, 559-72 (1933); cf. C. A. 25, 1819.—Mono- or polymeric Me<sub>3</sub>C(OH)CHO (I) in alk. soln. (180 hrs. in 3% NaOH at 20°, long standing at room temp. or 3 hrs. at 100° in 3-4% KOH) gives only a mixt. of Me<sub>3</sub>C(OH)CO<sub>2</sub>H and Me<sub>3</sub>C(OH)CH<sub>2</sub>OH with or without unchanged I, i. e., it undergoes almost solely the Cannizzaro reaction. In the presence of Cu(OH)<sub>2</sub> or Pb(OH)<sub>2</sub> at 100°, however, there is obtained, in addn. to unchanged I and the rearrangement product, MeCH(OH)COME (II), 40-5% Me<sub>3</sub>CHCO<sub>2</sub>H (with the Cu salts a little (7-8%) Me<sub>3</sub>C(OH)CO<sub>2</sub>H is also formed). The metal oxide transports the O from the OH to the CHO group but is itself not reduced. The oxidative-reductive transformation of I into II is best effected (with almost quant. yield) by heating 6-8 hrs. with very dil. acid at 135°. In alk. soln. II is formed only in very small amt. and in the presence of oxides of heavy metals. No Ar<sub>2</sub> could be detected, showing that HO ketones with alkyl radicals are oxidized to diketones with considerably greater difficulty than those which contain Ph or cyclohexyl residues. I was prep'd. from polymeric Me<sub>3</sub>CBBr-CHO made directly from Br and polymerized Me<sub>3</sub>CH-CHO. After several careful distns. it b<sub>60</sub> 62-4° and on standing gradually thickened, finally solidifying after some months to crystals m. 73-4°, the mol. wt. in freezing C<sub>6</sub>H<sub>6</sub> increasing from 95:1 immediately after distn. to 226 in 48 hrs., when I showed d<sub>4</sub><sup>20</sup> 1.1014, d<sub>20</sub><sup>20</sup> 1.0830, n<sub>D</sub><sup>20</sup> 1.44181, n<sub>D</sub> 1.43070; semicarbazone, m. 164-5°; p-nitrophenylhydrazone, m. 153-9° (decompn.). C. A. R.

*Synthesis of the hexuronic acids.* III. The synthesis of *dl*-alluronic acid from allomucic acid. Carl Niemann, Sulo Karjala and Karl P. Link. *J. Biol. Chem.* 104, 189-94 (1934); cf. C. A. 27, 3451.—Cryst. *dl*-alluronic acid has been prep'd. by the reduction of allomucic acid with Na-Hg, m. 145-6°, decomp. 148-9°; *Ba salt p*-bromophenylsazone, m. 209-11°; *brucine salt*, m. 180-1, (hydrate, m. 172-3°), [α]<sub>D</sub><sup>20</sup> -25° in H<sub>2</sub>O (after 8 recrystns. from 80% EtOH). All m. ps. are uncor. IV. The synthesis of *d*-galacturonic acid from *d*-galactose. Carl Niemann and Karl P. Link. *Ibid.* 195-204.—Cryst. *d*-galacturonic acid has been prep'd. in 30% yield from *d*-galactose through the oxidation of diacetone-*d*-galactose with RMnO<sub>4</sub> and subsequent hydrolysis of the diacetone-*d*-galacturonic acid to the free hexuronic acid. The diacetone deriv. prep'd. by direct acetonation of the hexuronic acid was found to be identical with the acid prep'd. by the oxidation of diacetone-*d*-galactose. *α*-Me-*d*-galacturonide has also been obtained in 3% yield by the oxidation of *α*-Me-*d*-galactoside by the method of Isbell and Frush and this reaction offers evidence supporting the pyranoside structure of *α*-Me-*d*-galacturonide previously prep'd. by the methylation of *d*-galacturonic acid. Forty-five references. A. P. Lothrop

*The methyl glucosides of the naturally occurring hexuronic acids.* II. The kinetics of the hydrolysis of *α*-methyl *d*-galacturonide.—Sam Morell and Karl P. Link. *J. Biol. Chem.* 104, 188-8 (1934); cf. C. A. 27, 3450.—The velocity const. for the hydrolysis of both *α*-Me-*d*-galacturonide and *α*-Me-*d*-galactoside in N HCl at 3 different temps. are practically identical. It may be concluded that the former substance contains a 6-membered ring and the results lend support to the contention that the stable forms of the hexuronic acids are pyranoside derivs. A. P. Lothrop

**Ethylene glutarate.** Yojiro Tsuzuki. *Bull. Chem. Soc. Japan* 8, 313-16 (1933).—Glutaric acid heated with ethylene glycol (10% excess) at 135-40° for 45 min. with 0.5 mol. ZnCl<sub>2</sub> as catalyst yields a polymeric ester—

mol. wt. (800–80), titration value and analysis agree with the formula  $\text{HO}[\text{CO}(\text{CH}_2)_2\text{COO}(\text{CH}_2)_2\text{O}]_n\text{OH}$ .

**Nature of racemic compounds.** V. N. Belov. *J. Gen. Chem.* (U. S. S. R.) 3, 7–12 (1933).—The ability of mols. of optical antipodes to form mol. (dl) compds. is explained as a "homochem. combination" (Veimarn, *C. A.* 15, 1838; Wittig, *C. A.* 24, 4789). The formation of homo-union is considered as a result of the approach to each other of similar at. groups. (1) *Homochem. compds. formed by 2 mols. of the d- or 2 mols. of the l-isomer.*—In the simplest case of mols. with 1 asym. C atom the homo-union between 2 mols. of the same optical antipode is effected by 2 pairs of similar at. groups. In such a homo-union there can take part any 2 pairs of similar at. groups of the 4 pairs of the 2 mols., whereby the most stable homochem. compd. will be formed by the approach to each other of similar at. groups possessing the greatest mutual extension. (2) *Homochem. compd. formed by 1 mol. of the d- and 1 mol. of the l-isomer (racemic compd.).*—The homo-union is effected by 3 pairs of similar at. groups in proximity to each other. An assumption must be made of the possibility of approach to each other of any 3 pairs of similar at. groups out of the 4 groups of the 2 mols., but, depending on the chem. nature of these at. groups, one of these possible homochem. compds. is most stable. From the comparison of the 2 homochem. compds. formed by 2 mols. of an optically active substance it must be concluded that: (1) a homochem. compd. formed by 2 mols. of one of the optical antipodes must be less stable than the corresponding homochem. compd. formed by 1 mol. of the l- and 1 mol. of the d-isomer, because in the former case out of 4 pairs of similar at. groups tending to approach each other this is realized by only 2 pairs, and in the latter case by 3 pairs; (2) the racemic compd. represents the most stable form of homochem. combination that can be formed by 2 mols. of the type  $\text{C}(\text{R}_1\text{R}_2\text{R}_3\text{R}_4)$ , because the tendency to approach to each other of similar at. groups is here realized to a max. degree. From a soln. of a mixt. of the 2 antipodes of Na  $\text{NH}_4$  tartrate there sep. crystals of the d- and l-isomers at temps. below 27°, and crystals of the dl-compd. at the temps. above 27° (crystals are considered homochem. compds.). Van't Hoff showed that such phenomena occur also in the solid state. The temp. of about 27° represents for Na  $\text{NH}_4$  tartrate the "temp. of conversion" of the dl-compd. B. considers such a temp. as the point of conversion for a homochem. compd. formed from 1 mol. of the d- and 1 mol. of the l-isomer, and for a homochem. compd. formed by 2 mols. of the d-isomer and correspondingly by 2 mols. of the l-isomer. Thus in the mixt. of both antipodes, it can be presumed, there is a state of equil. between the 2 possible homochem. compds., the equil. being shifted to one or the other side according to the conditions. Chas. Blanc

**Some citrate derivatives and their properties.** W. E. Donaldson, R. F. McCleary and Ed. F. Degering. *J. Am. Chem. Soc.* 56, 459–60 (1934).—Tri-Me citrate with  $\text{PrOH}$ ,  $\text{BuOH}$  or  $\text{AmOH}$  with a trace of  $p\text{-MeC}_6\text{H}_4\text{SO}_3\text{H}$  as catalyst gives the *Pr di-Me deriv.*,  $b_{\text{D}}^{20}$  1.06°,  $d_4^{20}$  1.1774,  $n_D^{20}$  1.4470; the *Bu di-Me deriv.*,  $b_{\text{D}}^{20}$  1.11°,  $d_4^{20}$  1.1303,  $n_D^{20}$  1.4477; and the *Am di-Me deriv.*,  $b_{\text{D}}^{20}$  1.21°,  $d_4^{20}$  1.1447,  $n_D^{20}$  1.4484. C. J. West

**Action of amines on the esters of carboxy-substituted ureas, thioureas and guanidines.** III. J. Alden Murray and F. B. Dains. *J. Am. Chem. Soc.* 56, 144–6 (1934); cf. *C. A.* 15, 531.— $\text{H}_2\text{NCONHCO}_2\text{Et}$  (I) and 33%  $\text{MeNH}_2$  or  $\text{EtNH}_2$  give 60% of 1-methylbiuret (II) and 1-ethylbiuret (III), m. 159°. I and  $\text{PhCH}_2\text{NH}_2$ , heated at 135° for 3 hrs., give  $\gamma$ -benzylallophanic ester (IV), m. 9 103°; at 150° for 5 hrs.  $\text{HN}(\text{CONHCH}_2\text{Ph})_2$  resulted, while at 200° the biuret disoc. to give cyanuric acid and  $\text{CO}(\text{NHCH}_2\text{Ph})_2$ . I and  $\text{PhNCO}$ , heated 5 hrs. at 125°, give carbamiliide and 1-phenyl-5-carbethoxybiuret.  $\text{PhNHNH}_2$  and  $\gamma$ -phenylallophanic ester 5 hrs. at 130° give  $\text{PhNH}_2$  and 1-phenylurazole. Carbonyldiurethan (V) and  $\text{EtNH}_2$  give I; on standing 2 weeks, III and Et thylcarbamate were formed;  $\text{MeNH}_2$  gives II in 36 hrs.;

$\text{PhCH}_2\text{NH}_2$  at 115° gives I and Et benzylcarbamate; at 135°,  $\text{NH}_3$ , I, IV and 1,5-dibenzylbiuret, m. 169°; at 200°  $\text{CO}(\text{NHCH}_2\text{Ph})_2$  was formed. V and  $\text{N}_2\text{H}_4$  give only I;  $\text{PhNHNH}_2$  gives 1-phenylurazole at 115° or 140° but at 160° there results iminodicarboxylic acid diphenylhydrazide, m. 291°.  $\text{H}_2\text{NCSNHCO}_2\text{Et}$  is hydrolyzed by aq.  $\text{NH}_3$  and alkyl amines to  $\text{CS}(\text{NH}_2)_2$ ; heated with  $\text{PhNH}_2$  or  $o\text{-MeC}_6\text{H}_4\text{NH}_2$  it yields the s-diaryllurcas.  $\text{MeSC}(\text{NCO}_2\text{Et})\text{NHCO}_2\text{Et}$  (VI) and  $\text{MeNH}_2$  in EtOH give  $\gamma$ -methyl- $\beta$ -dicarbethoxyguanidine, m. 71° (70% yield); Et deriv., oil (75%);  $\beta$ -hydroxyethyl deriv., m. 98° (85%); benzyl deriv., oil (85%); Ph deriv., m. 71° (70%); o-tolyl deriv., m. 75° (90%); anilino deriv., m. 192° (85%); o-hydroxyphenyl deriv., m. 135° (50%); p-carboxyphenyl deriv., m. 198° (60%); o-isomer (VII), m. 174° (45%); o-carbomethoxyphenyl deriv. (VIII), m. 67° (40%). VI and glycine give 40% of dicarbethoxyguanidineacetic acid, m. 210° (Et ester, m. 56°); 5% EtOH-KOH gives monocarbethoxyguanidineacetic acid, chars 250–75°. VI and  $\text{NH}_4\text{OH}$  in EtOH give 45% of tetrahydro-3-carbethoxyimino-5-keto-1,2,3,4-oxadiazole, m. 228°;  $\text{N}_2\text{H}_4$  gives 60% of the same deriv. of 1,2,4-triazole, m. above 335°;  $o\text{-C}_6\text{H}_4(\text{NH}_2)_2$  gives 97% of 2-carbethoxyimino-2,3-dihydrobenzimidazole, m. 320° (decompn.). 2-Carbethoxyimino-4-keto-1,2,3,4-tetrahydroquinazoline, m. 103°, results in small yield when VIII is heated carefully and in good yield when VII or VIII is boiled with EtOH-KOH. VI and  $o\text{-H}_2\text{NC}_6\text{H}_4\text{CO}_2\text{Me}$ , heated 3 hrs. at 140°, give 30% of o,o'-dicarbomethoxycarbamiliide, m. 144°. Dicarbethoxyguanidine (IX) and  $\text{PhNH}_2$  at 140° give 30% of hexahydro-1-phenyl-2,6-diketo-4-imino-s-triazine, m. above 335°. The K salt of IX and  $\text{Me}_2\text{SO}$  give 97% of  $\alpha$ -methyl- $\alpha,\gamma$ -dicarbethoxyguanidine, m. 85°. Carbethoxyguanidine and  $\text{PhNCO}$  give 40% of carbethoxydicarboxanilidoguanidine, m. 151° (decompn.);  $\text{PhNCS}$  gives 90% of hexahydro-1-phenyl-2-thio-4-imino-6-keto-s-triazine, m. 180° (decompn.), which gives with  $\text{Me}_2\text{SO}$  a Me thio ether, m. 247°. C. J. West

The structure of arginine in aqueous solution. Giovanni Devoto. *Z. physiol. Chem.* 222, 227–8 (1933).—Detn. of the dielec. coeff. gave a value of 62, in agreement with the calcd. value for the  $\delta$ -polar form represented by the formula  $\text{H}_2\text{N}(\text{HN}:\text{CNH}_2)^+\text{CH}_2\text{CH}_2\text{CH}_2\text{CH}(\text{NH}_2)\text{COO}^-$ . A. W. Dox

**Unsaturated reduction products of the sugars. XIX.** Isoglucal, isolactal and protoglucal. M. Bergmann, L. Zervas and J. Engler. *Ann.* 508, 25–38 (1933); cf. *C. A.* 25, 5895; 27, 4778; 28, 7451.—Isolactal (I), for which a unmodified method of prepn. is given (68% yield), m. 218° (all m. ps. cor.),  $[\alpha]_D^{25}$  88.9° ( $\text{H}_2\text{O}$ ); benzylphenylhydrazone, m. 145–7°. Enzymic hydrolysis of I gives isoglucal and galactose, showing that I is a 4-galactosidoisoglucal. I and  $\text{Ac}_2\text{O}\text{-C}_6\text{H}_5\text{N}$  yield a penta-Ac deriv. (II), m. 166–7°, and not a hexa-Ac deriv. as previously reported. II, boiled 1 hr. with 20 parts  $\text{H}_2\text{O}$ , gives 77% of the tetra-Ac deriv. (III), m. 138–9°,  $[\alpha]_D^{25}$  72.6° ( $\text{C}_6\text{H}_5\text{Cl}_4$ ). III and  $\text{PCl}_5$  in  $\text{CHCl}_3$  at  $-15^\circ$  give tetraacetylisolactal chlorohydrin, a white powder yielding with  $\text{Ag}_2\text{CO}_3$  in EtOH lactolide and with  $\text{C}_6\text{H}_5\text{N}$  at 100° 83% of the tetra-Ac deriv., m. 184–5°,  $[\alpha]_D^{25}$  141.3° ( $\text{C}_6\text{H}_5\text{Cl}_4$ ), of anhydrosolactal (IV, Gl = glucose residue), m. 243–4°, which is oxidized by  $\text{BzO}_2\text{H}$  to galactosidoanhydrofructose, whose

(IV)

(V)

osazone m. 184–6°. Protoglucal,  $\text{C}_6\text{H}_5\text{O}_2$  (V), results in a small yield (in addn. to isoglucal) in the hydrolysis of  $\psi$ -glucal diacetate with  $\text{Ba}(\text{OH})_2$ ,  $b_{\text{D}}^{20}$  104–6°,  $[\alpha]_D^{25}$  35° (EtOH), very hygroscopic; p-nitrophenylhydrazone, m.

153°; on catalytic reduction it takes up 2 atoms H<sub>2</sub>, the dihydro product b<sub>0.1</sub> 89-90°; O<sub>3</sub> gives glyoxal; oxidation with BzO<sub>2</sub>H shows the presence of the group CCOCH<sub>2</sub>.

C. J. West

The stability of levulose in aqueous solutions of varying  $\mu_H$  values. Joseph A. Mathews and Richard F. Jackson. *Bur. Standards J. Research* 11, 619-33 (1933) (Research Paper No. 611).—The rates of decompn. of levulose (I) have been detd. within the ranges 4° to 100°, and -2.6 to 14.2  $\mu_H$ . The rate is independent of the concn. of I, and in the early stages the curves are those of a monomol. reaction. A method for calcg. the equil. polarization, when the latter cannot be reached in practice, is described. In acid soln. the primary decompn. results in the formation of heterolevulosan and its dimer, while in alk. soln. the Lobry de Bruyn-van Ekenstein transformation predominates. I is most stable at  $\mu_H$  3.3. The temp. coeffs. of decompn. are unusually high and vary with the  $\mu_H$  being greatest in strong acid soln. A table shows the times required for the decompn. of 1% of I at integral  $\mu_H$ 's and 10° intervals.

M. P. Benoy

Tetrabenzoylfructofuranose (preliminary communication). Percy Brigi and Richard Schinle. *Ber.* 67B, 127-30 (1934); cf. *C. A.* 27, 2676.—By benzoylation of fructose had been obtained  $\beta$ -1,3,4,5-tetrabenzoylfructopyranose, a pentabenzoylate with open chain, and a small amt. of a tetrabenzoylate (I) which, because of its mutarotation, was assumed to be a furanose deriv. with the ring between C atoms 2 and 5. If this assumption is correct, further benzoylation of the 1,6-dibenzoate (II) of Zervas and Sessler (*C. A.* 28, 745<sup>1</sup>) should give I if II is not an open-chain deriv. Further benzoylation of II did, in fact, give I; none of the pentabenzoylate was formed even when the benzoylation was effected with the greatest caution.

C. A. R.

Preparation and properties of aldonic acids and their lactones and basic calcium salts. Horace S. Isbell and Harriet L. Frush. *Bur. Standards J. Research* 11, 649-64 (1933) (Research Paper No. 613).—Directions are given for the prepn. of a no. of aldonic acids and their lactones in cryst. form; in general, the aq. soln. of the acid (from the Ca salt) is distd. with dioxane, seeded with the desired compd., and distn. with dioxane continued until the flask is full of crystals. The acids are: *d*-gluconic (I), *d*-galactonic (II), *d*-mannonic (III), *l*-rhammonic (IV), *d*-xyloonic (V), *l*-arabonic (VI); the properties listed are, resp., m. p.,  $[\alpha]_D^{25}$  after 2, 5, 10 min., and 24 hrs. I: (C<sub>6</sub>H<sub>12</sub>O<sub>7</sub>), 120-31°, -6.9°, -5.2°, -4.2°, +7.3°. I  $\gamma$ -lactone (C<sub>6</sub>H<sub>10</sub>O<sub>6</sub>), 133-5°, 68.0°, 68.0°, 68.0°, 62.7°. I  $\delta$ -lactone (C<sub>6</sub>H<sub>10</sub>O<sub>6</sub>), 150-2°, 66.2°, 65.6°, 63.9°, 8.8°. II (C<sub>6</sub>H<sub>12</sub>O<sub>7</sub>), 148°, -13.6°, -13.2°, -13.0°, -17.0°. II  $\gamma$ -lactone hydrate (C<sub>6</sub>H<sub>10</sub>O<sub>6</sub>·H<sub>2</sub>O), 65-6°, -71.0°, -71.0°, -71.0°, -70.6°. II  $\gamma$ -lactone, anhyd. (C<sub>6</sub>H<sub>10</sub>O<sub>6</sub>), 110-2°, -77.4°, -77.4°, -77.4°, -76.4°. III  $\gamma$ -lactone (C<sub>6</sub>H<sub>10</sub>O<sub>6</sub>), 151-2°, 51.5°, 51.5°, 51.5°, 51.5°. III  $\delta$ -lactone (C<sub>6</sub>H<sub>10</sub>O<sub>6</sub>), 158-60°, 114.8°, 114.5°, 114.2°, 30.3°. IV  $\gamma$ -lactone (C<sub>6</sub>H<sub>10</sub>O<sub>6</sub>), 149-51°, -39.2°, -39.2°, -39.2°, -39.1°. IV  $\delta$ -lactone (C<sub>6</sub>H<sub>10</sub>O<sub>6</sub>), 172-82°, -100.4°, -100.1°, -99.6°, -35.1°. V  $\gamma$ -lactone (C<sub>6</sub>H<sub>10</sub>O<sub>6</sub>), 98-101°, 91.8°, 91.8°, 91.8°, 86.7°. VI (C<sub>6</sub>H<sub>10</sub>O<sub>6</sub>), 111-6°, -9.8°, -9.5°, -9.3°, -11.8°. VI  $\gamma$ -lactone (C<sub>6</sub>H<sub>10</sub>O<sub>6</sub>), 95-8°, -71.0°, -71.6°, -71.6°, -71.6°. These acids have the general formula CaX<sub>2</sub>·3CaO; for their basic Ca salts; maltobionic and lactobionic acids have Ca(C<sub>6</sub>H<sub>10</sub>O<sub>6</sub>)<sub>2</sub>·4CaO.

M. P. Benoy

The composition of an aldobionic acid from flaxseed mucilage. Carl Niemann and Karl P. Link. *J. Biol. Chem.* 104, 205-6 (1934).—The aldobionic acid in flaxseed mucilage has been definitely shown to yield *d*-galacturonic acid on hydrolysis as inferred from oxidation studies by Anderson and Crowder (*C. A.* 24, 5041). The occurrence of *l*-rhamnose was also confirmed. A. P. L.

Preparation of calcium lactobionate and lactobionic  $\delta$ -lactone. Horace S. Isbell. *Bur. Standards J. Research* 11, 713-47 (1933) (Research Paper No. 618).—Crude Ca lactobionate (I) is obtained as a jelly-like mass of fine crystals from the electrolytic oxidation of the sugar. Concn. of an aq. soln. with CaCl<sub>2</sub> yields Ca(C<sub>6</sub>H<sub>11</sub>O<sub>7</sub>)<sub>2</sub>·

CaCl<sub>2</sub>·6H<sub>2</sub>O,  $[\alpha]_D^{25}$  20.0° (H<sub>2</sub>O). From this the basic salt is prepd., decompd. with CO<sub>2</sub> and the filtrate concd. to a thick sirup from which after several weeks cryst. I seps., Ca(C<sub>6</sub>H<sub>11</sub>O<sub>7</sub>)<sub>2</sub>·5 H<sub>2</sub>O,  $[\alpha]_D^{25}$  23.7° (H<sub>2</sub>O). A soln. of the free acid prepd. from the Ca salt, dehydrated with dioxane, gives cryst. lactobionic  $\delta$ -lactone (II), m. 195-6° (decompn.) (from glacial AcOH),  $[\alpha]_D^{25}$  54° initially, becoming 22° after several hours (5% aq. soln.). Agreement between these values and those of the products of Br oxidation of the lactose in the presence of BaCO<sub>3</sub>, shows that the initial product in the 2nd case is II, changing into an equil. mixt. of 84% acid and 16% II. M. P. B.

Constitution of inulin. Synthesis of 3,4,6- and 1,4,6-trimethyl- $\gamma$ -fructose. T. N. Montgomery. *J. Am. Chem. Soc.* 56, 419-23 (1934).—Pos. and unquestionable evidence has been obtained proving that inulin on methylation and subsequent hydrolysis yields only 1 trimethylfructose, it being the 3,4,6-isomer (I).  $\beta$ -Diacetonefructose gives a 1-Bz deriv., m. 82°, which is hydrolyzed to 1-benzoylfructose; treatment with 1% MeOH-HCl and methylation with MeI and Ag<sub>2</sub>O give 1-benzoyl-3,4,6-trimethyl- $\gamma$ -methylfructose; debenzoylation and hydrolysis gives I,  $n_D$  1.4658,  $[\alpha]_D^{25}$  20.4° (CHCl<sub>3</sub>,  $c$  2.88); condensation with Me<sub>2</sub>CO gives a monoacetone deriv., b<sub>0.1</sub> 110°,  $n_D$  1.4450,  $[\alpha]_D^{25}$  70.3° (Me<sub>2</sub>CO,  $c$  3.03), expts. in which the condensation was arrested at various stages showed that equil. was reached when approx. 85% of I had reacted but the recovered uncondensed I is identical with the initial I. The condensation product of I with Me<sub>2</sub>CO is a mixt. of isomers; specimens isolated at various intermediate stages as the reaction proceeds range in sp. rotation from 80° to 58° and when hydrolysis of the compd. is arrested when about 80% complete the recovered unhydrolyzed monoacetone compd. shows a  $\alpha$  rotation of 32°.  $\alpha$ -Diacetonefructose and N<sub>2</sub>O<sub>5</sub> in CHCl<sub>3</sub> give the 3-nitrate, m. 61-2°; refluxed with Me<sub>2</sub>CO contg 20% 0.1 N HCl it gives 1,2-acetonefructose 3-nitrate, in 151-2°; this was hydrolyzed to fructose 3-nitrate, which was treated with 1% MeOH-HCl and then methylated, reduction and hydrolysis gives 1,4,6-trimethylfructose,  $n_D$  1.4639,  $[\alpha]_D^{25}$  29.7° (Me<sub>2</sub>CO,  $c$  2.13); the monoacetone deriv. b<sub>0.1</sub> 100°,  $n_D$  1.4464,  $[\alpha]_D^{25}$  1.85° (Me<sub>2</sub>CO,  $c$  1.85).

C. J. West

Action of metallic sodium on 1,4-dibromocyclohexane N. D. Pryanishnikov and S. I. Shuikina. *Ber.* 67B, 64-7 (1934).—Zelinskii and Kozeshkov (*C. A.* 21, 2464) describe the synthesis of a bicyclo[0.2.2] hexane from *cis*-1,4-dibromocyclohexane and Na. P. and S., using the same method, obtained a product C<sub>6</sub>H<sub>10</sub> (I), b. 77-82°,  $d_4^{25}$  0.8108,  $n_D^{25}$  1.4450, I no. 300.44, mol. refr. 26.94. I reacts extremely vigorously with Br; the amt. of added halogen depends on the concn. of the Br soln. In detns. of the I no. (Wijss) the soln. darkens as the result of the sepn. of I. With excess of KMnO<sub>4</sub>, I reacts vigorously and in the aq. soln. of the reaction products can be detected succinic and adipic acids. When I is passed over Pd-asbestos, some benzene is formed. The phys. consts. and chem. behavior of I show that it is not homogeneous. The chem. reactions can be explained by assuming that it is a mixt. of cyclohexadiene, cyclohexene and cyclohexane; this is corroborated by the increment of the parachor (-15.84), the calcd. value, according to Sippel, for a 6-membered ring being -17.1 and for a bicyclic hydrocarbon -23.2. The complete sepn. of such a mixt. by fractionation seems impossible, not only because the b. ps. of the constituents are so close together but on account of their tendency to form azeotropic mixts. P. and S. feel, therefore, that they have obtained no proof whatever of the presence of a bicyclic hydrocarbon. C. A. R.

The possible existence of three  $\alpha,\alpha'$ -dibenzylcyclohexanones. R. Cornubert and M. de Demo. *Compt. rend.* 197, 1656-8 (1933).—Catalytic hydrogenation of dibenzylidenecyclohexanone with either Pt or Ni gives 3  $\alpha,\alpha'$ -dibenzylcyclohexanones m. 55°, 103° and 122°, resp.

W. J. Peterson

Styrene and metastyrene. Samuel Natelson. *Ind. Eng. Chem.* 25, 1391-5 (1933).—An improved method for prepn. of styrene (I) from PhH and C<sub>2</sub>H<sub>4</sub> through PhEt

(II) and PhCHClMe (III) is given. II is best prepd. by first satg. the PhH-AlCl<sub>3</sub> suspension with HCl, then introducing C<sub>2</sub>H<sub>4</sub> with good stirring at 1 atm. and keeping the temp. below 75°. An 85% yield of III was obtained from II in ultra-violet light by the use of 60% of the theoretical Cl. I was obtained from the crude III by distn. with a Ag-Hg couple or HgCl<sub>2</sub>. Cu-Hg, H<sub>3</sub>PO<sub>4</sub>, HgO, HgSO<sub>4</sub>, Hg(OAc)<sub>2</sub>, and ZnCl<sub>2</sub> may also be used. The crude I was polymerized by heating with BzO<sub>2</sub>H formed *in situ* by first dissolving 0.6% O<sub>2</sub> in I, then adding 2% BzH. 1000 g. PhH gave 430 g. of II with 420 g. of PhH recovered. 1000 g. of II gave 340-379 g. of metastyrene.

Arnold M. Collins

**Allyltoluenes.** Charles D. Hurd and Harry T. Bollman. *J. Am. Chem. Soc.* 56, 447-9 (1934).—o-MeC<sub>6</sub>H<sub>4</sub>MgBr and allyl bromide give 70% of o-allyltoluene, b<sub>100</sub> 88-90°, b<sub>100</sub> 181-1.6°, d<sub>4</sub><sup>20</sup> 0.9110, d<sub>4</sub><sup>25</sup> 0.8970, n<sub>D</sub><sup>20</sup> 1.5255, n<sub>D</sub><sup>25</sup> 1.5171; on standing 1 month it had a yellow-green tint; the dibromide b<sub>100</sub> 166-8°, d<sub>4</sub><sup>20</sup> 1.6087, n<sub>D</sub><sup>20</sup> 1.5850. p-Allyltoluene, b<sub>100</sub> 58-60°, b<sub>100</sub> 180-1°, d<sub>4</sub><sup>20</sup> 1.5082, d<sub>4</sub><sup>25</sup> 0.9157, n<sub>D</sub><sup>20</sup> 1.5082, n<sub>D</sub><sup>25</sup> 1.5210; the dibromide b<sub>100</sub> 180°, d<sub>4</sub><sup>20</sup> 1.595, n<sub>D</sub><sup>20</sup> 1.5855. The o-isomer at 650° for 78 min. gave gaseous products contg. 7.8% (by vol.) of C<sub>2</sub>H<sub>4</sub>, 14.8% C<sub>2</sub>H<sub>2</sub>, 30.2% H<sub>2</sub>, 47.2% C<sub>n</sub>H<sub>2n+2</sub> (n = 1.06); the figures at 700° were not very different; the liquid products contained PhMe, o-C<sub>6</sub>H<sub>4</sub>Me<sub>2</sub>, C<sub>10</sub>H<sub>8</sub>, and unchanged o-allyltoluene and allylbenzene. p-Allyltoluene yielded p-C<sub>6</sub>H<sub>4</sub>Me<sub>2</sub> and PhMe; at 650° the gases contained 7.9% C<sub>2</sub>H<sub>4</sub>, 11.4% C<sub>2</sub>H<sub>2</sub>, 28.7% H<sub>2</sub> and 51.9% C<sub>n</sub>H<sub>2n+2</sub> (n = 1.04); at 575° the relations were 16.2% C<sub>2</sub>H<sub>4</sub>, 17.4% C<sub>2</sub>H<sub>2</sub>, 16.4% H<sub>2</sub> and 49.9% C<sub>n</sub>H<sub>2n+2</sub> (n = 1.89). These compds. were somewhat more stable than 1-phenyl-1-butene. Prolonged heating of the latter failed to effect any rearrangement into o-allyltoluene. C. J. W.

**Addition of hydrogen to acetylene derivatives.** XIX. Relation between the direction and progress of catalytic hydrogenation and the nature of catalyst. Yu. S. Zalkind, M. N. Vishnyakov and L. N. Morev. *J. Gen. Chem.* (U. S. S. R.) 3, 91-113 (1933); cf. C. A. 25, 2710.—While the hydrogenation of acetylene γ-glycols (I) in the presence of Pt black progresses uniformly with the formation of satd. glycols, the reaction with colloidal Pd proceeds in 2 stages: I rapidly adds 2 H atoms and then very slowly 2 more with the formation of satd. glycols. Such a sharp break in the process of hydrogenation is displayed only by γ-glycols. Acetylene alcs. combine with 4 H atoms without retardation in the reaction, while acetylene hydrocarbons (II), such as PhC≡CH, add the 2nd pair of H atoms even faster than the 1st (C. A. 8, 1419; 10, 1455, 17, 1453). The hydrogenation of diphenylbutynediol acetate (III) also proceeds in 2 stages with retardation of the reaction after addn. of 4 H atoms followed by highly increasing acceleration of the reduction with the addn. of 4 more H atoms and the formation of diphenylbutane. These facts indicate that the course of hydrogenation is detd. not only by the speed, but that the reaction can proceed selectively, viz., until the mols. of II (PhC≡CH) or those of an unsatd. glycol ester are present in the reaction system they will react with H<sub>2</sub> prior to other mols. (styrene or satd. glycol ester) available in the mixt., though separately the latter could combine with H<sub>2</sub> with a greater speed. Such a selective action of Pd was also demonstrated by Bourguet (C. A. 22, 2099; 27, 2372), who concluded that the selective action of colloidal Pd suspended in starch always leads to hydrogenation of all available mols. of acetylene derivs. first to ethylene derivs. and thereafter to the satd. compds. Thus sp. action of Pd suspended in starch is not characteristic of other catalysts, such as Pt, or of Pd suspended in other protective colloids (Z. and Vilenkins, C. A. 18, 1466). Thus if the selective action of a catalyst is more definitely pronounced in some cases, it was of interest to inquire whether all acetylene derivs. act similarly, regardless of their structure, and to what extent this selective action is related to the chem. nature of the catalyst and is conditioned by the phys. form of the catalyst or the kind of protective colloid used for its suspension. By catalytic hydrogenation of acetylene derivs. there

are formed *cis*- and *trans*-isomers of ethylene compds. While commonly the chief products are malenoid isomers, the tetramethylbutynediol (IV) and tetraphenylbutynediol produced also fumaroid isomers in various proportions, depending on the conditions of the reaction (Z., *J. Russ. phys.-chem. Soc.* 48, 1830 (1916); Z. and Teterin, C. A. 24, 78; Z., C. A. 21, 2459). Bourguet (C. A. 19, 2651; 24, 2451) ascribed the formation of the 2nd isomer of ethylene glycol to some stereoisomerizing agents, such as protective colloids (protalbinic acid). IV, Me<sub>2</sub>C<sub>2</sub>H<sub>2</sub>-C≡C≡COH and PhC≡CH were hydrogenated in the presence of Pd and Pt in the form of colloidal suspensions in protective colloids, powd. blacks and with various carriers. As protective colloids were used starch, gum arabic, gum tragacanth, agar, Na protalbinic acid and casein for Pd, and starch and gum arabic for Pt. The tabulated results of the exptl. work led to the following conclusions. The general course of hydrogenation of acetylene derivs. is conditioned by the chem. nature of the catalyst and the structure of the hydrogenated compd., and while different protective colloids and catalyst carriers may be unlike in their activity, they exert but little influence on the general progress of hydrogenation. The results substantiate the chem. character of the mechanism of catalysis. The catalyst displays selective affinity for hydrogenated mols., showing in general a preference for mols. with a triple bond. The character of catalytic distribution between acetylene and ethylene mols. is conditioned by the nature of the catalyst and the structure of the compd. Thus Pd acts with more definite selectiveness than Pt, while PhC≡CH and styrene differ in their relation to a catalyst considerably more than acetylene alcs. from the corresponding ethylene alcs. All catalysts produced some α-tetramethylbutenediol by hydrogenation of IV in AcOEt or alc. soln. The yields of the α-isomer are independent of the presence of an amino acid (protalbinic acid), and become greater with an increased quantity of a catalyst and a reduced time of addn. of H<sub>2</sub>.

Chas. Blanc

**Chlorine derivatives of p-xylene.** Henri Wahl. *Compt. rend.* 196, 1900-2 (1933).—Chlorination of p-xylene, with Fe as a catalyst, gave 2-chloro-1,4-dimethylbenzene (I), m. 1.6°, b. 184°, d<sub>4</sub><sup>20</sup> 1.0589. I was nitrated with HNO<sub>3</sub> + H<sub>2</sub>SO<sub>4</sub> at 0°, warmed to 50°, and poured on ice to give cryst. 2-chloro-5-nitro-1,4-dimethylbenzene (II), m. 97°, b<sub>10</sub> 135-6°, and an oil consisting of II and an isomer which could not be isolated. Reduction of II gave 2-chloro-5-amino-1,4-dimethylbenzene, m. 92.3°, b<sub>10</sub> 135-6°. *Ac deriv.* m. 176°; *Bs deriv.* m. 163°; *picrate*, orange, m. 195° (decompn.). Reduction of the oil gave also 2-chloro-1-amino-1,4-dimethylbenzene, m. 40°, b<sub>10</sub> 132-3°; *Ac deriv.* m. 171°; *Bs deriv.* m. 177°; *picrate*, yellow, m. 171-2° (decompn.). The isomeric amines from the reduction of the oil were sepd. by fractional crystn. of the HCl salts.

John E. Milbery

**Chloro derivatives of p-xylene.** Henri Wahl. *Compt. rend.* 197, 1330-2 (1933).—Nitration and hydrolysis of 2,5-acetoxylide yields 60% 4-NO<sub>2</sub> and 35% 6-NO<sub>2</sub> derivs.; the latter, by the Sandmeyer reaction, gives 75% 2-chloro-3-nitro-p-xylene, m. 56°, b<sub>10</sub> 135°. Reduction of this with Fe and HCl gives 6-chloro-2,5-xylidine (I), m. 41°, b<sub>10</sub> 120-7°; *Ac deriv.* m. 179°; *Bs deriv.* m. 144°; *picrate* m. 120°. I is not the unidentified isomer previously obtained (preceding abstr.); the latter, therefore, is 3-chloro-2,5-xylidine.

H. A. Beatty

**Catalytic reduction of nitro compounds.** A. M. Popov. *Anilinokrasochaya Prom.* 3, 391-402 (1933).—The investigation of the catalytic reduction of nitro compds. to amino derivs. with mol. H<sub>2</sub> by working in a liquid phase at low temps. and pressures was begun with the use of a Ni catalyst. The latter was obtained from freshly prepd. (HCO)<sub>2</sub>Ni by reduction with H<sub>2</sub> and by thermal decompn. The expts. were carried out in steel autoclaves provided with mech. stirring or rocking and elec. heating, and charged with 0.5 g. Ni and 14-17 H atm. at room temp. In the recorded expts. yields of over 90% of amino compds. were obtained with PhNO<sub>2</sub> (from C<sub>6</sub>H<sub>5</sub> contg. thiophene) (10 g.) and 100 cc. H<sub>2</sub>O, absorption of H<sub>2</sub> begins at 115°

and the temp. is raised to 134° in 2 hrs., giving 97% PhNH<sub>2</sub> (I). Complete conversions to I were obtained by using recovered Ni from previous expts., and by varying the quantities of H<sub>2</sub>O, the time of heating from 1.5–3.5 hrs. and the temp. from 120° to 180°. In the 10 expts. the washing of the recovered Ni with alc. and Et<sub>2</sub>O, long exposure to air and the loss in wt. showed no effect on its catalytic activity. A complete reduction of PhNO<sub>2</sub> was obtained at 180° in 2.5 hrs. without H<sub>2</sub>O. *p*-MeC<sub>6</sub>H<sub>4</sub>NO<sub>2</sub> (6 g.) and 20 cc. H<sub>2</sub>O in 25 min. at 95–105° gave 100% *p*-MeC<sub>6</sub>H<sub>4</sub>NH<sub>2</sub>, m. 44.5–5°. *p*-NO<sub>2</sub>C<sub>6</sub>H<sub>4</sub>CO<sub>2</sub>H (4.6 g.) and 2.3 g. NaHCO<sub>3</sub> in 20 cc. H<sub>2</sub>O in 20 min. at 92–125° gave *p*-H<sub>2</sub>NC<sub>6</sub>H<sub>4</sub>CO<sub>2</sub>Na, the free acid m. 187°. *m*-NH<sub>2</sub>-C<sub>6</sub>H<sub>4</sub>CO<sub>2</sub>H, m. 140–1°, was obtained in 25 min. at 100–10°. Tech. *p*-NO<sub>2</sub>C<sub>6</sub>H<sub>4</sub>OH (from *p*-NO<sub>2</sub>C<sub>6</sub>H<sub>4</sub>Cl) (5.8 g.) and 20 cc. EtOH or 20 cc. H<sub>2</sub>O in 20 min. at 100–10° gave *p*-NH<sub>2</sub>C<sub>6</sub>H<sub>4</sub>OH, m. 185–6° (187.5–8.5° in a sealed capillary). *p*-NH<sub>2</sub>C<sub>6</sub>H<sub>4</sub>Cl was prepd. from 6 g. *p*-NO<sub>2</sub>C<sub>6</sub>H<sub>4</sub>Cl and 40 cc. H<sub>2</sub>O in 40 min. at 100–10°. Aminosalicilic acid was prepd. from (1) 5 g. 2,6-HO(O<sub>2</sub>N)<sub>2</sub>C<sub>6</sub>H<sub>3</sub>CO<sub>2</sub>H, m. 152–4°, and 2.3 g. NaHCO<sub>3</sub> in 20 cc. H<sub>2</sub>O in 2 hrs. at 97°; (2) 5 g. 2,4-HO(O<sub>2</sub>N)<sub>2</sub>C<sub>6</sub>H<sub>3</sub>CO<sub>2</sub>H, m. 228°, and NaHCO<sub>3</sub> in 1 hr.; (3) 5 g. of the mixed isomers and NaHCO<sub>3</sub> in 40 min. at 90°; (4) 5 g. of the mixed isomers and 20 cc. H<sub>2</sub>O in 1 hr. at 90°; (5) 8 g. Na benzencarbazosalicilate and 40 cc. H<sub>2</sub>O in 1.5 hrs. at 64° or in 40 min. at 75–90°. 4,3-HO(H<sub>2</sub>N)<sub>2</sub>C<sub>6</sub>H<sub>3</sub>SO<sub>2</sub>H, m. 155–6°, from 10 g. nitro compd. and 20 cc. H<sub>2</sub>O in 1.5 hrs. at 70–100°. 4,3,5-HO(H<sub>2</sub>N)<sub>2</sub>C<sub>6</sub>H<sub>3</sub>SO<sub>2</sub>H from 5 g. of the 5-NO<sub>2</sub> acid and 25 g. H<sub>2</sub>O in 1.5 hrs. at 85–105°. 4,2-Cl(H<sub>2</sub>N)-C<sub>6</sub>H<sub>3</sub>OH, m. 137–8°, from 8 g. nitro compd. (prepd. by nitrating *p*-C<sub>6</sub>H<sub>4</sub>Cl<sub>2</sub> and decompg. with NaOH under pressure) and 20 cc. H<sub>2</sub>O in 50 min. at 60–82°. 2,5-Cl<sub>2</sub>C<sub>6</sub>H<sub>3</sub>NH<sub>2</sub>, from 4.9 g. nitro deriv. and 20 cc. H<sub>2</sub>O in 4 hrs. at 65–170° or with 20 cc. EtOH in 3 hrs. at 67–116°. 1,2,4-C<sub>6</sub>H<sub>3</sub>(NH<sub>2</sub>)<sub>2</sub>Cl, m. 70.5–0.7°, from 3.75 g. 4,2-Cl(O<sub>2</sub>N)<sub>2</sub>C<sub>6</sub>H<sub>3</sub>NH<sub>2</sub> (prepd. by amidation of 2,5-Cl<sub>2</sub>C<sub>6</sub>H<sub>3</sub>NO<sub>2</sub> in an autoclave) and 20 cc. H<sub>2</sub>O in 15 min. at 90–96°. *p*-C<sub>6</sub>H<sub>4</sub>(NH<sub>2</sub>)<sub>2</sub>, m. 139–40°, from 5.7 g. *p*-NH<sub>2</sub>-C<sub>6</sub>H<sub>4</sub>NO<sub>2</sub> and 20 cc. H<sub>2</sub>O in 1 hr. at 60–95°.  $\alpha$ -C<sub>10</sub>H<sub>7</sub>NO<sub>2</sub> (recrystd. from tech. xylene) (10 g.) and 50 cc. H<sub>2</sub>O in 3 hrs. at 160–70° with rocking gave  $\alpha$ -C<sub>10</sub>H<sub>7</sub>NH<sub>2</sub>, m. 47–9°.  $\alpha$ -C<sub>10</sub>H<sub>7</sub>NO<sub>2</sub> (50 g.) was purified by energetically stirring twice with 500 cc. hot H<sub>2</sub>O for 20 min., decanting from the H<sub>2</sub>O, pouring into cold H<sub>2</sub>O and drying. When 6 g. of purified  $\alpha$ -C<sub>10</sub>H<sub>7</sub>NO<sub>2</sub> with 20 cc. H<sub>2</sub>O at 100–5° was heated 25 min. there was obtained  $\alpha$ -C<sub>10</sub>H<sub>7</sub>NH<sub>2</sub>, m. 49.3–9.8°. Chas. Blanc

**2,4,6-Trinitrobenzalanilines.** Stephan Secareanu. *Bull. soc. chim.* 53, 1016–24, 1024–32 (1933); cf. C. A. 26, 5081.—The action of excess PhNH<sub>2</sub> on 2,4,6-(NO<sub>2</sub>)<sub>3</sub>-C<sub>6</sub>H<sub>2</sub>CHO (I) in boiling AcOH gave a solid (II, m. 224°), probably 4,6-dinitro-2-hydroxy-1,3-diphenyldihydrobenzotriazole. II was also obtained from 2,4,6-(NO<sub>2</sub>)<sub>3</sub>-C<sub>6</sub>H<sub>2</sub>-CH:NPh (III) along with a substance m. 257–8°. When III, PhNH<sub>2</sub> and KI are caused to react, II is formed and I<sub>2</sub> is liberated showing the presence of free HNO<sub>3</sub>. Like III,  $\beta$ -C<sub>10</sub>H<sub>7</sub>N:CHC<sub>6</sub>H<sub>4</sub>(NO<sub>2</sub>)<sub>2</sub> gave the  $\beta$ -naphthyl analog of II, m. 262°; *p*-C<sub>6</sub>H<sub>4</sub>N:CHC<sub>6</sub>H<sub>4</sub>(NO<sub>2</sub>)<sub>2</sub>, the *p*-tolyl analog (IV), m. 272°. IV was also formed from III and *p*-C<sub>6</sub>H<sub>4</sub>NH<sub>2</sub>. S. explains the formation of II through the replacement of an *o*-NO<sub>2</sub> group with PhNH and the reaction of this *o*-phenylenediamine with HNO<sub>3</sub> to form a triazole. *p*-BrC<sub>6</sub>H<sub>4</sub>N:CHC<sub>6</sub>H<sub>4</sub>(NO<sub>2</sub>)<sub>2</sub>, m. 184°, in boiling AcOH formed 4,6-dinitro-2-hydroxy-1,3-bis(*p*-bromophenyl)-dihydrobenzotriazole (V), m. 281°. Likewise 3,4-BrMe-C<sub>6</sub>H<sub>3</sub>N:CHC<sub>6</sub>H<sub>4</sub>(NO<sub>2</sub>)<sub>2</sub>, m. 209°, gave the corresponding benzotriazole (VI), m. 298°. Br and mol.-wt. detns. (Rast) sustain the triazole formulas. The reduction of II with Na<sub>2</sub>S<sub>2</sub>O<sub>4</sub> and benzoylation gave a tri-Bz deriv., m. 236°. Since 2,4,6-(O<sub>2</sub>N)<sub>3</sub>-C<sub>6</sub>H<sub>2</sub>NHPh on reduction and benzoylation gave a tri-Bz deriv. m. 262°, the possibility that II and its analogs might have a nitrosoamine structure is definitely eliminated. E. W. Scott

Compounds from salicylidene- and hydrocyanosalicylideneaniline as well as analogs and related substances. I. G. Rohde. *J. prakt. Chem.* 139, 17–26 (1934); cf. C. A. 4, 3217.—A discussion of the constitution of Schwab's

compd., prepd. from KCN and salicylideneaniline. II. Experimental and supplement. *Ibid.* 27–43.—Details are given of the prepn. of Schwab's compd., CaH<sub>10</sub>O<sub>2</sub>N<sub>2</sub>, from hydrocyanosalicylideneaniline (I) or from salicylaldehyde, aniline and KCN; salicylideneaniline (II) and KCN give an isomer, m. 146°; I and KCN in CCl<sub>4</sub> give an isomer, m. 136–7° or, in another expt., 147–8°, which is oxidized by O<sub>2</sub> to the unsatd. amide, HOC<sub>6</sub>H<sub>4</sub>C(=CONH<sub>2</sub>):NPh, m. 175–6°. The condensation of the isomers with BzH and HOC<sub>6</sub>H<sub>4</sub>CHO, also with II, is described. Details are given of the prepn. of the *p*-toluidine analog, m. 175.5–6°, of Schwab's compd., and of its splitting by concd. HCl. The condensation of salicylaldehyde, PhNHMe and HCN or KCN is also discussed. Most of the details are given in dissertations to which reference is made. C. J. West

**Cleavage of phenyl-R-anilinoethanes by reduction.** I. Gazopoulos. *Praktika (Akad. Athenon)* 7, 47 (5) (1932).—Based on the behavior of a free bond between the C and N atoms in secondary amines of the type PhNHCHPhR, G. formulates the reduction of such amines thus: PhNHCHPhR + H<sub>2</sub> → PhNH<sub>2</sub> + CH<sub>2</sub>PhR. If R is alkyl the cleavage product will be a combination of PhCH<sub>2</sub> with R, as PhCH<sub>2</sub>Me. If R is aryl or aralkyl, compds. such as CH<sub>2</sub>Ph<sub>2</sub>, MeC<sub>6</sub>H<sub>4</sub>CH<sub>2</sub>Ph, C<sub>10</sub>H<sub>7</sub>CH<sub>2</sub>Ph or PhCH<sub>2</sub>CH<sub>2</sub>Ph are formed. Prepn. of the secondary amines is effected from org. Mg compds. and PhN:CHPh according to the reactions (1) PhN:CHPh + RMgX = PhN(MgX)CHPhR, and (2) PhN(MgX)CHPhR + H<sub>2</sub>O = PhNHCHPhR + Mg(OH)X. *Prepn. of diphenylmethane.* To 40 cc. abs. Et<sub>2</sub>O are added gradually 3.6 g. powd. Mg and a small crystal of I<sub>2</sub>. Then 12 cc. of PhBr is added gradually and when the soln. of Mg is nearly complete the prepn. is heated on a water bath 45 min. To this soln. is added 25 g. dry PhN:CHPh prepd. by mixing 1 part aniline and BzH (freshly distd.) and washing with alc. After addn. of the PhN:CHPh the mixt. is heated to boiling and the heating continued 1 hr. after expulsion of the ether. The product is dissolved in dil. HCl, sep'd. and washed well with water. It is purified by shaking with concd. NH<sub>4</sub>OH and NH<sub>4</sub>Cl soln., again dissolving in ether and washing with water until neutral. The HCl deriv. is ppt'd. from the ether soln. by addn. of 12 g. HCl in 40 cc. EtOH. The salt is filtered and dried on a porous plate. To 17 g. of the salt in 50 cc. alc. under a reflux condenser are added 100 cc. concd. HCl and 50 g. Zn-Hg. The latter is prepd. by adding 50 g. of Zn in small pieces to aq. HgCl<sub>2</sub>. After reduction for about 1 hr. the prepn. is washed well with water. The contents of the flask are then heated on a gauze to produce vigorous evolution of H<sub>2</sub>, and the solid salt changes to an oily liquid. Water is added and the oily prepn. is decanted into a little ether, after which the ether is evap'd. and the oily liquid returned to the reflux and heated about 45 min. with 20% NaOH. The product is again taken up with ether, washed with water and shaken with dil. HCl, causing the sepn. of the HCl salt of the base. The ether soln., after more washing with water and drying over CaCl<sub>2</sub>, is distd. at 255–65°, yielding about 3.5 g. A second distn. at 260–2° yields pure CH<sub>2</sub>Ph<sub>2</sub>. *Phenyl- $\alpha$ -naphthylmethane* was similarly prepd. from  $\alpha$ -C<sub>10</sub>H<sub>7</sub>CHPhNHPh. An oily product is obtained which crystallizes after 1–2 days. This is distd. at 340–50° producing an oil which crystallizes when dried over H<sub>2</sub>SO<sub>4</sub> yielding a solid product. Recrystn. from alc. yields pure  $\alpha$ -C<sub>10</sub>H<sub>7</sub>CH<sub>2</sub>Ph, m. 59°. L. Y. D.

**Inhibition of oxidation of phenylhydrazine.** R. H. Hamilton, Jr. *J. Am. Chem. Soc.* 56, 487 (1934).—In the formation of osazones the oxidation of PhNHNH<sub>2</sub> is inhibited by the presence of NaHSO<sub>3</sub>; no tar forms in tubes in which all air has been evacuated. C. J. West

**Diazoamino compounds.** A. Mangini and I. Dejudicibus. *Gazz. chim. ital.* 63, 601–12 (1933).—Various metal salts of diazoamino compds. were prepd. with a view toward throwing further light on the constitution of the latter. Alc. PhNHPh (I) and alc. KOH give an intense violet color but no further reaction, and with H<sub>2</sub>SO<sub>4</sub> I is recovered. However, I in anhyd. Et<sub>2</sub>O and K

directly the *K* salt,  $\text{PhN}_2\text{KPh}$ , dark violet-red, decomps. in air to I; when heated it decomps. violently. Its constitution is the *malenoid form*. Though the *Hg* salt,  $(\text{C}_6\text{H}_5\text{N}_2)_2\text{Hg}$  (II), has been prepd. by Ciusa (*Atti. Accad. Lincei* [5], 18, II, 92(1932)) and otherwise by Vecchiotti and Capodacqua (*C. A.* 20, 591) it can be prepd. more simply in 100% yield by addn. of I in MeOH to  $\text{Hg}(\text{OAc})_2$  in MeOH (contg. AcOH). Its solns. in  $\text{PhNO}_2$  and  $\text{PhNH}_2$  are an intense orange and yield yellow crystals, whereas from  $\text{C}_6\text{H}_5\text{N}$  the crystals are dark orange and explosive. II therefore exists in 2 chromoisomeric forms, a non-explosive yellow ( $\text{PhN}:\text{NNPh}$ )<sub>2</sub>Hg, and the explosive dark orange malenoid form  $\text{Ph}-\text{N}:\text{NPh}:\text{Hg}:\text{NPh}:\text{N}:\text{NPh}$ . Though the *Cu* salt (III)

of I was prepd. otherwise by Meunier and Desparmet (*Compt. rend.* 131, 52), it can be prepd. like II, in which case it has the compn.  $(\text{C}_6\text{H}_5\text{N}_2)_2\text{Cu}:\text{MeOH}$ , is lustrous gray-black and explodes when heated. It has the malenoid form. Like I, alc. *m*- $\text{PhN}_2\text{HC}_6\text{H}_4\text{NO}_2$  (IV) gives an intense violet color with alc. KOH but no product, while III in anhyd. xylene and alc. KOH ppt. a substance contg. approx. 22% K, which may be a *K* salt of a decompn. product of IV. The *Cu* salt,  $(\text{C}_6\text{H}_5\text{O}_2\text{N})_2\text{Cu}$ , prepd. like III (the ppt. forms after 7-8 days), is intense green, and explodes when heated. It has the malenoid form. The *Hg* salt,  $(\text{C}_6\text{H}_5\text{O}_2\text{N})_2\text{Hg}$ , from I and  $\text{Hg}(\text{OAc})_2$  in boiling MeOH (let stand 15 days), exists in 2 forms, a non-explosive yellow salt from MeOH, and an explosive bright red salt from  $\text{C}_6\text{H}_5\text{N}$  or  $\text{PhNH}_2$ . From a  $\text{C}_6\text{H}_5\text{N}:\text{MeOH}$  mixt. an orange mixt. is obtained. IV and  $\text{AgNO}_3$  in MeOH ppt. the *Ag* salt,  $\text{C}_{12}\text{H}_9\text{O}_4\text{N}_4\text{Ag}$  (V), which probably exists in 2 forms, an explosive dark red malenoid form (VI) by pptn. from  $\text{C}_6\text{H}_5\text{N}$  with MeOH, and a non-explosive yellow form (VII). Addn. of MeOH to V in  $\text{C}_6\text{H}_5\text{N}$  ppts. VI, while addn. of  $\text{Et}_2\text{O}$  gives an orange ppt., probably a mixt. of VI and VII. Pure VII could not be isolated. Alc. *p*- $\text{PhN}_2\text{HC}_6\text{H}_4\text{NO}_2$  (VIII) and KOH give a slight ppt., but 100% of the *K* salt,  $\text{C}_6\text{H}_5\text{O}_2\text{N}_2\text{K}$  (IX), is obtained by addn. of alc. KOH to VIII in anhyd. xylene. It is steel-blue and decomps. rapidly in air to VIII. It does not explode when heated. Prepd. like IX (the yield is lower), the *Na* salt,  $\text{C}_6\text{H}_5\text{O}_2\text{N}_2\text{Na}$ , violet-blue, does not explode when heated. Prepd. like V, the *Ag* salt,  $\text{C}_{12}\text{H}_9\text{O}_4\text{N}_4\text{Ag}$ , of VIII has 2 chromoisomeric forms, orange-yellow from xylene, and intense pomegranate-red from  $\text{C}_6\text{H}_5\text{N}$  by  $\text{EtOH}$ . Each can be converted into the other by the proper solvent. The red form explodes when heated, therefore is probably the malenoid type. Prepd. like II, the *Hg* salt,  $(\text{C}_6\text{H}_5\text{O}_2\text{N})_2\text{Hg}$  (X), of VIII is obtained in an orange form (XI) from xylene or by addn. of water to its  $\text{C}_6\text{H}_5\text{N}$  soln., a bright red form (XII) by addn. of  $\text{EtOH}$  to its  $\text{C}_6\text{H}_5\text{N}$  soln., and a canary-yellow form (XIII) by addn. of  $\text{Me}_2\text{CO}$  and water to its  $\text{C}_6\text{H}_5\text{N}$  soln. XIII passes to XI by crystn. from xylene, and to XII by pptn. from  $\text{C}_6\text{H}_5\text{N}$  with  $\text{EtOH}$ . X therefore exists in 2 chromoisomeric forms, (1) XIII, which has the constitution  $(\text{PhN}:\text{NNPh})_2\text{Hg}$  and is not explosive, and (2) XII, the malenoid form, which explodes on heating. XI is probably a mixt. of XII and XIII. On standing 10 days, VIII and  $\text{Cu}(\text{OAc})_2$  in MeOH ppt. a small yield of the *Cu* salt,  $(\text{C}_6\text{H}_5\text{O}_2\text{N})_2\text{Cu}$ , dark green. The various colors of the products described indicate that those which are different from the parent diazoamino compd. are internal complex derivs. This complex structure does not involve the  $\text{NO}_2$  group, because (1) it is found not only in nitrodiazamino compds. but also in all triazenes, whether substituted or not; (2) the *Cu* salts and *K* salts of I, IV and VIII have the same increased intensity of colors over I, IV and VIII; and (3) II and III each exist in 2 chromoisomeric forms. The theory of Hantzsch explains the ease of formation and chromoisomerism of the internal complexes, i. e., the less intensely colored forms are the *anti*-forms, and the more intensely colored ones the *syn*-forms. This is analogous to nitrohydrazones, where the lighter colored compds. have the fumaroid form and the darker compds.

the malenoid form. Sulfication of IV and VIII must fix the mobile H atom (otherwise there would be a greater no. of isomers), and the complex malenoid salts can be re-

All of the salts described are very stable toward light and cannot be converted from I form to another by this agency.

Hydrolysis of substituted benzenesulfonamides. R. S. Schreiber and R. L. Shriner. *J. Am. Chem. Soc.* 56, 114 7(1934).—Substituted benzenesulfonamides contg.  $\text{NO}_2$  groups ortho or para to the sulfone group may be decompd. by concd. alkali to the amine,  $\text{O}_2\text{NC}_6\text{H}_4\text{OH}$  and  $\text{Na}_2\text{SO}_3$ . This cleavage between the C of the ring and the S atom offers a different mode of decompn. from previous hydrolyses which attempted cleavage between the S and N. An *o*- $\text{NO}_2$  group is more effective than a *p*- $\text{NO}_2$  group and a *m*-group has little effect. The 2,4-di- $\text{NO}_2$  derivs. were very readily cleaved by alkali. A mixt. of primary, secondary and tertiary amines may be sepd. satisfactorily by means of *o*- $\text{O}_2\text{NC}_6\text{H}_4\text{SO}_2\text{Cl}$  and the amines recovered from the sulfonamides in good yields. The anilides were prepd. from the amine and chloride with cooling, adding HCl after 15 mins. stirring. 2-Nitrobenzenesulfonamide, m. 114-5° (74% yield); 4- $\text{NO}_2$  isomer, m. 135-6° (74%); 3- $\text{NO}_2$  isomer, m. 122 3° (81%); 2,4-di- $\text{NO}_2$  deriv., m. 112 13° (83%); 2-nitrobenzenesulfonmethylanilide, m. 71-2° (73%); 4- $\text{NO}_2$  isomer, m. 117-8° (65%); 2,4-di- $\text{NO}_2$  deriv., m. 148-49° (92%). A table gives the percentage yield of amine with 20, 30, 40 and 80% NaOH.

C. J. West  
Iodo derivatives of diphenyl ether. I. The mono- and certain diiodo derivatives of diphenyl ether and of 2- and 4-carboxydiphenyl ethers. R. Q. Brewster and Franklin Strain. *J. Am. Chem. Soc.* 56, 117-20(1934).—Most of the following compds. were prepd. by standard methods. 2- $\text{IC}_6\text{H}_4\text{OPh}$ , m. 58°; 3-*I* isomer, b<sub>2</sub> 155°, b<sub>3</sub> 194-6°, d<sub>25</sub> 1.616, n<sub>D</sub> 1.643; 4-*I* isomer, m. 47°; 2-iodo-4'-nitro deriv., m. 104°; 4-*I* isomer, m. 70°; 2-iodo-4'-amino deriv., m. 69° (Ac deriv., m. 150°); 2- $\text{IC}_6\text{H}_4\text{OC}_6\text{H}_4\text{I}$ -4, m. 48°; 2-nitro-4'-iododiphenyl ether, m. 86° (constitution proved for 1st time); 3,4'-dinutrodiphenyl ether, m. 123°; 3,4'-diamino deriv., m. 72° (di-Ac deriv., m. 192°); 3,4'-diiododiphenyl ether, b<sub>2</sub> 200°, d<sub>25</sub> 2.051, n<sub>D</sub> 1.696; 4-phenoxyphenylurethane, m. 63°; 4-iodophenoxy deriv., m. 126°; 4-(4-iodophenoxy)phenylurea, m. 201°; (4- $\text{IC}_6\text{H}_4$ )<sub>2</sub>O, m. 139°; 2-amino-4-nitrodiphenyl ether, m. 107°; 2-*I* deriv., m. 61°; 2-iodo-4-amino deriv., b<sub>2</sub> 203°, d<sub>25</sub> 1.667, n<sub>D</sub> 1.677 (Ac deriv., m. 120°); 2,4-diiododiphenyl ether, b<sub>2</sub> 198°, d<sub>25</sub> 2.056, n<sub>D</sub> 1.700; 3-nitro-4-aminodiphenyl ether, m. 82°; 3,4'-diamino deriv., m. 69° (di-Ac deriv., m. 188°); 3-nitro-4-iodo deriv., b<sub>2</sub> 195°, d<sub>25</sub> 1.722, n<sub>D</sub> 1.657; 3-amino deriv., b<sub>2</sub> 188°, d<sub>25</sub> 1.664, n<sub>D</sub> 1.676 (Ac deriv., m. 144°); 3,4'-di-*I* deriv., b<sub>2</sub> 208°, d<sub>25</sub> 2.055, n<sub>D</sub> 1.700; *o*- $\text{ClC}_6\text{H}_4\text{CO}_2\text{H}$ ,  $\text{PhOH}$ , NaOH and a little Cu, heated at 190° for 15 min. give 2- $\text{PhOC}_6\text{H}_4\text{CO}_2\text{H}$ ; *p*- $\text{ClC}_6\text{H}_4\text{NO}_2$  and *o*- $\text{KOC}_6\text{H}_4\text{CHO}$ , heated 6 hrs. at 190-200°, give 2-(4-nitrophenoxy)benz-

aldehyde, m. 112°; oxidation of the aldehyde or nitration of 2-PhOC<sub>6</sub>H<sub>4</sub>CO<sub>2</sub>H gives the corresponding acid, m. 187°; 4-amino deriv., m. 180° (Ac deriv., m. 185°); 4-I deriv., m. 143°; heating the latter with concd. H<sub>2</sub>SO<sub>4</sub> at 100° for 10 min. gives 2-iodoxanthone, m. 150°. 2-Phenoxy-5-aminobenzoic acid, m. 164° (Ac deriv., m. 165°); 5-I deriv., m. 148°. 2-(2-Nitrophenoxy)benzaldehyde, m. 77°; the acid m. 153°; 4-nitroxanthone, m. 190°; 2-(2-aminophenoxy)benzoic acid, m. 153° (Ac deriv., m. 179°); the lactam m. 211°. 2-(2-Iodophenoxy)benzoic acid, m. 133°; the 4-(4-iodophenoxy) deriv. m. 217°; 2-(4-iodophenoxy)-5-nitrobenzoic acid, m. 178°; the 5-amino deriv. m. 185°; 2-(4-nitrophenoxy)-5-nitrobenzoic acid, the α-form m. 158° and the β-form m. 170-1°; the α-form is converted into the β-form above its m. p.; 2-(4-iodophenoxy)-5-iodobenzoic acid, m. 176°. These compds., with the possible exception of the iodocarboxy compds., do not possess any marked physiol. activity. C. J. W.

Chlorination with dichlorourea. M. V. Likhoshesterov. *J. Gen. Chem.* (U. S. S. R.) 3, 164-71 (1933).—Chlorination with dichlorourea (I) in alk. or neutral soln. is usually accompanied by oxidative processes leading to the formation of gaseous or tarry products. Urotropin is exceptional and can be chlorinated to give dichloropentamethylenetetramine. Also picric acid in Na<sub>2</sub>CO<sub>3</sub> soln. gives some chloropicrin. In the presence of HCl, which acts catalytically, chlorination with I is rapid, proceeds without formation of gases or tar, and can be used to prep. mono- and poly-Cl compds. in aq. soln. Compds. which already contain substituents facilitating halogenation are very smoothly chlorinated by I. PhH, PhMe and C<sub>6</sub>H<sub>5</sub>Me<sub>2</sub> are difficultly chlorinated with I even with heat and catalysts. Thus PhH when boiled with I in the presence of a trace of I<sub>2</sub> gives PhCl, Cl<sub>2</sub>, HCl and NCl<sub>3</sub>. AcOH can be chlorinated similarly in the presence of S. EtOH with the same treatment gives a colorless substance, insol. in H<sub>2</sub>O and sol. in EtOH, which contains C, H, N and Cl. Aromatic amines are strongly oxidized by I with evolution of heat and sometimes with explosive violence. I with dil. aq. or EtOH solns. of amines gives intense colors suitable for sensitive qual. tests, e. g., PhNMe<sub>2</sub> in EtOH soln. gives a green color detectable at a concn. of 1:100,000. Acylated amines can be chlorinated smoothly. An aq. suspension of PhNHAc with I and concd. HCl gives o- and p-ClC<sub>6</sub>H<sub>4</sub>NHAc. Of the dihydric phenols, resorcinol (II) reacts quantitatively, giving mono-, di- and trichlororesorcinols. 4-Chlororesorcinol (III): II (16.5 g.) in 75 cc. H<sub>2</sub>O with 10.17 g. I and 1 cc. concd. HCl gave a reddish soln. with evolution of heat. Cooling was used to keep the temp. below 35°. Extn. with Et<sub>2</sub>O followed by evapn. of the Et<sub>2</sub>O gave a thick liquid which yielded wart-like crystals on standing. Distn. of these gave A b. 256-9°, m. 81°, and B b. 259-60°, m. 88° with evolution of HCl. A 2nd distn. did not give a product with higher m. p. Crystn. of B from PhH gave III, m. 102.5°, b. 259.5° (uncor.). Recrystn. of A from PhH gave a small quantity of substance, m. 94°, differing from III in cryst. habit. III could also be prepd. by chlorination of II in MeOH soln. 4,6-Dichlororesorcinol (IV): Mol. quantities of I and II gave IV, m. 113°. Hydrated IV m. 70°. II (5.5 g.) in 35 cc. of H<sub>2</sub>O, 0.7 g. I and 2 cc. concd. HCl with cooling gave a reddish yellow soln., which after standing several hrs. was treated with Et<sub>2</sub>O, pptg. a reddish brown oil. This crystallizes on standing under reduced pressure. Sublimation of these crystals under reduced pressure gave long silky needles, m. 110-11°. By fractional crystn. from H<sub>2</sub>O a small quantity of substance differing from IV was obtained, probably 2,4-dichlororesorcinol. IV was also prepd. by chlorinating in MeOH, AcOH or Et<sub>2</sub>O. IV is easily sol. in H<sub>2</sub>O, EtOH and Et<sub>2</sub>O, and can be recrystd. from ligroin. The H<sub>2</sub>O soly. of hydrated IV is less than that of anhyd. IV. 2,4,6-Trichlororesorcinol (V): Addn. of the theoretical quantity of I to a dil. aq. soln. of II gave V, recrystd. from H<sub>2</sub>O, m. 83°. 4-Bromo-6-chlororesorcinol (VI) and 4-bromo-2,6-dichlororesorcinol (VII): 4-bromoresorcinol (VIII) (3.8 g.) in 20 cc. H<sub>2</sub>O, a 10% excess of I, and a few drops of HCl reacted with

the evolution of heat and the production of a yellow soln. which was extd. with Et<sub>2</sub>O, the Et<sub>2</sub>O removed, and the residue allowed to crystallize. This crystd. from warm ligroin as a voluminous flocculent mass, easily sublimed. Recrystn. of the sublimate from ligroin gave VI, m. 108.5°. No isomer of VI was isolated. VI is easily sol. in H<sub>2</sub>O, EtOH, Et<sub>2</sub>O and AcMe, somewhat more difficultly in CHCl<sub>3</sub>, PhH and CS<sub>2</sub>. VIII (3.8 g.) in 75 cc. H<sub>2</sub>O, 2.8 g. I and a few drops of HCl gave a voluminous white substance in theoretical yield, which, recrystd. from H<sub>2</sub>O, formed VII, needles, m. 78.5°, very sol. in Et<sub>2</sub>O, AcMe and EtOH from which solns. it is pptd. by H<sub>2</sub>O. VII is more difficultly sol. in cold PhH or CHCl<sub>3</sub>. L. W. B.

Bromination with dichlorourea and potassium bromide M. V. Likhoshesterov. *J. Gen. Chem.* (U. S. S. R.) 3, 172-6 (1933).—Bromination with dichlorourea (I) and KBr is especially valuable for the prepn. of mono- and di-Br derivs. of phenols and aromatic amines in water. Cl derivs. are not formed because of the relatively slow speed of the chlorination reaction. Bromination is attributed to the action of free HBrO formed by the hydrolysis of unstable CO(NHBr)<sub>2</sub>. When the bromination was carried out in neutral soln. considerable oxidation occurred with the formation of tarry products. In the presence of H<sub>2</sub>SO<sub>4</sub> the amt. of oxidation was greatly reduced. The present paper describes the prepn. of 4-bromo- (II), 4,6-dibromo- (III), 2,4,6-tribromo- (IV), 4-chloro-2,6-dibromo- (V), and 4,6-dichloro-2-bromoresorcinol (VI). In the prepn. of III an acid environment gave the highest yield, since in neutral soln. II and IV were also formed. KBr (23.8 g.) in 50 cc. H<sub>2</sub>O, added in large portions to a mixt. of 22 g. resorcinol (VII) in 80 cc. H<sub>2</sub>O and 13.5 g. I with const. shaking and cooling, gave a reddish brown soln., which was extd. with Et<sub>2</sub>O, the Et<sub>2</sub>O evapd., and the thick dark, oily residue allowed to crystallize by standing for several days in a vacuum desiccator over H<sub>2</sub>SO<sub>4</sub>. The crystals by repeated extn. with hot ligroin gave II, m. 99°, very sol. in H<sub>2</sub>O, EtOH, and Et<sub>2</sub>O, much less sol. in PhH, CHCl<sub>3</sub>, and cold ligroin. Aq. II gave a blue color with FeCl<sub>3</sub>. KBr (23.8 g.) in 40 cc. of H<sub>2</sub>O, added in large portions to a mixt. of 11 g. VII in 40 cc. of H<sub>2</sub>O and 13.4 g. I with cooling, gave an oily substance which was dissolved, except for a small residue of IV, in a small amt. of warm H<sub>2</sub>O. Extn. of the aq. soln. with Et<sub>2</sub>O followed by removal of the Et<sub>2</sub>O gave a crystallizable residue. Extn. of this with cold H<sub>2</sub>O removed II. The remaining III, after recrystn. from H<sub>2</sub>O and drying in a vacuum desiccator, m. 115°. III sublimes, is sol. in EtOH and Et<sub>2</sub>O, and is colored blue by FeCl<sub>3</sub>. The theoretical proportions of KBr and I with VII gave IV, recrystd. from dil. EtOH, m. 110°. V, prepd. by the action of 2 mols. Br upon chlororesorcinol, m. 104°. Dichlororesorcinol (1.8 g.), m. 113°, in 75 cc. H<sub>2</sub>O, with 1.2 g. KBr and 0.8 g. I gave a ppt. which was repeatedly crystd. from hot H<sub>2</sub>O, giving VI, needles, m. 101°, sol. in Et<sub>2</sub>O, EtOH and AcMe, from which solns. it is pptd. by H<sub>2</sub>O. Lewis W. Butz.

Iodination with dichlorourea and potassium iodide M. V. Likhoshesterov and R. I. Trimbali. *J. Gen. Chem.* (U. S. S. R.) 3, 177-82 (1933).—Resorcinol (I) (2.2 g.) and 4 g. KI in 25 cc. H<sub>2</sub>O, acidified with 3 drops of concd. H<sub>2</sub>SO<sub>4</sub> with 1.4 g. of finely powd. dry dichlorourea (II) added with const. shaking gave a nearly colorless soln. free from I<sub>2</sub>. Addn. of Na<sub>2</sub>SO<sub>3</sub>, extn. with Et<sub>2</sub>O and removal of the Et<sub>2</sub>O under reduced pressure gave an oil which crystd. readily. The crystals were filtered with suction and recrystd. by dissolving in a small quantity of H<sub>2</sub>O at 50-60° and allowing the soln. to cool. Fine white needles with 1 H<sub>2</sub>O, m. 83°. Upon standing in the air the H<sub>2</sub>O is gradually lost, giving anhyd. iodoresorcinol (III), m. 100°, easily sol. in hot H<sub>2</sub>O, EtOH, Et<sub>2</sub>O, CHCl<sub>3</sub>, AcMe and CS<sub>2</sub>. In the prepn. of 4,6-diiodoresorcinol (V) there was obtained about 40% of by-products, chiefly III and triiodoresorcinol (IV). II (6.8 g.) was added in portions to a mixt. of 5.5 g. I and 16 g. of finely powd. KI in 75 cc. of glacial AcOH. Cooling, addn. of Na<sub>2</sub>SO<sub>3</sub> followed by H<sub>2</sub>O to 400 cc., removal of the pptd. IV, extn. of the filtrate with Et<sub>2</sub>O and re-

removal of the  $\text{Et}_2\text{O}$  gave a mass which crystd. on standing. III was removed by dissolving in EtOH and adding  $\text{H}_2\text{O}$  until an emulsion formed. On standing V crystd., m.  $84^\circ$ , sol. in EtOH,  $\text{Et}_2\text{O}$ , PhH,  $\text{CHCl}_3$  and  $\text{CS}_2$ . IV was prepd. by treating 1 mol. I in dil. aq. soln. with 3 mols. KI and 1.5 mols. II. 4-Chlororesorcinol (1 mol.), 2 mols. KI and 1 mol. II in neutral aq. soln. gave a dark brown product. From this in EtOH addn. of  $\text{H}_2\text{O}$  gave a purified ppt. which by redissolving in EtOH and reprecip. gave 4-chloro-2,6-diiodoresorcinol, needles, m.  $106^\circ$ . Equiv. quantities of KI and II with 4-chlororesorcinol in water acidified with  $\text{H}_2\text{SO}_4$  gave, after treatment of the 1st brown product with  $\text{NaHSO}_3$  and recrystn. from warm benzene, 4-chloro-6-iodoresorcinol, m.  $71.4^\circ$ . Equiv. quantities of KI and II gave with 4,6-dichlororesorcinol in  $\text{H}_2\text{O}$  acidified with  $\text{H}_2\text{SO}_4$  2-iodo-4,6-dichlororesorcinol, m.  $94^\circ$ . III and II in equiv. quantities in glacial AcOH poured into dil. HCl and then dild. with  $\text{H}_2\text{O}$  gave 4-iodo-2,6-dichlororesorcinol, colorless crystals (from hot benzene), m.  $92.6^\circ$ . By similar procedures were prepd. bromoiodoresorcinol (monohydrate), m.  $65^\circ$ , (anhyd.) m.  $87.6^\circ$ , and 4-iodo-2,6-dibromoresorcinol, m.  $112.2^\circ$ .

Lewis W. Butz

**The preparation of aromatic thiocyanates with the aid of dichlorourea.** M. V. Likhoshervostov and A. A. Petrov. *J. Gen. Chem.* (U. S. S. R.) 3, 183-97 (1933).—Dichlorourea (I) and  $\text{NH}_4\text{SCN}$  react slowly in dil. aq. soln. giving pseudothiocyanogen (II), urea,  $\text{H}_2\text{SO}_4$ , HCN, HSCN and HCl. The formation of these substances may be explained by postulating the intermediate formation and hydrolysis of  $\text{CO}(\text{NHSCN})_2$  (III), the following reactions occurring: (1)  $\text{CO}(\text{NHCl})_2 + 2\text{NH}_4\text{SCN} \rightarrow \text{CO}(\text{NHSCN})_2 + 2\text{NH}_4\text{Cl}$ , (2)  $\text{CO}(\text{NHSCN})_2 + 2\text{HOH} \rightarrow \text{CO}(\text{NH}_2)_2 + 2\text{HOSCN}$ , (3)  $2\text{HOSCN} \rightarrow \text{HSCN} + \text{NCSO}_2\text{H}$ , (4)  $\text{NCSO}_2\text{H} + \text{HOSCN} \rightarrow \text{HSCN} + \text{NC}_2\text{SO}_2\text{H}$ , (5)  $\text{NCSO}_2\text{H} + \text{H}_2\text{O} \rightarrow \text{HCN} + \text{H}_2\text{SO}_4$ . More concd. solns. of I and  $\text{NH}_4\text{SCN}$  react more quickly with evolution of heat, giving considerable quantities of II. In AcMe II is formed together with theoretical yields of urea and  $\text{NH}_4\text{Cl}$ . The reaction in MeOH is similar, yielding II, but in addn. a white substance, sol. in EtOH, insol. in  $\text{H}_2\text{O}$ , contg. much C, and exhibiting reducing properties. This unidentified substance reacts energetically with concd.  $\text{HNO}_3$  with formation of free C. An  $\text{Et}_2\text{O}$  soln. of  $\text{Hg}(\text{SCN})_2$  (made by shaking  $\text{HgCl}_2$  in  $\text{Et}_2\text{O}$  with  $\text{NH}_4\text{SCN}$  and filtering out the  $\text{NH}_4\text{Cl}$ ) with the exactly theoretical quantity of I in  $\text{Et}_2\text{O}$  gave a transparent soln. free from I. This reacted with  $\text{PhNH}_2$  with pptn. of urea, furnishing evidence of III in the  $\text{Et}_2\text{O}$  soln. Likewise the red color of  $\text{Fe}(\text{SCN})_3$  in  $\text{Et}_2\text{O}$  is changed to the yellow of  $\text{FeCl}_3$  by the addn. of I. III could not be isolated from its soln. in  $\text{Et}_2\text{O}$  or EtOH. All aromatic compds. contg. substituents favoring the introduction of halogen can be thiocyanated with I and  $\text{NH}_4\text{SCN}$ . The reaction occurring is  $2\text{RH} + 2\text{NH}_4\text{SCN} + (\text{NHCl})_2\text{CO} \rightarrow 2\text{RSCN} + 2\text{NH}_4\text{Cl} + (\text{NH}_2)_2\text{CO}$ , since the urea and  $\text{NH}_4\text{Cl}$  can be quantitatively recovered. Phenols were best thiocyanated in aq. AcOH, amines in EtOH or AcMe, and diamines and amino acids in AcOH or aq. EtOH. AcMe was especially suitable because most aromatic compds. and  $\text{NH}_4\text{SCN}$  are sol. therein, I acts upon AcMe only very slowly, and, since  $\text{NH}_4\text{Cl}$  is insol., the course of the reaction can be followed. The pptn. of orange II along with  $\text{NH}_4\text{Cl}$  indicates the absence of thiocyanation. A few drops of  $\text{H}_2\text{SO}_4$  improve the quality and yield of product. Cooling and const. shaking during the introduction of I are required.  $\text{PhNMe}_2$  (5.63 g.) and 3.54 g.  $\text{NH}_4\text{SCN}$  in 40 cc. AcMe with 3 g. I in 20 cc. AcMe gave, after filtration of the pptd.  $\text{NH}_4\text{Cl}$ , evapn. of the AcMe, and twice washing with alc., *p*-dimethylaminophenyl thiocyanate, m.  $73.4^\circ$ . Recrystn. from EtOH or  $\text{Et}_2\text{O}$  did not raise the m. p.  $\text{PhNH}_2$  (2.86 g.) and 2.5 g.  $\text{NH}_4\text{SCN}$  in 20 cc. of 60% MeOH, 3-5 drops of concd.  $\text{H}_2\text{SO}_4$ , and 2 g. I in 15 cc. of MeOH gave the sulfate of *p*-aminophenyl thiocyanate (IV) which was filtered and converted on the filter with  $\text{Na}_2\text{CO}_3$  soln. to the free base IV (yield 80%), m.  $56-7^\circ$  after recrystn. 2 mols. of I and  $\text{NH}_4\text{SCN}$  in AcMe,  $\text{PhNH}_2$  gave

80% of 2,4-dithiocyananiline, m.  $108^\circ$  from EtOH or PhH.  $\alpha\text{-C}_6\text{H}_4\text{NH}_2$  (V) (4.4 g.) and 2.4 g.  $\text{NH}_4\text{SCN}$  in 20 cc. MeOH with 2 g. I in 10 cc. MeOH gave a product which was treated with large quantities of  $\text{H}_2\text{O}$ , whereupon 70-80% of readily crystallizable yellow oil formed. Recrystn. from aq. alc. gave 4-thiocyano- $\alpha$ -naphthylamine, m.  $140^\circ$ . V (2.2 g.) and 2.36 g.  $\text{NH}_4\text{SCN}$  in 20 cc. AcMe with 2 g. I in 15 cc. AcMe gave 2,4-dithiocyano- $\alpha$ -naphthylamine, decomp.  $204^\circ$ .  $\text{NH}_4\text{Cl}$  was filtered from the reaction mixt. while still warm and the filtrate on cooling gave needles of the above product which were recrystd. from EtOH. Addn. of  $\text{H}_2\text{O}$  to the mother liquor gave more product. L. and P. prepd. for the 1st time 4-thiocyano- (VI), and 4,6-dithiocyano-*m*-phenylenediamine (VII) and dithiocyanobenzidine (VIII). *p*- $\text{C}_6\text{H}_4(\text{NH}_2)_2$ , because of its ready oxidizability, did not give a thiocyano deriv., and the monothiocyanobenzidine could not be sepd. from the accompanying oxidation products. *m*- $\text{C}_6\text{H}_4(\text{NH}_2)_2$  (1.68 g.) and 1.2 g.  $\text{NH}_4\text{SCN}$  in 20 cc. of 80% AcOH with 1 g. I in 10 cc. AcOH gave, after dildn. of the reaction mixt. with  $\text{H}_2\text{O}$ , VI, m.  $160-1^\circ$  from MeOH, sol. in EtOH,  $\text{Et}_2\text{O}$ , AcMe and AcOH, insol. in  $\text{H}_2\text{O}$  and PhH. *m*- $\text{C}_6\text{H}_4(\text{NH}_2)_2$  with 2 mols. I and  $\text{NH}_4\text{SCN}$  gave VII, recrystd. from EtOH, m.  $170-2^\circ$  (decompn.), rhombic, less sol. than VI. VI (1.28 g.) and 1.84 g. KBr in 25 cc. 80% AcOH with 1 g. I in 15 cc. AcOH gave on cooling silvery crystals with a metallic luster, 4-thiocyano-6-bromo-*m*-phenylenediamine (IX). The  $\text{NH}_2$  groups in IX did not diazotize easily. IX decompd. on warming and was less sol. than VI. Benzidine (1.4 g.) and 1.2 g.  $\text{NH}_4\text{SCN}$  in 30 cc. AcOH with 1 g. I in 15 cc. AcOH gave, by pptn. from the reaction mixt. with  $\text{H}_2\text{O}$  and recrystn. of the ppt. from EtOH, VIII, decomp.  $250^\circ$ , difficultly sol. in EtOH, insol. in  $\text{H}_2\text{O}$ , sol. in AcOH and AcMe. 4-Thiocyananthranilic acid (X) and 4-thiocyano-1-aminobenzene-3-carboxylic acid (XI) were prepd. for the 1st time. Anthranilic acid (2.12 g.) and 1.2 g.  $\text{NH}_4\text{SCN}$  in 30 cc. AcMe with 1 g. I in 10 cc. AcMe gave on dildn. 80% of X, recrystd. from hot  $\text{H}_2\text{O}$ , needles, m.  $168-70^\circ$ . X is insol. in cold  $\text{H}_2\text{O}$ , sol. in hot  $\text{H}_2\text{O}$ , EtOH,  $\text{Et}_2\text{O}$ , AcMe and hot AcOH. *m*- $\text{NH}_2\text{C}_6\text{H}_4\text{CO}_2\text{H}$ , by a similar procedure, gave XI, decomp. on warming, insol. in  $\text{H}_2\text{O}$ , sol. in EtOH,  $\text{Et}_2\text{O}$  and AcMe. PhOH and  $\text{NO}_2\text{C}_6\text{H}_4\text{OH}$  could not be thiocyanated with I and  $\text{NH}_4\text{SCN}$ . Hydroquinone and pyrocatechol were first converted to the corresponding quinones, then to the monothiocyanophenols, and finally to esters of thiocarbamic acid,  $\text{C}_6\text{H}_5(\text{OH})_2\text{SCONH}_2$ . Resorcinol did not give a thiocyano deriv.  $\alpha$ - (XII) and  $\beta$ -Naphthol (XIII) gave thiocyano derivs. with the same exptl. procedure. In the case of XIII there was formed at the same time a dark-red substance yielding on standing colorless needles of unknown compn. but not contg. a thiocyano group. 1-Thiocyano- $\beta$ -naphthol is readily decompd. with  $\text{H}_2\text{O}$ , giving a yellow solid which cannot be diazotized. XII (2.22 g.) in 20 cc. AcOH, 1.2 g.  $\text{NH}_4\text{SCN}$  in 5 cc.  $\text{H}_2\text{O}$ , and 1 g. of dry I, mixed in the order mentioned, gave on dildn. the mixt. with 3 parts of  $\text{H}_2\text{O}$ , 75% of 4-thiocyano- $\alpha$ -naphthol, m.  $112-13^\circ$  from EtOH and  $\text{H}_2\text{O}$ , sol. in EtOH,  $\text{Et}_2\text{O}$ , difficultly sol. in AcMe, and insol. in  $\text{H}_2\text{O}$ . XII with 2 mols.  $\text{NH}_4\text{SCN}$  and I gave 2,4-dithiocyano- $\alpha$ -naphthol, long yellow needles from EtOH and hot  $\text{H}_2\text{O}$ , m.  $118^\circ$  (decompn.), sol. in the common org. solvents. The yields of aromatic thiocyanates obtained by L. and P. are usually about 4-5 times those reported previously.

Lewis W. Butz

**Pseudoquinonoid character of tribromoresorcinol.** Tenney L. Davis and Valentine F. Harrington. *J. Am. Chem. Soc.* 56, 129-32 (1934).—1,3,2,4,6-(HO) $_2\text{C}_6\text{HBr}_3$  (I) evidently exists in the tautomeric pseudoquinonoid form, for the effect of reagents upon it is the effect which the reagents would be expected to have upon the pseudoquinone or upon the 2,6-dibromo-3-hydroxy-4-benzoquinyl, which corresponds to the loss of HBr from that tautomer. I is definitely an oxidizing agent, liberating I from  $\text{HI}$  or from KI in EtOH; it oxidizes  $\text{SnCl}_2$  and  $\text{Na}_2\text{SO}_3$ .  $\text{C}_6\text{H}_5\text{N}$  or alkali, by removing HBr from I, produces dark amorphous polynuclear compds. but dry  $\text{C}_6\text{H}_5\text{N}$  in  $\text{C}_6\text{H}_6$  or aq. alkali in

large excess, by forming salts of I in its phenol form, reverses the equil. and suppress quinuonization and the formation of the quinyl radical. Mild reduction of I with  $\text{Na}_2\text{SO}_3$  or  $\text{SnCl}_2$  successively removes the Br atoms para to the HO groups and ceases with the production of 2-bromo-resorcinol, m. 101.2-2°; the 2,4-di-Br deriv. m. 92.8-3.7°. Oxidation of the Me ether of I gives 2-methoxy-3,5,6-tri-bromobenzoquinone, red, m. 168-8.5°, also prepd. by bromination of 2-methoxyhydroquinone; reduction with  $\text{SO}_2$  gives the hydroquinone, m. 175-6°; with 2 N KOH there results methylbromosulfate, does not m. 350°.

C. J. West

**Preparation and enzymic splitting of basic glucosides.** Burekhardt Heflerich, Erich Günther and Siegfried Winkler. *Ann.* 508, 192-205 (1934).—Tetraacetyl-*o*-cresol- $\beta$ -D-glucoside, m. 142-4° (all m. ps. cor.),  $[\alpha]_D^{25}$  -27.5° ( $\text{CHCl}_3$ ), gives an *o*-bromo-*o*-cresol deriv. (I), m. 158-60°,  $[\alpha]_D^{25}$  35.2°; in  $\text{MeOH-NH}_4\text{OH}$  satd. with  $\text{NH}_3$  9 g. I gives 4 g. *o*-(aminomethyl)phenol  $\beta$ -D-glucoside, m. 182-5°,  $[\alpha]_D^{25}$  -64.2° ( $\text{H}_2\text{O}$  contg. AcOH); *N*-Ac deriv., m. 195-6°,  $[\alpha]_D^{25}$  -33.3°; penta-Ac deriv., m. 140-2°,  $[\alpha]_D^{25}$  -64.5° ( $\text{CHCl}_3$ ). Tetraacetyl-*p*-cresol- $\beta$ -D-glucoside, m. 116-8°,  $[\alpha]_D^{25}$  -17.6°; *o*-bromocresol deriv. (II), m. 155-8°,  $[\alpha]_D^{25}$  -19° ( $\text{CHCl}_3$ ); *p*-(aminomethyl)phenol  $\beta$ -D-glucoside, m. 140°,  $[\alpha]_D^{25}$  -70.1° ( $\text{H}_2\text{O}$  contg. AcOH); the HBr salt m. 197° (decompn.); *N*-Ac deriv., crystals with 1 mol.  $\text{H}_2\text{O}$ , m. 130-2°,  $[\alpha]_D^{25}$  -53.8° ( $\text{H}_2\text{O}$ ); penta-Ac deriv., m. 123-5°,  $[\alpha]_D^{25}$  -14.9° ( $\text{CHCl}_3$ ); with emulsin the *N*-Ac deriv. gives *N*-acetyl-*p*-hydroxybenzylamine, m. 135-7°, and glucose. II and  $\text{Ag}_2\text{CO}_3$  in  $\text{Me}_2\text{CO}$  give the tetra-Ac deriv., m. 107-10°,  $[\alpha]_D^{25}$  -18° ( $\text{CHCl}_3$ ), of *p*-(hydroxymethyl)phenol  $\beta$ -D-glucoside, m. 136-8° and 114-8° (dimorphous),  $[\alpha]_D^{25}$  -65.8° ( $\text{H}_2\text{O}$ ). *o*-(Aminomethyl)phenol  $\beta$ -D-galactoside, m. 218-20°,  $[\alpha]_D^{25}$  -35° ( $\text{H}_2\text{O}$ ); *N*-Ac deriv., m. 211-12°,  $[\alpha]_D^{25}$  -19.7° ( $\text{H}_2\text{O}$ ). Tetraacetyl-*p*-cresol- $\beta$ -D-galactoside, m. 105-7°,  $[\alpha]_D^{25}$  3.9° ( $\text{CHCl}_3$ ); *o*-bromo-*p*-cresol deriv., m. 104-7°,  $[\alpha]_D^{25}$  -1.2° ( $\text{CHCl}_3$ ); *p*-(aminomethyl)phenol  $\beta$ -D-galactoside, m. 206-8°,  $[\alpha]_D^{25}$  -45.7° ( $\text{H}_2\text{O}$  and AcOH); penta-Ac deriv., m. 131-2°; *N*-Ac deriv., m. 166-8°. The comps. of  $\beta$ -D-glucoside in their reaction with emulsin stand in the following order: *o*-acetamido 33, *p*-isomer 4.8, *o*-amino 1.3, *p*-amino 1;  $\beta$ -D-galactoside: *o*-acetamido 60, *p*-isomer 4, *o*-amino 1.8, *p*-amino 1. Splitting by acids was in the following order for the  $\beta$ -D-glucosides: *o*-acetamido 7, *p*-isomer 16, *o*-amino 1, *p*-amino 13;  $\beta$ -D-galactosides: *o*-acetamido 3.5, *p*-isomer 0.2, *o*-amino 1, *p*-amino 0.5.

C. J. West

**The constitution of resorcinol and acetylacetone viewed from the Raman effect.** Taro Hayashi. *Sci. Papers Inst. Phys. Chem. Research (Tokyo)* 23, 16-21 (1933); cf. *C. A.* 27, 3700. Repetition of earlier work supports the diketone tautomer of  $m\text{-C}_6\text{H}_4(\text{OH})_2$  previously postulated by H. (cf. Kohrausch *C. A.* 27, 3841). Repetition of measurements on  $\text{CH}_3\text{C}=\text{CH}(\text{OH})\text{C}(\text{Me})_2$  leads H. to postulate the equil.  $\text{MeCOCH}_2\text{C}(\text{Me})=\text{MeC}(\text{OH})\text{:CHC}(\text{Me})_2$  for this substance.

W. Gordon Rose

**A new method of synthesis of derivatives of quinoline.** IV. K. Dzewoński, J. Moszew, T. Chechliński and I. Pietrzykowska. *Roczniki Chem.* 13, 530-9 (1933) (in French 539); cf. *C. A.* 27, 5331.—2-*p*-Tolyl-4-phenylaminoquinoline (I) is obtained by heating 21 g. *p*- $\text{MeC}_6\text{H}_4\text{C}(\text{Me})_2$  (II) and 35.7 g.  $\text{CS}(\text{NHPh})_2$  for 6 hrs. at 180-260°. The solidified mass is powd. and treated with small aints. of  $\text{C}_6\text{H}_6$ . The difficultly sol. product sepd. and purified from EtOH m. 139-40°, sol. in glacial HOAc and with violet fluorescence in cold concd.  $\text{H}_2\text{SO}_4$ ; picrate, m. 240°; HCl salt, m. 175-6°; nitroso deriv., m. 185-6° (decompn.); Ac deriv. m. 154-5°. 2-Tolyl-4-hydroxyquinoline, prepd. by adding 5 g. of I to 30 g. melted KOH at 160°, heating to 300° for 15 min., cooling, powdering, dissolving in  $\text{H}_2\text{O}$ , filtering, acidifying with concd. HCl, sepg. and warming in dil.  $\text{Na}_2\text{CO}_3$ , crystals from alc., m. 277-8°. 2-*p*-Tolyl-4-(*p*-tolylamino)-6-methylquinoline (III) is obtained by heating 15 g. II with 28 g. of di-*p*-tolylthiourea for 5-6 hrs. at 180-260°, and purify as for I; yield 40%, sol. in HOAc and  $\text{H}_2\text{SO}_4$  as in I; picrate, m. 267-8°; HCl salt, m. 302-3°; nitroso compd., m. 202°; Ac

deriv., m. 164-5°. 2-*p*-Methoxyphenyl-4-phenylaminoquinoline (IV) was prepd.: (1) by heating 5 g. *p*-acetoanisole (V) and 7.6 g.  $\text{CS}(\text{NHPh})_2$  for 6 hrs. at 160-260°, cooling, dissolving in a small amt. of alc., adding dil.  $\text{H}_2\text{SO}_4$ , heating to boiling for a short time, washing with dil. alc., dissolving in alc., making alk. with  $\text{Na}_2\text{CO}_3$ ; crystals from alc. m. 190°; (2) by heating  $\text{PhNCS}$  with the aml of V. Picrate of IV, m. 257°; nitrate, m. 205° (decompn.); nitroso compd., m. 212° (decompn.); Ac deriv., m. 132°.

C. T. Ichniowski

**Preparation of *p*-nitrosophenol by direct nitrosation of phenol.** Chao-Lun Tseng and Mei Hu. *J. Chinese Chem. Soc.* 1, 183-7 (1933).—The direct nitrosation method of Baeyer and Caro is revised by using a higher concn. of reaction mixt. (50 g. PhOH and 200 g.  $\text{KNO}_2$  in 1 l.  $\text{H}_2\text{O}$ ), and a lower temp. (-10°), making possible a yield of 90%. The crude *p*-nitrosophenol is dissolved in ether and decolorized with active C.  $\text{KNO}_2$  gives a purer product than  $\text{NaNO}_2$ .

Wm. H. Adolph

**1,4-Bis(arylimino)quinone-2,5-dicarboxylic acids and their esters.** Hans Liebermann and Bernhard Schulze. *Ann.* 508, 144-53 (1934).—Di-Et *p*-di-*p*-toluinoterephthalate (I) and  $\text{NaNO}_2$  in cold AcOH give the di-*NO* deriv., pale yellow, m. 146° (decompn.); heating a suspension of the ester in PhMe or  $\text{C}_6\text{H}_5\text{Me}$  gives di-Et 1,4-bis(*p*-tolylimino)quinone-2,5-dicarboxylate, dark red-brown, m. 124°; reduction with Zn and AcOH gives I. Di-Et *p*-bis(nitroso-*p*-anisidino)terephthalate, golden yellow; di-Et 1,4-bis(*p*-methoxyphenylimino)quinone-2,5-dicarboxylate, brown-violet, m. 136°. Et succinylsuccinate and  $\text{p-H}_2\text{NC}_6\text{H}_4\text{Ph}$  in EtOH-AcOH give di-Et *p*-(bis-*p*-biphenylimino)- $\Delta^{4,4}$ -dihydroterephthalate, m. 235°; oxidation with I, in AmOH gives di-Et *p*-(bis-*p*-biphenylimino)terephthalate, carmine-red, m. 234°; di-*NO* deriv., pale yellow, m. 160°; heating in PhMe gives di-Et 1,4-bis(biphenylimino)quinone-2,5-dicarboxylate, dark red-brown, m. 185°. Di-Et *p*-bis(nitrosoanisidino)terephthalate, yellow; di-Et 1,4-bis(phenylimino)quinone-2,5-dicarboxylate, dark red-brown, amorphous, m. 93-5°. Di-Et *p*-bis(nitrosoethylamino)terephthalate, m. 114°; at 180° it loses NO, giving 1,4-bis(ethylimino)quinone-2,5-dicarboxylate, deep red-brown, m. 122-5°. *p*-Bis(nitroso-*p*-toluinoterephthalic acid, light yellow; heating in PhMe gives 1,4-bis(*p*-tolylimino)quinone-2,5-dicarboxylic acid, red-brown, m. above 300°;  $\text{NH}_4$  salt, black; K salt, black, rather unstable; Ba salt, brown-black. *p*-Bis(nitroso-*o*-toluinoterephthalic acid, citron-yellow; 1,4-bis(*o*-tolylimino)quinone-2,5-dicarboxylic acid, Cu-colored needles. Bis(nitrosoanisidino)terephthalic acid, nearly colorless; heating in PhMe 1 hr. gives 1,4-bis(phenylimino)quinone-2,5-dicarboxylic acid, prisms with Cu luster, m. 274° (decompn.); K salt, black, amorphous. *p*-Bis(nitroso-*p*-anisidino)terephthalic acid, Cr-green powder; heating in  $\text{C}_6\text{H}_5\text{Me}$  gives 1,4-bis(*p*-methoxyphenylimino)quinone-2,5-dicarboxylic acid, red-brown; K salt, brown-black. Nitrosoanisidino-*p*-hydroxyterephthalic acid, light yellow; *p*-naphthylimino deriv., yellow (di-Et ester, yellow).

C. J. West

**Molecular rearrangements of optically active radicals.** Everett S. Wallis and P. I. Bowman. *J. Am. Chem. Soc.* 56, 491 (1934).—1-EtMePhCCH<sub>2</sub>OH,  $[\alpha]_D^{25}$  -4.90, yields a *tert*-chloride, which has a *d*-rotation, the rearrangement being accompanied by an inversion in sign of rotation.

C. J. West

**Reaction between duroquinone and sodium malonic esters. II. Synthesis and reactions of 2,5-dimethoxy-3,4,6-trimethylbenzaldehyde.** Lee Irvin Smith. *J. Am. Chem. Soc.* 56, 472-4 (1934); cf. *C. A.* 20, 2320.—3,4,6,2,5-Me<sub>5</sub>(MeO)<sub>2</sub>C<sub>6</sub>CHO (I), previously obtained as a degradation product of the compd. resulting from the reaction between duroquinone and  $\text{CHNa}(\text{CO}_2\text{Et})_2$ , has been synthesized as follows: 3,4,6-Me<sub>3</sub>C<sub>6</sub>H<sub>2</sub>NHAc is nitrated, the di- $\text{NO}_2$  deriv. hydrolyzed and the 1,4,5,2,6-Me<sub>5</sub>C<sub>6</sub>H<sub>2</sub>( $\text{NO}_2$ )<sub>2</sub> reduced to the di- $\text{NH}_2$  deriv.; oxidation gives pseudocumquinone, whose dihydro deriv. yields a dibenzoate, m. 179.5-80.5°, and a *di-MeO* deriv., m. 144°, m. 35.5-6°; by the  $\text{Zn}(\text{CN})_2$  method there results I, m. 83.5-4.5°. Condensation of I with  $\text{CH}_3(\text{CO}_2\text{Me})_2$  and Na

gives 3,4,6,2,5-Me<sub>5</sub>(MeO)<sub>2</sub>C<sub>6</sub>H<sub>2</sub>C(CO<sub>2</sub>Me)<sub>2</sub>; the corresponding acid, m. 184–6° (decompn.), is identical with another degradation product obtained in the earlier work.

C. J. West

**2,5-Dimethoxy-3,4,6-trimethylbenzoic acid.** Lee Irvin Smith and Russell O. Denyes. *J. Am. Chem. Soc.* 56, 475–6(1934).—Since all attempts to oxidize 3,4,6,2,5-Me<sub>5</sub>(MeO)<sub>2</sub>C<sub>6</sub>H<sub>2</sub>CHO to the corresponding acid were unsuccessful, this acid was synthesized to study its behavior toward oxidizing agents. 3,4,6-Me<sub>3</sub>C<sub>6</sub>H<sub>2</sub>CO<sub>2</sub>H was converted into the 2,5-di-NO<sub>2</sub> deriv. (87% yield) and the di-NH<sub>2</sub> deriv. (96%), which was oxidized to the quinone and reduced by SO<sub>2</sub> to the 2,5-di-HO deriv. (69%); Me<sub>2</sub>SO<sub>4</sub> in MeOH gives 53% of *Me* 2,5-dimethoxy-3,4,6-trimethylbenzoate, m. 39–41°; the free acid m. 100–1°, decomp. slowly at 200° (*Ag salt*). The acid decolorizes KMnO<sub>4</sub>, giving only small amts. of oily products, and gives trimethylnitroquinone with HNO<sub>3</sub>.

C. J. West

**Tetramethyl-o-benzoquinone.** Lee Irvin Smith and Lucile R. Hac. *J. Am. Chem. Soc.* 56, 477–8(1934).—Prehnitene gives 80% of the di-NO<sub>2</sub> deriv., m. 176°; reduction of 22 g. gives 24 g. of the HCl salt of the di-NH<sub>2</sub> deriv. (I); the free base m. 144°; 10 g. of the HCl salt gives 4–5.2 g. of *dihydroxyprehnitene* (II), m. 111°; *diacetate*, m. 175°; *dibenzate*, m. 157°; *di-Me ether*, m. 21°. Oxidation of 2 g. of II with Ag<sub>2</sub>O in Et<sub>2</sub>O gives 1.6 g. of *prehnitenesquinone* (*tetramethyl-o-benzoquinone*), bright red, m. 110–1°, begins to decomp. in about 4 hrs. II and *o*-C<sub>6</sub>H<sub>4</sub>(NH<sub>2</sub>)<sub>2</sub> gives 1,2,3,4-tetramethylphenazine, bright yellow, m. 217°. I and II give *octamethylphenazine*, bright yellow, m. 279°.

C. J. West

**Action of acetic acid on 3,4-dimethoxyphenyldiazonium borofluoride.** L. E. Smith and H. L. Haller. *J. Am. Chem. Soc.* 56, 237–9(1934).—Veratrylamine gives 76% of 3,4-dimethoxyphenyldiazonium borofluoride, m. 123° (decompn.); refluxing 25 g. with AcOH gives 12 g. 2,4,5-HO(MeO)<sub>2</sub>C<sub>6</sub>H<sub>2</sub>Ac (I) (and a small quantity of 3,4-(MeO)<sub>2</sub>C<sub>6</sub>H<sub>2</sub>F(?), b<sub>10</sub> 98°); *oxime*, m. 162°. I (6 g.) and Me<sub>2</sub>SO<sub>4</sub> give 4 g. 2,4,5-trimethoxyacetophenone, m. 99° (*semicarbazone*, m. 206°); oxidation with KMnO<sub>4</sub> gives 2,4,5-trimethoxyphenylglyoxylic acid, m. 186°, further oxidized to asaronic acid by H<sub>2</sub>O<sub>2</sub>.

C. J. West

**Palladium catalyst. III. Reduction of ketones.** Walter H. Hartung and Frank S. Crossley. *J. Am. Chem. Soc.* 56, 158–9(1934); cf. *C. A.* 25, 3635.—Pd on charcoal quickly and easily reduces PhCOEt to PhPr; a Pt catalyst similarly prepd. was inactive. The substitution of HO or MeO groups in PhCOEt influences the rate but not the extent of the reduction. Results are given as curves for the reduction of PhCOEt, *o*-, *m*- and *p*-EtCOC<sub>6</sub>H<sub>4</sub>OH, *o*-, *m*- and *p*-EtCOC<sub>6</sub>H<sub>4</sub>OMe and propionylcatechol and -resorcinol.

C. J. West

**Possibilities of obtaining by synthesis valuable aromatic aldehydes from new sources.** A. L. Rushchinskii. *Compt. rend. acad. sci.* (U. R. S. S.) 1933, 118–21 (in English 121–3).—R. suggests the prepn. of such aldehydes as vanillin, burbonal and heliotropin from certain C-contg. raw materials. The CHO group might be introduced into the substituted or non-substituted benzene ring by means of mesoxalic ester (I). Since I is not readily available, this method would not be practicable commercially unless I were obtained from malonic ester, which in turn was made from C<sub>2</sub>O<sub>2</sub>. If elec. current is cheap, C<sub>2</sub>O<sub>2</sub> may become a com. product and a valuable source of org. raw materials. Another possible starting point is C<sub>6</sub>H<sub>5</sub>, which, after conversion into di-HO derivs. of C<sub>6</sub>H<sub>4</sub>(CO)<sub>2</sub>O, might subsequently furnish the aldehydes desired.

L. Kelley

**Synthesis of pseudoephedrine.** Roy G. Bossert and Wallace R. Brode. *J. Am. Chem. Soc.* 56, 165–6(1934).—MeCHBrCH(OEt)Ph and MeNH<sub>2</sub> in dry MeOH, heated in a steel bomb 50 hrs. at 125–30°, give 15% of MeCH(NHMe)CH(OEt)Ph, b<sub>10</sub> 116–22°; hydrolysis with 48% HBr gives MeCH(NHMe)CH(OH)Ph. If the bomb is heated to 150–5° there results a small amt. of a *tertiary amine*, MeN[CHMeCH(OEt)Ph]<sub>3</sub>, m. 134.5–5°.

C. J. West

**Ring-chain tautomerism of the β-p-bromobenzoyl-**

**crotonic esters.** Robert E. Lutz and Arthur W. Winne. *J. Am. Chem. Soc.* 56, 445–7(1934).—*cis*-β-p-Bromobenzoylcrotonic acid (*C. A.* 27, 1875–6) (I) yields with MeI through the Ag salt a *Me ester* (II), m. 69° (cor.), in 94% yield; in CHCl<sub>3</sub> with a crystal of I sunlight converts 96% of II into the *trans*-ester in 6 hrs.; the reverse change occurs in EtOH (90%). I and SOCl<sub>2</sub> give 80% of the chloride (β-methyl-γ-p-bromophenyl-γ-chloro-γ-crotonolactone); refluxing with MeOH for 3 hrs. gives the cyclic *Me β-bromobenzoylcrotonate* (γ-Cl replaced by γ-MeO), m. 64°; this also is formed by refluxing II in MeOH contg. H<sub>2</sub>SO<sub>4</sub> or by esterification of I with MeOH-HCl; hydrolysis of these esters yields I. The *Et ester* m. 42° and the *cyclic ester* b<sub>10</sub> 165–8°. The reduction of the open chain esters gives the *Me ester*, b<sub>10</sub> 193–4°, and the *Et ester*, m. 34.5°, of β-p-bromobenzoylbutyric acid. The cyclic esters with Zn and AcOH give 30–40 and 40–43% of *p*-BrC<sub>6</sub>H<sub>4</sub>CO<sub>2</sub>H and its esters, resp.; different samples of Zn behaved quite differently and the study is being continued.

C. J. West

**Structure of reactants and extent of acetal formation.**

II. Ralph E. Dunbar and Homer Adkins. *J. Am. Chem. Soc.* 56, 442–4(1934); cf. *C. A.* 27, 954.—In the study of acetal formation, the following % conversion and *K* were detd. (using 5 alc. to 1 aldehyde) as follows: for hexahydrobenzaldehyde (I) with MeOH 93, 6.35; tetrahydrofurfural alc., 92, 5.38; 3-tetrahydrofurfurylpropan-1-ol 91, 4.63; iso-AmOH 88, 3.15; cyclohexylcarbinol (II), 87, 2.75; BuOH 80, 1.44; EtOH 78, 1.22; cyclohexanol (III) 75, 0.96; octan-2-ol (IV) 74, 0.88; cyclopentanol 44, 0.101; iso-PrOH (V) 29, 0.035. BzH with II 35, 0.059; III 23, 0.019. Me<sub>2</sub>CCHO with EtOH (using in this group 11 alc. to 1 aldehyde) 73, 0.25; II 58, 0.095; IV 38, 0.026; III 24, 0.007; V 21, 0.006. Cyclopentylaldehyde (VI) with IV (5 alc. to 1 aldehyde) 50, 0.168; EtOH 45, 0.122; II 41, 0.092; III 35, 0.56; V 13, —. The figures for AcH, Me<sub>2</sub>CHCHO and Me<sub>2</sub>CCHO show a progressive lowering of the extent of conversion to acetals, indicating the marked effect of branching upon lowering affinity for acetal formation. VI is rather similar to Me<sub>2</sub>CCHO and is even more nearly like BzH in acetal formation. The relationship of I to BzH is very much the same as found for tetrahydrofurfural and furfural; the satd. compds. have a much higher affinity for acetal formation than the unsatd. compd. In connection with the alcs. the most striking "abnormality" is the high affinity (actual or relative) which III and IV show with the cyclic aldehydes. The *acetal* of MeOH and I b<sub>10</sub> 63°, b<sub>10</sub> 183°, d<sub>4</sub> 0.9363 n<sub>D</sub> 1.4402; of EtOH and I, b<sub>20</sub> 115–17°, d. 0.9021, n. 1.4399 of BuOH and I, b<sub>20</sub> 149–50°, d. 0.8893, n. 1.4439; of iso-AmOH and I, b<sub>10</sub> 168–9°, d. 0.8781, n. 1.4456; of IV and I, b<sub>10</sub> 215–17°, d. 0.8701, n. 1.4475; of γ-tetrahydrofurfurylpropyl alc. and I, b<sub>10</sub> 236–8°, d. 0.9821, n. 1.4620; of III and I, b<sub>20</sub> 202–3°, d. 0.9589, n. 1.4782; of II and I, b<sub>20</sub> 234–5°, d. 0.9680, n. 1.4887; of EtOH and Me<sub>2</sub>CCHO, b<sub>10</sub> 146–8°, d. 0.8192, n. 1.3942; of II and Me<sub>2</sub>CCHO, b<sub>20</sub> 194–5°, d. 0.9235, n. 1.4635. I b<sub>10</sub> 70.5–2°, d. 0.9235, n. 1.4506; Me<sub>2</sub>CCHO b<sub>10</sub> 74–5°; VI b<sub>20</sub> 62–4°, d. 0.9356, n. 1.4435.

C. J. West

**The dissociation constant of hippuric acid.** Bertil A. Josephson. *Biochem. Z.* 267, 74–6(1933).—The value of *K* for hippuric acid is 15.7 × 10<sup>-5</sup>, and *pK* = 3.81. This value is practically the same as that for glycodesoxycholic acid and about 4–5 times that of glycolic acid.

S. M.

**α,α'-Dimethyl-α-phenylsuccinic acid.** H. Marjorie Crawford. *J. Am. Chem. Soc.* 56, 139–41(1934).—MeCH(CO<sub>2</sub>Et)<sub>2</sub> and PhCHBrCO<sub>2</sub>Et with Na give 45% of *tri-Et 1-phenylpropane-1,2,2-tricarboxylate* (I), b<sub>10</sub> 210–17°, which is hydrolyzed to α-methyl-α-phenylsuccinic acid (II), m. 169–72°. I, MeI and Na give 50% of *tri-Et 2-phenylbutane-2,3,3-tricarboxylate*, b<sub>20</sub> 213–16°; hydrolysis gives II. Condensation of PhCHMeCN (for which a method of prepn. is given, 66% yield) and MeCHBrCO<sub>2</sub>Et with NaNH<sub>2</sub> give 15% of *Et α-methyl-β-phenyl-β-cyanobutyric acid*, b<sub>10</sub> 172–3°, d<sub>18</sub> 1.0591; hydrolysis gives α,α'-dimethyl-α-phenylsuccinic acid, m. 145°, sepd. into 2 racemic forms, m. 170–2° and 159–60°; the higher-melting form is identical with the acid obtained by the

oxidation of 2,3,5,6-tetramethyl-3-phenyl-5-cyclohexene-1,4-dione (C. A. 22, 1838).

**Ester enolates and ketene acetals. XVII. Reactions of ester enolates with halogenoacyl compounds.** Helmuth Scheibler and Hans Stein. *J. prakt. Chem.* 139, 105-12 (1934); cf. C. A. 28, 1022<sup>4</sup>.— $\text{PhCH}_2\text{CO}_2\text{Et}$  and  $\text{K}$  give an ester enolate (I), which reacts with  $\text{BzCl}$  to give 17.2% of phenylketene *Et* benzoylacetate, m. 103-4°, 21.5% of  $\text{PhBzCHCO}_2\text{Et}$ ,  $\text{BzOH}$ ,  $\text{BzOEt}$  and  $\text{PhCH}_2\text{CO}_2\text{H}$ .  $\text{Cl-CO}_2\text{Et}$  and I (from 40.3 g. ester) give 6.7 g. *phenylketene Et carboxyacetate* (II), b<sub>14</sub> 155-60°, 8.5 g.  $\text{PhCH}(\text{CO}_2\text{Et})_2$ , 11 g.  $\text{PhCH}_2\text{CO}_2\text{Et}$  and 4.5 g.  $\text{CO}(\text{OEt})_2$ . The addn. product of II and  $\text{EtOK}$  with  $\text{CO}_2$  gives pure II, b<sub>14</sub> 150-1°, while heating with  $\text{EtOH}$  at 75° gives  $\text{PhCH}(\text{CO}_2\text{Et})_2$ .  $\text{Me}_3\text{CHCO}_2\text{Et}$  and  $\text{NaNH}_2$  give  $\text{Me}_3\text{CHC}(\text{OEt})(\text{NH}_2)_2\text{ONa}$ ; with  $\text{ClCO}_2\text{Et}$  there results  $\text{Me}_3\text{CHCO}_2\text{Et}$ , *isobutyramide*, m. 128-30°, and *di-isobutyramide*, m. 172-4°.  $\text{PhCN}$  and  $\text{Me}_3\text{CHCO}_2\text{Et}$  give an ester enolate which reacts with  $\text{BzCl}$  to give *Et dimethylbenzoylacetate*, b<sub>14</sub> 150-60°.

**Organic compounds of selenium. IV. Confirmation of the structure of dimethyl 5,5'-selenodisalicylate *Se*-dichloride.** R. E. Nelson and R. G. Baker. *J. Am. Chem. Soc.* 56, 467(1934); cf. C. A. 27, 1333.—Morgan and Hurstall's (C. A. 23, 2158) theory of the position of the *Se* in 5,5'-selenodisalicylate has been confirmed by changing di-*Me* 5,5'-selenodisalicylate *Se*-dichloride (I) into 5,5'-selenodisalicylic acid (II) and then back to I, the following reactions being carried out:  $\text{MeO}_2\text{C}(\text{HO})\text{C}_6\text{H}_4\text{Se}(\text{Cl})_2\text{C}_6\text{H}_4(\text{OH})\text{CO}_2\text{Me}$  with  $\text{Zn}$  gives  $\text{Se}[\text{C}_6\text{H}_4(\text{OH})\text{CO}_2\text{Me}]_2$ ; hydrolysis gives II, which is esterified with  $\text{MeOH}$ , transformed into the dibromide, then the dihydroxide and then into I. In an attempt to prep. the *Se*-dibromide from II there resulted 3,5-dibromosalicylic acid, m. 233°, indicating that the *Se* was attached to C atom 5.

**Isomerization of the methyl and ethyl ethers of phenylglycidol.** Darnon. *Compt. rend.* 197, 1049-50(1933).—The *Me* ether of phenylglycidol heated with  $\text{ZnCl}_2$  (anhyd.) gives the corresponding ether of phenylacetylcarbinol,  $\text{PhCH}_2\text{C}(\text{OCH}_3)\text{CH}_2\text{OMe}$ , b<sub>14</sub> 139-40°; *semicarbazone*, m. 127-8°. The *Et* ether, b<sub>14</sub> 116-7° (*semicarbazone*, m. 100°), is obtained similarly together with some *Et* ether of tropaldehyde,  $\text{PhCH}(\text{CH}_2\text{OEt})\text{CHO}$  (*semicarbazone*, m. 129°). It is concluded that the affinity capacities of methoxy- and ethoxymethyl are inferior to that of the *Ph* radical and their migratory tendencies less than that of *H*.

**Approximate ionization constant of pantothenic acid as determined by fractional electrolysis.** Roger J. Williams and Robin Moser. *J. Am. Chem. Soc.* 56, 169-70 (1934).—A new method involving fractional electrolysis has been applied to the approx. detn. of the ionization const. of pantothenic acid (I), the value being approx. that of gallic acid ( $3.9 \times 10^{-4}$ ), although slightly lower. From comparison with the ionization consts. of acids of known structure, it is concluded that I cannot be an  $\alpha$ -HO acid but may possess  $\beta$ - or  $\gamma$ -HO groups.

**Natural coumarins. VIII. Bergaptol, a new constituent of Calabrian bergamot oil.** Ernst Spath and Luis Socias. *Ber.* 67B, 59-61(1934); cf. C. A. 27, 4800.—The study of the coumarin derivs. found in masterwort (*Imperatoria ostruthum*) showed that some of them are closely related to bergaptene, the *MeO* group of the latter being replaced by a complicated ether residue. Bergaptol (I), the phenol corresponding to bergaptene, is the common mother substance of these masterwort constituents and has been obtained by hydrolysis of ostruthol, isomeratorin and hydroxypercedanun. As it seemed possible that I might also be the mother substance of the bergaptene found in *Citrus bergamia* Risso the lactones of bergamot oil were tested for the presence of I, which had hitherto not been found in nature. The oil was treated with  $\text{KOH}$  in  $\text{MeOH}$  at room temp. to convert the coumarins into the corresponding HO acids, whose sol. *K* salts were obtained in aq. soln. by shaking with water and petroleum ether. From this soln. the lactones were recovered by acidification, and fractional distn. in a high vacuum yielded a product (0.58 g. from 600 g. oil), m. 280-

2°, identical with the I obtained from isomeratorin. In this procedure, however, the intermediate hydroxycinnamic acid might be formed from the phenol corresponding to isobergaptene (Wessely and Nadler, C. A. 26, 4803) just as well as from I; the bergamot oil was therefore worked up by a process involving only fractional distn. *in vacuo* and in which the use of alkali was entirely avoided, and again I was obtained (0.01 g. from 80 g. of the oil).

**IX. Heraclin.** Ernst Spath and Sigwin Raschka. *Ibid.* 62-3.—Addn. of petroleum ether to the ether ext. of the seeds of *Heracleum spondylium* L. gives bergaptol,  $\text{C}_{15}\text{H}_{12}\text{O}_4$  (0.15% of the dry seeds), m. 189-90°, identical with the "heraclin" of Gutzeit (*Chem. Zentr.* 1879, 727), to which he assigned the compn.  $\text{C}_{15}\text{H}_{12}\text{O}_{10}$ . The residue from the ether-petroleum ether mother liquors allowed to stand with  $\text{KOH}$  in  $\text{MeOH}$  to convert the coumarins into the salts of the HO acids, then dild. with water, freed of neutral substances with ether, converted back into the coumarins by acidification and freed from acids with bicarbonate, give another 0.05% of bergaptene.

**Synthesis of 2-acylresorcinols by means of the Nidhone process. I. 2-Benzoylresorcinol.** Dattatraya Balkrishna Limaye. *Ber.* 67B, 12-15(1934).—Treatment of 30 g. 4-methylumbelliferone benzoate, m. 159°, instead of the acetate (C. A. 26, 2971) with  $\text{AlCl}_3$  at 160-70° yields 18-20 g. 4-methyl-8-benzoylumbelliferone (I), m. 210°, which gives no color with  $\text{FeCl}_3$ . It is not necessary to start with the preformed benzoate (Fries); the same results are obtained with umbelliferone,  $\text{BzCl}$  and  $\text{AlCl}_3$  (Friedel-Crafts). Refluxed with an equiv. amt. of  $\text{Na}$  and  $\text{BrCH}_2\text{CO}_2\text{Et}$  in alc., 2.8 g. I gives 2 g. 4-methyl-8-benzoyl-7-(carboxymethoxy)coumarin, m. 130°, saponif. by alc.  $\text{KOH}$  to the 7-(carboxymethoxy) compd., m. 203°, 1 g. of which, boiled with  $\text{NaOAc}$  and  $\text{Ac}_2\text{O}$  until the evolution of  $\text{CO}_2$  ceases, yields 0.6 g. 2-phenyl-4'-methyl-7', 8'-furocoumarin, m. 170°; when 20 g. of the latter is gently boiled 1 hr. with 20%  $\text{NaOH}$ , the pyrone ring is opened, the  $\text{AcCH}_2\text{CO}_2\text{H}$  residue is split off partly as acetone and  $\text{CO}_2$ , partly as  $\text{AcOH}$ , and there is obtained 10-12 g. of 2-benzoylresorcinol, m. 135°, which gives a blue-black color with  $\text{FeCl}_3$ , regenerates I with  $\text{AcCH}_2\text{CO}_2\text{Et}$  and  $\text{H}_2\text{SO}_4$ , forms with  $\text{Me}_2\text{SO}_4$  a *di-Me* ether, m. 99°, b. 345°, volatile with steam, and yields a *dibenzoyl*, m. 115°. The name "Nidhone" (from Nidhi, the ending one indicating that a ketone is involved) is suggested for the process resorcinol  $\rightarrow$  4-

methylumbelliferone  $\rightarrow$  { acylation  $\rightarrow$  Fries rearrangement  
or  
Friedel-Crafts reaction  
 $\rightarrow$  sepn. of isomeric acyl-4-methylumbelliferones  $\rightarrow$  treatment with alkali  $\rightarrow$  2-acylresorcinol. C. A. R.

**Preparation of 3-aminophthalhydrazide for use in the demonstration of chemiluminescence.** Ernest H. Huntress, Lester N. Stanley and Almon S. Parker. *J. Am. Chem. Soc.* 56, 241-2(1934).—Details are given for the prepn. of 3-nitrophthalhydrazide from 3-nitrophthalic acid (99.5% yield) and its reduction to the 3- $\text{NH}_2$  deriv (luminol) by  $(\text{NH}_4)_2\text{S}$ .

**Biogenetics in the terpene series.** J. A. Hall. *Chem. Rev.* 13, 479-99(1933).—An attempt is made to refer all known terpene configurations to underlying fully hydroxylated compds., the simple dehydration of which in a single stage should give groups of hydrocarbons of related biogenetic characteristics. The relationships thus found should persist more or less consistently throughout all known volatile oils. A few references to the literature are given.

**Isomeric myrtenols. V.** Paolini. *Gazz. chim. ital.* 63, 666-9(1933).—The differing phys. properties of myrtenol alcs. isolated from different sources by Soden and Elz (Chem.-Zig. 29, 857(1905)) and by Semmler and Bartlet (C. A. 1, 1710) suggest that in 1 case or in both cases the product was impure, perhaps because of the presence of an isomer. The present paper shows that myrtenol does exist in a *l*-gyratory form. Myrtenol oil from Calabria prepd. by steam distn. of the leaves of *Myrtus communis* was saponif. by alc.  $\text{KOH}$ , steam-distd., dried, the fraction which b. 210-30° converted by  $\text{C}_6\text{H}_5(\text{CO})_2\text{O}$  (I) to a mixt. of phthalates, which was sepd. by fractional pptn. from

petr. ether and 95% AcOH into acid myrrilenyl phthalate,  $\alpha$ - $\text{HO}_2\text{CC}_6\text{H}_4\text{CO}_2\text{C}_{10}\text{H}_{11}$  (II), m. 116°,  $[\alpha]_D^{25}$  21.95°. Neutralized in water with  $\text{NH}_4\text{OH}$ , II gives with  $\text{AgNO}_3$  Ag myrrilenyl phthalate,  $\alpha$ - $\text{AgO}_2\text{C}_6\text{H}_4\text{CO}_2\text{C}_{10}\text{H}_{11}$ , m. 102°. On sapon. with hot alc. KOH, II yields  $\alpha$ -myrrilenol (III), clear oil, odor of myrtle, b. 222°,  $[\alpha]_D^{49}$  68°. With I, III reverts to II. The product sepd. from II gave on sapon. 3 liquids all of which b. around 230°, and had  $[\alpha]_D$  values of 24°30', 6°15' and -3°50', resp. The laboratory alc. had  $d_{15}$  0.981. The best results in the prepn. of II were had by letting stand at room temp. a mixt. of crude alc. in benzene with excess Na, and letting the product stand in turn with I, dissolving in very dil. NaOH, and liberating with  $\text{H}_2\text{SO}_4$ . C. C. Davis

**5- and  $\pi$ -Hydroxycamphor and their derivatives.** Yasuhiko Asahina and Meizo Ishidate. *Ber.* 67B, 71-7 (1934); cf. *C. A.* 28, 472<sup>3</sup>, 1034<sup>4</sup>.—Camphorol has been shown to be a complex mixt. of hydroxycamphors, one of which (3-hydroxycamphor) had already been isolated; the remainder, which yielded 5-ketocamphor (I) on oxidation, was assumed to be 5-hydroxycamphor (II), but it could not have been homogeneous, as it had merely been recrystd. from ligroin and the presence of  $\pi$ -hydroxycamphor (III) was not suspected at the time. I with 1 mol  $\text{H}_2\text{NCONHNH}_2 \cdot \text{AcOH}$  in dil. alc. yields the disemicarbazone, m. 290°, and the 5-monomemicarbazone, m. 238-40°, which is reduced by Na in alc. at 170-80° to *d*-borneol. The 5-keto group in I is therefore more reactive than the 2-keto group; treated at 10-15° in water with Na-Hg (while  $\text{CO}_2$  is passed through the soln.), I yields II, m. 210°,  $[\alpha]_D^{15}$  47.4° (abs. alc.) (semicarbazone, m. 222° (decompn.)), isolated through the acetate, b<sub>m</sub> 165-7° (semicarbazone, m. 237-8° (decompn.)). With Na and alc. at 170-80°, the semicarbazone of II or of its acetate gives epiborneol, m. 188°,  $[\alpha]_D^{15}$  -3.4° (abs. alc.), oxidized by  $\text{K}_2\text{Cr}_2\text{O}_7$ -AcOH to *d*-epicamphor (IV), m. 182°,  $[\alpha]_D^{15}$  45.4° (abs. alc.). II, whole soly. in water at 15° is 3.1%, thus affords a far more convenient starting point for the prepn. of IV than the cyanohydrin of I recently described. *trans*-III, a 3rd constituent of camphorol, was prepd. by reducing with Na and alc. on the water bath the semicarbazone, m. 235-6° (decompn.), of the *Me* ester, m. 72-3°, of the *trans*- $\pi$ -apocamphor-7-carboxylic acid which was isolated from the oxidation products of camphorol. III, m. 233°,  $[\alpha]_D^{15}$  12.20° (abs. alc.), soly. in water at 18° 12.5%, semicarbazone, m. 224-5° (decompn.); acetate, b<sub>m</sub> 176° (semicarbazone, m. 234-5° (decompn.)). With  $\text{H}_2\text{SO}_4$ ,  $\text{Na}_2\text{Cr}_2\text{O}_7$  III yields *trans*-7-aldehyde- $\pi$ -apocamphor, m. 195-6°, previously obtained, together with the *cis*-isomer, in the oxidation of camphorol. The semicarbazone of III with Na-EtOH at 170-80° gives *d*-borneol, m. 200.5°,  $[\alpha]_D^{15}$  17.68° (abs. alc.), oxidized by AcOH- $\text{K}_2\text{Cr}_2\text{O}_7$  to  $\pi$ -camphor, m. 172-3°, almost inactive optically (2% soln. in alc.) (semicarbazone, m. 214-15° (decompn.)). *Me cis*- $\pi$ -apocamphor-7-carboxylate, m. 74-5°, semicarbazone, m. 259-60°, is reduced by Na and alc. to *cis*- $\pi$ -hydroxycamphor (V), m. 233-4°,  $[\alpha]_D^{15}$  40.68° (abs. alc.), soly. in water at 15° 8% (semicarbazone, m. 216-17°); acetate, b<sub>m</sub> 160° (semicarbazone, m. 210-11°). *trans*-7-aldehyde- $\pi$ -apocamphor, m. 205°; disemicarbazone, m. 254°. *l*- $\pi$ -Borneol, from the semicarbazone of V with Na-EtOH at 170-80°, m. 200.5°,  $[\alpha]_D^{15}$  -16.77°, oxidized by  $\text{CrO}_3$ -AcOH to  $\pi$ -camphor. C. A. R.

**Fenchene series.** V.  $\alpha$ -Fenchene hydrate (methyl  $\alpha$ -fenchocamphorol),  $\alpha$ - and  $\beta$ -fenchene. Gust. Komppa and Siegfried Beckmann. *Ann.* 508, 205-14 (1934); cf. *C. A.* 27, 4228.—*dl*- $\alpha$ -Fenchocamphorone and MeMgI give *dl*-methyl- $\alpha$ -fenchocamphorol ( $\alpha$ -fenchene hydrate), b<sub>m</sub> 76-7°, b<sub>14</sub> 86.5-7°, m. 46-7° (phenylurethan, m. 117-8°); this also results from  $\alpha$ -fenchene-HCl and KOH; distn. at atm. pressure gives  $\alpha$ -fenchene.  $\alpha$ -Fenchene, by catalytic reduction of  $\alpha$ -fenchene, b<sub>m</sub> 161-3°,  $d_4^{25}$  0.8612,  $n_D^{20}$  1.45921, 1.46152, 1.46741, 1.47640 for  $\alpha$ ,  $D$ ,  $\beta$  and  $\gamma$ . *dl*- $\beta$ -Fenchene, b<sub>m</sub> 168-60°,  $d_4^{25}$  0.8553,  $n_D^{20}$  1.45511, 1.45741, 1.46304, 1.47208 for  $\alpha$ ,  $D$ ,  $\beta$  and  $\gamma$ . C. J. West

**Biphenyl and its derivatives.** XII. Nitration of some halogenated derivatives of biphenyl. L. Mascarelli, D. Gatti and B. Longo. *Gazz. chim. ital.* 63, 684-60 (1933);

cf. *C. A.* 26, 5090.—The paper describes unfinished investigations on the influence of halogens on the nitration of halogenated Ph<sub>2</sub> derivs. The nitrating mixt. was  $\text{HNO}_3$  (d. 1.43) and concd.  $\text{H}_2\text{SO}_4$ . By heating, 2-chlorobiphenyl (I) yields, on steam distn., 25% of 2-chloro-4-nitrobiphenyl (II), yellowish, m. 73-4°; oxidized by refluxing with  $\text{CrO}_3$  in glacial AcOH (with  $\text{V}_2\text{O}_5$ , cf. Schlemann and Roselius, *C. A.* 24, 79), it gives 30% 4- $\text{O}_2\text{NC}_6\text{H}_4\text{CO}_2\text{H}$ . The steam-distn. residue yields (1) 50% of 2-chloro-3',4'-dinitrobiphenyl (III), pale yellow, m. 158-9°; oxidized like II it gives 80% of 3,4-( $\text{O}_2\text{N}$ )<sub>2</sub> $\text{C}_6\text{H}_3\text{CO}_2\text{H}$ , and (2) on distn. *in vacuo* more II. The yields indicate that the 1st  $\text{NO}_2$  group enters the 4'-position and the 2nd  $\text{NO}_2$  the 3'-position, i. e., the halogen in the 2-position induces the  $\text{NO}_2$  group to enter the position farthest away. Reduction of III with Sn and HCl yields 3-chloro-3',4'-diaminobiphenyl-2-HCl, silky, decomp. 233-305°. Diazotized, decompd. with CuCl, and steam-distd., it yields 2,3',4'-trichlorobiphenyl, silky, m. 65-6°. van Alphen (*C. A.* 26, 3789), oxidized ( $\text{o-ClC}_6\text{H}_4$ )<sub>2</sub> (IV) with concd.  $\text{HNO}_3$  to a dichlorotetrannitro deriv., but when IV was oxidized as was I, a non-steam-distillable 2,2'-dichloro-*x,y*-dinitrobiphenyl (V), light yellow, m. 205°, was obtained. It could not be oxidized with  $\text{CrO}_3$ - $\text{V}_2\text{O}_5$ -AcOH and thus identified. The only  $\text{NO}_2$  derivs. of  $p$ - $\text{BrC}_6\text{H}_4\text{Ph}$  (VI) heretofore described are mono- $\text{NO}_2$  derivs. However, VI nitrated as were I and V yields a 4-bromo-*x,y*-dinitrobiphenyl (VII), yellow, m. 205-6°, and another 4-bromo-*x,y*-dinitrobiphenyl (VIII), silky, pale yellow, m. 147-8°. Neither VII nor VIII could be oxidized and therefore identified. Nitrated like I, V and VI, ( $p$ - $\text{BrC}_6\text{H}_4$ )<sub>2</sub> yields [4,2- $\text{Br}(\text{O}_2\text{N})\text{C}_6\text{H}_4$ ]<sub>2</sub> and 4,4'-dibromo-2,3'-dinitrobiphenyl, which agrees with similar expts. by Shaw and Turner (*C. A.* 26, 2188). Nitration in the same way of *m*- $\text{ClC}_6\text{H}_4\text{Ph}$  yields a 3-chloro-*x,y*-dinitrobiphenyl, m. 202-3°, the position of the  $\text{NO}_2$  groups in which were not detd. XIII. Attempts to obtain *o*-biphenylene. *Ibid.* 661-5.—Though Dobbie, Fox and Gauge (*C. A.* 5, 3048; 7, 1490) reported having obtained *o*-biphenylene (I) from ( $o$ - $\text{BrC}_6\text{H}_4$ )<sub>2</sub> (II), Schwechten (*C. A.* 27, 69) failed to obtain any I, and the present paper describes other futile attempts to prep. I. Previous to the method of S. for prep. II, and subsequent to unsuccessful attempts to form II from 2,2'-bis(diazobiphenyl) by CuBr (cf. Treche, *Andamento anormale della reazione di Sandmeyer nella serie del biphenile*, Thesis, Bologna, July, 1911), it was found that II cannot be prepd. from ( $o$ - $\text{O}_2\text{NC}_6\text{H}_4$ )<sub>2</sub> (III) because partial reduction of III by ( $\text{NH}_4$ )<sub>2</sub>S gives an oil difficult to purify, and if diazotization and decompn. with CuBr or CuCl are carried out, the yield of 2-nitro-2'-bromobiphenyl (IV) is very low. A better yield of IV is had with the method of Ullmann, i. e., by the action of powd. Cu on equimol. mixts. of  $o$ - $\text{BrC}_6\text{H}_4\text{I}$  and  $o$ - $\text{IC}_6\text{H}_4\text{NO}_2$  (or  $o$ - $\text{BrC}_6\text{H}_4\text{NO}_2$ ). The reduction of IV to 2-amino-2'-bromobiphenyl by  $\text{SnCl}_2$  takes place readily, but decompn. of the diazobromodibiphenyl by CuBr gives a very poor yield. Attempts to transform, by the method of D., F. and G. (*loc. cit.*), II into I yielded II unaltered, even after 200 hrs. with a large excess of Na. With ( $o$ - $\text{IC}_6\text{H}_4$ )<sub>2</sub> (V) the product was chiefly unaltered V, with a very small yield of an unidentified compd. contg. I, m. 54°. With ( $o$ - $\text{ClC}_6\text{H}_4$ )<sub>2</sub> (VI) the product was chiefly VI, with a small yield of Ph<sub>2</sub>. By heating V with powd. Cu at 25°, D., F. and G. obtained only resinous products, but in the present work  $o$ - $\text{IC}_6\text{H}_4\text{Br}$  (VII) was heated because it was thought that the greater activity of I would lead to II, which might in turn give Ph<sub>2</sub>. However, VII and excess Cu at 230-40° gave largely resins, from which by steam distn. a small proportion of diphenylene oxide (VIII) was isolated. VIII is probably formed by the secondary action of CuO on II. The unsuccessful attempt of S. and of M. and G. to obtain I suggests that in the expts. of D., F. and G., an impurity was present which had a favorable catalytic action. Cases in the literature are cited to show that under conditions which seem to vary in some insignificant way, pos. and neg. yields of various derivs. are obtained in unexplainable ways. C. C. Davis

4,4'-Dihydrazinodiphenylmethane. W. Borsche and R.

Manteuffel. *Ber.* 67B, 144(1934).—B. and Klenitz (C. A. 4, 3220) describe 4,4'-dihydrazinodiphenylmethane as m. 71–2° while Finger (*J. prakt. Chem.* 74, 155 (1906)) gives 139–40° as the m. p. Repetition of the work has shown that the pure compd. m. 141–3°.

C. A. R.

**Reduction by magnesium and magnesium iodide. XII. The reduction of benzopinacolone.** W. E. Bachmann. *J. Am. Chem. Soc.* 56, 449–50(1934); cf. C. A. 26, 5296.—Benzopinacolone is reduced by Mg +  $MgI_2$  at 80° to tetraphenylethylene; there also results 8–10% of a yellow gum; this gum is the principal product at room temp.

C. J. West

**Uranium tetrachloride, tungsten hexachloride and molybdenum pentachloride in organic syntheses. I.** I. Kashtanov. *J. Gen. Chem.* (U. S. S. R.) 3, 229–33 (1933).—Previous work has shown that the compds. of  $TiCl_4$  with ethers and esters decompose in PhH, one of the 2 radicals of the ether or ester being substituted for H of PhH (C. A. 23, 2170) with the formation of mono- or di-derivs. Similar compds. with  $AlCl_3$  and  $TiCl_4$  decompose even more energetically and both radicals of the ether may enter the PhH nucleus (C. A. 27, 975). However, the Ph group in esters is exceptional since PhBz is not formed. Compds. with  $UCl_4$ ,  $WCl_6$  and  $MoCl_5$  decomp. in a manner analogous to those with  $TiCl_4$ , e. g.,  $PhCH_2OEt$  (I) in PhH gives mono- and disubstituted PhH. iso-AmOAc (II) and iso-AmOBz (III) do not decompose in the presence of  $UCl_4$  although  $AcCl$  and  $BzCl$  do. PhBz could not be prepd. from  $BzOCH_2Ph$  (IV) and  $UCl_4$  although the  $PhCH_2$  radical does react with PhH to give mono- and di-derivs.  $UCl_4$  (25 g.), 200 cc. PhH and 10.5 g.  $AcCl$ , heated on a steam bath till evolution of HCl ceases, give a brown soln. which, shaken with several portions of  $H_2O$ , dried with  $CaCl_2$ , the PhH distd. off, and the fraction b. 199–203° collected and redistd., gave 21.6% of PhAc. Similarly 20 g.  $UCl_4$ , 200 cc. PhH and 13.3 g.  $PhCH_2Cl$  gave 12.3 g.  $Ph_2CH_2$ , 2.7 g. *p*- and *m*- $C_6H_4(CH_2Ph)_2$ , 1.1 g. of a hydrocarbon of higher mol. wt., and 3.2 g. of a liquid tar.  $UCl_4$  (17.5 g.), 200 cc. PhH and 13 g.  $BzCl$  gave 22% of PhBz and 8 g. of  $BzOH$  extd. from the reaction mixt. by washing with 50% NaOH.  $UCl_4$  (20 g.), 200 cc. PhH and 15 g. I gave 12.5 g.  $Ph_2CH_2$ , and 2.5 g. *p*- and *m*- $C_6H_4(CH_2Ph)_2$ .  $UCl_4$  (25 g.), 250 cc. PhH and 28 g. IV gave 15.6 g.  $BzOH$ , 13 g. of crude PhBz, and 2.9 g. of *p*- and *m*- $C_6H_4(CH_2Ph)_2$ .  $UCl_4$  (15 g.), 200 cc. PhH and 15 g. III gave 14 g. of unchanged III. II likewise was unattacked.  $WCl_6$  (20 g.), 250 cc. PhH and 14 g.  $BzCl$  gave 4.8 g. crude PhBz.  $WCl_6$  (19 g.), 200 cc. PhH and 13 g. I gave 10.7 g.  $Ph_2CH_2$  and 3.2 g. of *m*- and *p*- $C_6H_4(CH_2Ph)_2$ .  $MoCl_5$  (9 g.), 200 cc. PhH and 9 g. I gave 8.6 g.  $Ph_2CH_2$  and 2.5 g.  $C_6H_4(CH_2Ph)_2$ . Lewis W. Butz

**Apparent isomerism of  $\alpha,\alpha,\beta,\beta$ -tetraphenylethanol.** Richard Wegler. *Ber.* 67B, 35–9(1934).—It has been reported (Paternò and Chieffi, C. A. 5, 682; Bergmann and Engel, C. A. 24, 4274) that  $\alpha,\alpha,\beta,\beta$ -tetraphenylethanol exists in 2 forms, m. 235° (I) and 216° (II), the latter prepd. by illumination of  $Ph_2CO$  and  $CH_3Ph_2$ . Repetition of the illumination expts. gave a product which after 3 crystns. from acetone m. 215–7°. Attempts to replace the HO group by Cl never gave halogenated derivs. and only after repeated crystn. was a homogeneous product (chiefly  $Ph_3C:CPh_3$ ) obtained from II whereas I readily yielded the same compd. By repeating the crystn. of II 15 times its m. p. was raised to 229° and it no longer depressed the m. p. of I. This was not due to a rearrangement of II into I; the same results were obtained when all heating was avoided. When II was heated several hrs. in pyridine at 135° its m. p. was lowered somewhat but recrystd. of the product yielded I. It was concluded that II is impure I and that heating with pyridine so changes the impurities that they are now readily removed by crystn. The literature on the reactions of  $Ph_2CO$  with aliphatic or aromatic hydrocarbons in the light shows that the products are never homogeneous but always contain, in addn. to the alc., varying amts. of glycol and hydrocarbon, and an artificial mixt. of about 20% ( $HOCPh_2$ ) and ( $Ph_3C:$ ); with I behaved exactly like II. When the

mixt. is heated with pyridine, the glycol decomp. into  $Ph_2CO$  and  $Ph_2CHOH$ . The  $\alpha$ -*p*-tolyl homolog of I, prepd. like I and like II, also seemed to exist in 2 isomeric forms but the lower-melting product was more easily purified than II. I with Na gave  $CH_3Ph_2$ ,  $Ph_2CO$ ,  $Ph_2CHOH$ ,  $BzOH$  and especially ( $Ph_3C:$ ), which is in harmony with the conception of intermediate radicals; II with Na in boiling  $C_6H_6$  soon gave an intense blue-green color due to the glycol present. The following soly. detns. (g. in 50 cc. 96% alc.) are recorded: I 0.0215 at 16.5°, 0.0227 at 19°; ( $HOCPh_2$ ) 0.3493 at 18°, 0.3828 at 19°;  $PhCOCPh_2$  (into which the glycol readily rearranges under the influence of acids) 0.0528 at 17.5°, 0.0552 at 19°; ( $Ph_3C:$ ) 0.0318 at 20°.

C. A. R.

**Reaction of potassium amide in liquid ammonia with chloroethenes.** Geo. H. Coleman and Roy D. Maxwell. *J. Am. Chem. Soc.* 56, 132–4(1934).—The action of  $KNH_2$  in liquid  $NH_3$  on 1,1-diaryl-2-chloroethenes causes the removal of HCl and the rearrangement of the mols. to form tolan or substituted tolan; with dichloroethanes 2 mols. of HCl are removed and a similar rearrangement occurs. The following new 1,1-bis(alkylphenyl)-2-chloroethenes are reported: *p*-Et, b. 165–6°,  $n_D^{20}$  1.5898; *p*-Pr, b. 178–81°,  $n_D^{20}$  1.5782; *p*-Bu, b. 190–2°,  $n_D^{20}$  1.5652; 3,4-dimethyl, b. 166–70°,  $n_D^{20}$  1.6035. 1,1-Dibiphenyl-2,2-dichloroethane, m. 139–40°, *p*, *p*'-Diethyltolan, m. 71.5–2.5° (all m. ps. cor.); *Pr* deriv., m. 69.5–70.5°; *Bu* deriv., m. 41–2°; 3,3',4,4'-tetramethyltolan, m. 143–4°; *p*, *p*'-diphenyltolan, m. 243–4°. The ultra-violet absorption spectra of the compds. were detd.; the chloroethenes show non-selective absorption in the region between 200–280  $m\mu$ . Tolans show characteristic absorption bands; tolan 298, 279; di-Me deriv. 304, 284; di-Et deriv. 305, 287; di-Pr deriv. 305, 288; di-Bu deriv. 306, 287; tetrameth deriv. 306, 286; di-MeO deriv. 314, 294. C. J. W.

**Ammonolysis of fluorenone and fluorenone anil.** Louis A. Pinck and Guido E. Hilbert. *J. Am. Chem. Soc.* 56, 490(1934).—Fluorenone and  $NH_3$  at room temp. for several weeks give quantitatively the imide, m. 124°; the anil and  $NH_4Cl$  in liquid  $NH_3$  give the imide and  $PhNH_2$ .  $Ph_2CO$ , 9,9-dichlorofluorene and 1,2-dichlorodiphenyleneethane do not react with  $NH_3$ .

C. J. West

**The law of periodicity. IX. The constitution of triaryl methyl compounds.** P. Petrenko-Kritchenko. *Ber.* 66B, 1771–4(1933); cf. C. A. 27, 5225.—A reply to Hantzsch and Burawoy (cf. C. A. 27, 5736). B. A. Soule

**Reactivity of atoms and groups in organic compounds. XIII. The influence of structure on the pyrolysis of esters of triphenylacetic acid.** James F. Norris and Arthur Cresswell. *J. Am. Chem. Soc.* 56, 423–6(1934); cf. C. A. 28, 1082.—The following esters of  $Ph_3CCO_2H$  are reported: *Pr*, m. 98–9°; *iso*-*Pr*, m. 83.5–4.5°; *Bu*, m. 99–99.6°; *iso*-*Bu*, m. 88–9°; *sec*-*Bu*, m. 101–2°; *Am*, m. 76–6.5°;  $C_6H_5$ , m. 84–4.5°;  $PhCH_3$ , m. 99–9.5°;  $PhCH_2CH_3$ , m. 92.5–3°. The temps. at which the esters first begin to show signs of decomp. when heated for 1 hr. (the cracking temps.) are given in a curve and compared with the values for the corresponding  $Ph_3C$  ethers; from Me to *sec*-Bu the activating influence of these radicals on the lability toward heat of the bonds broken is similar in the 2 series; when the radicals present were *iso*-Bu,  $PhCH_2$  and  $PhCH_2CH_2$ , the effects on cracking temps. were opposite from those in the cases of the other radicals. The percentages of  $CO_2$  in these cases and of olefin products in the pyrolysis products are given. The cracking temps. of the esters are: Me 190°, Et 188°, *Pr* 160°, *iso*-*Pr* 154°, *Bu* 183°, *sec*-*Bu* 163°, *iso*-*Bu* 149°,  $PhCH_2$  179°,  $PhCH_2CH_3$  157°.

C. J. West

**Heteropolar compounds. XXIII. Tetraphenylcyclopentadienone and its reduction products.** W. Diltz, W. Braun and O. Tröskén. *J. prakt. Chem.* 139, 1–16 (1933); cf. C. A. 27, 4222.—2,3,4,5-Tetraphenylcyclopentenone (I) and  $PCl_5$ , heated 15 min. at 185–70°, give the compd.  $C_{20}H_{12}OCl$ , which m. 165–6° (decompn.) and on being heated at 180–90° loses HCl, yielding 2,3,4,5-tetraphenylcyclopentadienone (II). I gives an *Ac* deriv., m. 183°. Reduction of 2,3,4,5-tetraphenylcyclopentenolone or II with HI and red P gives I; I or II with amal-

garnated Zn in AcOH gives 2,3,4,5-tetraphenyl-1-hydroxy- $\Delta^1$ -cyclopentene (III), m. 176°; 2,3,4,5-tetraphenyl-1-hydroxycyclopentadiene (IV) gives the same product. IV, heated 7 hrs. in AcOH in H, gives I. Tetraphenylcyclopentadiene results from the Zn distn. of I, II, III or IV. Tetraphenyl-3-hydroxy- $\Delta^1$ -cyclopentenone, catalytically reduced with Pd, gives a compd. (V),  $C_{26}H_{20}O$ , m. 163°, which gives a depression of 23° in the m. p. of I. With 4% Pt, there results a compd.,  $C_{26}H_{20}O_2$  or  $C_{26}H_{20}O_3$ , m. 228-9°, which yields V on Zn distn.; with 10% Pt some I and V are also formed.

C. J. West  
Tautomerism of  $\alpha$ -diketones. I. Benzyl phenyl diketone. E. P. Kohler and R. P. Barnes. *J. Am. Chem. Soc.* 56, 211-14 (1934).—O.CPh<sub>2</sub>CHBz is rearranged by

HCl in AcOH, giving 70% of PhCH:C(OH)Bz (I). The enol content of the equil. mixt., detd. by Br titration, was: 100° 28.5%, 125° 25.5%, 145° 23.5%, 165° 21%, distillate 9.1% and in the residue after 1 distn. from soft glass into a Pyrex condenser and receiver 27%. For 0.1 N solus.: MeOH 43%, EtOH 38%, CHCl<sub>3</sub> 53%, C<sub>6</sub>H<sub>6</sub> 39%. On autoxidation I forms a peroxide, which could not be isolated, the end products being BzH and BzCO<sub>2</sub>H. I in EtOH-Et<sub>2</sub>O and EtONa give a yellow Na salt, C<sub>16</sub>H<sub>11</sub>O<sub>2</sub>Na.0.5EtOH, sol. in MeI and Et<sub>2</sub>O, from which a new Na salt ppts., lighter in color and free from EtOH. I and Ac<sub>2</sub>O with a drop of H<sub>2</sub>SO<sub>4</sub> give the *O-Ac deriv.*, PhCH.C(OAc)Bz, pale yellow, b<sub>p</sub> 195-200°; the product never contains enough of a C-acyl deriv. to give a color reaction with FeCl<sub>3</sub>. I forms a mixt. of *O*- and *C*-Me derivs. by every method of alkylation; the Na salt and Me<sub>2</sub>SO<sub>4</sub> in Me<sub>2</sub>CO give 80.9% of the *O*-Me compd. and in Et<sub>2</sub>O 64.2%, the Na salt and MeI in Me<sub>2</sub>CO give 64.6% and in MeOH 50.9% of the MeO deriv. The Na salt and I in Et<sub>2</sub>O give a small yield of BzCOCHPhCHPhCOBz, yellow, m. 198°. I and PhMgBr give 89% of PhCH<sub>2</sub>CO.CPh<sub>2</sub>OH, m. 60°. II. Benzohydryl phenyl diketone. E. P. Kohler and N. Weiner. *Ibid.* 434-8.—O.CPh<sub>2</sub>CHBz,

rearranged with MeONa, gives 73-84% of benzohydryl Ph diketone (I), m. 49-50°. I is rapidly oxidized by alk. H<sub>2</sub>O<sub>2</sub> to H<sub>2</sub>O and Ph<sub>2</sub>CHCO<sub>2</sub>H. Condensation of I with *o*-C<sub>6</sub>H<sub>4</sub>(NH<sub>2</sub>)<sub>2</sub> gives benzohydrylphenylquinoxaline, m. 108-9°. I does not form a Cu deriv. and gives no color with EtOH-FeCl<sub>3</sub>; it resists bromination under all conditions and is therefore completely ketonic. I in satd. MeOH-KOH passes through the color changes of yellow, orange and deep red, finally giving triphenylacetic acid, m. 243-5° (decompn.), *Me ester*, m. 18°. Alk. Me<sub>2</sub>SO<sub>4</sub> and I in MeOH, shaken until the red color disappears, give 94% of  $\alpha$ -methoxy- $\beta$ -phenylbenzalacetophenone, m. 103-4°. MeI may also be used, but the reaction mixt. must be boiled. Benzoylation of I in C<sub>6</sub>H<sub>5</sub>N or in NaOH gives  $\alpha$ -benzoyloxy- $\beta$ -phenylbenzalacetophenone, m. 161° (93.5% in C<sub>6</sub>H<sub>5</sub>N); it is not hydrolyzed by acids and is not catalytically reduced. Catalytic reduction of I in AcOEt or in Ac<sub>2</sub>O gives 1,3,3-triphenyl-1-hydroxypropanone, m. 128°, previously obtained from O.CPh<sub>2</sub>CHCH(OH)Ph; the oxime, m. 135-

6°, is an  $\alpha$ -oxime, since it forms a Cu deriv. and gives a red color in EtOH-FeCl<sub>3</sub>. Addn. of MeMgI to I in Et<sub>2</sub>O gives 1,3,3-triphenyl-2-methyl-2-hydroxypropan-1-one (II), m. 176° (188° in *Am. Chem. J.* 36, 536 (1906) is an error); addn. of I to MeMgI gives 1,3,3-triphenyl-1-methyl-1-hydroxypropan-2-one (III), m. 72-3°; excess HI gives 1,3-diphenyl-1-methylindan-2-one, m. 185° (decompn.). III, added to PhMgI, gives 1,2,3,3-tetraphenyl-1-methylpropane-1,2-diol, m. 184°. II and PhMgBr give a mixt. of this diol and the isomeric 1,1,3,3-tetraphenyl-2-methylpropane-1,2-diol (IV), m. 173°. Ph<sub>2</sub>CHCO<sub>2</sub>Me, treated with MeMgI, gives 86% of *Me*  $\alpha$ -methyl- $\beta$ -*di*-phenyl-, m. 87-8°; with PhMgBr this yields 76% of IV. I

and PhMgBr give Ph<sub>2</sub>CHCPh(OH)Bz. In an attempt to rearrange O.CPh<sub>2</sub>CHBz with HCl in AcOH there results

1,3-diphenyl-1-chloroindan-2-one, m. 174° (decompn.); EtOH gives the 1-EtO compd., m. 133°. C. J. West  
7-Nitrodesoxybenzoin. Jakob Meisenheimer and Emil Mahler. *Ann.* 508, 185-91 (1934).—7-Nitrostilbene, shaken with 15% MeOH-KOH until soln. results, dild. with H<sub>2</sub>O and treated with Br-H<sub>2</sub>O, gives 1,2-diphenyl-1-methoxy-2-bromo-2-nitroethane; the mixt. of isomers m. 58-68°, from which the  $\alpha$ -form, m. 91°, is obtained by repeated crystn. from AcOH. The mixt. of isomers with MeOH-KOH at 30-50° for 1 hr. gives, on addn. of (NH<sub>4</sub>)<sub>2</sub>CO<sub>3</sub>, 66% of the *di-Me acetal* (I), m. 117-8°, of nitrodesoxybenzoin (II), BzCH(NO<sub>2</sub>)Ph, m. 73°, prepd. from the acetal by shaking with 75% H<sub>2</sub>SO<sub>4</sub> at 100-10°; continued heating at 100° results in complete splitting to PhCH<sub>2</sub>NO<sub>2</sub> and BzOMe; the Br deriv. of II m. 91-1.5°. If in the prepn. of I, HCl is used in place of (NH<sub>4</sub>)<sub>2</sub>CO<sub>3</sub>, there results 7-nitro-7'-methoxystilbene, S-yellow, m. 87°. From the mother liquor of I, a small quantity of 7-nitro-7'-aminostilbene, yellow, m. 157°, may be isolated. II does not give an oxime with NH<sub>2</sub>OH.HCl in C<sub>6</sub>H<sub>5</sub>N but under the same conditions there results anthraquinone diosime, pale yellow, m. 245-50° (decompn.). C. J. W.

The oxidoreduction of 1-chloro-1,2-diphenylethanal and the so-called oxide of tolan. Georges Richard. *Compt. rend.* 197, 1432-4 (1933).—Dry powd. KOH acting on PhCOCHClPh in Et<sub>2</sub>O gives BzOH, Ph<sub>2</sub>CHCO<sub>2</sub>H, PhCOCH<sub>2</sub>Ph (I) and Bz<sub>2</sub>. Contrary to Madelung and Oberwagner no tolan was obtained. R. suggests that their product was possibly impure I. Rachel Brown

Indirect hydrolysis of hexaphenylethane. W. E. Bachmann. *J. Am. Chem. Soc.* 56, 230-40 (1934).—Ph<sub>2</sub>C (I) is converted to a mixt. of equiv. amts. of Ph<sub>2</sub>CH and Ph<sub>2</sub>COH by a mixt. of H<sub>2</sub>O and a small amt. of I. I does not react with MgI<sub>2</sub> in Et<sub>2</sub>O and C<sub>6</sub>H<sub>6</sub> to give a Grignard reagent as has been reported. I promotes the oxidation of MgI<sub>2</sub> by O of the air. Ph<sub>2</sub>CMgBr reacts rapidly with I and gives I and Mg halides. C. J. West

Pinacol-pinacolone rearrangement. V. The rearrangement of unsymmetrical aromatic pinacols. W. E. Bachmann and Helen R. Sternberger. *J. Am. Chem. Soc.* 56, 170-3 (1934); cf. *C. A.* 27, 5071.—The pinacols were prepd. by the action of a Grignard reagent on the Me esters of benzoic acid or a substituted acid. *Me anisilate*, m. 110-10.5°; *Me 4,4'-diphenylbenzoic acid*, m. 130.5-1.5°. *Benzopinacols*: 3,3'-dimethyl-4',4''-dimethoxy, m. 153.3-4.5° (49% yield); 4,4'-dimethyl-4',4''-dimethoxy, m. 159.5-61° (69%); 4,4'-diethoxy, m. 162-3° (73%); 4,4'-diphenyl, m. 190.5-1° (86%); 3,3'-dimethyl-4',4''-diphenyl, m. 160-1° (69%); 4,4'-dichloro, m. 143-4.5° (69%); 4,4'-difluoro, m. 166.5-7.5° (67%). These pinacols have been rearranged to pinacolones and the relative migration aptitudes of the groups detd. to be: *p*-biphenyl 1.18, Ph 1, *m*-tolyl 1, *p*-tolyl 0.96, *p*-chlorophenyl 0.75, phenetyl 0.49, anisyl 0.39, *p*-fluorophenyl 0.099. The corresponding series for the sym. pinacols is: anisyl 70, phenetyl 39, *p*-tolyl 15, *p*-biphenyl 11.5, *m*-tolyl 1.95, *p*-fluorophenyl 1.85, Ph 1, *p*-chlorophenyl 0.66. There is no simple relationship between the values for the 2 groups 2,2-Di-*p*-fluorophenyl-1,2-diphenyl-1-ethanone, m. 121.5-2.5°; 4,4'-difluorotriphenylmethane, m. 55-6°.

C. J. West  
Rearrangement of  $\alpha$ -naphthalene derivatives into  $\beta$ -naphthalene derivatives under the influence of catalysts. Fritz Mayer and Rudolf Schiffner. *Ber.* 67B, 67-9 (1934).—Several examples were given (*C. A.* 26, 5934) of the conversion of cycloaromatic ketones, by means of arylmagnesium halides, into unsatd. compds. which were dehydrogenated to diaryl compds. with S. In an attempt to effect the dehydrogenation with catalysts in order to avoid the formation of S-contg. by-products, 1-phenyl- $\Delta^1$ -dialin (prepd. from PhMgCl and  $\alpha$ -tetralone) was passed in a current of air over silica gel in a porcelain tube at 350°. It was hoped thereby to obtain  $\alpha$ -C<sub>16</sub>H<sub>7</sub>Ph in better yield and purer form, but the product proved to be  $\beta$ -C<sub>16</sub>H<sub>7</sub>Ph, m. 102.5°.  $\alpha$ -C<sub>16</sub>H<sub>7</sub>Ph itself yields the same

product;  $\alpha$ -C<sub>10</sub>H<sub>7</sub>Me and  $\alpha$ -C<sub>10</sub>H<sub>7</sub>Et at 420-80° are rearranged into the  $\beta$ -isomers; 1,6-C<sub>10</sub>H<sub>7</sub>Me gives 2,6-C<sub>10</sub>H<sub>7</sub>Me;  $\alpha$ -C<sub>10</sub>H<sub>7</sub>C(CH<sub>3</sub>)Me yields only C<sub>10</sub>H<sub>8</sub>;  $\alpha$ -C<sub>10</sub>H<sub>7</sub>Br gives C<sub>10</sub>H<sub>8</sub> and  $\beta$ -C<sub>10</sub>H<sub>7</sub>Br. C. A. R.

Reactions of *o*-phenylenebis(phenylglyoxal) and the retrobenzile acid rearrangement. Preparation of 2,8-diphenyl-1,4-dihydroxynaphthalene. Richard Weiss and Karl Bloch. *Monatsh.* 63, 39-51(1933); cf. C. A. 26, 2451.—Dibenzalphenanthrene (I), from benzaldehyde and PhCH<sub>2</sub>MgBr, with Br<sub>2</sub> gives *o*-C<sub>6</sub>H<sub>4</sub>(COCBrPh)<sub>2</sub> (II), which reacts with EtOH in a sealed tube 24 hrs. at 100° to give *o*-C<sub>6</sub>H<sub>4</sub>(COCOPh)<sub>2</sub> (III). I and Cl in cold AcOH give *dichlorobis(dichlorobenzyl)phthalon* (IV), m. 242-8°. I with a little I in AcOH rearranges to 2-phenyl-3-benzylindone, m. 130-3°. II with Zn in AcOH, heated 2-3 hrs., gives 2,3-diphenyl-1,4-dihydroxynaphthalene (V), m. 236-43°, which is oxidized by Na<sub>2</sub>C<sub>2</sub>O<sub>4</sub> to 2,3-diphenyl-1,4-naphthoquinone (VI), m. 136-9°. III, Ac<sub>2</sub>O and H<sub>2</sub>SO<sub>4</sub> with Zn dust give the *de-Ac* deriv. of V, m. 200-2°; hydrolysis with dil. HCl gives V. Distn. of V with Zn gives a red-brown mol. compd. of VI and 2,3,1-Ph<sub>3</sub>C<sub>10</sub>H<sub>8</sub>OH (VII) and some VII. The mol. compd. is also formed from the components and m. 133-6°; EtOH-KOH decomps. the mol. compd. into VI and VII. VII gives a 4-NO compd., yellow, m. 193° (decompn.). A nearly satd. soln. of III in hot EtOH and 10% EtOH-KOH, refluxed 1 hr., give *diphenylphthalancarboxylic acid* (VIII), m. 200-2°; *Me ester*, m. 197°; boiling 3 g. with 100 cc. Ac<sub>2</sub>O for 5 hrs. gives a mixt. of diphenylindone (IX) and *o*-benzoylbensilic acid (X), m. 176° (decompn.). Heating VIII at 18 mm. gives IX. Reduction of VIII with HI and red P gives *diphenylhomophthalide*, m. 166°; this also results by reduction of X. C. J. West

Synthesis of polynuclear hydrocarbons by the cyclodehydration of aromatic alcohols. Marston T. Bogert, David Davidson and Richard O. Roblin, Jr. *J. Am. Chem. Soc.* 56, 248(1934); cf. C. A. 27, 3211.—1-Methyltetralin has been obtained by the action of PhOH on PhCH<sub>2</sub>CH<sub>2</sub>CH<sub>2</sub>CH(OH)Me, PhCH<sub>2</sub>CH<sub>2</sub>CH<sub>2</sub>CH<sub>2</sub>CH<sub>2</sub>OH, PhCH<sub>2</sub>CH<sub>2</sub>CH(OH)CH<sub>2</sub>Me or PhCH<sub>2</sub>CH<sub>2</sub>CH<sub>2</sub>CH<sub>2</sub>Me; 1-ethyltetralin has been obtained from both Ph(CH<sub>2</sub>)<sub>3</sub>CH(OH)Me and Ph(CH<sub>2</sub>)<sub>3</sub>CH<sub>2</sub>CH<sub>2</sub>OH; from Ph(CH<sub>2</sub>)<sub>3</sub>CMe(OH)CH<sub>2</sub>Me both 1,2-dimethyltetralin and 1-methyl-1-ethylindan are formed. C. J. West

Synthesis of bicyclic compounds. P. C. Guha, K. N. Gaid and D. R. Mehta. *Current Sci.* 2, 53(1933); cf. C. A. 27, 3211.—The di-Na deriv. of di-Et 4,6-diketo-2,2-dimethylcyclohexane-1,3-dicarboxylate in C<sub>6</sub>H<sub>6</sub> reacts with CH<sub>3</sub>I, when heated in a closed vessel at a high temp.,

to give  $\text{CMe}_3\text{C}(\text{CO}_2\text{Et})\text{CO}_2\text{CH}_2\text{CO}_2\text{CCO}_2\text{Et}$ , which on

hydrolysis gives ketonopinone,  $\text{CMe}_3\text{CH}(\text{CO}_2\text{CH}_3)\text{CO}_2\text{CH}_3$ .

Under similar conditions succinosuccinic ester yields the 1,4-bridged compd. Louise Kelley

Chlorine derivatives of 4-hydroxybiphenyl. J. C. Colbert, Wyman Meigs and Brown Mackin. *J. Am. Chem. Soc.* 56, 202-4(1934).—4-HOC<sub>6</sub>H<sub>4</sub>Ph in CHCl<sub>3</sub>, treated with Cl for 1 hr., gives 65% of 3-chloro-4-hydroxybiphenyl (I), m. 76-75° (all m. ps. cor.); in CCl<sub>4</sub> the yield is 73%, in AcOH, 46%; 1 mol. Br gives 44% of the 5-Br deriv., m. 84-6°; 2 mols. Br give 56.4% of the 5,4'-di-Br deriv., m. 143-6°. Chlorination in CHCl<sub>3</sub> for 2 hrs. gives 50% of the 3,5-di-Cl deriv. (II), m. 80.5-2°; CCl<sub>4</sub> gives a 58% yield; CS<sub>2</sub> gives 35%; increasing the time to 2.5 hrs. decreases the yield to about 39%. Chlorination in AcOH for 4 hrs. gives 10% of the 3,5,4'-tri-Cl deriv. (III), m. 133.5-7°. The benzate of I m. 95-7°, of II, 144-6°, of III, 161°. The following 2,4-dimethoxybiphenyl ethers were prepd.: 4'-phenyl-2'-chloro, yellow, m. 109-11°; 4'-phenyl-2',6'-dichloro, light yellow, m. 112-13°; 4'-(*p*-chlorophenyl)-2',6'-dichloro, yellow, m. 174-6°. C. J. West

Biaryls and their derivatives. I. 2,7,2',7'-Tetrahydroxybiphenyl. I. S. Ioffe. *J. Gen. Chem.* (U.S. S. R.) 3, 453-52(1933).—The structure of 2,7-dihydroxy-

naphthalene and 2,7,2',7'-tetrahydroxy-1,1'-biphenyl requires further study. Investigation of other sulfonic acids of  $\beta$ -naphthol and polyhydroxynaphthalenes is being continued. II. Cyclization of 2,7,2',7'-tetrahydroxy-1,1'-biphenyl. I. S. Ioffe and I. V. Grachev. *Ibid* 463-9.—Bromination of 2,7,2',7'-tetrahydroxy-1,1'-biphenyl (I) and the cyclization of the mixt. of its penta- and hexa-Br derivs. was studied. Heating of the latter mixt. with Cu powder at 200° caused a flash and resulted in a product, investigation of which is incomplete. Prepn. of the Pb salt of I is described. W. P. Ericks

Naphthaleneearsonic acids. Application of the Béchamp reaction to  $\alpha$ -naphthylamine. Harold P. Brown and Cliff S. Hamilton. *J. Am. Chem. Soc.* 56, 151-3(1934).—The aminonaphthaleneearsonic acid obtained by the direct arsonation of  $\alpha$ -C<sub>10</sub>H<sub>7</sub>NH<sub>2</sub> by means of the Béchamp reaction has been identified structurally as 1,2-C<sub>10</sub>H<sub>6</sub>(NH<sub>2</sub>)<sub>2</sub>AsO<sub>3</sub>H<sub>2</sub> (I) by a series of mixed m. ps., the prepn. of an Ac deriv. and the prepn. of 1,2-C<sub>10</sub>H<sub>6</sub>(NHAc)<sub>2</sub>Cl from this Ac deriv. The assignment of this instead of the 4,1-structure (II) as reported in the literature involves a correction of the structure of all C<sub>10</sub>H<sub>6</sub> arsenicals dependent on the Béchamp reaction as a part of their method of prepn., including certain substituted naphthaleneearsonic acids, the only known HO deriv. and the product at present assigned the structure of the C<sub>10</sub>H<sub>6</sub> analog of arspenamine. I was obtained from II by heating the latter in  $\alpha$ -C<sub>10</sub>H<sub>7</sub>NH<sub>2</sub>, this demonstrates that in a medium of  $\alpha$ -C<sub>10</sub>H<sub>7</sub>NH<sub>2</sub> at temps. above 175°, the former isomer is more stable than the latter. C. J. West

Synthesis of condensed polynuclear hydrocarbons by the cyclodehydration of aromatic alcohols. I. Indans Marston T. Bogert and David Davidson. *J. Am. Chem. Soc.* 56, 185-90(1934).—Monophenylated alcs. of the

type PhCC(OH)CHMe<sub>2</sub> and PhCCHC(OH)Me<sub>2</sub>, which on dehydration may be expected to yield olefins of the type

PhCC: CMe<sub>2</sub>, are converted into indans by 85%

the intermediate olefins are also cyclized to indans by H<sub>2</sub>SO<sub>4</sub>. PhCH<sub>2</sub>CH<sub>2</sub>CM<sub>2</sub>OH gives 65% of 1,2-dimethylindan (I), b. 191°; PhCH<sub>2</sub>CH(OH)CHMe<sub>2</sub> gives 55% of the same product. PhCH<sub>2</sub>CHMeCH(OH)Me, b. 135-6°, gives a polymer only. PhCH<sub>2</sub>CM<sub>2</sub>(OH)CHMe<sub>2</sub>, b. 122-4°, gives 90% of 1,1,2-trimethylindan (II), b. 208°. PhCM<sub>2</sub>CH<sub>2</sub>CH<sub>2</sub>OH, b. 137-8°, gives 15% of I. PhCM<sub>2</sub>CH<sub>2</sub>CH(OH)Me, b. 206-8°, gives 35% of 1,1,3-trimethylindan. PhCM<sub>2</sub>CH<sub>2</sub>CM<sub>2</sub>OH, b. 133°, gives 85% of 1,1,3,3-tetramethylindan (III), b. 206-9°. A case of direct cyclodehydration appears to exist in the conversion of Ph(CH<sub>2</sub>)<sub>3</sub>OH into tetralin by the action of hot H<sub>2</sub>PO<sub>4</sub>. These results show that aralkyl alcs. which bear a HO group on the C atom in the 3-position with respect to the Ph group are incapable of undergoing direct cyclodehydration; apparently the steric relationships are such that normal dehydration to olefins takes precedence over cyclodehydration to indans. In those cases in which the polymer was the final product, a trace of cycle was indicated; hence the behavior of the alcs. differs merely in degree and not in kind, except from a practical point of view. The indans with 1-1.5 vol. H<sub>2</sub>SO<sub>4</sub> at 60° give sulfonic acids: I, m. 67°; II, m. 109°; III, m. 107-8°. C. J. West

2-Methyl-1-indone. N. Kizhner. *J. Gen. Chem.* (U.S. S. R.) 3, 201-7(1933).—Elimination of HBr from 2-bromo-2-methyl-1-hydrindone (I) (C. A. 9, 2066) with C<sub>6</sub>H<sub>5</sub>N gives 37% of 2-methyl-1-indone (II). The nature of the by-products was not detd. Boiling 5 g. I in 10 cc. C<sub>6</sub>H<sub>5</sub>N for 1 hr. with a reflux condenser, cooling, acidification with 10% H<sub>2</sub>SO<sub>4</sub>, distn. of the cryst. product with steam, and recrystn. from petrol. ether gave II, yellow platelets, m. 47-75°, b. 99-100°. At ordinary pressures, II begins to b. 240°, but the temp. quickly rises to 350° because of polymerization. II is sol. in H<sub>2</sub>O and org. solvents. Its soln. in concd. H<sub>2</sub>SO<sub>4</sub> is blue. Warming II in alc. with KOH or NaOH produces a blue soln., de-

colored on acidification, and yielding a ppt. of a polymer of II. II and  $\text{KMnO}_4$  gave phthalic acid. The *p*-nitrophenylhydrazones of II, orange, m. 195–7° from hot AcOH. The *p*-bromophenylhydrazones, which can be prepd. from either I or II, HBr being eliminated in the former reaction, orange, m. 122° from AcOH. II when kept in a stoppered tube for 1.5 months polymerizes to an insol. yellow glassy solid. Analysis indicated that polymerization was accompanied by oxidation. Polymerization was more quickly induced by heating with 1% KOH at 50°. The polymer, pptd. from its soln. in PhH by petrol. ether, m. 170–90°; its soln. in  $\text{H}_2\text{SO}_4$  was colorless; evapn. with alc. KOH gave a blue color. II with HBr gives not I or its isomer, *s. e.*, the normal addn. products, but  $\text{C}_{20}\text{H}_{17}\text{O}_3\text{Br}$  (III) by condensation of 2 mols. of II, linking probably between the C<sub>9</sub> atoms. Elimination of HBr from III by alkali gives IV,  $\text{C}_{20}\text{H}_{16}\text{O}_3$ , probably contg. a new 4-C ring. Heating 4.7 g. II with 20 cc. of fuming HBr in a closed tube at 100° for 4 hrs. and diln. of the reaction mixt. with  $\text{H}_2\text{O}$  gave a mixt. of III and II which by extn. with  $\text{Et}_2\text{O}$  followed by pptn. with MeOH gave 56% III. With AcOH satd. with HBr 80% of III was obtained. III m. 170–1° from boiling PhH. III (0.699 g.) boiled 1 hr. with 1 g. NaOH in 15 cc. 70% alc. gave IV, m. 197–8° from boiling PhH, in theoretical yield after removal of the alc. and acidification with  $\text{HNO}_3$ . IV could not be brominated in PhH soln., added HBr only very slowly to give III, and did not form a phenylhydrazone. Lewis W. Butz

4-Cyano-1-hydrindone. Hans Hoyer. *J. prakt. Chem.* 139, 94–6 (1934).—8-(2-Nitrophenyl)propionic acid, treated with  $\text{SOCl}_2$  and then with  $\text{AlCl}_3$ , gives 4-nitro-1-hydrindone, brown, m. 104–5° (oxime, brown, m. 212–13°); reduction with  $\text{NH}_4\text{OH}$  and  $\text{FeSO}_4$  gives the 4-NH<sub>2</sub> deriv., pale yellow, m. 122–8° (*Bs* deriv., yellow, m. 184–5°; oxime, pale yellow, m. 180–1°); through the diazo reaction there results the 4-CN deriv., light yellow, m. 116–17°.

Condensation of *o*-benzoylbenzoic acid with resorcinol. G. Charrier and Elisa Ghigi. *Gazz. chim. ital.* 63, 630–4 (1922).—In view of the fact that *o*- $\text{BzC}_6\text{H}_4\text{CO}_2\text{H}$  (I) is easily transformed into anthraquinone (II) by warm  $\text{H}_2\text{SO}_4$ , it was thought possible that the compd.  $\text{C}_{20}\text{H}_{16}\text{O}_4$  obtained by Pavolini (*C. A.* 26, 5946) by the condensation of I with resorcinol (III) by  $\text{H}_2\text{SO}_4$  was the same compd. as diresorcinolanthraquinone anhydride (IV) obtained by Sharvin and Kuneszoff (*Ber.* 36, 2020 (1903) and *S.*, *C. A.* 6, 316) from III and II. By the condensation method the product was IV, both from III and II as obtained by *S.*, and from I in place of II. By the method of *P.*, there was obtained from II and III a compd. contg. S, from which no Ba salt sufficiently pure for analysis could be isolated. However, with resorcinol-4,6-disulfonic acid and II in concd.  $\text{H}_2\text{SO}_4$  at 250°, there was obtained, not dihydroxyphenanthrone, but a disulfonic acid,  $\text{C}_{20}\text{H}_{14}\text{O}_4(\text{SO}_3\text{H})_2$  (V),

of the diresorcinolanthraquinone anhydride of *S.* Only by arduous purification could V be isolated, and the initial product had to be washed with satd. aq. NaCl and EtOH, and converted to its Ba salt,  $\text{C}_{20}\text{H}_{12}\text{O}_4\text{S}_2\text{Ba}$ , black. The so-called rhodanin of *P.* is only the di- $\text{SO}_3\text{H}$  deriv. of the  $\text{C}_{20}\text{H}_{16}\text{O}_4$  compd. of Deichler (*Ger. pat.* 108,836 (1897); *Chem. Centr.* 1900, I, 1212). V does not m. up to 350°. IV could not be sulfonated under ordinary conditions, and with fuming  $\text{H}_2\text{SO}_4$  (contg. 60%  $\text{SO}_3$ ) the sulfonated product could not be purified. C. C. Davis

Action of sodium on 9-methoxy-10-phenylphenanthrene

and on 1-diphenylene-3-phenylindene. C. Frederick Koelsch. *J. Am. Chem. Soc.* 56, 480–4 (1934).—*o*-Xenylmagnesium bromide (I) and BzH give *o*-phenylbenzohydrol, m. 69–70°; AcOH contg. a little  $\text{H}_2\text{SO}_4$  or  $\text{SOCl}_2$  in  $\text{Et}_2\text{O}$  gives quantitatively 9-phenylfluorene; MeOH contg. 5%  $\text{H}_2\text{SO}_4$  gives the *Me ether*, m. 72–3°; cleavage by Na in  $\text{Et}_2\text{O}$  gives phenyl-*o*-xenylacetic acid (II), m. 171–3°. I and  $\text{BzCO}_2\text{Et}$  give *o*-phenylbenzylidene acid, m. 189–91° (decompn.); reduction with I and red P in AcOH gives II. II and  $\text{PCl}_5$  in  $\text{C}_6\text{H}_6$ , boiled until HCl is no longer evolved, and then treated with  $\text{AlCl}_3$ , form 9-phenyl-10-phenanthrol, m. 142–3°; acetate, m. 153–5°; benzoate, m. 179–80°; picrate, orange-red, m. 135°;  $\text{Me}_2\text{SO}_4$  in MeOH gives quantitatively 9-methoxy-10-phenylphenanthrene (III), m. 189–90°; 40% Na-Hg in  $\text{Et}_2\text{O}$  gives a violet mono-Na compd., hydrolysis of which gives 9-phenylphenanthrene (IV), m. 105–6° (picrate, orange-red, m. 115°; Br gives 9-bromo-10-phenylphenanthrene, m. 108–10°); the Na compd. and  $\text{CO}_2$  give 9-phenylphenanthrene-10-carboxylic acid, m. 185–7°; refluxing the latter with  $\text{SOCl}_2$  in  $\text{CCl}_4$  gives 1,2,3,4-dibenzo-fluorenone, orange-red, m. 186–7°. III and Na-Hg in  $\text{Et}_2\text{O}$ , after 8 hrs., form a di-Na compd., which is decolorized by  $\text{CO}_2$ , the product being IV. IV reacts with Na-Hg to give a mono-Na compd., which reacts with BzH to give 9-( $\alpha$ -hydroxybenzyl)-10-phenylphenanthrene, which could not be crystd.; boiling with AcOH- $\text{H}_2\text{SO}_4$  gives 1,2,3,4-dibenzo-9-phenylfluorene (V), m. 210–11°; this yields a Na compd. which reacts with  $\text{BzCl}$  to give the 9-Bz deriv. of V, m. 228–9°; this also results from 1-diphenylene-3-phenylindene, Na and  $\text{BzCl}$ . Attempts to oxidize V with  $\text{CrO}_3$  give a compd.  $\text{C}_{27}\text{H}_{18}\text{O}_4$ , m. 188–9° which forms with  $\text{NH}_4\text{OH}$  5% of a compd. m. 218–20° (decompn.); HI gives an I-contg. compd., red-brown, m. 185–7°; boiling 5% NaOH gives a compd.  $\text{C}_{27}\text{H}_{18}\text{O}_4$ , m. 184–6°.

Preparation of 2-iodophenanthrenequinone. L. McMaster and R. S. Wobus. *J. Am. Chem. Soc.* 56, 164–5 (1934).—2-Aminophenanthrenequinone, m. 324° (for which a method of prepn. is given), diazotized in  $\text{H}_2\text{SO}_4$  (d. 1.84) at 0–5° and treated with KI, gives 30% of the 2-I deriv., orange, m. 223–4° (cor.), decompd. well above its m. p. with liberation of I; concd.  $\text{H}_2\text{SO}_4$  gives a dark green soln., turning deep red on diln.

Sulfonation of phenanthrene. Preparation of the monosulfonic acid. I. S. Ioffe. *J. Gen. Chem.* (U.S.S.R.) 3, 448–52 (1933).—The decrease in time interval of the sulfonation reaction increases the total yield of monosulfonic acid of phenanthrene. The yield of monosulfonic acids increases with the decrease in quantity and in strength of the  $\text{H}_2\text{SO}_4$ , but in both cases requires a longer sulfonation period. An excessively large sulfonation period with dil. acid decreases the yield of monosulfonic acids due to desulfonation which takes place with dil. acids. The 9-sulfonic acid of phenanthrene is obtained at higher temps. but quickly rearranges into other monosulfonic acids. The yield of phenanthrene-2-sulfonic acid increases with the time interval of the process, reaching 17–37%.

Experimental investigations on the application of the electronic theory in the chemistry of organic compounds. I. A. M. Berkenheim and M. I. Gostev. *J. Gen. Chem.* (U.S.S.R.) 3, 385–410 (1933).—The electronic formula of isomeric nitro compds. of the aromatic series shows the degree of firmness with which the nitro group is attached to the C ion and indicates the possible group rearrangements. During electrostatic rearrangement, formation of more stable compds. takes place due to change in position of the groups in the nucleus; the signs of all charges remain unchanged. As a result of electrodynamic rearrangement of abnormal nitro compds., complex aromatic nitrite ethers are formed, the existence of which was confirmed and methods for their prepn. established, consisting in the interaction of a metallic salt of phenol with NOCl. The formation of by-products during nitration is due to rearrangement of complex nitrite ethers into HO-containing compds. II. A. M. Berkenheim and A. N. Chivikova. *Ibid.* 411–18. —The formation of an amino

oxide from a tertiary amine by the action of  $H_2O_2$ , the N ion being recharged into the N ion, is described. III. A. M. Berkenheim, S. I. Lur'e and M. F. Eliseeva. *Ibid.* 419-31.—The rearrangement of all charges of C ions of Ph group at the time the aromatic amino oxides are formed was experimentally established. W. P. Ericks

Orientation in the furan nucleus. VII. Di- $\alpha$ -substituted furans. Henry Gilman, N. O. Calloway and E. W. Smith. *J. Am. Chem. Soc.* 56, 220-1 (1934); cf. C. A. 27, 2952.—In the sulfonation of 5-bromo-2-furoic acid and in the acetylation of Et 5-methyl-2-furoate the substituent assumes the 4-position and no significant quantity of isomer appears to form. Et 4-acetyl-5-methyl-2-furoate m. 99° (54% yield); the free acid m. 235°; oxidation of the acid gives 5-methyl-2,4-furandicarboxylic acid, m. 270-2°. If in a di- $\alpha$ -substituted furan 1 of the substituents is an *o,p*-director in  $C_6H_5$  and the other a *m*-director, the entering element or group is directed to that  $\beta$ -position contiguous to the *o,p*-director. C. J. West

Hydrogenation and hydrogenolysis of furan derivatives. Harold E. Burdick and Homer Adkins. *J. Am. Chem. Soc.* 56, 438-42 (1934).—Hydrogenation of  $\beta$ -furyl-acrolein (I) at 160° with Ni on kieselguhr (6.5 hrs.) gives 3%  $\alpha$ -ethyltetrahydrofuran, 33% 1,5-dioxoctahydroindene (II), b<sub>10</sub> 49-50°, b<sub>20</sub> 156-7°, n<sub>D</sub> 1.4461, d<sub>4</sub> 1.0314, and 38% of 3-tetrahydrofurylpropanol (III); at 23° with Raney Ni (16 hrs.) there results 46%  $\beta$ -furylpropionaldehyde (IV) and 30% of a mixt. of 3-furylpropanol (V) and I; at 160° Raney Ni gives 3% II and 65% of III; at 120-75° Cu-Cr oxide gives 4% II and 72% IV; twice as much catalyst gives 8% II and 64% V; at 200° Cu-Cr oxide gives 4%  $\alpha$ -heptanol, 22% of III, 29% of heptane-1,4-diol (VI) and 20% heptane-1,7-diol (VII). IV with Ni on kieselguhr at 160° gives 28% II and 29% III. V and Raney Ni at 160° give 80% of III. VII gives 21%  $C_7H_{16}$  and VI gives 66% of hexan-3-ol. III with Raney Ni at 250° gives 1%  $C_7H_{16}$ ,  $H_2O$ , 60% of  $\alpha$ -ethyltetrahydrofuran, 1%  $\alpha$ -propyltetrahydrofuran, b<sub>10</sub> 132-3°, n 1.4230, d. 0.8533 and 9% III. Furfural diacetate with Ni at 160° gives 10%  $\alpha$ -methyltetrahydrofuran, 78% AcOH, 41% tetrahydrofurfuryl acetate and 24% of the diacetate. Furfuryl alc. gives 85% of the tetrahydro deriv. Furfuroin gives 77% of the high-boiling and 16% of the low-boiling isomer of 1,2-dihydroxy-1,2-ditetrahydrofurylthane. Furfural-acetone gives 89% of 1-tetrahydrofurylbutan-3-ol. Furfuralacetophenone gives 31% of 1-tetrahydrofuryl-3-phenylpropane (VIII), b<sub>10</sub> 160°, n 1.5200, d. 0.9795 and 25% of 1-tetrahydrofuryl-3-phenylpropan-3-ol. VIII gives 95-100% of 1-tetrahydrofuryl-3-cyclohexylpropane, b<sub>10</sub> 121-2°, n 1.4675, d. 0.9135. Et  $\beta$ -furylacrylate gives 90% of Et  $\beta$ -tetrahydrofurylpropionate. II with Ni at 200° gives 32% unchanged II and 39% of III. Raney Ni is active at low temps., especially toward C. C and either Raney Ni or Ni on kieselguhr are excellent catalysts for the satn. of C:C in the side chain or in an "aromatic" nucleus as in furan,  $C_6H_4$  or  $C_6H_5N$ . Raney Ni is the best catalyst for the cleavage of C to C in primary alcs. Cu-Cr oxide is rather inactive toward the satn. of an "aromatic" nucleus but is very effective for the cleavage of the ether linkage in furan and at lower temps. for the hydrogenation of multiple linkages in the side chain without affecting an "aromatic" nucleus. C. J. West

Super-aromatic properties of furan. III. Nitration. Henry Gilman and R. V. Young. *J. Am. Chem. Soc.* 56, 464-6 (1934); cf. C. A. 27, 5738.—Nitration of 2-furyl Ph ketone in  $Ac_2O$  at -8° gave 51% of 5-nitro-2-furyl Ph ketone, m. 111°; this also resulted in 63% yield from 5-nitro-2-furyl chloride,  $C_6H_5$  and  $AlCl_3$ . 2-Furyl 2-thienyl ketone (*semicarbazone*, m. 160°) gave 48% of 5-nitro-2-furyl 2-thienyl ketone, m. 161°; in attempts to prep. this from 5-nitro-2-furyl chloride (I) and thiophene, the yield of recovered 5-nitro-2-furoic acid varied from 48% with  $SnCl_4$  to 84% with  $TiCl_4$ ; with  $AlCl_3$   $H_2S$  was evolved on heating; the ketone was not oxidized by acid  $KMnO_4$ ; warming with 10% NaOH and addn. of 5%  $KMnO_4$  to the cooled soln. gave 2-thienoic acid. 2-

Furyl *p*-phenetyl ketone and  $HNO_3$  gave only tars. Furoyl-2,4,6-tribromoacetanilide, m. 164°; nitration gave only resins. I and 2,4,6- $Br_3C_6H_3NH_2$  yielded 98% of 5-nitro-2-furoyl-2,4,6-tribromoacetanilide, m. 191-2°. Furoyl-N-methylanilide, m. 125°; nitration gave no identifiable product. The relative aromaticities are furyl > thienyl > phenyl. C. J. West

Condensations of furan compounds. II. Colored products of the furylidene series and a new method for the determination of small quantities of acetone based on the formation of these products. V. V. Chelutzev and F. K. Nikitin. *Bull. soc. chim.* 53, 1130-9; *J. Gen. Chem.* (U. S. S. R.) 3, 319 28 (1933); cf. C. A. 26, 5948. The known methods of  $Me_2CO$  detn. are reviewed. The reaction of furfural with  $Me_2CO$  in alk. soln. forms difurylideneacetone which combines with  $H_2SO_4$  to give a stable violet color. One cc. of an  $Me_2CO$  soln. conng 0.05-0.005% is mixed with 1 cc. of 0.2% furfural and 1 cc. of 5% NaOH. The mixt is heated 45 min at 50°, dild. to 50 cc. with 80%  $H_2SO_4$  and compared to a standard soln.  $Me_2CO$  was detd. in  $H_2O$ , EtOH, AcOH,  $MeEtCO$  and  $AcCH_3CO_2Et$ . Other ketones and aldehydes do not respond, but aliphatic aldehydes must be removed by oxidation with 0.1%  $KMnO_4$  and  $H_2SO_4$ , since they replace furfural in difurylideneacetone. The lower limit of sensitivity is 0.0001%. E. W. Scott

The compound of the unstable isomer of 2-methylfuran (methylenedihydrofuran) with quinone. N. Kizhaur. *J. Gen. Chem.* (U. S. S. R.) 3, 198 200 (1933).—Attempt to form an addn. product from 2-methylfuran (I) and quinone (II) failed. The unstable isomer (III) of I (C. A. 26, 5299), however, added easily to give a ruby red, cryst. compd. (IV),  $C_8H_8O + 2C_6H_4O_2$ , of unknown structure. With an excess of III, a family colored oil was obtained, probably  $C_8H_8O + C_6H_4O_2$ . This with II gave IV. Mol.-wt. detns. of IV in PhH indicated that the reaction,  $(C_8H_8O + 2C_6H_4O_2) \rightarrow (C_8H_8O + C_6H_4O_2) + C_6H_4O_2$ , had occurred in soln. II (2.2 g.) added to a mixt of 1 cc. III (b 77-9°) and 4 cc. PhH gave in 12 hrs. a cryst. red mass. After washing with petr. ether to remove II, and allowing the residue (2.1 g.) to stand in the air until the odor of II was no longer perceptible, the IV was recrystd from boiling PhH, low, ruby-red platelets, m. 105°, soln. in PhH or EtOH yellow. IV is non-volatile and yielded only trace of II when distd. with steam. Finely powd. II (6.5 g.) and 3.5 cc. III gave in 0.5 hr. a thick brown liquid with evolution of heat, in 4 hrs. a red cryst. mass and in 2 days a solid product which after prolonged evacuation to remove II gave 8.5 g. IV (theoretical 8.97 g.). Addn. of petr. ether to a soln. of 1 g. II in 2 cc. III and 2.5 cc. PhH gave a thick brown oil, which with more II gave IV. IV in EtOH acidified with HCl liberates I, from 1 g. equiv to 1 mol. II. IV is dissolved by  $FeCl_3$  soln. with liberation of II. With  $SO_2$  or by boiling with 5%  $H_2SO_4$ , IV gives hydroquinone. III combines also with toluquinone, but a cryst. substance could not be obtained. Toluquinone (2.4 g.) and 1 cc. III gave after several hrs. an orange soln. which became reddish orange on the 2nd day. Addn. of petr. ether to this soln. gave a reddish orange oil which could not be crystd. Lewis W. Butz

Preparation and reaction of some furyl isocyanates. A. T. Blomquist and H. B. Stevenson. *J. Am. Chem. Soc.* 56, 146-9 (1934).—By heating the appropriate ester with excess  $N_2H_4 \cdot H_2O$  the following furylhydrazides were prepd.: 5-methyl-2-, m. 61-2°; 5-bromo-2-, m. 135.5-6°; 2,4-dimethyl-3-, m. 144-5°; 2-methyl-, m. 149.5-50°; 2,5-dimethyl-3-, m. 136-6.3°. With  $NaN_3$  and AcOH the corresponding azides were prepd. m., resp., 35-6°, 66-7°, oil, 22-3°, 24-5°. Heating the azide in an inert solvent (ligroin, b. 90-100°) gives the isocyanates, b<sub>10</sub> 53-4°, b<sub>10</sub> 75°, b<sub>10</sub> 74-5°, b<sub>10</sub> 42°, b<sub>10</sub> 68°, resp.; the 1st compd. was also obtained from the chloride and  $NaN_3$ . By heating with  $H_2O$  there results *sym bis*(5-methyl-2-furyl)urea, m. 182°; the 2,4-dimethyl-3-furyl deriv., m. 285°; the 2-methyl-3-furyl deriv., m. 227°, and the 2,5-dimethyl-3-furyl deriv., m. 247°. With  $PhMgBr$  there results 5-methyl-2-furylbenzamide, in

the 2,4-dimethyl-3-deriv., m. 100–70°, and the 2-methyl-3-deriv., m. 137.8–8°. With MeOH there results *Me* 5-methyl-2-furylcarbamate, m. 64–6°; the 2,4-dimethyl-3-deriv., m. 95–6°; the 2-methyl-3-deriv., m. 128°, and the 2,5-dimethyl-3-deriv., b.p. 107°. The substituted  $\beta$ -furyl isocyanates are much more stable toward air, light and heat than are the  $\alpha$ -derivs.; this difference in stability is also found in the derivs. of the isocyanates.

C. J. West  
 Synthesis of  $\alpha$ -substituted pyrroles and pyrrole sulfide. Hans Fischer and Zoltán Csukás. *Ann.* 508, 167–84 (1934).—Opsopyrrolecarboxylic acid aldehyde (3-methylpyrrole-4-propionic acid-2-aldehyde) (I),  $\text{CH}_3(\text{CO}_2\text{H})_2$  and piperidine, warmed 1 hr. on the water bath, give 3-methyl-2-( $\omega,\omega'$ -dicarboxyvinyl)pyrrole-4-propionic acid, yellow, m. 173° (*tri-Me ester*, yellow, m. 80°);  $\text{CH}_3(\text{CN})_2$  gives nearly quant. the  $\omega,\omega'$ -dicyanovinyl deriv., decomp. 251° (piperidine salt, m. 185°); 1 or 2 mols. Br gives the Br deriv., m. 181° (decompn.);  $\text{NCCCH}_2\text{CO}_2\text{Et}$  gives nearly quant. the  $\omega$ -cyano- $\omega$ -carbethoxyvinyl deriv., yellow, m. 176°. I and  $\text{CH}_3\text{N}_3$  in  $\text{Et}_2\text{O}$  give *Me* 3-methyl-2-formylpyrrole-4-propionate (II), m. 77°; I is not esterified by MeOH and HCl and  $\text{Me}_2\text{SO}_4$  gives a poor yield of the ester; with  $\text{CH}_3(\text{CO}_2\text{Et})_2$  II gives *Me* 3-methyl-2-( $\omega,\omega'$ -dicarboxyvinyl)pyrrole-4-propionate, m. 89°. 2,3-Dimethyl-5-carbethoxypyrrrole-4-propionic acid and Br in  $\text{HCO}_2\text{H}$ -AcOH give a Br deriv., decomp. 178°, which is unstable and on 2 crystals from  $\text{C}_2\text{H}_5\text{N}-\text{H}_2\text{O}$  gives 3,3'-dimethyl-4,4'-dipropionic acid-5,5'-dicarboxypyrrolemethane, m. 277°; this also results in attempted condensations with  $\text{CHNa}(\text{CO}_2\text{Et})_2$ . 3-Bromo-5-bromomethyl-2-carbethoxypyrrrole-4-propionic acid and  $\text{HNa}(\text{CO}_2\text{Et})_2$  in  $\text{C}_2\text{H}_5\text{N}$  give *di-Et* 3-bromo-2-carbethoxypyrrrole-4-propionic acid-5-methylmalonate, m. 127°. Opsopyrrolecarboxylic acid (10 g.) and  $\text{NCCCH}_2\text{CO}_2\text{Et}$  in  $\text{CHCl}_3$ - $\text{Et}_2\text{O}$ , treated with HCl gas with cooling, give 3 g. *Et* 3-methylpyrrole-4-propionic acid-2-( $\alpha$ -ketopropionate), m. 164°; the imine m. 189°. 3-Methyl-2-acetylpyrrole-4-propionic acid, from MeCN, m. 178°. Opsopyrrolecarboxylic acid-2-aldoxime (III), pale red, m. 185°; heating with  $\text{Ac}_2\text{O}$  and AcOK gives 3-methyl-5-acetyl-2-cyanopyrrole-4-propionic acid, m. 144°. III and  $\text{SOCl}_2$ , heated 1 hr., give a mixt. of bis(4-methyl-5-cyanopyrrole-3-propionic acid) 2-sulfide, m. 249° (decompn.) (*Et ester*, m. 120°), and 2-chloro-4-methyl-5-cyanopyrrole-3-propionic acid (IV), m. 170°. III and Br in AcOH give the HBr salt, m. 188°, of 2-bromo-4-methylpyrrole-3-aldoxime-3-propionic acid, m. 158°. III and  $\text{SOCl}_2$  in  $\text{Et}_2\text{O}$  give the 2-Cl deriv., m. 175° (decompn.), which gives IV with  $\text{Ac}_2\text{O}$  and AcOK. 2,4-Dimethyl-5-carbethoxypyrrrole (V) and  $\text{S}_2\text{Cl}_2$  in  $\text{Et}_2\text{O}$  give bis(2,4-dimethyl-5-carbethoxypyrrrole) 3-sulfide (VI), m. 252°; the free acid m. 193°. VI and Br give the compd.  $\text{C}_8\text{H}_{10}\text{O}_2\text{N}_2\text{Br}_2$ , m. 152°. Oxidation of VI with  $\text{H}_2\text{O}_2$  in AcOH gives V. Bis(4-methyl-5-carbethoxypyrrrole-3-propionic acid) 2-sulfide, m. 217°; the free acid m. 240° (decompn.). Bis(5-methyl-3-ethyl-4-acetylpyrrole) 2-sulfide, m. 219°. 2,4-Dimethylpyrrole-3-propionic acid-5-aldoxime, m. 187° (Cu complex, m. 215° (decompn.));  $\text{Ac}_2\text{O}$  gives 2,4-dimethyl-5-cyanopyrrole-3-propionic acid, m. 153°. 3-Methyl-5-bromomethyl-4-ethyl-2-cyanopyrrole, light yellow; the intermediate product,  $\text{C}_8\text{H}_{10}\text{N}_2\text{Br}_2$ , light red, m. 139° (decompn.). 3-Methyl-4-ethyl-2-cyanopyrrole-5-carboxylic acid, m. 228° (decompn.); heating at 230–5° gives the compd.  $\text{C}_{10}\text{H}_{10}\text{O}_2\text{N}_2$ , pale yellow. 3-Methyl-4-ethyl-2-cyanopyrrole-5-aldehyde, pale green, m. 143°. C. J. W.

Removal of thiophene from benzene. Harry N. Holmes and Norvil Beeman. *Ind. Eng. Chem.* 26, 172–4 (1934).—Removal of thiophene from  $\text{C}_6\text{H}_6$  by the use of com.  $\text{AlCl}_3$  is far more complete by repeated treatment, instead of a single treatment with large quantities of  $\text{AlCl}_3$ . A temp. of 35° is recommended. E. M. S.

The condensation products of isatin with pyrroles (pyrrole blues). II. P. Pratesi. *Atti accad. Lincei* 18, 53–8 (1933); cf. C. A. 27, 4797; 28, 765°.—Phyllopyrrole (2,4,5-trimethyl-3-ethylpyrrole) does not form a pyrrole blue, showing that the bond with isatin must

be through a C atom in the pyrrole nucleus. The  $\alpha$ -C atoms are the ones involved, for, whereas  $\beta,\beta'$ -dialkylpyrroles form blues readily,  $\alpha,\alpha'$ -dimethylpyrrole does not. Cryptopyrrole ( $\alpha$ -methyl- $\beta$ -methyl- $\beta'$ -ethylpyrrole) also forms a blue, so that 1 free  $\alpha$ -C atom is sufficient for the reaction to take place. It has been shown that the carbonyl O atom eliminated is in the  $\beta$ -position (von Baeyer, *Ber.* 18, 2638 (1885)). Cryptopyrrole blue is formed by the reaction of 1 mol. each of cryptopyrrole and isatin, with elimination of 1 mol. of water. The reaction can only be explained by admitting that the imido H has reacted, i. e., the formula of the blue is

A. W. Contieri

Indigoid dyes. IV. 2,1-Naphthothiophenophenanthrenindigo. Paresch Chandra Dutta. *Ber.* 67B, 5–8 (1934); cf. C. A. 27, 5332.—This work was undertaken to det. the influence of the position of the S in the  $\text{C}_{10}\text{H}_6$  nucleus on the color of naphthothiophenophenanthrenindigo. 2,1-Naphthothiophene-9'-phenanthrenindigo,

and the following derivs. were prepd. by condensation of 2,1-naphthoxythiophene (II) with phenanthraquinones, usually in AcOH with HCl. They give in general a characteristic color with concd.  $\text{H}_2\text{SO}_4$  and dissolve with yellow or yellowish brown color in the hyposulfite vat, from which they are reprecipitated by the air. They have stronger shades than the 1,2-isomers. The colors they impart to  $\text{H}_2\text{SO}_4$  and to cotton, resp., are given in parentheses. I, chocolate-brown, m. 280° (bright red, bright violet). Derivs. of I: 4'-nitro, chocolate-brown, m. above 290° (blue, dark violet); 2'-nitro, chocolate-brown, m. above 290° (blue, brownish violet) (the filtrate from this compd. on treatment with aq. HCl and concn. yields a brick-red cryst. substance, m. 232–3°, possibly a HO compd. formed by aldol condensation, sol. in NaOH and with brown color in concd.  $\text{H}_2\text{SO}_4$ ); 4',5'-dinitro, chocolate-brown, m. above 290° (blue, dark violet); 3'-Br, chocolate-brown, m. 232–3°, sol. in pyridine with brownish red color turning to magenta-red with bluish green fluorescence on diln. (violet, bluish violet); 2'-amino, needles with Cu-red luster, m. above 290° (brown, bright reddish brown); 4'-amino, needles with Cu-red luster, does not m. 290° (—, reddish brown); 2'-HO, dark red-brown, m. above 290° (greenish blue, violet); 4'-HO (greenish blue, dark violet). V. *Ibid.* 9–12.—2,1-Naphthothiophen-3'-indolindigo (III) and 2,1-naphthothiophen-2'-acenaphthyleneindigo (IV) and their derivs., prepd. by condensing II with isatins and acenaphthenequinones, are beautifully colored cryst. compds. which dye cotton powerfully from a hyposulfite vat; as compared with the 1,2-isomers they in general produce colors toward the red and although the shades are strong the tinctorial effect, unlike that produced by the phenanthrene compds. (preceding abstr.), is somewhat lighter than that of the 1,2-isomers. Anhyd.  $\text{Na}_2\text{CO}_3$  in alc. proved to be a useful condensing agent in the prepn. of some of these compds. which could not be obtained with AcOH and concd. HCl. Most of them are readily sol. in a hyposulfite vat with yellow or orange color. The colors imparted to concd.  $\text{H}_2\text{SO}_4$  and to cotton, resp., are given in parentheses. III, dark pink, does not m. 295° (blue, scarlet). Derivs. of III: 5'-Cl, needles with violet-red luster, m. above 290° (—, violet-red); 5'-Br, needles with Cu-red luster, does not m. 295° (—, dark red-brown); 5',7'-di-Br, needles with reddish violet luster, m. 285–7° (—, reddish brown); 5'-nitro, chocolate-red,

m. above 295° (beginning to sublime 280°) (violet, chocolate-brown). IV, scarlet, does not m. 295°, sol. in hot PhNO<sub>2</sub>, pyridine and xylene with red color (blue, red). Derivs. of IV: 5'-nitro, chocolate-brown, m. 290-2° (evolving red-brown vapors at 260°) (blue, green); 5',6'-dinitro, Cu-red, m. above 295° (—, greenish brown). 2,1-Naphthothioaphen-1-aceanthrylenindigo from II and aceanthraquinone, brownish red, m. above 295° (—, reddish brown). Bis-2,1-naphthothioaphenethylenindigo, from II and glyoxal-NaHSO<sub>3</sub>, reddish violet, m. above 290° (green, dark violet). C. A. R.

Optically active aryl sulfoxo fatty acids. Wacław Piechulek and Jerzy Suszko. *Roczniki Chem.* 13, 520-9 (1933) (in German 529). Phenylthiodimethylglycolic acid (I) is obtained by mixing 40 g. Me<sub>2</sub>CBrCO<sub>2</sub>H in 100 cc. alc. (cooled on ice) and 10 g. NaOH (satd. soln.) with 28 g. PhSH in 110 cc. alc. and 12 g. NaOH (50% soln.). It is kept on ice for several hrs., then at room temp. overnight, refluxed 12 hrs., concd. to half, boiled 8 hrs., dild. with H<sub>2</sub>O and acidified with H<sub>2</sub>SO<sub>4</sub>. Extn. with ether and recrystn. from C<sub>6</sub>H<sub>6</sub> gives 36 g. of crystals contg. 0.5 mol. C<sub>6</sub>H<sub>6</sub> and m. 65-6°. Derivs. of I prepd. were: acid chloride (II), a yellow oil, b<sub>p</sub> 108-10°; amide, m. 69-70°. Phenylsulfoxodimethylacetic acid (III) is obtained by keeping below 60° 4.8 g. of I in 10 cc. glacial AcOH and 3 cc. 30% H<sub>2</sub>O<sub>2</sub> (IV). The AcOH is removed, the residue dissolved in CHCl<sub>3</sub> and petr. ether added; the crystals m. 121-2° (3.3 g. yield). II is obtained from SOCl<sub>2</sub> and III. I-III cinchonidine salt, m. 162-3°, [α]<sub>D</sub><sup>20</sup> -136.2°; I-III, m. 122-3°, [α]<sub>D</sub><sup>20</sup> -93.8°; d-III quinine salt, m. 167-9°, [α]<sub>D</sub><sup>20</sup> -40.7°; d-III, m. 122°. Phenylsulfonyldimethylacetic acid (V) is obtained by heating 1 g. I-III in 7 cc. glacial AcOH on a water bath with the addn. of 1.6 cc. IV during the course of 2 hrs. The solvent is expelled and a brown oil, cryst. after moistening with H<sub>2</sub>O and rubbing, is obtained, washed with H<sub>2</sub>O, dried and recrystd. from C<sub>6</sub>H<sub>6</sub>, it m. 146-7° (yield 47%). Et ester of V, from II, abs. alc. and IV, m. 39-40°. l-Phenylsulfoxoacetic acid (VII), m. 119-20°, [α]<sub>D</sub><sup>20</sup> -179.5°; cinchonidine salt, m. 174-6° (decompn.), [α]<sub>D</sub><sup>20</sup> -179.1°; d-VII, m. 119-20°, [α]<sub>D</sub><sup>20</sup> 180.6°, was best obtained from its cinchonine salt, m. 138-40° (decompn.), [α]<sub>D</sub><sup>20</sup> 220.5°. Optical rotations were detd. with c = 1 and the solvent CHCl<sub>3</sub> + EtOH (2 + 1). C. T. Ichniowski

Structure and rearrangement of N-acylpyrazoles. K. v. Auwers and K. Dietrich. *J. prakt. Chem.* 139, 65-68 (1934).—Benzoylacetone yields the following hydrazones: acetyl, m. 117-8°; propionyl, m. 87-8°; butyryl, m. 61-3°; phenylacetyl, m. 94-6°; carboethoxy, m. 104-5°; benzoyl, m. 130-2°; o-toluy, m. 113-4°; m-toluy, m. 111°; p-toluy, m. 148-60°. The hydrazones with 10 parts POCl<sub>3</sub> 1 day at 0° give the acylpyrazoles. 1-Acetyl-3-methyl-5-phenylpyrazole (I), m. 45.5-6.5°; rearrangement by heating 15-20 min. *in vacuo* and distg. gives the 3-phenyl-5-methyl deriv. (II), b<sub>p</sub> 158-60°, m. 36-8°; a mixt. of the 2 is liquid at room temp. 1-Propionyl analog of I, m. 33-4°; of II, m. 77-8.5°, also obtained from the pyrazole and EtCOCl. 1-Butyryl analog of I, m. 34-5.5°; of II, b<sub>p</sub> 150-2°, m. 72-2.5°. 1-Phenylacetyl analog of I, m. 104.5-5.5°; of II, b<sub>p</sub> 178-80°, m. 58-9.5°. 1-Carboethoxy analog (III) of I, m. 65-6° (in 1 prepn. the m. p. was 50.5-1.5°); that (IV) of II, b<sub>p</sub> 198°, m. 73.5-4.5°. 1-Benzoyl analog of I, m. 88-9°, results from the B-Me ether of BzCH<sub>2</sub>Ac (PhC(OMe):CHCOMe) at 40-60° in abs. EtOH; of II (V), m. 83-4°; this results from the hydrazone and POCl<sub>3</sub> in place of the expected I deriv. 1-o-Toluy analog of I, m. 63-5°; of II, m. 36.5-7.5°; 1-m-toluy analog of I, m. 79-80°; of II, m. 56-7°, b<sub>p</sub> 224-6°. 1-p-Toluy analog of I, m. 78-9°; of II, m. 68-70°. Methylphenylpyrazole and KCNO give 3-phenyl-5-methylpyrazole-1-carboxylic amide. The o-nitrobenzoylhydrazones of oxymethyleneacetone m. 187-9°; 1-o-nitrobenzoyl-5-methylpyrazole, m. 130°; 3-methyl isomer, m. 118.5-9.5°; rearrangement expts. gave a mixt. of isomers. 1-o-Nitrobenzoyl-4,5-dimethylpyrazole, m. 118-20°; 3,4-dimethyl isomer, m. 149-60°. Hydroxymethylenacetophenone yields a

1 benzoylhydrazones, m. 148°, an o-nitrobenzoylhydrazones, yellow, m. 151-2°, and a carboethoxyhydrazones, m. 111, 8.5°. 1-o-Nitrobenzoyl-5-phenylpyrazole, m. 181-2°; 3-phenyl isomer, b<sub>p</sub> 208-10°, m. 107.5-8.5°. The 2,1-carboethoxy deriv., m. 58-9° (in 1 expt. 37-9°) and b<sub>p</sub> 192°; the 5-Ph isomer has d<sub>4</sub><sup>20</sup> 1.1165, n<sub>D</sub><sup>20</sup> 1.53359, 1.53880, 1.55232 for α, He and β; the 3-Ph isomer has d<sub>4</sub><sup>20</sup> 1.1694 and d<sub>4</sub><sup>20</sup> 1.1222; n<sub>D</sub><sup>20</sup> 1.57216, 1.57901, 1.59063; n<sub>D</sub><sup>20</sup> 1.54562, 1.55195, 1.56897 for α, He and β. III has d<sub>4</sub><sup>20</sup> 1.1034, n<sub>D</sub><sup>20</sup> 1.53100, 1.53681, 1.55045, IV has d<sub>4</sub><sup>20</sup> 1.0853, n<sub>D</sub><sup>20</sup> 1.53569, 1.54136, 1.55713 V has d<sub>4</sub><sup>20</sup> 1.1043, n<sub>D</sub><sup>20</sup> 1.59080, 1.59908, 1.61900. Et 1-carboethoxy-5-methylpyrazole-3-carboxylate, b<sub>p</sub> 178 9°, d<sub>4</sub><sup>20</sup> 1.1709, n<sub>D</sub><sup>20</sup> 1.48876, 1.49243, 1.50191; 1-o-nitrobenzoyl deriv., m. 107°. Et acetophenoneoxalate gives a benzoylhydrazones, m. 109-12°, which does not yield a pyrazole, the Bz group being split off; the carboethoxyhydrazones, m. 88-90°. Et 1-acetyl-3(5)-phenylpyrazole-5(3)-carboxylate, m. 109-10°; the 1-carboethoxy deriv., m. 80-1°; a 9.709% soln. in α-C<sub>10</sub>H<sub>7</sub>Me has d<sub>4</sub><sup>20</sup> 1.0377, n<sub>D</sub><sup>20</sup> 1.60385, 1.61253, 1.63319. C. J. West

Effect of constitution on the rearrangement of the phenylhydrazones of some unsymmetrically substituted dibenzylacetones. L. Chas. Relford and Edward L. Hill. *J. Am. Chem. Soc.* 56, 174-6 (1934).—Styryl 4-methylstyryl ketone, m. 107-8° (67% yield); 4-tolyl deriv., m. 77-8° (68%); 4-PrO deriv., m. 119-20° (60%), these were prepd. from PhCH:CHAc and the proper aldehyde with NaOH in 50% EtOH. Styryl 4-dimethylaminostyryl ketone yields a phenylhydrazones, yellow, m. 162-3° (52% yield); this could not be reduced by Na-Hg but heating with AcOH for 1 hr. gives the compd. C<sub>8</sub>H<sub>8</sub>N<sub>2</sub>, yellow, m. 133-4°; the product from p-Me. NC<sub>6</sub>H<sub>4</sub>CH:CHAc and PhNHNH<sub>2</sub>, 1-phenyl-3-styryl-5-(4-dimethylaminophenyl)pyrazoline, yellow with greenish fluorescence, m. 166 7°; other compds. with the radical in position 5 are: p-tolyl, yellow, m. 167 8°; 4-methoxyphenyl, yellow, m. 124°; 4-ethoxyphenyl, yellow, m. 126-7°; 4-propoxyphenyl, greenish yellow, m. 118 9°; 3,4-methylenedioxyphenyl, amber, m. 167-8°. Oxidation gives the following 1,5-diphenylpyrazole-3-carboxylic acids: 4-MeO, m. 198-7°; 4-EtO, m. 163-4°; 4-Me<sub>2</sub>N, m. 141-2°. These oxidation products are the acids expected if the closing of the pyrazoline ring takes place in the direction of the Ph radical contg. the "non-acidic" group; this is opposite to that observed when ketones with "acid-forming" substituents were employed. C. J. West

Synthesis of thiazolebarbituric acids. XIII. Florence E. Hooper and Treat B. Johnson. *J. Am. Chem. Soc.* 56, 484-5 (1934).—2-Methyl-4-chloromethylthiazole and CHBr(CO<sub>2</sub>Et)<sub>2</sub> give 59% of di-Et ethyl(2-methylthiazole-4-methyl)malonate, b<sub>p</sub> 168-74°; condensation with CO(NH<sub>2</sub>)<sub>2</sub> gives 63% of 5-ethyl-5-(2-methylthiazole-4-methyl)barbituric acid, m. 261-5°. Di-Et ethyl(2-phenylthiazole-4-methyl)malonate, pale yellow, b<sub>p</sub> 206 11° (50% yield); the free acid, m. 145°; 5-ethyl-5-(2-phenylthiazole-4-methyl)barbituric acid, m. 210-11°. From 2-phenyl-4-chloromethylthiazole there were also prepd the 4-methoxymethyl deriv., b<sub>p</sub> 116°, the phenoxymethyl deriv., m. 67-8°, and the thiophenoxymethyl deriv., m. 42°. The pharmacol. investigation is in progress. C. J. West

Polymerization of 2-methyl-4-chloromethylthiazole Florence E. Hooper and Treat B. Johnson. *J. Am. Chem. Soc.* 56, 470-1 (1934).—(CICH<sub>2</sub>)<sub>2</sub>CO and Me-CSNH<sub>2</sub> in Me<sub>2</sub>O give ClCH<sub>2</sub>COCH<sub>2</sub>SCMe:NH HCl, which yields with ZnCl<sub>2</sub> 2-methyl-4-chloromethylthiazole, b<sub>p</sub> 65-7° (total yield 75-80%); on standing at room temp. or more rapidly by heating at 110-15° it yields a dimer, does not m. 300°; this polymerization is analogous to the transformation of α-haloethylalkylamines into cyclic quaternary salts and the product may be represented structurally as a piperazine deriv. C. J. W.

Dihydro-1,4-pyran. IV. The synthesis of γ-benzoyl-γ-butyrolactone and α-hydroxy-β-benzoylvaleric acid. Reynold C. Fuson, M. E. Davis, B. H. Wojcik and J. A. V. Turck. *J. Am. Chem. Soc.* 56, 285-7 (1934);

cf. C. A. 26, 2435.— $(\text{CH}_3)_2\text{CH:CPh}$  (I) is treated with  $\text{O}_3$  in AcOH and the ozonide decompd. in the presence of  $\text{Zn}$  dust, giving  $\gamma$ -benzoylbutyraldehyde (II), which could not be distd.; the  $\text{NaHSO}_3$  deriv. and aq.  $\text{NaCN}$  give  $\alpha$ -hydroxy- $\gamma$ -benzoylvaleronitrile, m. 151–1.5°; concd.  $\text{HCl}$  gives  $\text{Bz}(\text{CH}_2)_2\text{CH}(\text{OH})\text{CO}_2\text{H}$  (III), m. 117.5–8.5°, identical with the compd. obtained by the degradation of 3-phenyl-3-cyano-6-benzoyl-5,6-dihydro-1,4-pyran.  $\text{Bz}(\text{CH}_2)_2\text{CO}_2\text{H}$ , m. 126°, resulted by the oxidation of I with  $\text{KMnO}_4$  or  $\text{O}_3$  or of II with  $\text{KMnO}_4$ ; the  $\gamma$ -Br deriv. m. 97–8° (80% yield); hydrolysis with  $\text{H}_2\text{O}$  gives  $\gamma$ -benzoyl- $\gamma$ -butyrolactone (IV), m. 78–9°; in attempts to prep. the benzoate of III nearly quant. yields of IV were obtained when the Br deriv. reacted with  $\text{BzOAg}$ .

C. J. West

Synthesis of 5- $\beta$ -D-glucosidokojic acid. Raymond M. Hann. *J. Am. Chem. Soc.* 56, 485–6(1934).—Condensation of the K salt of kojic acid with acetobromoglucose gives 70% of the tetra-Ac deriv., m. 201° (m. ps. cor.),  $[\alpha]_D^{25}$  –88.4° (0.1485 g. in 25 cc.  $\text{CHCl}_3$ ), of 5- $\beta$ -D-glucosidokojic acid (2-hydroxymethyl-5- $\beta$ -D-glucosido-1,4-pyrone), m. 197–8°,  $[\alpha]_D^{25}$  –107.3° (0.1470 g. in 25 cc.  $\text{H}_2\text{O}$ ), the hydrolysis being accomplished with  $\text{MeONa}$ .

C. J. West

Kuromamin, the coloring matter of "kuromame." II Chika Kuroda and Mizu Wada. *Proc. Imp. Acad. (Tokyo)* 9, 517–20(1933); cf. C. A. 27, 2448.—The H<sub>2</sub>O-sol. coloring matter in the seed-coat of kuromame has been shown to be the monoglucoside of cyanidin chloride; the H<sub>2</sub>O-insol. matter is the same anthocyan. The same kryst. compd. is obtained from the coloring matter of kuromame, regardless of differences in the variety and the locality of production.

C. J. West

Action of ultra-violet rays on pyridine. V. Detection of primary aromatic amines; the behavior of pyridine derivatives in ultra-violet light; the nature of photopyridine. Hans Freytag. *J. prakt. Chem.* 139, 44–62(1933); cf. C. A. 28, 768°.—Color reactions are given for photopyridine (I) with 4- $\text{H}_2\text{NC}_6\text{H}_4\text{CO}_2\text{Et}$ , 4,3- $\text{H}_2\text{N}(\text{HO})\text{C}_6\text{H}_3\text{CO}_2\text{Et}$ , 4- $\text{H}_2\text{NC}_6\text{H}_4\text{CO}_2(\text{iso-Bu})$ , 4- $\text{H}_2\text{NC}_6\text{H}_4\text{CO}_2\text{CH}_2\text{CH}_2\text{NMe}_2$ ,  $p$ - $\text{C}_6\text{H}_4(\text{NHMe})_2$ , 2- $\text{H}_2\text{NC}_6\text{H}_4\text{CO}_2\text{H}$ ,  $\alpha$ -aminophthalic acid and its 2-Me ester,  $p$ - $\text{H}_2\text{NC}_6\text{H}_4\text{OME}$ , triaminomesitylene and aminoterephthalic acid; the colors do not seem to be very characteristic. The behavior in ultra-violet light of the 2-, 3- and 4-Me, 2,4- and 2,6-di-Me and 2,4,6-tri-Me derivs. of  $\text{C}_6\text{H}_3\text{N}$  is described and the color reactions with  $\beta$ - $\text{C}_{10}\text{H}_7\text{NH}_2$  recorded, 2- and 3-pyridinecarboxylic acids, 2,3,4,5-pyridinetetracarboxylic acid, a dibromopyridine, m. 111°, 3-nitropyridine and pyridine-3-sulfonic acid were also studied. I is formed only in the presence of  $\text{O}_3$ ;  $\text{O}_3$  and  $\text{H}_2\text{O}_2$  react with  $\text{C}_6\text{H}_5\text{N}$  but not with the formation of I, I is very probably the  $\text{NH}_2$  salt of enolic glutaric aldehyde; the dyestuffs from I are therefore identical with the known pyridine dyestuffs.

C. J. West

Azopyridines. Alfred Kirpal. *Ber.* 67B, 70–1(1934).—The 2,2'-azopyridine (I) prepd. by reduction of 2- $\text{C}_6\text{H}_4\text{NNO}$ , in alk. soln. with  $\text{As}_2\text{O}_3$  (C. A. 26, 3505) was apparently not identical with that (II) obtained by oxidation of 2- $\text{C}_6\text{H}_4\text{NNH}_2$  with  $\text{NaOCl}$ . In further expts. to obtain larger amts. of the substance in absolutely pure form for dipole measurements it was found that the supposedly homogeneous II contained traces of halogen which could not be removed by repeated crystn. from org. solvents; this was finally effected accidentally when a sample crystd. from a very concd. aq. soln. in cold weather. The pure II can now generally be obtained quite readily by rubbing it with ice water. It crystallizes in flat prisms with 8  $\text{H}_2\text{O}$ , m. 80°, which quickly lose their water of crystn. in the air; the mother liquors yield the impurity, 5-chloro-2,2'-azopyridine (III), orange-red, m. 135°. As I is stable toward  $\text{NaOCl}$  or free Cl at room temp., in the formation of III the chlorination must precede the oxidation. The structure of III was established by the synthesis of III from 2- $\text{C}_6\text{H}_4\text{NNEt}_2$  and 2,5- $\text{C}_6\text{H}_3\text{N}(\text{NEt}_2)_2$  with aq.  $\text{KOC}$ ; at the same time there were formed some I and 5,5'-dichloro-2,2'-azopyridine,

reddish, m. 243°, which is obtained almost exclusively from 2,5- $\text{C}_6\text{H}_3\text{N}(\text{NEt}_2)_2$  alone with  $\text{KOC}$ . C. A. R.

Preparation of  $\alpha$ -pyridyl halides from  $\alpha$ -aminopyridine by the diazo reaction. Lyman C. Craig. *J. Am. Chem. Soc.* 56, 231–2(1934).— $\alpha$ -Bromopyridine can be prepd. conveniently and cheaply by diazotization of  $\alpha$ -aminopyridine in  $\text{HBr}$  in the presence of excess Br. The  $\alpha$ -I compd. could not be prepd. The  $\alpha$ -Br deriv. and anhyd.  $\text{CuCN}$  give 74% of  $\alpha$ -pyridyl cyanide, b. 118–20°, b. 222.5–3.5°.

C. J. West

The behavior of the pyridine ring on electrochemical oxidation. IV. Piperidine. Moriaki Yokoyama and Kazuo Yamamoto. *Bull. Chem. Soc. Japan* 8, 306–12(1933).—Piperidine (5.15 g.) in 100 cc. 2  $N$   $\text{H}_2\text{SO}_4$  was electrolyzed for 1.5 hrs. at 22° in a clay cell with Pb foil as anode and Pt foil surrounding the cell as cathode. The c. d. was 0.05 amp. per sq. cm., the quantity 13 amp. hrs.  $\delta$ -Aminovaleric acid, succinic acid,  $\text{NH}_3$ , glutaric acid,  $\text{HCO}_2\text{H}$ ,  $\text{CO}_2$  and CO were isolated. The probable primary product,  $\delta$ -aminovaleraldehyde, could not be isolated but its presence was indicated by a color test with fuchsin. The  $pH$  decreased sharply at first. The current yield was 75.9% after 1 hr. and const. at about 58% after 2 hrs.

Janet E. Austin

Constitution of conhydrine. Ernest Späth and Erich Adler. *Monatsh.* 63, 127–40(1933).—Conhydrine (I), heated with  $\text{P}_2\text{O}_5$  in PhMe at 120–40° for 5 hrs., gives a concine mixt., reduced to a dihydro deriv., identical with (–)-conine. That I is 1-( $\alpha$ -piperidyl)propan-1-ol is substantiated by the following work. I, MeI and MeOH with KOH give methylconhydrine-MeI, m. 221–3°;  $\text{Ag}_2\text{O}$  gives a base which decomp. *in vacuo* to conhydrine-methine (II),  $\text{C}_{10}\text{H}_{17}\text{ON}$ , b. 91°,  $[\alpha]_D^{25}$  30.36°,  $d_4^{25}$  0.8616; picrate, m. 109–10°; II absorbs no  $\text{H}_2$ , contains no HO group and with  $\text{H}_2\text{O}$  and NaI gives the methiodide. II and MeI in  $\text{Me}_2\text{CO}$  give a methiodide (III), m. 134–5°,  $[\alpha]_D^{25}$  16.6° (12.052% soln. in  $\text{H}_2\text{O}$ ). The base from III and  $\text{Ag}_2\text{O}$  on distn. gives a compd.  $\text{C}_8\text{H}_{11}\text{O}$  (IV), b. 157–9°,  $d_4^{25}$  0.858,  $[\alpha]_D^{25}$  28.7°, and the compd.  $\text{C}_8\text{H}_{11}\text{O}_2$  (V), m. 76–6°, which contains 2 active H atoms. Reduction of IV gives the compd.  $\text{C}_8\text{H}_{11}\text{O}_2$ , m. 94–6°, which yields valeric acid on oxidation. Oxidation of V gives EtCHO and succinic acid. IV is transformed into V by heating with  $\text{H}_2\text{O}$  2 hrs. at 170–80°. IV is therefore  $\text{CH}_2\text{:CHCH}_2\text{CH}_2\text{CH CHEt.O}$  and V is  $\text{CH}_2\text{:CHCH}_2\text{:}$

C. J. West

Pseudo bases. IV. Mechanism of formation of dimolecular ethers from pseudo bases. Aromatic nature of heterocyclic compounds. John G. Aston and Percival A. Lascelle. *J. Am. Chem. Soc.* 56, 426–33(1934); cf. C. A. 26, 728.—A method for the calcn. of the instantaneous sp. reaction rate of an ionic reaction from resistance-time plots has been outlined. The rate of formation of dimol. ethers from 1-methyl- (I) and 1,2-dimethylquinolinium hydroxide (II) has been measured by a cond. method at 25°; the measurements indicate a reaction 2nd order with respect to the pos. ion and 2nd order with respect to the OH ion in either case. Measurements at 33.8° on I yield a value of the formal heat of activation of 10,420 cal. 1,2-Dimethylpyrazolinium and -pyridinium hydroxides do not yield ethers at 25°; both bases are strong electrolytes. The sp. reaction rate const. calcd. for a reaction bimol. with respect to the pos. and neg. ions, resp., cor. for the Bronsted salt effect, was 710 for I and 100 for II at 25° (both in moles per l. per hr. in 1  $M$  soln.); in the same units the corresponding rate for 1,2,5-trimethylpyrazinium hydroxide was  $8.9 \times 10^4$ .

C. J. West

Quinoline derivatives. XLII. Derivatives of 2-phenyl-4'-aminoquinoline. Hanns John. *J. prakt. Chem.* 139, 97–104(1934); cf. C. A. 27, 1884.—2-Phenyl-4'-aminoquinoline-4-carboxylic acid (I) results in 205 g. yield from 100 g.  $p$ - $\text{H}_2\text{NC}_6\text{H}_4\text{CO}_2\text{H}$ , 120 g. isatin and 165 g. KOH in 385 cc.  $\text{H}_2\text{O}$  on heating 20 hrs.; Me ester, light yellow, m. 123°; Et ester, light yellow, m. 145°. Heating 77 g. I above the m. p gives 42 g. 2-phenyl-4'-aminoquinoline (II), light yellow, m. 136°; di-Ac deriv., m. 163.5°; Bz

deriv., m. 224°; formyl deriv., m. 160°; benzylidene deriv., m. 158.5°; *p*-methylbenzylidene deriv., m. 171°; *p*-methoxybenzylidene deriv., m. 190°; benzyl deriv., m. 136°. II with KCN in 2 *N* HCl gives 2-phenylquinolyl-4'-urea, m. above 300°; 4'-thiourea, brick-red, m. 206°; 4'-selenourea, red-brown, m. 217°. II and HCHO in EtOH-KOH give *N,N'*-bis(2-phenyl-4'-quinolyl)methylenediamine, m. 172°. II and CS<sub>2</sub> give *N,N'*-bis(2-phenyl-4'-quinolyl)thiourea, m. 218°. The diazo compd. from II and 8-hydroxyquinoline give the orange compd. C<sub>20</sub>H<sub>18</sub>ON<sub>2</sub>, m. 252°. C. J. West

Synthesis of cinchophens from phenacylideneoxindoles. R. N. DuPuis and H. G. Lindwall. *J. Am. Chem. Soc.* 56, 471-2(1934).—3-Phenacylideneoxindole (2 g.), 20 cc. concd. HCl and 20 cc. 95% EtOH, refluxed 2 hrs. at 120°, give 72% crude cinchophen (2-phenylcinchoninic acid); 4'-Me deriv., 95% yield; 4'-Br deriv., 85% yield; 4'-Cl deriv., m. 243-5° (cor.), 65% yield. H<sub>2</sub>SO<sub>4</sub> may also be used, though the yield is not as large. C. J. W.

Isoquinoline derivatives. III. 3-Isoquinolinecarboxylic acids. H. J. Harwood and T. B. Johnson. *J. Am. Chem. Soc.* 56, 408-9(1934); cf. *C. A.* 27, 5743.—The Me ester, m. 143-4°, and the Et ester, m. 118-19°, of  $\alpha$ -benzamido-3,4-dimethoxycinnamic acid, on catalytic reduction give the Me ester, m. 104-5°, and the Et ester, m. 100-1°, of *N*-benzoyl-3,4-dimethoxyphenylalanine; these esters with P<sub>2</sub>O<sub>5</sub> in boiling xylene give the Me ester, m. 120.5-1.5°, and the Et ester, resp., of 1-phenyl-6,7-dimethoxy-3,4-dihydro-3-isquinolinecarboxylic acid (I). I with SOCl<sub>2</sub> and MeOH gives Me 1-phenyl-6,7-dimethoxy-3-isquinolinecarboxylate, m. 172-3°; the free acid, m. 216-6.5°; I with PCl<sub>5</sub> in C<sub>6</sub>H<sub>6</sub> gives an acid chloride, which regenerates the Me ester of I with MeOH. Heating I in C<sub>6</sub>H<sub>6</sub> causes decarboxylation, giving 1-phenyl-6,7-dimethoxy-3,4-dihydroisoquinoline (II), m. 120.5-1.5°, identical with that obtained by the ring closure of *N*-(3,4-dimethoxyphenyl)ethylbenzamide, m. 90-1°, prepd. from homoveratrylamine and BzCl in 10% NaOH. The chloride from I and SOCl<sub>2</sub> with Et<sub>3</sub>NCH<sub>2</sub>CH<sub>2</sub>OH gives the diethylaminoethyl ester of II, m. 158.5-9°. C. J. West

Pyrimidines. CXL. Pyrimidines derived from carbethoxymalonic aldehyde. Elizabeth Dyer and Treat B. Johnson. *J. Am. Chem. Soc.* 56, 222-5(1934); cf. *C. A.* 28, 154°, 1040°.—(EtO)<sub>2</sub>CHCH<sub>2</sub>CO<sub>2</sub>Et, b<sub>p</sub> 65°, *n*<sub>D</sub><sup>20</sup> 1.4101, and HCO<sub>2</sub>Et with Na in Et<sub>2</sub>O give the Na salt (I) of carbethoxymalonic aldehyde, amorphous; Cu salt, blue-green, m. 205° (decompn.); K salt, m. 264° (decompn.). I and Et pseudothiourea-IIBr in H<sub>2</sub>O give 46% of the compd. NH<sub>2</sub>C(SeEt)NH<sub>2</sub>.OHCC(CO<sub>2</sub>Et):CHOH (II), m. 143.5-4.5°, and a little 2-ethylmercapto-5-carbethoxypyrimidine (III), m. 47-8°; III also results from II by heating with Ac<sub>2</sub>O for 4 hrs. at 100°; II in AcOH and PhNHNH<sub>2</sub> gives 1-phenyl-4-carbethoxypyrazole, m. 99-100°; EtOH-KOH hydrolyzes II to OHCC(CO<sub>2</sub>Et):CHOK. Careful hydrolysis of III gives 2-ethylmercapto-5-carboxypyrimidine (IV), m. 182-3°. Hydrolysis of III or IV with concd. HCl gives 2-keto-5-carboxypyrimidine, turns brown above 220°; it seps. with 1 mol. H<sub>2</sub>O; Et ester, m. 163-4°, crystals with 1 mol. H<sub>2</sub>O. I and CO(NH<sub>2</sub>)<sub>2</sub> give 84% of Et  $\beta$ -urea- $\alpha$ -formylpropionate, m. 175° (decompn.); CS(NH<sub>2</sub>)<sub>2</sub> gives 34% of the  $\beta$ -thiourea deriv., dehydrated to 2-thio-5-carbethoxypyrimidine, bright yellow, m. 214-6° (decompn.); with ClCH<sub>2</sub>CO<sub>2</sub>H this yields 2-methoxycarbonyl-5-carbethoxypyrimidine, m. 175-6.5°, 1 g. of which dissolves in 100 cc. boiling and 500 cc. cold H<sub>2</sub>O. C. J. West

Synthesis of pyrazine by the catalytic dehydrogenation of ethanalamine. J. G. Aston, T. E. Peterson and J. Holowchak. *J. Am. Chem. Soc.* 56, 153-4(1934).—Pyrazine can be prepd. by the catalytic dehydrogenation of ethanalamine, the most favorable conditions being a Cu catalyst at a temp. of 300°; the catalyst loses its activity after a few hrs. of use. The yield was 5.6% of pyrazine isolated as the HgCl<sub>2</sub> salt. Most of the amine disappears by side reactions producing resins, which render the catalyst inactive. C. J. West

Alkylation of pyrimidines. An attempt to prepare 1-glucosidocytosine. Guido E. Hilbert. *J. Am. Chem. Soc.* 56, 190-5(1934).—4-Amino-2-methoxypyrimidine (I) (0.5 g.), heated 5 hrs. at 180°, gives 0.025 g. 1-methylcytosine (II). I and MeI in MeOH give 75% of a 1-methiodide, m. 128° and then 230-5°; the action of Ag<sub>2</sub>SO<sub>4</sub> in H<sub>2</sub>O gives II; decompn. by refluxing in 95% EtOH for 3 hrs. gives 75% of II; concd. HCl gives II nearly quant.; heating at 130-5° causes a loss of 32% of the MeI; at 140°, 42% after 15 min. Heating at 140-5° at 1 mm. gives a trace of 1,3-dimethylcytosine (III), II and an I salt, probably 1-methylcytosine 3-methiodide (IV), converted by Ag<sub>2</sub>SO<sub>4</sub> into III, which is hydrolyzed in acid medium to 1,3-dimethyluracil, characterized by its 5-Br deriv. (V). IV, m. 265-6° (decompn.), results from II, MeI and abs. MeOH on standing in the dark at room temp. for several months; concd. NaOH gives III, m. 147.5°; Br gives V. Attempts to introduce glucose in the 1-position of cytosine by the interaction of acetobromoglucose and I were unsuccessful. C. J. West

Action of alkali and ammonia on 2,4-dialkoxypyrimidines. Guido E. Hilbert and Eugene F. Jansen. *J. Am. Chem. Soc.* 56, 134-9(1934).—2,4-Dichloro-5-bromopyrimidine (60 g.) in 50 cc. abs. MeOH with 21 g. Na in 300 cc. MeOH, cautiously refluxed 2 hrs., give 25 g. Na salt of  $\alpha$ -bromo- $\beta$ -methylisoureidoacrylic acid (I), m. about 250° (decompn.); with concd. HCl it yields 5-bromouracil (II); AcOH gives 4-keto-3,4-dihydro-2-methoxy-5-bromopyrimidine, m. 190° (decompn.), hydrolyzed by concd. HCl to II and gives I with NaHCO<sub>3</sub>. II, in the 1st reaction, the NaCl is filtered and the MeOH removed *in vacuo*, there results 80% of 2,4-dimethoxy-5-bromopyrimidine (III), m. 63-4°; heating III with 60% EtOH contg. NaOH gives I. III and MeOH satd. with NH<sub>3</sub> at 0°, heated at 80° for 96 hrs., give 2-methoxy-5-amino-5-bromopyrimidine, m. 134-6°; with concd. HCl it gives 5-bromocytosine, decomp. at 245-55°, also prepd. by bromination of cytosine; in the latter reaction some 5,5-dibromo-6-hydroxy-5,6-dihydrocytosine-HBr (?), decomp. 175-80°, also results. 2,4-Dimethoxy-5-bromopyrimidine, m. 72-4° (55% yield); 4-keto-3,4-dihydro-2-ethoxy-5-bromopyrimidine, m. 183°. C. J. West

Synthesis with  $\beta,\beta'$ -dichloroethyl ether. Morpholine derivatives. W. Nelson Axe and Charles Freeman. *J. Am. Chem. Soc.* 56, 478-9(1934).—(ClCH<sub>2</sub>CH<sub>2</sub>)<sub>2</sub>O and PhNHNH<sub>2</sub>, refluxed in the presence of sufficient 40% KOH to take care of the HCl formed, give 20-30% of *N*-phenylaminomorpholine, m. 107.5°; *p*-C<sub>6</sub>H<sub>4</sub>(NH<sub>2</sub>)<sub>2</sub> gives 55-65% of *N,N'*-phenylene-1,4-dimorpholine, m. 196°, which gives interesting color reactions when treated with solns. of salts of heavy metals, halogens and acids. (*p*-H<sub>2</sub>NCH<sub>2</sub>H<sub>2</sub>)<sub>2</sub> gives 35-40% of *N,N'*-bisphenylene-4,4'-dimorpholine, m. 228.5°. *m*-C<sub>6</sub>H<sub>4</sub>(NH<sub>2</sub>)<sub>2</sub> gave only resinous material. C. J. West

Derivatives of piperazine. I. C. B. Pollard and David E. Adelson. *J. Am. Chem. Soc.* 56, 150(1934).—Piperazine hexahydrate (I) and PhCH<sub>2</sub>COCl give 1,4-bis(phenylacetyl)piperazine, m. 150-1° (65% yield). 1,4-bis(hydrocinnamyl) deriv., m. 122.5-3° (61%). 1,4-diamisoyl deriv., m. 192.5-3.5° (50%). I and PhCH<sub>2</sub>CO<sub>2</sub>H give 1,4-piperazonium 1,4-bis(phenylacetate), m. 146.5-7.5° (80%); bis(hydrocinnamate), m. 150.5-1.5° (85%); diamisoylate, m. 172-4° (90%). I and CH<sub>2</sub>(CO<sub>2</sub>H)<sub>2</sub> give 1-piperazonium acid malonate, m. 180° (decompn.) (90%); acid *C,C*-diethylmalonate, m. 80.1° (85%); 1,4-piperazonium bis(ethylmalonate), m. 144° (78%). These compds. are being studied for physical effects. C. J. West

Constitution of peganine. Ernst Späth and Eduard Nikawitz. *Ber.* 67B, 45-55(1934).—Peganine (I), which is obtained from the mother liquors in the technical prepn. of the alkaloids of *Peganum harmala* and has the compn. C<sub>11</sub>H<sub>17</sub>ON<sub>2</sub>, m. 208-10°, contains no MeO or NMe group, does not react with the usual ketone reagents nor with CH<sub>2</sub>N<sub>2</sub>; with Ac<sub>2</sub>O it gives an oily *Ac* deriv., b<sub>p</sub> 230-40°, in which the *Ac* group is so loosely held that attempts to destroy the excess of Ac<sub>2</sub>O by shaking with water resulted

in the regeneration of I. This points to the absence of a secondary or primary N atom, and the presence of an active H atom (Zerevitinov) indicates that I contains a HO group, which is confirmed by the formation with  $\text{POCl}_3$  of a *desoxychloropogonine*,  $\text{C}_{11}\text{H}_{11}\text{N}_2\text{Cl}$ , somewhat greenish platelets, m.  $136-7^\circ$ . With  $\text{KMnO}_4$  in faintly alk. suspension at room temp. I rapidly uses up the equiv. of approx. 5 atoms O, yielding an acid (II), whose *Me ester*,  $\text{C}_{11}\text{H}_{13}\text{O}_5\text{N}_2$  (prepd. with  $\text{CH}_3\text{N}_3$ ), m.  $152.5^\circ$ , gives anthranilic acid almost quantitatively with boiling 20% KOH. The compn. of the ester and the behavior of the acid toward  $\text{KMnO}_4$  point to a quinazoline. Of the 4 possible quinazoline esters which could give anthranilic acid on alk. cleavage, 3 should also give  $\text{NH}_3$  or  $\text{MeNH}_2$ , neither of which was detected in any appreciable amt. This leaves only the structure *Me 4-keto-3,4-dihydroquinazolinyl-3-acetate* for the ester; on alk. cleavage it should therefore give, along with anthranilic acid, glycol which was actually isolated as hippuric acid. The free acid (II), from the ester and hot concd. HCl, m.  $235-7^\circ$  (slight decompn.); *methylamide*, from the ester and  $\text{MeNH}_2$  in abs. alc., m.  $233-5^\circ$ . Attempts to decarboxylate II by heating it above its m. p. or treating it with fuming HCl in sealed tubes did not give homogeneous cryst. products in sufficient amt. for study; heating with quinoline and Naturkupfer C at  $240^\circ$ , however, yielded 3-methyl-4-keto-3,4-dihydroquinazoline, m.  $103-5^\circ$ . II was unchanged by long hydrogenation with Pd-charcoal at  $50^\circ$ ; treatment at  $95^\circ$  with Sn and concd. HCl, added in the course of 24 hrs., gives a little of an oil of amine-like odor, b.  $70-90^\circ$  (bath temp.) in a high vacuum, having the compn.,  $\text{C}_{11}\text{H}_{13}\text{N}_3$ , of a *desoxyhexahydro-pogonine*. Na and  $\text{ArOH}$  gave *desoxytetrahydro-pogonine* (III), m.  $89.5^\circ$ , yielding an *Ac deriv.*, yellow oil, b.  $190-200^\circ$  (bath temp.) in a high vacuum, and contg. an active H atom (Zerevitinov). Further reduction with Sn and HCl gave the hexahydro compd. In alk. suspension, III is sensitive to  $\text{KMnO}_4$ . Attempts to dehydrate I with concd. HCl or  $\text{P}_2\text{O}_5$  were unsuccessful. Of the various possible structures for I, that of 3-allyl-4-hydroxy-3,4-dihydroquinazoline,  $\text{C}_8\text{H}_9\text{N}$ ,  $\text{CH}(\text{OH})\text{N}(\text{CH}_2\text{CH}:\text{CH}_2)\text{CH}:\text{N}$

is in agreement with the above facts. As the double bond in the allyl group could not be detected by catalytic hydrogenation, I was oxidized with  $\text{KMnO}_4$  in acetone; this smoothly gave II. The similarity in m. ps. of I and Sen's vasicine and of their chlorodesoxy derivs. indicate the 2 bases may be identical, although Späth and Nikawitz have not observed an isomerization of I by NaOH in acetone, and I, unlike vasicine, is difficultly sol in acetone. C. A. R.

Evidence for an asymmetrical arsenic atom. C. F. H. Allen, F. B. Wells and C. V. Wilson. *J. Am. Chem. Soc.* 56, 233-4 (1934); cf. *C. A.* 27, 5078.—The treatment of 7-chloro-7,12-dihydro- $\gamma$ -benzophenarsazine with Ag  $\alpha$ -bromocamphorsulfonate (I) in  $\text{Ac}_2\text{O}$  gives 2 compds. free from halogen (m.  $211-2^\circ$  and  $200^\circ$ ), a yellow compd.,  $\text{C}_{20}\text{H}_{25}\text{O}_4\text{NSBrAs}$ , m.  $188-9^\circ$ ,  $[\alpha]_D^{25}$   $59.5^\circ$ , half-life in the sunlight, 36 min., and an isomer, m.  $182-3^\circ$ ,  $[\alpha]_D^{25}$   $35.1^\circ$ , half-life 70 min. The isomeric 12-chloro-7,12-dihydro- $\alpha$ -benzophenarsazine, from  $\beta$ - $\text{C}_{10}\text{H}_7\text{NHP}$  in 70% yield, yellow, m.  $252-3^\circ$ ; with I it gives 2 compds. which were Br-free and 2 isomers,  $\text{C}_{20}\text{H}_{25}\text{O}_4\text{NSBrAs}$ , yellow, m.  $224-5^\circ$ , and brown, m.  $218-9^\circ$ . *p*-Tolyl- $\alpha$ -naphthylamine gives 47% of 7-chloro-9-methyl-7,12-dihydro- $\gamma$ -benzophenarsazine, greenish yellow, m.  $258-9^\circ$ , with I it gives a small quantity of the compd.  $\text{C}_{27}\text{H}_{33}\text{O}_4\text{NSBrAs}$ , yellow, m.  $250^\circ$ ,  $[\alpha]_D^{25}$   $32.6^\circ$ , half-life 25 min. All rotations were in 95% EtOH, using 0.122 g. per 25 cc. The formation and mutarotation of these diastereoisomers may be considered as evidence in favor of an asym trivalent As atom. C. J. West

Condensation of some toluenesulfonamides with trioxymethylene and with formaldehyde solution. L. McMaster. *J. Am. Chem. Soc.* 56, 204-6 (1934).—*p*- $\text{MeC}_6\text{H}_4\text{SO}_2\text{NH}_2$  and trioxymethylene in  $\text{AcOH}$ ,  $\text{H}_2\text{SO}_4$ , or 40% HCHO in EtOH-HCl give about 40% of tri-*p*-toluenesulfonyltrimethylenetriimide or 1,3,5-tri-*p*-

toluenesulfonylhexahydro-sym-triazine, m.  $169.8-70.5^\circ$ ; from  $\text{PhNH}_2$  a compd., m.  $73^\circ$ , seps., which decomps. on warming into  $\text{PhNH}_2$  and the original compd. *p*- $\text{MeC}_6\text{H}_4\text{SO}_2\text{NHMe}$  and  $(\text{CH}_3\text{O})_2$  or 40% HCHO give the compd.  $\text{CH}_3(\text{NMeO})_2\text{SC}_6\text{H}_4\text{Me}$ , m.  $113-4^\circ$ ; EtNH<sub>2</sub> gives a brown viscous liquid. *o*- $\text{MeC}_6\text{H}_4\text{SO}_2\text{NH}_2$  and 40% HCHO gives the triimide, m.  $245.5-6.5^\circ$ ; the  $\text{PhNH}_2$  compd. m.  $259.2-9.4^\circ$ ; with  $(\text{CH}_3\text{O})_2$ , there results a mixt. of the triimine and the diimine, m.  $168.8-9.9^\circ$ . All m. ps. are cor. C. J. West

Cactus alkaloids. X. Constitution of pellotine and anhalonidine. Ernst Späth and Friedrich Boschan. *Monatsh.* 63, 141-53 (1933); cf. *C. A.* 27, 725.—The following facts further confirm the structure for pellotine proposed in part IX. *O*-Benzylpellotine-MeI, m.  $193-5^\circ$ , could not be used in the Hofmann degradation because of the ease with which the  $\text{PhCH}_2$  group was removed. *O*-Ethylpellotine-MeI, m.  $185-6^\circ$ ; 4% Na-Hg reacts with the MeCl deriv. to give a basic oil, partly unsatd., which was catalytically reduced, changed into the methiodide and sepd. into 2 compds., 6,2,3,4-Et(EtO)(MeO) $\text{C}_6\text{H}_4\text{CH}_2\text{CH}_2\text{NMe}_2$  (I), easily sol. in MeOH and  $\text{H}_2\text{O}$ , and 2,3,4,5-Et(EtO)(MeO) $\text{C}_6\text{H}_4\text{CHCHMeNMe}_2$  (II), difficultly sol., m.  $238-9^\circ$ . With alkali II easily splits off  $\text{Me}_2\text{N}$ , giving the compd. 2,3,4,5-Et(EtO)(MeO) $\text{C}_6\text{H}_4\text{CH}:\text{CH}_2$ ; this is oxidized by  $\text{KMnO}_4$  in  $\text{Me}_2\text{CO}$  to 1-ethyl-2-ethoxy-3,4-dimethoxybenzoic acid, m.  $102-3^\circ$ ;  $\text{HNO}_3$  at  $-14^\circ$  gives a small yield of 1-ethyl-2-ethoxy-3,4-dimethoxy-5,6-dinitrobenzene, which was not purified but reduced to the 5,6-di- $\text{NH}_2$  deriv. (III), m.  $80.5-1^\circ$  (di-Bs deriv., m.  $220-30^\circ$ ). III was synthesized by starting with the 3,4-di-Me ether of pyrogallolaldehyde, 2,3,4-HO(MeO) $\text{C}_6\text{H}_3\text{CHO}$ , which reacts with  $\text{MeCHN}_2$  to give 2-ethoxy-3,4-dimethoxybenzaldehyde, b.  $120-30^\circ$ ; oxidation gives the acid, m.  $78-9^\circ$ . Reduction of 2,3,4-HO(MeO) $\text{C}_6\text{H}_3\text{Ac}$  with Zn and HCl gives 1-ethyl-2-hydroxy-3,4-dimethylbenzene, b.  $124^\circ$ , whose 2-EtO deriv. b.  $122-3^\circ$ . Nitration and reduction give III. C. J. West

New method for the preparation of quinoxalones. Hermann Eichler. *J. prakt. Chem.* 139, 113-14 (1934).—*m*- $\text{C}_6\text{H}_4(\text{OH})_2$  (2 parts) in 19 parts concd.  $\text{H}_2\text{SO}_4$ , treated with 0.8-3 parts solid  $\text{NaNO}_2$  or 1-3.7 parts solid  $\text{KNO}_3$ , gives 95-9% of resorufin. C. J. West

Curare alkaloids. II. Constitution of curine (beberine). Ernst Späth and Friedrich Kuffner. *Ber.* 67B, 55-9 (1934); *C. A.* 23, 146.—As stated in the 1st paper, mol.-wt. detns. on curine (I) in camphor gave values about 20% higher than that calcd. from the formula  $(\text{C}_{18}\text{H}_{19}\text{O}_4\text{N})$  assigned to it. When I was digested with 0.5 of the amt. of HCl required for complete neutralization, 0.5 of the I was converted into the HCl salt and the other 0.5 remained as free base; hence I has no tendency to form basic salts, as might have been expected of a diacid base with a doubled mol. wt. To exclude the possible disturbing influence of the phenolic group, an ether soln. of the neutral Me ether was shaken out with 0.01 N HCl; the amt. of base passing into the aq. layer always corresponded to a mol. wt. of 362 (calcd. for the simple empirical formula of the ether 311.18). While the earlier work is thus confirmed, 2 purely chem. methods have been found which indicate definitely that the formula of I should be doubled. The Me ether with a relatively small amt. of MeI gives a cryst. compd.  $(\text{C}_{18}\text{H}_{19}\text{O}_4\text{N})_2\text{MeI}$ , m.  $257-8^\circ$  (foaming) in vacuum tubes. Also, after partial methylation of I with  $\text{CH}_3\text{N}_3$  in ether in the presence of acetone and MeOH and removal of the neutral ether, which is insol. in KOH, there remains a mixt. of phenol bases from which can be isolated I and 2 other compds. One of the latter, m.  $208-8^\circ$ , has a MeO content corresponding to the mono-Me ether of a compd.  $\text{C}_{18}\text{H}_{19}\text{O}_4\text{N}_2$ ; the 2nd is probably a mixt. of the 2 isomeric mono-Me ethers, as it does not melt sharply ( $154-60^\circ$ ); it also has close (14.61%) to the calcd. (15.64%) MeO content. The doubled formula also makes it possible to explain the formation of proto-catechelic acid, along with *p*- $\text{HOC}_6\text{H}_4\text{CO}_2\text{H}$ , in the KOH fusion of I. Oxidation of the N-free compd. resulting

from the 2-fold Hofmann degradation of the Me ether of I gives, among other products,  $p$ -[2,3,5,6-(MeO)<sub>4</sub>(HO<sub>2</sub>C)<sub>2</sub>CH<sub>2</sub>OH]C<sub>6</sub>H<sub>4</sub>CO<sub>2</sub>H (Faltis and Fraendorfer, C. A. 24, 3513). The tentative formula

is proposed for the Me ether of I. Exptl. data on the position of the diphenyl ether union and the MeO residues in the left half of the mol. are not yet available.

C. A. R.

**Sophora alkaloids.** IV. Alkaloids of the seeds of *Sophora pachycarpa*. A. P. Orekhov and N. Proskurnina. Ber. 67B, 77-83(1934); cf. C. A. 27, 4234.—The seeds contain about the same amt. of alkaloids as the herb but low-boiling fractions are completely absent from the mixt. of bases obtained from the seeds. The sepn. of these bases proved to be very difficult and was finally effected by tedious fractionation of the HI salts. There were thus obtained 2 well-characterized cryst. bases C<sub>18</sub>H<sub>25</sub>N<sub>3</sub>O, *sophocarpine* (I) and *sophocarpidine* (II). I seps. in crystals, m. 81-2°, with 1 mol. H<sub>2</sub>O, [α]<sub>D</sub><sup>20</sup> -29.44° (alc.), loses its H<sub>2</sub>O *in vacuo* and m. 54-5°, shows a max. in its soly. in water at 70-80°, is not attacked by boiling several hrs. in alc. KOH; the HCl, HBr and HI salts begin to darken 230-40° but do not m. 300°; *chloroaurate*, light yellow, m. 166-70°; *chloroplatinate*, orange-red, m. 209-12° (decompn.); *picrate*, yellow, m. 155-7°; *methiodide*, m. 200-2°. II, m. 73-6°, [α]<sub>D</sub><sup>20</sup> 38.38°, is more sol. in cold than in hot water; HCl, HBr and HI salts; *chloroaurate*, yellow ppt. immediately decomp. with sepn. of Au; *methiodide*, hygroscopic cryst. powder with 2 EtOH rapidly deliquescing in the air. Refluxed in abs. alc. with KOH, II gives the K salt, needles with 4 H<sub>2</sub>O, m. 160-5°, loses 3 H<sub>2</sub>O at 105° and the 4th mol. at 125° and then m. 222-6°, of *sophocarpidine* acid, C<sub>18</sub>H<sub>25</sub>N<sub>3</sub>O<sub>2</sub> 4H<sub>2</sub>O, m. 170-5°, which loses its H<sub>2</sub>O at 105° and then m. 200-2°, [α]<sub>D</sub><sup>20</sup> 19.16°; *chloroaurate*, yellow, m. 194-5°; *chloroplatinate*, orange-red, does not m. 250°. With MeI in boiling MeOH under a reflux the K salt yields an ester *methiodide*, C<sub>18</sub>H<sub>25</sub>N<sub>3</sub>O<sub>2</sub> MeI.H<sub>2</sub>O, m. 212-14°. With Ac<sub>2</sub>O on the water bath, the acid regenerates II. II in many respects resembles the α-form of matrine, from *Sophora angustifolia* (S. *flavescens*), as described by Kondo (C. A. 22, 1212), but there are some appreciable differences, and until they can make a direct comparison of the 2 products, O. and P. assign a distinctive name to II.

C. A. R.

**Strychnos alkaloids.** LXXVIII. An isomer of benzal-dihydrostrychnine. Hermann Leuchs and Hans Beyer. Ber. 67B, 108-12(1937); cf. C. A. 28, 772°.—In a repetition of the work of Kotake and Mitsuwa (C. A. 27, 5334), the yield of benzal-dihydrostrychnine (I) was not as high as reported by them (75-80%), and the greater the amt. of alc. used as solvent the smaller was the yield. It was found that along with I there is formed, especially in the NaOEt condensation in dil. soln., a colorless isomer, *isobenzal-dihydrostrychnine*, C<sub>28</sub>H<sub>33</sub>O<sub>5</sub>N<sub>2</sub> (II), m. 187-9°, [α]<sub>D</sub><sup>20</sup> -324° to -325.1°/d. in abs. alc., [α]<sub>D</sub><sup>20</sup> -665°/d. in CHCl<sub>3</sub> (1.3% soln.), mol. wt. 459 in freezing AcOH; reacts basic to litmus, does not give a color with FeCl<sub>3</sub> and gives a neg. Otto reaction (brownish color at most); *methiodide*, m. 278-80° (decompn.); *Ac deriv.*, m. 157-9°, [α]<sub>D</sub><sup>20</sup> -295°/d. (abs. alc.), gives a neg. Otto reaction. II is quite stable to KMnO<sub>4</sub> in acetone and

absorbs no H with Pt oxide in cold AcOH, while in hot soln., especially HCl, it uses up 12-14 atoms H stepwise but the product has thus far been obtained only in resinous form. The above facts indicate that the acid amide

group, -C<sub>6</sub>H<sub>4</sub>N·CO·CH<sub>2</sub>-, of the strychnine is changed, probably into -C<sub>6</sub>H<sub>4</sub>·N·C·C·CH(OH)·C<sub>6</sub>H<sub>4</sub>-,

in the formation of II. Oxidation of I according to Method I of Kotake and Mitsuwa, with KMnO<sub>4</sub> in Me<sub>2</sub>CO-AcOH, proceeds as they describe but the chief product (III) (70% yield), m. 288° instead of 280°, [α]<sub>D</sub><sup>20</sup> -25.6°/d. (1.8% in 95% HCO<sub>2</sub>H) and has the compn. C<sub>28</sub>H<sub>35</sub>O<sub>4</sub>N<sub>2</sub> (or C<sub>28</sub>H<sub>33</sub>O<sub>4</sub>N<sub>2</sub>), not C<sub>28</sub>H<sub>35</sub>O<sub>4</sub>N<sub>2</sub>; HCl salt, m. 233-6°; *perchlorate*. This corresponds to the addn. of 2 HO residues at the benzal grouping (and possibly further oxidation of 1 of them): PhCH·C(CON)<sub>2</sub>·CHO → PhCH(OH)·C(OH)· → PhCOC(OH)·. With Ac<sub>2</sub>O the product gives a *mono-* or *di-Ac deriv.*, m. 242-5° (found, C 70.51, H 5.99; *perchlorate*, found C 59.78, H 5.45, N 4.68%). In the prepn. of III some BzH is split off and 2 N NH<sub>4</sub>OH exts. from the MnO<sub>2</sub> sludge about 4% of an acid, m. 295-300° (gas evolution) probably identical with that obtained by K. and M. by their Method II (KMnO<sub>4</sub> in Me<sub>2</sub>CO-H<sub>2</sub>O). This method yielded 36% of the acid (33% in the MnO<sub>2</sub> sludge, 3% in the acetone filtrate), [α]<sub>D</sub><sup>20</sup> 91.8°/d. in 1 mol. 0.1 N NaOH. The acetone filtrate yielded in addn. 3% of a neutral substance, m. 263-4°, [α]<sub>D</sub><sup>20</sup> -30.8°/d. (95% HCO<sub>2</sub>H), which is believed to be III, not C<sub>28</sub>H<sub>35</sub>O<sub>4</sub>N<sub>2</sub>.

C. A. R.

**Yohimbe alkaloids.** Hermann Heinemann. Ber. 67B, 15-21(1934); cf. Hahn and Schuch, C. A. 24, 5039.—In the tech. prepn. of yohimbine, H. has isolated 4 addnl. secondary alkaloids, 2 of which were as yet unknown. One, recrystd. from 50% alc., m. 104.5°, [α]<sub>D</sub><sup>20</sup> -73.6° (1% pyridine soln.), has a water content corresponding to C<sub>18</sub>H<sub>25</sub>O<sub>2</sub>N<sub>2</sub>·3H<sub>2</sub>O and after drying, m. 133-40°; it is probably allyoyohimbine. The 2nd alkaloid (I) seps. from MeOH with 1 mol. MeOH, from 95% alc. with 1 mol. EtOH + 1 mol. H<sub>2</sub>O, m. 234-5°, [α]<sub>D</sub><sup>20</sup> for anhyd. base -28.0° (abs. alc., c 2.006), [α]<sub>D</sub><sup>20</sup> for HCl salt 53.8° (water, c 1.045). The yohimboic acid obtained by alk. sapon. of I, hygroscopic crystals with 1 H<sub>2</sub>O, decomposes 276°, [α]<sub>D</sub><sup>20</sup> 50.1° (pyridine, c 1.008). These facts made it seem probable that I is α-yohimbine (II), but Hahn and Schuch state repeatedly that the yohimboic acid obtained from II is very easily sol. in alc. while Heinemann found that his acid is sol. to the extent of only 0.3% by wt. in abs. alc. (contg. 2% PhMe) at 17° and 1 g. in 160 cc. at the b. p.; in MeOH (d<sub>4</sub><sup>20</sup> 0.7973), the soly. is 2% at room temp. and 1 g. in 40 cc. at the b. p. The Et ester, m. 236°, [α]<sub>D</sub><sup>20</sup> -6.7° (pyridine, c 1.037) (HCl salt, 64.0° (water, c 0.492)), while H. and S. give [α]<sub>D</sub><sup>20</sup> 29° for the ester. In view of these discrepancies H. compared his product directly with a sample of Merck α-yohimbine and found the 2 to be identical. The 3rd alkaloid is named β-yohimbine (III). It is characterized by its unusually low soly. in MeOH, from which it seps. in leaflets with 2 MeOH, m. 235.6°, [α]<sub>D</sub><sup>20</sup> -46.8° (pyridine, c 0.998), and, after drying [α]<sub>D</sub><sup>20</sup> -54.0° (pyridine, c 1.047), is pptd. from acids by alkalies as a highly hydrated gel which on the water bath turns into a cryst. *monohydrate*. HCl salt, decomp. 292°, loses 1 H<sub>2</sub>O over P<sub>2</sub>O<sub>5</sub> at 100° and 7 mm, [α]<sub>D</sub><sup>20</sup> 27.7° (water, c 0.542). III depresses the m. p. of allyoyohimbine and II but not that of yohimbine (IV). An equimol. mixt. of III and IV m. 235-6° but the III can be sepd. quite readily by means of MeOH (after 3 re-crystns., [α]<sub>D</sub><sup>20</sup> -47.1°), whereas 3 crystns. from abs. EtOH gives a product still contg. considerable IV and showing [α]<sub>D</sub><sup>20</sup> -12°, and 50% EtOH gives a product with [α]<sub>D</sub><sup>20</sup> 40.5°, although the m. p. remains const. throughout. β-Yohimboic acid, crystals with 1 H<sub>2</sub>O, decomposes 250-1°, 260-1° or 270°, depending on whether it has been pptd. from the aq. soln. of its K salt with AcOH or crystd. from 96% EtOH or from MeOH, [α]<sub>D</sub><sup>20</sup> 15.3°

(pyridine,  $c$  1.009). The 4th alkaloid, *8-yohimbine*, is apparently present in only very small amt. in the bark. It m.  $284^\circ$ ,  $[\alpha]_D^{25} -50.0^\circ$  (pyridine,  $c$  0.992); *HCl salt*, crystals with 1  $H_2O$  from water, anhyd. crystals from alc.  $HCl$ , decomposes  $288^\circ$ ,  $[\alpha]_D^{25} -18.6^\circ$  (MeOH,  $c$  0.994); 0.315 g. dissolves in 100 g. water at  $100^\circ$ . *8-Yohimboic acid* is pptd. from solns. of its salts in highly hydrated form but seps. from MeOH in anhyd. crystals, m.  $258^\circ$ ,  $[\alpha]_D^{25} 1.5^\circ$  (pyridine,  $c$  1.000). C. A. R.

**Amyrins.** III. Constitution of sapotalin and the hydrocarbon  $C_{15}H_{14}$ . Otto Brunner, Hans Hofer and Rosa Stein. *Monatsh.* 63, 79-98(1932); cf. C. A. 27, 501.—Dehydration of amyris with Se gives sapotalin (I),  $C_{15}H_{14}$ , a hydrocarbon  $C_{15}H_{14}$  (II), a hydrocarbon, m.  $304-5^\circ$  and a naphthol  $C_{15}H_{14}O$ . This paper is concerned with the structures of the 1st 2, which have been reached by methods differing from those already published. I is oxidized by  $CrO_3$  in AcOH to a quinone, golden yellow, m.  $113^\circ$ ; the concd.  $H_2SO_4$  soln. is orange-red, further oxidation with  $KMnO_4$  in  $Me_2CO$  gives 3,4-dimethylphthalic acid, isolated and analyzed as the anhydride (III), m.  $124-5^\circ$ , which was synthesized by Franz Grof as follows: 1,2-dimethylbutadiene and maleic anhydride in  $C_6H_6$ , warmed 5 hrs. on the water bath, give 1,4-dimethyl- $\Delta^4$ -tetrahydrophthalic anhydride, m.  $67-8^\circ$ ; this was treated with Br (5 hrs. at  $200^\circ$ ) and the resulting acid reduced with Na-Hg and the anhydride (III) prepd. by the action of  $Ac_2O$ ; the free acid, m.  $149-50^\circ$ ; the methylimide, m.  $98-9^\circ$ . I (1,2,7-trimethylnaphthalene) was prepd. as follows:  $p-MeC_6H_4CHO$  and  $Me_2CO$  give  $p-MeC_6H_4CH:CHAc$ , catalytically reduced to  $p-MeC_6H_4CH_2CH_2CHMeOH$ , which through the bromide and cyanide yields  $p-MeC_6H_4CH_2CH_2CH_2CHMeCO_2H$ ; concd.  $H_2SO_4$  gives 2,7-dimethyl-1-keto-1,2,3,4-tetrahydronaphthalene, transformed by MeMgI and dehydrogenation with Se to I. II (1,2,5,6-tetramethylnaphthalene) on oxidation with  $CrO_3$  does not give a quinone and with  $KMnO_4$  gives only mellophanic acid. In the synthesis of II 2,3- $Me_2C_6H_3CN$  was hydrolyzed to 2,3-dimethylbenzoic acid, m.  $145-6^\circ$  (82% yield); chloride,  $b_m$   $128^\circ$ ; amide, m.  $155-6^\circ$ ; catalytic reduction of the chloride gives 2,3-dimethylbenzaldehyde, whose oxime m.  $80-2^\circ$  and semicarbasone m.  $222^\circ$ ; with  $Me_2CO$  and NaOH there results 81% of 4-(2,3-dimethylphenyl)- $\Delta^4$ -buten-2-one, m.  $37^\circ$  (oxime, m.  $160-2^\circ$ ; semicarbasone, m.  $215^\circ$ ); catalytic reduction with Pd gives the buten-2-one,  $b_m$   $139^\circ$  (semicarbasone, m.  $204^\circ$ ), further reduced by Na and EtOH to the buten-2-ol,  $b_m$   $156^\circ$ ; the bromide  $b_m$   $151-2^\circ$  and the cyanide was immediately hydrolyzed and the crude acid warmed with concd.  $H_2SO_4$ , giving 2,5,6-trimethyl-1-keto-1,2,3,4-tetrahydronaphthalene,  $b_m$   $160-70^\circ$ , which was treated with MeMgI and then heated with Se to give II, m.  $118^\circ$  (picrate, red, m.  $156-7^\circ$ ; styphnate, m.  $166^\circ$ ). 4,5-Dimethyl- $\Delta^4$ -tetrahydrophthalic acid, m.  $189-90^\circ$ ; imide, m.  $126.5-7.5^\circ$ ; 4,5-Dimethylphthalic acid, m.  $196^\circ$ ; anhydride, m.  $208-9^\circ$ ; methylimide, m.  $150-1^\circ$ ; ethylimide, m.  $89^\circ$ . C. J. West

**Santonin series.** XVIII. Constitution of santonin acid E. Wedekind and O. Engel. *J. prakt. Chem.* 139, 115-28(1934); cf. C. A. 26, 1937.—Santonin acid (I)  $b_m$   $285^\circ$  and m.  $170-2^\circ$ ; the Me ester m.  $86^\circ$ . The action of 10% NaOH upon  $\beta$ -metasantonin does not give I but an isomeric acid, m.  $167^\circ$ . I cannot be reduced catalytically but with Na-Hg in 10% NaOH gives dihydrosantonin acid (II), m.  $180-2^\circ$ ; boiled with  $Ac_2O$  5 hrs., there results an acetylactone,  $C_{17}H_{16}O_4$ , m.  $204^\circ$ , and the di-Ac deriv., m.  $232^\circ$  (Me ester, m.  $151^\circ$ ); sapon. of either deriv. gives II.  $\alpha$ -Tetrahydrosantonin (III) and KOH give  $\alpha$ -tetrahydrosantonin acid, m.  $115^\circ$ ; heating the acid in Et<sub>2</sub>O for 2 hrs. gives III.  $\alpha$ -Santonin oxide is unchanged after heating with KOH 1 hr.; the same is true of chloro- and desmotroposantonin and artemonic acid. C. J. West

**Chlorophyll.** XL. New syntheses of desoxyphyloerythrin and several derivatives of phylloporphyrin. Hans Fischer, Martin Speitmann and Hubert Meth. *Ann.* 808, 154-67(1934); cf. C. A. 28, 1041.—Phyllohematin (I) (s.) in 100 cc.  $ClCH_2OMe$ , treated with 8 cc.  $BaCl_2$

at  $40^\circ$  for 5 min., gives nearly quantitatively (crude) hydroxymethylphyllohematin,  $C_{54}H_{52}O_8N_4FeCl$ ; pptd. from AcOH it gives an acetate.  $HBr-AcOH$  and hydrolysis with 10%  $HCl$  give hydroxymethylphylloporphyrin,  $C_{54}H_{52}O_8N_4$ , acid no. 0.25; with 10%  $MeOH-KOH$  the  $HBr$  reaction product gives an ether ester (II),  $C_{54}H_{52}O_8N_4$ , m.  $241^\circ$  (cor.) (*Cu salt*,  $C_{54}H_{52}O_8N_4CuAc$ , red, m.  $205-6^\circ$ ). II and pyrotartaric acid, heated 12-15 min. at  $155^\circ$ , give desoxyphyloerythrin, whose Me ester,  $C_{54}H_{52}O_8N_4$ , m.  $261^\circ$  (*Cu salt*, red, m.  $254^\circ$ ). Heating II with  $HBr-AcOH$  at  $35-40^\circ$  gives the  $HBr$  salt of bromomethylphylloporphyrin,  $C_{54}H_{52}O_8N_4Br$ , very hygroscopic; this reacts with  $CHK(CO_2Et)$ , in  $Me_2CO$  to give a tri-Me ester,  $C_{54}H_{52}O_8N_4$ , m.  $211-12^\circ$ . I and  $Ac_2O$  at  $65-70^\circ$  with  $SaCl_4$  give an Ac deriv., from which was prepd. by heating 12 hrs. with  $HBr-AcOH$  at  $40^\circ$  acetylphylloporphyrin, whose Me ester,  $C_{54}H_{52}O_8N_4$ , m.  $236^\circ$  (*Cu salt*, m.  $318^\circ$ ; the hemin, black, m.  $314^\circ$ ). Phylloporphyrin Me ester (*Fe salt*) and MeMgI give the compd.  $C_{54}H_{52}ON_4$ , m.  $252^\circ$  (the propionic ester group in position 7 is replaced by the corresponding tert. alc. group). The Et ester of phylloporphyrin, m.  $256^\circ$  (cor.), yields a Cu salt, light red needles. Phylloporphyrin yields a mono- $NO_2$  deriv., acid no. 8 (*Fe and Cu salts*; Me ester, m.  $228^\circ$  (cor.)). C. J. West

**Chlorophyll series.** XII. The pheopurpurins. Emma M. Dietz and Wm. F. Ross. *J. Am. Chem. Soc.* 56, 159-64(1934); cf. C. A. 27, 1353.—Pheopurpurin 18 (I) in  $C_6H_5N$  with  $NH_4OH.HCl$  and  $Na_2CO_3$  gives a hydroxylamine deriv. (II),  $C_{54}H_{52}N_4O_8$ , acid no. 18, forms an insol. green K salt; a small quantity of the deriv. (III) of rhodoporphyrin- $\gamma$ -carboxylic anhydride (IV) is also formed. Me pheopurpurin 18 forms a hydroxylamine deriv. (V), acid no. 15-6, giving an insol. green K salt. Either II or V with  $CH_3N_3$  in Et<sub>2</sub>O gives the Me ether of V, acid no. 18, not extd. by alkali; the spectra of these 3 derivs. are identical. III, acid no. 5, was prepd. directly from IV and on methylation gives the Me ester, acid no. 7, and its Me ether, acid no. 9; the 3 spectra are identical. Heating II at  $325^\circ$  gives III. As compared with the oxime of rhodin g tri-Me ether, the  $NH_4OH$  derivs. of the anhydrides were much more acidic. Since I, like chlorin a, has 1 C atom less than the unstable chlorins (VI) or pheopurpurin 7 (VII), somewhere in its prepn. this atom is split off. Fischer concluded that this loss occurred as  $HCO_2H$  in the original phase test hydrolysis. This is not the case. The mixt. of VI formed directly in the phase test hydrolysis still contains the full complement of C atoms, since with  $CH_3N_3$  an excellent yield of di-Me pheopurpurin 7 is obtained. During the standing of the soln. of VI in Et<sub>2</sub>O, oxidation occurs and the C atom is eliminated as  $CO_2$ . The transformation occurs only with the MeO-free VI from the  $a_1$  series and not with the precursor of VII which is derived from chlorophyll  $a_2$ . A more convenient method of prepn. of I is to oxidize an alk. soln. of VI with  $K_2Fe(CN)_6$ ; K molybdicyanide (VIII) may also be used (36% yield). Oxidation of VII with VIII gives  $\beta$ -mono-Me chlorin a (IX), I and  $CO_2$ ; the acid no. of IX is 7 and with  $CH_3N_3$  it gives the tri-Me ester; pyrolysis of IX gives I. Me pheopurpurin 18 with KOH in  $C_6H_5N$  gives  $\alpha$ -mono-Me chlorin a, acid no. 6. Tri-Me chlorin a (X), heated with 25%  $MeOH-KOH$  for 70 min., gives some isorhodoporphyrin and a larger proportion of chlorin f. X gives a Cu deriv., black, m.  $235^\circ$ , and a Zn deriv., greenish black, m.  $242^\circ$ . With 25% KOH in  $MeOH$  X in  $C_6H_5N$  gives a di-Me chlorin a, blue, m.  $241-2^\circ$ ; a di-Me ester also results on refluxing in 1%  $MeOH-KOH$  for 30 min., greenish black, m.  $208^\circ$ . I in  $C_6H_5N-Et_2O$  gives an unstable chlorin a with acid no. 3 and spectrum similar to that of chlorin a;  $CH_3N_3$  gives a tri-Me ester, dark blue, m.  $237-8^\circ$ , giving no depression with known tri-Me chlorin a. C. J. West

**Prodigiosin**, the red pigment of *Bacillus prodigiosus*. V. Fritz Wrede and Alexander Rothhaas. *Z. physiol. Chem.* 222, 203-6(1933); cf. C. A. 27, 5334.—Further proof of the structure recently assigned to prodigiosin, viz., that consisting of a trialkylated pyrrole, a methoxy-

pyrrole and an unsubstituted pyrrole grouped about a central methine C, has now been obtained. Maleimide and methoxymaleimide were isolated by sublimation of the  $\text{CrO}_3$  oxidation products of prodigiosin. Proline was isolated from the  $\text{KMnO}_4$  oxidation products of hydrogenated prodigiosin, and identified as the Reinecke salt and by methylation to stachydrine, which was identified as the chloroaurate. A. W. Dox

The action of ozone on porphyrins. I. Hans Fischer and Mladen Deželić. *Z. physiol. Chem.* 222, 270-8 (1933).—Although  $\text{O}_3$  in high concn. causes a complete breakdown of etioporphyrin into  $\text{H}_2\text{C}_2\text{O}_4$  and  $\text{NH}_3$ , a brief treatment with dil.  $\text{O}_3$  yields *di-* and *triazonides* which are relatively stable and can be obtained cryst. by addn. of  $\text{H}_2\text{O}$  to the  $\text{MeOH}$  soln. The red color of the  $\text{CHCl}_3$  soln. changes to olive-green and at 650  $\mu$  an intense absorption band characteristic of the chlorophyll derivs. is observed. If the treatment is interrupted at this stage an olive-green substance can be isolated which dissolves in  $\text{MeOH}$  and  $\text{Et}_2\text{O}$  with green color and red fluorescence and shows a spectrum very similar to that of pheophorbide *a*. Prolonged treatment with  $\text{O}_3$  decolorizes the etioporphyrin soln., the absorption spectrum disappears, and only a pale yellow, smeary substance can be isolated, probably a tetraozonide. Thus far no mono-ozonide has been obtained. In this oxidation process the  $\text{O}_3$  adds at the double bond of the methine bridge in the porphin nucleus. Although 4 double bonds are present only 3 of them are especially active. The interesting feature of this reaction is the conversion of porphyrins into substances with chlorophyll-like properties. Etiohematin in  $\text{CHCl}_3$  gave with  $\text{O}_3$  a mono-ozonide with absorption band at 670  $\mu$ . This ozonide when heated reverted to the original etiohematin. Similar color changes and spectral behavior were observed when isourpophyrin and 2,3,5,8-tetramethyl-1,4-dipropyl-6,7-dipropionic acid porphyrin and its ester were treated with  $\text{O}_3$ . The stability of the porphyrin ozonides is noteworthy. They do not react with  $\text{KI}$  and are quite resistant to reducing agents such as  $\text{HI}$ ,  $\text{Na-Hg}$  and  $\text{Zn}$  dust. Methylethylmaleimide, an oxidation product of the porphyrins, forms a stable cryst. ozonide, m.  $89^\circ$ , which can be recrystd. from concd.  $\text{H}_2\text{SO}_4$ . A. W. Dox

Dehydrogenation of cholesterol and ergosterol and the nonidentity of the hydrocarbon  $\text{C}_{25}\text{H}_{42}$  with 1,2-cyclopentenophenanthrene. Otto Diels and Hermann Klare. *Ber.* 67B, 113-22(1934); cf. *C. A.* 27, 4810.—In view of the doubt cast by Ruzicka, Goldberg and Thomann (*C. A.* 27, 4808) on the identity of the hydrocarbons  $\text{C}_{25}\text{H}_{42}$  obtained by dehydrogenation of cholesterol and of ergosterol with  $\text{Se}$ , the dehydrogenations have been repeated many times and most carefully, with exactly the same results; the identity of the 2 products has been further confirmed by measurements of their absorption spectra in  $\text{CHCl}_3$  by Windaus. The product obtained by R., G. and T. from ergosterol was probably not free of the impurities which are formed in most dehydrogenations with  $\text{Se}$ , and the exptl. conditions under which they worked were also probably responsible for the formation of such impurities in large amt. A detailed description is therefore given of the method for obtaining the pure hydrocarbon  $\text{C}_{25}\text{H}_{42}$ . For some reason which has not yet been discovered, it is much more difficult to purify the product from ergosterol than that from cholesterol. More important for the chemistry of the sterols is the structure of the hydrocarbon  $\text{C}_{25}\text{H}_{42}$  (I), likewise obtained in the dehydrogenation of cholesterol and ergosterol, which Cook and Hewett (*C. A.* 27, 5335) claim is not  $\text{C}_{25}\text{H}_{42}$  at all but 1,2-cyclopentenophenanthrene (II),  $\text{C}_{27}\text{H}_{44}$ . D. and K. have subjected a sample of C. and H.'s synthetic II to treatment with  $\text{N}_2\text{O}_5$  in ether at  $0^\circ$  (with I this gives a characteristic yellowish cryst. ppt.  $\text{C}_{25}\text{H}_{40}\text{O}_5\text{N}$ ); the soln. remained colorless for 5-10 min., then gradually became greenish and finally, at the end of 0.5 hr., emerald-green (due to dissolved  $\text{N}_2\text{O}_5$ ), but remained perfectly clear. On further standing at  $0^\circ$ , the green soln. gradually evolved  $\text{NO}$  and in 4-5 hrs. had the yellow color of an ether soln.

of  $\text{NO}_2$ . After 2 days longer at  $0^\circ$  a part of the  $\text{NO}_2$  was driven off with dry air and the rest was removed by shaking with water and  $\text{Na}_2\text{CO}_3$ . After drying with  $\text{Na}_2\text{SO}_4$  and slowly evap. in the air, the soln. yielded unchanged II without a trace of the compd.  $\text{C}_{25}\text{H}_{40}\text{O}_5\text{N}$ . Furthermore, spectroscopic measurements by Windaus of II (m.  $137-8^\circ$  after recrystn. from alc.), and of very pure I, m.  $125-6^\circ$ , from cholesterol and from ergosterol gave curves which, although very similar for all 3 samples, showed at certain points differences beyond the limits of exptl. error between that for II on the 1 hand and those for the 2 preps. of I on the other hand. If the statement of Kon (*J. Soc. Chem. Ind.* 52, 950(1933)) that I is  $\gamma$ -methyl-1,2-cyclopentenophenanthrene should be verified, then the synthetic compd. described under the latter name by Bergmann and Hilleman (*C. A.* 27, 5749) must have some other structure. C. A. R

Ag halide complexes of the carboxyl acids (Prevost) 6 Derivs. of 8-aminoquinoline as antimalarial preps (Magidson, Strukov) 11H. Me and Et esters of hemato-prosthelin and of a combination of the compn.,  $\text{C}_{20}\text{H}_{14}\text{N}_4\text{O}_4\text{Fe}$  (Herzog) 11A. Recent advances in org. chemistry (Brady) 2. App. for synthesis of  $\text{MeOH}$  (U. S. pat. 1,942,021) 1.

Hydrocarbons. Henry Dreyfus Brit. 399,526, Sept. 26, 1933. See Fr. 749,916 (C. A. 28, 480°).

Separation of olefins. Wm. Engs and Richard Z. Moravec (to The Shell Development Co.). Can. 338,207, Dec. 26, 1933; cf. C. A. 27, 5751. Hydrocarbons boiling within the gasoline range are produced from a mixt. of hydrocarbons contg. olefins of the types  $R_1CH_2CHR$  and  $R_1CCHR$ , derived from the pyrolysis of mineral oil, by treating the mixt. with aq. 60–70%  $H_2SO_4$  at 0–25°, thereby selectively forming the monoalkyl sulfates of the  $R_1CCHR$  with the formation of an acid liquor contg. said alkyl sulfates. The acid liquor is removed and heated and the oily polymers produced are sepd.

Addition reactions with unsaturated organic compounds. Richard M. Deaneley (to The Shell Development Co.). Can. 338,211, Dec. 26, 1933. When an unsatd. compd. or compds. or mixts. of one or more unsatd. compds. with satd. compds. are treated with halogen, substitution reactions are inhibited by conducting the reaction in the presence of free O.

Nitrogenous organic compounds. I. G. Farbenind. A.-G. (Alfred Fehle, Karl Streitwolf and Walter Herrmann, inventors). Ger. 582,505, Aug. 22, 1933. Stable aq. solns. of nitrogenous org. compds. are prepd. by treating compds. of the type  $R_1R_2CR_3R_4NR_5R_6$ , where  $R_1$  represents a substituted aryl residue,  $R_2$  and  $R_3$ , O, OH or H,  $R_4$  a C chain and  $R_5$  and  $R_6$ , H or alkyl residues, with  $CO_2$  in the presence of water. Thus,  $\beta$ -3,4-dihydroxyphenyl- $\beta$ -hydroxyethylmethylamine is dissolved in water by the aid of a current of  $CO_2$ . Cf. C. A. 27, 2533.

Catalytic oxidation of organic compounds. Alphons O. Jaeger (to Selden Research & Engineering Corp.). U. S. 1,941,688, Jan. 2. An acid leached permutogenetic material such as one contg. V is used as a catalyst in effecting oxidations such as the production of oxidation de- vs. from aromatic hydrocarbons. Numerous details and examples are given. Cf. C. A. 28, 480°.

Oxygenated organic compounds from hydrogen and carbon oxides. Walter Bader and Edward B. Thomas (to Celanese Corp. of America). U. S. 1,942,530, Jan. 9. For the production of products such as MeOH, gaseous mixts. contg. H and oxides of C are subjected to the action of heat and pressure in the presence of a catalyst contg. a catalytic metal such as Zn, Cu, Pb and Cd solely in the form of its sulfide.

Operating catalytic apparatus such as in oxidizing aromatic hydrocarbons, etc. Alphons O. Jaeger (to Selden Co.). U. S. 1,942,817, Jan. 9. A temp.-regulat-

ing medium is cyclically circulated, first in indirect and then in direct heat-exchange relation with the interior of the catalyst mass and then through an outside heat-exchange system. App. is described.

Organic mercury compounds. I. G. Farbenind. A.-G. Fr. 754,436, Nov. 7, 1933. The compds. are of the

general formula  $XR^1C_2H_5R^2C(SHgR^3)N$ , where  $R^1$  is the radical of an acid group,  $R^2$  is O, S or NH,  $R^3$  is alkyl or cycloalkyl and X is H or an alkali metal. They are sol. in water. Examples are given of the prepn. of compds. in which  $XR^1$ ,  $R^2$  and  $R^3$  are (1) 5-COONa, O and Et, (2) 6-SO<sub>3</sub>Na, NH and Et, (3) 5-AsO<sub>2</sub>HNa, NH and Et, (4) 5-COONa, O and Pr, (5) 5-COONa, S and Et, and (6) 7-COONa, S and cyclohexyl. The prepn. of 2-mercaptobenzoxazole-5-carboxylic acid (decomposed at 283–4°) and 2-mercapto-1-imidazole-6-sulfonic acid, used as starting materials, is also described.

Liquid products by polymerization of olefinic gases. Wm. B. Plummer (to Standard Oil Co. of Ind.). U. S. 1,941,577, Jan. 2. Rich olefinic gases are subjected to polymerization at a relatively low temp. (suitably about 370–510°) and high pressure (suitably about 500–3000 lb.). Lean olefinic gases are subjected to polymerization at high temp. (suitably about 510–675°) and high pressure (suitably about 500–3000 lb.). A lean olefinic gas is sepd. from liquid products of the low-temp. system and a rich olefinic gas from reaction products of the high-temp. system, and the sepd. gases thus obtained are mixed with the corresponding streams of lean and rich gases, resp., supplied to the high- and low-temp. systems. App. is described.

Halogenation. Richard M. Deaneley (to The Shell Development Co.). Can. 338,210, Dec. 26, 1933. Substitution of halogen in a paraffin and addn. of halogen to an olefin are effected simultaneously in a mixt. of paraffin and olefin by the action of free halogen in the absence of O, in the dark, below 100°.

Chlorinating hydrocarbons. Richard M. Deaneley (to N. V. de Bataafsche Petroleum Maatschappij). Brit. 399,991, Oct. 19, 1933. Substantial substitution of paraffin and aromatic hydrocarbons in the dark with Cl is induced by simultaneously carrying out an addn. process in the same reaction zone between Cl and unsatd. hydrocarbons in the absence of substantial amts. of O. The process is not limited to the phys. state of the reactants and is effected at temps. from below 0°, e. g., for  $C_2H_4$ , at its b. p. (–41°) up to 100° or (in the case of hydrocarbons boiling above 100°) over 100°. In an example a mixt. of  $C_2H_6$  and  $C_4H_8$  is chlorinated to form mono- and dichlorobutane.

Alcohol. Benjamin T. Brooks (to The Petroleum Chemical Corp., to The Standard Alcohol Co.). Can. 337,543, Nov. 28, 1933. A secondary or tertiary alc. is obtained from the corresponding alkyl sulfate by dilg. with water and holding at a temp. in excess of 50° and below the b. p. of the corresponding alc. A system is maintained including in countercurrent communication a vertical series of zones contg. liquid and vapor and the alc.  $H_2SO_4$  mixt. is supplied to the upper part of the series and heat is supplied to the lower part of the series. Alc. vapor is continuously removed while the liquid content of the zones is retained by surfaces of a vitreous character and the soln. is held substantially exclusively in contact with surfaces of a vitreous character.

Alcohols. E. I. du Pont de Nemours & Co. Brit. 399,848, Oct. 9, 1933. Higher alcs. are prepd. by treating a fat or fatty oil with excess H at 300–400° and 100–205 atm. in the presence of a mixed Cd-Cu-Zn chromite catalyst. If olefinic linkages are present in the products they may be reduced by further hydrogenation with a Ni catalyst. The catalyst may be prepd. by adding a soln. of  $(NH_4)_2Cr_2O_7$  and  $NH_4OH$  to a soln. of Zn, Cu and Cd nitrates. Examples are given of the hydrogenation of cottonseed, palm, coconut and castor oils, further hydrogenation with Ni being used in the case of cottonseed oil. Palm oil yields mainly cetyl alc. and coconut

oil a mixt. of octanol, decanol, lauryl and myristyl alcs. Cf. C. A. 28, 1049<sup>9</sup>.

**Alkyl alcohols.** I. G. Farbenind. A.-G. Brit. 399,258, Oct. 5, 1933. Addn. to 354,992 (C. A. 26, 5574). See Fr. 752,478 (C. A. 28, 1047<sup>9</sup>).

**Alkylaminocarbinols.** Frederick H. Kranz (to National Aniline & Chemical Co.). U. S. 1,942,820, Jan. 9. An improvement in quality and an increase in yield of alkyl diaminodiaryl carbinols can be obtained by carrying out the oxidation of the corresponding alkyl-diaminodiarylmethanes with a suitable oxidant in the presence of  $\text{HCO}_2\text{H}$ ; thus, for example, tetraethyl-(methyl, propyl, etc.)diaminodiphenylcarbinol may be obtained by oxidizing tetraethyl(methyl, propyl, etc.)-diaminodiphenylmethane with lead peroxide in the presence of  $\text{HCO}_2\text{H}$ . Various details and modifications of procedure are described.

**Hydroxy aldehydes.** F. Hoffmann-La Roche & Co. A.-G. Brit. 399,723, Oct. 12, 1933. Phenols contg. a carbinol group in *o*- or *p*-position are oxidized with nitroaryl sulfonic and carboxylic acids in alk. soln., acids contg. a halogen atom in *o*-position to the  $\text{NO}_2$  group being excluded. Among examples (1) vanillin is prepd. from vanillyl alc., *m*-nitrobenzenesulfonic acid or (I) *p*-nitrobenzoic acid being used, and (2) 4-hydroxyvitine-aldehyde is prepd. from dimethylol-*p*-cresol with the aid of I. Cf. C. A. 27, 5337.

**Ketones from unsaturated fatty acids.** Donald K. Tressler (to Mathieson Alkali Works). U. S. 1,941,640, Jan. 2. Higher unsatd. fatty acids such as oleic acid or "red oil" are heated to a high temp. (suitably about 200° and then to 310-320°) in the presence of a ketone-forming catalyst such as reduced iron or Fe oxide while bringing a non-oxidizing gas such as  $\text{CO}$ , into contact with the reaction mixt. from before the reaction begins until after it has been completed. Products thus obtained are of waxy character.

**Wax-like hydroxy ketones.** Donald K. Tressler and Carlisle Schade (to Mathieson Alkali Works). U. S. 1,941,639, Jan. 2. Unsatd. ketones such as oleone are treated with concd.  $\text{H}_2\text{SO}_4$  to convert them into ethereal sulfates and the latter are hydrolyzed to form hydroxy ketones which may be used as substitutes for Chinese insect wax in polishes, etc.

**Imides of ketones.** Edgar C. Britton and Fred Bryner (to Dow Chemical Co.). U. S. 1,938,800, Dec. 12. An alkali metal or Ca salt of a primary amine is caused to react directly with an aromatic ketone, to form products such as benzophenone anil, m. 114° (from aniline, Na and benzophenone), *p*-chlorobenzophenone anil, m. about 64.5°,  $\alpha$ -naphthylimide of benzophenone, m. about 135-6°,  $\alpha$ -naphthylimide of *p*-chlorobenzophenone, m. 159-60°, acetophenone anil, m. 37°, etc. Various details and modifications of procedure are described.

**Amines.** Werner M. Lauter (to The Goodyear Tire and Rubber Co.). Can. 337,669, Dec. 5, 1933. Secondary aromatic amines are prepd. by the reaction in the presence of an alkali metal bisulfate of naphthols, polyhydroxybenzenes, alkylhydroxybenzenes, hydroxyanthracenes and halogen-substituted hydroxybenzenes with aniline, alkylphenylamines, naphthylamines, cyclohexylamine, furfurylamine, benzylamine, *p*-phenetidine, aminobiphenyls, aminophenols, halogen-substituted naphthylamines and halogen-substituted phenylamines.

**Amines.** Röhm & Haas Co. Brit. 399,201, Oct. 2, 1933. Amines are prepd. by treating an aliphatic alc. with  $\text{NH}_3$  or a primary or secondary amine in the presence of a catalyst contg. P, e. g.,  $\text{P}_2\text{O}_5$ ,  $\text{H}_3\text{PO}_4$ ,  $\text{HPO}_4$ ,  $\text{H}_2\text{P}_2\text{O}_7$ ,  $\text{NH}_4\text{H}_2\text{PO}_4$ ,  $(\text{NH}_4)_2\text{HPO}_4$ ,  $\text{AlPO}_4$ , etc. The reaction is preferably effected in the vapor phase at 250-500°.

**Recovering amines and phenols from their aqueous solutions.** Waldo L. Semon (to B. F. Goodrich Co.). U. S. 1,942,833, Jan. 9. Pptn. of a phenol-amine salt is effected by a suitable proportionate addn. of either a phenol or an amine such as required, e. g., in the sepn. of  $\text{PhOH}$  from aq. soln. by the addn. of  $\text{PhNH}_2$ . Various examples are given.

**Diamines.** Werner M. Lauter (to The Goodyear Tire

and Rubber Co.). Can. 337,668, Dec. 5, 1933. Diamines are prepd. by subjecting a chloride of an aliphatic hydrocarbon to heat and pressure in the presence of an aq. soln. of  $\text{NH}_3$  and an ammo salt of Zn, Cu or equiv. metals, and subsequently splitting off the diamine.

**Sulfuric acid esters of fatty acid compounds of high molecular weight.** Hugo Siebenbürger (to Soc. pour l'ind. chim. à Bâle). U. S. 1,942,577, Jan. 9. Reaction is effected between a fatty acid compd. contg. at least one OH group in the fatty acid radical, such as castor oil, and an addn. product of  $\text{SO}_3$  and an org. tertiary base such as pyridine in the presence of an excess of such tertiary base. Cf. C. A. 27, 4540.

***o*-Aminoaryl alkyl sulfones and *o*-aminoaryl aralkyl sulfones.** Kurt Schimmelschmidt and Hans Thomas (to General Aniline Works). U. S. 1,939,416, Dec. 12.  $\alpha$ -(*o*-Nitroarylsulfonyl) fatty acids, -aryl fatty acids and their substitution products may be transformed, with a good yield, into *o*-nitroaryl alkyl or aralkyl sulfones and their substitution products by heating the alkali metal salts of the acids in an aq. feebly acid soln. (suitably without isolation of the initial materials after their formation by oxidation of the  $\alpha$ -(*o*-nitroarylmercapto) fatty acid or -aryl fatty acid in a soln. of alkali bicarbonate). By reduction of the *o*-nitroaryl alkyl sulfones, *o*-nitroaryl aralkyl sulfones and their substitution products, the *o*-amino derivs., are obtained which are suitable for use as dye intermediates.

4-Chloro-2-nitrophenyl methyl sulfone m. 155-6° and on reduction yields 4-chloro-2-amino-phenyl methyl sulfone, m. 87-8°. 4-Trifluoromethyl-2-nitrophenyl methyl sulfone m. 150-1° and on reduction yields the 2-amino deriv., m. 94-5°. 4-Chloro-2-nitrophenyl benzyl sulfone m. 112-13° and on reduction yields the 2-amino deriv., m. 132-3°. In an analogous manner there may be obtained from *o*-nitrophenylsulfonylactic acid, m. 170-1°, *o*-nitrophenyl methyl sulfone, m. 106-7°, and *o*-aminophenyl methyl sulfone, m. 84-5°; from  $\alpha$ -(*o*-nitrophenylsulfonyl)propionic acid, m. 126-8°, *o*-nitrophenyl ethyl sulfone, m. 44-5°, and *o*-aminophenyl ethyl sulfone, m. 74-5°; and from  $\alpha$ -(4-chloro-2-nitrophenylsulfonyl)butyric acid, m. 88-90°, 4-chloro-2-nitrophenyl propyl sulfone, m. 73-4°, and 4-chloro-2-aminophenyl propyl sulfone m. 54-5°. Other nitro compounds

6 and bases obtainable comprise: *o*-nitrophenyl benzyl sulfone, m. 127-8°; *o*-amino deriv., m. 156°; *o*-aminophenyl butyl sulfone, m. 45-7°; *o*-aminophenyl cyclohexyl sulfone, m. 128-30°; 4-chloro-2-nitrophenyl ethyl sulfone, m. 123-5°; 2-amino deriv., m. 87-9°; 4-chloro-2-aminophenyl butyl sulfone, oil, b<sub>p</sub> 225-6°; 5-chloro-2-aminophenyl methyl sulfone, m. 121-3°; 2-amino-1-naphthyl methyl sulfone, m. 140-1°; 4-methyl-2-nitrophenyl methyl sulfone, m. 122-4°; 2-amino deriv., m. 105-6°; 4-methyl-2-nitrophenyl ethyl sulfone, m. 88-9°; 2-amino deriv., m. 102°; 4-methyl-2-aminophenyl butyl sulfone, m. 87-9°; 4-methyl-2-nitrophenyl benzyl sulfone, m. 134-6°; 2-amino deriv., m. 135-6°; 5-methoxy-2-aminophenyl methyl sulfone, m. 100-2°; 4-nitro-2-aminophenyl methyl sulfone, m. 199-200°; 5-nitro-2-aminophenyl methyl sulfone, m. 203-4°; 4-trifluoromethyl-2-nitrophenyl ethyl sulfone, m. 116-18°; 2-amino deriv., m. 42-3°; 4-trifluoromethyl-2-nitrophenyl benzyl sulfone, m. 134-5°; 2-amino deriv., m. 193-5°; 3-nitro-4-methylsulfonylbenzenesulfondimethylamide, m. 176-7°; 3-amino deriv., m. 187-8°; 4-chloro-2-nitrophenyl 4-methylbenzyl sulfone, m. 133-4°; 2-amino deriv., m. 119-20°; 2-nitrophenyl 4-methylbenzyl sulfone, m. 163-4°; 2-amino deriv., m. 163°; 2-nitrophenyl 3,4-dichlorobenzyl sulfone, m. 148-9°; 2-amino deriv., m. 150°.

9 **Alkylated cycloheptanones and cyclooctanones.** Soc. anon. M. Naef & Cie. Ger. 580,713, July 14, 1933. The above derivs. are prepd. by heating suberic or azelaic acid, alkylated in the  $\alpha$ - or  $\beta$ -position, with salts or hydroxides of metals of the 8rd or 4th groups of the periodic table or of uranyl to temps. of 300-400°. Thus, 2,3-dimethylheptane-2,7-dicarboxylic acid is neutralized with NaOH and heated with  $\text{Th}(\text{NO}_3)_4$ . The pptd. Th salt is filtered off, washed and heated to 300-400°. The

product is *1,1,7-trimethylcycloheptane-3-one*, b. 80–83° at 12 mm. Uranyl nitrate may be used instead of  $\text{Th}(\text{NO}_3)_4$ . Another example describes the prepn. of *1,1,8-trimethylcyclooctane-2-one*, b. 105–7° at 12 mm.

**Tertiary alkyl-substituted *o*-dihydroxybenzenes.** Lindley E. Mills and Bruce L. Fayerweather (to Dow Chemical Co.). U. S. 1,942,827, Jan. 9. 1,2-Dihydroxy-4-*tert*-butyl- and amyl-benzenes m. about 47° and may be used as stabilizers for insecticidal compns. such as those prepd. from pyrethrum and rotenone and as antioxidants with animal or vegetable fats, waxes, soaps, etc., and to prevent gum formation in gasoline or the like. They may be prepd. by the hydrolysis of a 2-halo-4-*tert*-alkyl-1-hydroxybenzene in the presence of  $\text{Cu}_2\text{O}$ , and it is generally stated that the *tert*-hexyl, heptyl, octyl, etc., derivs. may be similarly obtained. Examples with details of procedure are given.

**Halonitroanilines.** I. G. Farbenind. A.-G. Brit. 399,769, Oct. 12, 1933. 6-Bromo- and 6-chloro-2,4-dinitroaniline are obtained by passing Br or Cl into an aq suspension of 2,4-dinitroaniline at moderately raised temp., e. g., 40–60°, with continuous stirring. The product is sepd. by filtration. Examples are given.

**Vinyl polymers of low viscosity.** Harold J. Barrett (to E. I. du Pont de Nemours & Co.). U. S. 1,942,531, Jan. 9. A mixt. comprising a vinyl ester or styrene together with an org. peroxide catalyst such as benzoyl peroxide and rosin or a rosin ester is heated (suitably at a temp. of about 110°) to obtain a product of relatively low viscosity.

**Ether derivatives of 1-benzyl-3-methylisoquinoline.** Otto Wolfes. U. S. 1,941,647, Jan. 2. A 1-benzyl-3-methyl-6,7-dialkoxyisoquinoline, such as the 6,7-dimethoxy deriv., is produced by condensing a phenylacetic acid with 1-(3',4'-dialkoxyphenyl)-2-aminopropane, treating thea mide thus obtained with acid condensing agents at temps. of 60–150°, sepg. the cryst. hydrochlorides of the bases thus formed, liberating the free bases from the hydrochlorides by addn. of alkali, and heating the bases with Pd black to about 160–220° for effecting dehydrogenation. 1-(3',4'-Methylenedioxybenzyl)-3-methyl-6,7-methylenedioxyisoquinoline m. 141°; its hydrochloride m. 254° (decompn.).

**Benzanthrone and derivatives.** The Newport Co. Ger. 580,513, July 13, 1933 (Cl. 12v. 10). See Brit. 305,536 (C. A. 23, 4429).

**Camphane derivatives.** Kenzo Tamura, Gyokuzo Kihara, Yasuhiko Asahina and Morizo Ishidate. Fr. 755,069, Nov. 18, 1933. 2,5-Diketocamphane-3-(or 6)-carboxylic acid and 6-hydroxy-3-ketocamphane-2-carboxylic acid (or 5-hydroxy-2-ketocamphane-3-carboxylic acid) are prepd. by introducing  $\text{CO}_2$  into 2,5-diketocamphane or bromo-2,5-diketocamphane in the presence of a catalyst such as Na, K or Mg. An org. solvent such as xylene, toluene or  $\text{C}_6\text{H}_6$  may be used.

**Anthraquinone derivatives.** Imperial Chemical Industries Ltd. and Frank Lodge. Brit. 399,528, Oct. 4, 1933. *N*-Substituted-1-amino-2-sulfoanthraquinones are prepd. by treating a 1-halo-2-sulfoanthraquinone, free from further  $\text{HSO}_3$  groups, with a suitable amine (in the presence of a Cu catalyst). Basic material, e. g., common alkali or excess amine, and solvents may be present. When further reactive substituents are present, particularly halo-substituents, these may also be replaced by the same or a different (substituted) amino group. In examples Na-1-chloroanthraquinone-2-sulfonate is condensed with  $\text{MeNH}_2$  in presence of Cu bronze or with  $\text{PhNH}_2$  in presence of  $\text{Na}_2\text{CO}_3$  and Na 4-bromo-1-chloroanthraquinone-2-sulfonate is condensed with *p*-toluidine in presence of  $(\text{AcO})_2\text{Cu}$  and  $\text{Na}_2\text{CO}_3$ .

**Pyridinium compound.** Soc. pour l'ind. chim. à Bâle. Swiss 159,926, Apr. 17, 1933. A pyridinium compd. contg. an acylated carbon residue contg. an OH group is prepd. by treating pyridine with the  $\text{CH}_3(\text{OH})\text{CH}_2\text{Cl}$  ester of oleic acid.

**Acylbenzoic acid compounds.** Bernard H. Jacobson (to Calco Chemical Co.). U. S. 1,942,430, Jan. 9. An acylbenzoic acid such as *p*-toluyl- or *o*-benzoyl-

acid is formed by reacting, in the presence of anhyd.  $\text{AlCl}_3$  and at a reaction temp. not substantially exceeding 40°, phthalic anhydride with an excess of a liquid benzenoid compd. such as toluene or  $\text{C}_6\text{H}_6$ , and drowning the reaction mass with sufficient cool water contg. an inorg. acid such as HCl to liberate an acylbenzoic acid and produce a dild. mixt. the temp. of which is sufficiently low to prevent the excess of the benzenoid compd. from holding more than a minor portion of the acylbenzoic acid in soln. (the undissolved acylbenzoic acid being directly sepd. from the mixt.). App. is described. Cl. C. A. 28, 491<sup>2</sup>.

**Continuous production of nitro compounds such as nitropentaerythritol.** Josef Meissner. U. S. 1,943,031, Jan. 9. For the continuous production of nitropentaerythritol, pentaerythritol is dissolved in  $\text{H}_2\text{SO}_4$ ,  $\text{HNO}_3$  is added, the mixt. is passed over an extended ascending path (in a described app.) at the reaction temp. while agitated, and mixed acid and crystals of nitrated pentaerythritol are separately discharged (the crystals floating on the surface of the acid). Methylaniline and resorcinol may be similarly nitrated.

**Reaction products of ketene.** George H. Law (to Carbide and Carbon Chemicals Corp.). U. S. 1,942,110, Jan. 2. See Brit. 397,025 (C. A. 28, 780<sup>1</sup>).

**Ketene reaction product.** Marion K. Young, executrix for Charles O. Young, and George H. Reid (to The Carbide and Carbon Chemicals Corp.). Can. 838,162, Dec. 26, 1933. Ketene is formed by the pyrolysis of acetone and the vapors formed are absorbed in the substance with which it is desired to have the ketene react (e. g.  $\text{PhNH}_2$ ,  $\text{AcOH}$ ,  $\text{HOCH}_2\text{CH}_2\text{OEt}$ ,  $\text{R(OH)}$  or  $\text{H}_2\text{O}$ ). If the absorption takes place at ordinary temp., the resultant liquid will contain the reaction product, excess absorbing medium and condensed unchanged acetone. The liquid may be treated for the sepn. or recovery of its several constituents.

**Disubstituted tetrazoles.** Georg Scheuing and Bruno Walach (to E. Bilhuber, Inc.). U. S. 1,943,148, Jan. 9. The formation of hydrazidines takes place according to the equation: (starting from the oximes)  $\text{R}_1\text{R}_2\text{C:NOH} \rightarrow \text{R}_1\text{R}_2\text{C(OAc):NR}_3 + \text{NH}_2\text{NH}_2 \rightarrow \text{R}_1\text{R}_2\text{C(NR}_3\text{)NHNH}_2$  (I) (or starting from the acid amides)  $\text{R}_1\text{CONHR}_2 \rightarrow \text{R}_1\text{C(OAc):NR}_2 \rightarrow \text{I}$ . The hydrazidines thus obtained may be converted into tetrazoles by further treatment with compds. contg. and yielding the nitrous acid radical under the conditions of the process according to the

equation:  $\text{I} + \text{HNO}_2 \rightarrow \text{R}_1\text{R}_2\text{C:N:N:N.NR}_3$ . The enol esters of the mono-substituted acid amides serving as starting materials need not be employed in a pure isolated form but can be used in the form in which they result in the reaction mixt., for example in the intramol. rearrangement of oxime esters or in the esterification and enolization of mono-substituted acid amides. Since the free hydrazidines are unstable and difficult to handle as well as the enol esters of the monosubstituted acid amides it is in general advisable to avoid isolating them and to carry out the conversion in one step by starting with oximes or oxime esters or from mono-substituted acid amides or their esters. Several examples with details of procedure are given.

**Stabilization of organic nitrates.** James H. Werntz (to The Canadian Industries Ltd.). Can. 336,584, Oct. 24, 1933. Aliphatic nitrates are stabilized by dissolving in a solvent comprising ethylene oxide and acetone and then removing the solvent.

**Organic disulfides.** Howard I. Cramer (to The Good-year Tire and Rubber Co.). Can. 337,670, Dec. 5, 1933. Cyclic disulfides are prepd. by oxidizing the corresponding cyclic dithiocarbamates with a persulfate.

**Water soluble metal carbamates.** Robert B. MacMullin (to Mathieson Alkali Works). U. S. 1,942,610, Jan. 9.  $\text{NH}_3$  carbamate is caused to react with a water-sol. salt such as KCl, NaCl or  $\text{CaCl}_2$  in aq. soln. at a temp. below about 10° to ppt. the carbamate of the metal.

**Aluminum formate and acetate.** Max Schwarz, Fritz Zschimmer, Erich Zschimmer, Rudolf Schwarz and

Werner Schwarz (trading as Zachimmer & Schwarz<sup>1</sup> Chemische Fabrik Dörlau). Brit. 399,737, Oct. 12, 1933. See Ger. 574,452 (C. A. 27, 5085).

**Aliphatic acids.** British Celanese Ltd., Horace F. Oxley and Walter H. Groombridge. Brit. 399,520, Oct. 9, 1933. AcOH and other aliphatic acids are concd. by extg. with a low-boiling solvent, e. g., Et<sub>2</sub>O (partly) removing the solvent from the ext. and then adding an entraining agent, e. g., C<sub>6</sub>H<sub>6</sub>, s-C<sub>4</sub>H<sub>9</sub>Cl<sub>2</sub>, C<sub>6</sub>H<sub>5</sub>Cl<sub>2</sub>, C<sub>6</sub>HCl<sub>5</sub>, AcOEt, AcOBu and distg. to remove the H<sub>2</sub>O as an azeotropic mixt. of lower b. p. than the acid.

**Gluconic acid and its lactones.** Richard Pasternack and Wm. R. Giles (to Chas. Pfizer & Co.). U. S. 1,942,660, Jan. 9. Crystn. from an "over-satd." aq. gluconic acid soln. is effected with temp. ranges so selected as to det. the product of crystn. by excluding transition temps.

**Separating acetic acid from acetic anhydride.** Richard Möller, Hans Hatzig and Erich Rabald (to C. F. Boehringer & Soehne G. m. b. H.). U. S. 1,941,951, Jan. 2. See Ger. 584,571 (C. A. 28, 1055).

**Hydroxybenzoquinolinecarboxylic acids.** Leopold Laska and Oskar Haller (to General Aniline Works). U. S. 1,942,108, Jan. 2. See Ger. 571,832 (C. A. 27, 4414).

**Benzoic acid.** Courtney Conover (to Monsanto Chemical Co.). U. S. 1,942,380, Jan. 2. A mixt. of molten phthalic anhydride and a decarboxylating catalyst such as one contg. Al and Cr compds. is heated in the presence of water (suitably at a temp. of about 280°) to produce benzoic acid. U. S. 1,942,390 also relates to a similar process.

**Separating o- and p-halobenzoic acids.** Lindley E. Mills (to Dow Chemical Co.). U. S. 1,942,826, Jan. 9. Aq. mixts. of these acids or their water-sol. salts have their *p*<sub>H</sub> adjusted to a point (suitably about 4.5) at which *p*-halobenzoic acid is present in free and undissolved form and *o*-halobenzoic acid is present in dissolved form as a water-sol. salt.

**Aliphatic anhydrides.** British Celanese Ltd., Horace F. Oxley, Leonard Fallows and Henry Dreyfus. Brit. 399,793, Oct. 2, 1933. Aliphatic acids are thermally treated at above 550° in presence of catalysts promoted by non-reducible metal oxides other than WO<sub>3</sub>, and the oxides of As and Sb. Suitable mixts. are molten Na<sub>2</sub>P<sub>2</sub>O<sub>7</sub> contg. 2% Na<sub>3</sub>P<sub>2</sub>O<sub>7</sub> and 5% CaO or 4% TiO<sub>2</sub> and solid CaWO<sub>4</sub> with 10% CaO, 5% Al<sub>2</sub>O<sub>3</sub> or 13% V<sub>2</sub>O<sub>5</sub>.

**Aliphatic anhydrides.** Henry Dreyfus. Brit. 399,792, Oct. 2, 1933. The corresponding acids are thermally treated in presence of 5-25% of H<sub>2</sub>O vapor. The vapor may be introduced by evapg. an acid contg. the requisite amt. of H<sub>2</sub>O. The reaction temp. may be 550-900° and the vapor may be preheated to 210-350°. Suitable catalysts may be present, those yielding Me<sub>2</sub>CO as described in Brit. 250,664 (C. A. 21, 2006) being excluded. Cf. C. A. 28, 783<sup>1</sup>.

Straight-tube heat-exchangers, applicable to the con-

densation of acetic anhydride vapor. British Celanese Ltd. Brit. 399,803, Oct. 19, 1933.

**Acetylene from methane.** Thomas S. Wheeler and David Binnie (to Imperial Chemical Industries Ltd.). U. S. 1,942,889, Jan. 9. A mixt. of CH<sub>4</sub>, H and Cl is passed through a reaction tube which may be formed of silica at a min. velocity of about 64,000 cm. per min. and at a high temp. obtained by the exothermic formation of HCl in the mixt.

**Elimination of acetylene from gases.** Marion K. Young, executrix for Charles O. Young (to The Carbide and Carbon Chemicals Corp.). Can. 337,317, Nov. 21, 1933. C<sub>2</sub>H<sub>4</sub> contg. C<sub>2</sub>H<sub>2</sub> is scrubbed with acetone. The residual gas contg. C<sub>2</sub>H<sub>2</sub> is passed through a catalyst at a rate up to 30 cc. of gas per min. per g. of catalyst. The catalyst is prepd. by impregnating pea-size filters with Cu(NO<sub>3</sub>)<sub>2</sub>, roasting and reducing with H at 220-50°. The catalyst is maintained at 195° during the process. The C<sub>2</sub>H<sub>4</sub> after treatment is free from C<sub>2</sub>H<sub>2</sub>. The spent catalyst is revived by passing air or other O-contg. gas through it at 250° and reducing with H.

**Acetaldehyde.** Russell W. Millar and Leo V. Steck (to The Shell Development Co.). Can. 337,706, Dec. 5, 1933. AcH is prepd. from C<sub>2</sub>H<sub>2</sub> by hydrating with a soln. contg. free acid, a Hg compd. (calcd. as HgO) and an acid salt of alkali metal or NH<sub>4</sub> in the proportions of 21:1:100 parts by wt.

**1-Phenyl-2-amino-1-propanol.** I. G. Farbenind. A.-G. (Max Bockmühl, Gustav Ehrhart and Leonhard Stern, inventors). Ger. 587,586, Nov. 6, 1933 (Cl. 12q 32.21). 1-1-Phenyl-2-keto-1-propanol is reduced with H and noble metal catalysts in the presence of NH<sub>3</sub> or primary amines except CH<sub>3</sub>NH<sub>2</sub>. Alternatively, the keto-propanol may be treated with NH<sub>4</sub>OH and the resulting oxime reduced to give the amino compd. This may be alkylated. Examples are given. The HCl salt m 174-5°.

**Dibenzanthrone.** Herbert J. West (to Selden Co.). U. S. 1,941,771, Jan. 2. In the production of dibenzanthrones by the alkali fusion process, oxidizing agents such as NaNO<sub>2</sub> or NaClO<sub>2</sub> are added to the melt before dissolving it in water, in order to facilitate obtaining of a product free from objectionable impurities.

**Polyglycidols.** Georg Frank. Ger. 575,750, Aug. 22, 1933. These are prepd. by polymerizing monomeric glycidols at low temps. by the aid of catalysts. Thus, glycidol is stirred rapidly at -25° and SnCl<sub>4</sub> added drop by drop to produce a polyglycidol.

**Separation of a mixture of alizarin blue and alizarin yellow.** M. A. Il'inskiĭ. Russ. 27,750, July 31, 1931. In the sepn. of blue from yellow alizarin by a treatment with chalk of solns. of their alkali salts, the melt containing mixts. of mono- and di-sulfonates of anthraquinone is neutralized with caustic and transferred into soln. by means of alkali carbonate. This soln. is treated with powdered chalk to ppt. the calcium deriv. of alizarin, while the filtrate from the latter is acidified for the pptn. of flavo- and iso-purpurin.

## 11—BIOLOGICAL CHEMISTRY

PAUL E. HOWE

### A—GENERAL

ARTHUR W. DOX

**Tastes of glutamic acid and related compounds.** II. Tastes of some derivatives of *dl*-glutamic acid. Chao-Lun Tseng and Edith Ju-Hwa Chu. *J. Chinese Chem. Soc.* 1, 189-98(1933); cf. C. A. 26, 484.—The most convenient method for prepg. *dl*-glutamic acid is racemization, by heating the *d*-acid with Ba(OH)<sub>2</sub> and H<sub>2</sub>O in an autoclave under 1.5 atm. for 9 hrs. Derivs. of the *dl*-acid including the Na, K, Li, Ca, Ba, Mg, Sr monobasic salts, the HCl and H<sub>2</sub>SO<sub>4</sub> salts, Me ammonium salts, the Et ester and acyl derivs. were prepd. Of these compds., the Na, K, Li monobasic salts possess intensely meat-

like tastes similar to mono Na *d*-glutamate. The tastes of these *dl*-compds. did not always correspond to those of the corresponding *d*-compds. Wm. H. Adolph

*p<sub>H</sub>* in microbiology. J. Made Castro Marçal. *Rev. bras. med. pharm.* 9, 245-68(1933). E. S. G. B.

A formula and nomogram for the estimation of the osmotic pressure of colloids from the albumin and total protein concentrations of human blood sera. Herbert S. Wells, John B. Youmans and David G. Miller. *J. Clin. Investigation* 12, 1103-17(1933).—From the detn. of the osmotic pressure of colloids and the total protein, albumin and globulin concns. in 53 persons, the following formula is derived:  $P = C(21.4 + 5.9 A)$ , where *P* is the osmotic pressure in mm. water, *C* the total protein

concn. and  $A$  the albumin concn. in g. per 100 cc.

The liquefaction and saccharification of starch by the action of amylases from different sources. G. Orestano. *Arch. farmacol. sper.* 56, 388-406(1933); cf. C. A. 27, 1646.—Inactivation of soy bean (I), malt (II) and pancreatic (III) (dog) amylase by dry heat has given evidence concerning the no. and kinds of enzymes present in these preps. After drying to const. wt. over  $\text{CaCl}_2$ , I, II and III were heated for 0.5 hr. at various temps. Enzymic activity was measured by (1) decrease in viscosity of crude starch suspensions, (2) disappearance of substances giving a color with I when both crude (IV) and sol. (V) starch were digested, and (3) formation of reducing sugars from both IV and V. Complete inactivation of dry I, II and III was brought about by heating at 140-50°. Regardless of what method was used in following changes in enzymic activity no partial specific inactivation by dry heat was observed, i. e., there was no evidence for the presence of 2 component enzymes, one converting starch to achroodextrin and another converting the latter to maltose. With low concns. of II, however, heating at 130° produced inactivation so far as ability to convert V to maltose was concerned, but did not completely destroy the activity as measured by the other methods. This exceptional behavior of II was not observed if the II concn. was sufficiently increased. From these results O. constructs the following hypothesis. III contains only  $\alpha$ -amylase (acting upon  $\alpha$ -glucoside linkages, starch  $\rightarrow$  high-mol. substance  $\rightarrow$  maltose) since the ratio (velocity of liquefaction)/(velocity of saccharification) is relatively high. I contains only one component, probably  $\beta$ -amylase (acting upon  $\beta$ -glucoside linkages, starch  $\rightarrow$  maltose directly) since the above ratio of velocities is relatively small. II contains both  $\beta$ -amylase and  $\alpha$ -amylase (or  $\alpha$ -amylase + kinase), the latter in greater proportion. Heating at 130° inactivates the small amt. of  $\beta$ -amylase without destroying all of the  $\alpha$ -amylase. IV and V differ in the relative no. of  $\alpha$ - and  $\beta$ -glucoside linkages contained.

Lewis W. Butz

The influence of side chains on oxidation processes in the body. II. Model experiments on the biological breakdown of carotene pigments. Richard Kuhn and Kyriako Livada. *Z. physiol. Chem.* 220, 235-46(1933).—The resistance of carotenes to biol. oxidation may be due in part to their insol. in aq. media and their tendency to accumulate in fatty tissue, and in part to the presence of the branched grouping:  $\text{CHCH}:\text{CMeCH}:$  contg. a  $\beta$ -Me. To det. whether this grouping is amenable to the usual  $\beta$ -oxidation, the Ph derivs. of a no. of satd. and unsatd. acids with  $\alpha$ - and  $\beta$ -alkyl substitution were fed to dogs and rabbits and the urines examd. for oxidation products.  $\alpha$ -Methylcinnamic acid undergoes oxidation to  $\text{BzOH}$ , which is excreted as hippuric acid, while the corresponding Et deriv. and its isomeric crotonic acid,  $\text{PhCH}_2\text{C}(\text{CHMe})\text{CO}_2\text{H}$ , are excreted unchanged. Of the  $\beta$ -Me derivs.,  $\text{PhCMe}:\text{CHCO}_2\text{H}$  is paired with glycine and thus excreted, and  $\text{PhCHMeCH}_2\text{CO}_2\text{H}$ ,  $\text{PhCH}:\text{CHCMe}:\text{CHCO}_2\text{H}$  and  $\text{PhCH}_2\text{CH}_2\text{CHMeCH}_2\text{CO}_2\text{H}$  are excreted unchanged. Citral undergoes an  $\omega$ -oxidation to  $\text{HO}_2\text{CMe}:\text{CHCH}_2\text{CH}_2\text{CMe}:\text{CHCO}_2\text{H}$ . It thus appears that alkyl groups on the side chain, instead of undergoing dealkylation, may cause unexpected changes in the behavior of the substance. In general, the biol. breakdown of a substance is impeded by the presence of Me in the  $\beta$ -position. A. W. Dox

The refractive index of protoplasm. A. M. Frederikse. *Protoplasma* 19, 473-84(1933).—The method of Chaunles has been to det. the  $n$  of the protoplasm of *Amoeba vermicosa*.

F. L. Dunlap

The kinetic energy of some cell constituents. A. Kalkanov. *Protoplasma* 20, 20-30(1933).—Twenty-three references.

F. L. Dunlap

Studies on the physiology of ciliary movement. II. Intracellular oxidation-reduction potential limiting the ciliary movement. Shichiroku Nomura. *Protoplasma* 20, 85-9(1933); cf. C. A. 26, 3850.

F. L. Dunlap

Mathematical theory of oxygen consumption at low oxygen pressures. N. Rashevsky. *Protoplasma* 20,

125-30(1933).—"A math. analysis of the diffusion of O into a cell is made, under the assumption that the true rate of O consumption by protoplasm is const. and independent of the O pressure. The results are compared with exptl. data. For unfertilized *Arbacia* eggs and for bacteria the exptl. curves do not conform to the theory. Some addl. assumptions, like those proposed by Gerard, seem unavoidable. For fertilized *Arbacia* eggs a good agreement can be obtained by taking for the diffusion coeff. of O through the protoplasm  $7 \times 10^{-7}$  sq. cm. min.<sup>-1</sup>, and for the permeability of the cell surface to O  $4.25 \times 10^{-4}$  cm. min.<sup>-1</sup>."

F. L. Dunlap

Germ layer origin and mitotic potentiality of regenerating tissues in *Clymenella torquata*. Frederick S. Hammett. *Protoplasma* 20, 181-8(1933).—"Mitotic activity is enhanced by SH and held back by its sub-oxidized deriv. in the 3 chief germ layer derivs. of regenerating *Clymenella torquata*. Growth by increase in cell no. is found to be regulated by the naturally occurring essential chem. equil. comprised of these chem. groups. The degree of enhancement of mitotic activity by SH differed in the 3 types of growing tissue. The inference is drawn that relative proliferation intensity has played an important role in evolution. The mesodermal deriv. exhibited the greatest mitotic potentiality. In this property lies, in significant part, an explanation for the greater diversity of differentiated mesodermal end-products."

F. L. Dunlap

The theoretical physics of the cell as a basis for a general physicochemical theory of organic form. N. Rashevsky. *Protoplasma* 20, 180-8(1933).—"It is shown by thermodynamical considerations that, in general, regardless of the particular nature of a cell, there must be 2 kinds of forces between cells: a force of repulsion, due to metabolism, and a force of attraction, due to irritability. The various geometrical forms, which cellular aggregates may assume under the influence of those forces, correspond in general features to various forms found in nature."

F. L. Dunlap

Hemolysis and the solar spectrum. W. W. Lepeschkin and G. E. Davis. *Protoplasma* 20, 188-94(1933).—"The spectral distribution of radiation efficiency in decreasing the stability of red blood corpuscles corresponds very closely to the spectral distribution of the power of oxy-hemoglobin to absorb radiation. This correspondence clearly indicates that it is a chem. change in the hemoglobin which is responsible for the decrease in resistance of the corpuscles and hemolysis produced by light. In other words, hemolysis is not due to some change in the colorless membrane of the red corpuscle, but to a chem. change in the hemoglobin; i. e., in one of the components of the principal compds. constituting the protoplasm of the erythrocytes."

F. L. Dunlap

Necrobiotic rays. I. W. W. Lepeschkin. *Protoplasma* 20, 232-50(1933); cf. C. A. 27, 316.—The formation of ultra-violet rays in the process of necrobiosis was investigated principally in yeast cells, although this phenomenon was found in other plant cells, such as *Helodea* leaves, *Bacillus subtilis*, petals, etc. The emission of ultra-violet rays can be shown by the use of light-sensitive Ag salts. AgBr suspensions, photographic plates, as well as a compd. of Ag with org. substances of the yeast, were used as detectors of necrobiotic rays. Particularly convincing were the expts. with AgBr suspensions in quartz tubes, shaken in suspensions of dying yeast. The necrobiotic rays of yeast are absorbed to a great degree by glass and the gelatin of photographic plates, but not by air and water. Their wave length lies principally between 1800 and 2300 Å. They contain, however, a small proportion of rays with a wave length greater than 2300 Å. The wave lengths of necrobiotic rays lie very close to those of the mitogenetic rays. It can hardly be doubted that in cases where mitogenetic rays are induced by any necrobiotic process, the rays are in reality necrobiotic rays. It is further possible that in all cases where mitogenetic rays have been observed, these rays arise from a disintegration process of basal substances in living material during energetic physiol. processes, so that they

are in such cases also to be looked on as necrobiotic rays. From the standpoint of modern photochemistry, the production of ultra-violet rays during the process of necrobiosis is in agreement with the fact that ultra-violet rays increase the stability of living matter toward destructive influences, because this increase may be explained by a synthetic action of ultra-violet rays on the products of decompn. of the basal compds. of living matter F. L. D.

**Influence of preservatives on the action of enzymes.** Hans Kluge. *Z. Untersuch. Lebensm.* 66, 412-35 (1933).—A study has been made of the influence of different substances on the enzymes which split starch, fat and proteins. BzOH and its derivs. do not interfere with the activity of enzymes which split starch and fats. The protein-splitting enzyme pancreatin is arrested by the chem. preservatives formalin, salicylic acid,  $\text{Na}_2\text{SO}_3$ , NaF, BzOH and its derivs. Small amts. of BzOH and BzONa showed no harmful effects when fed to healthy guinea pigs. In animals, whose resistance is reduced because of scurvy, BzONa and BzOH are strongly injurious.

F. L. Dunlap

**Influence of preservatives on enzymic processes.** B. Bleyer, W. Diemair and K. Leonhard. *Arch. Pharm.* 271, 539-52 (1933).—The results obtained in a comprehensive study of the behavior of some 15 different preservatives toward both enzymes (pancreatin, pepsin, trypsin, erepsin, lipase, dehydrogenase, peroxidase) and substrate are discussed and tabulated. The question, whether and how chem. preservatives affect enzymic processes, may be answered by the bipartite manner of expt. followed, whether applied directly to the substrate or first to the enzyme. Certain differences in behavior observed afford grounds for a more cautious evaluation of lab. expts. and their application to practical conditions involved in the process of digestion. Noteworthy in this connection is the difference in behavior of the preservative, whether applied as acid or as Na salt, with actual acidity identical in both cases. The reason therefor is as yet unexplained. Of the several substances examd. ( $\text{CH}_3\text{CO}_2\text{Na}$ ,  $\text{H}_2\text{O}_2$ , and (with few exceptions) NaOH) are relatively inert toward enzymes; salicylic acid and saccharin show, on the other hand, marked activity. The behavior of other substances tested renders them somewhat difficult of classification, since some in amylolytic degradation exert a restraining influence, while in peptic degradation on the other hand they function only partially thus or not at all. Furthermore, the "activating" influence of some preservatives toward dehydrogenases and peroxidases are so striking and clear as to be worthy of particular mention. Of the 3 hydroxybenzoic acids the *m*-acid occupies a middle position with respect to their inhibitory and activating properties. The esters of the *p*-acid present a characteristic picture. While the amylolytic activity remains unimpaired, both peptic proteolysis and lipolysis suffer inhibition, and it thus develops that the "nipasol" preps. (Et esters) are more highly active than the "nipagin" preps. (Me esters). Noteworthy too are the cases in which activation is developed by these preservatives up to 100%, as shown in trypsin, dehydrogenase and peroxidase expts. This activation sets in stronger with "nipagin" than with "nipasol," being observable likewise in tryptic degradation, as well as in the peroxidase expts. with free *p*-hydroxybenzoic acid. The "albenal" preps. are in the usual concn. more weakly active, as contrasted in enzymic processes, than BzOH,  $\text{CH}_3\text{CO}_2\text{Na}$ ,  $\text{K}_2\text{S}_2\text{O}_8$  and "mikrobin." An evaluation of the customary preservatives in their higher or lower action on enzymic processes, and hence on the digestion and general compatibility, is naturally possible only by the simultaneous consideration of their varying action on the microorganisms commonly encountered in food and drug spoilage.

W. O. E.

**Osmotic properties of the erythrocytes.** III. The applicability of osmotic laws to the rate of hemolysis in hypotonic solutions of nonelectrolytes. M. H. Jacobs. *Biol. Bull.* 62, 178-94 (1932); *Physiol. Abstracts* 18, 26; cf. C. A. 27, 3979.—Equations are derived for predicting the relation between the time required for osmotic hemoly-

sis and the concn. of a surrounding hypotonic medium. It is shown that when allowance is made for certain known peculiarities of the erythrocyte the rate of hemolysis is, on the whole, in fairly good agreement with osmotic laws. Reasons are given for believing that the increased osmotic resistance of the erythrocyte that develops within a few seconds in solns. of nonelectrolytes is not caused by leakage of salts from the cell, but rather by a changed ionic equil. in which the normal impermeability of the cell to cations need not be lost. Rough ests. are made of the permeability of the erythrocytes of the ox and of man to  $\text{H}_2\text{O}$ . IV. Is the permeability of the erythrocyte to water decreased by narcotics? M. H. Jacobs and A. K. Parpart. *Ibid.* 313-27.—The observation of previous investigators that narcotic substances in proper concns. tend to oppose osmotic hemolysis is confirmed in the case of several urethans. The conclusion frequently drawn from such observations, that the antihemolytic effect of narcotics is due to a decreased permeability of the erythrocyte to water, is unwarranted by the existing exptl. evidence. The necessity for a sepn. of "rate" and "equil." factors in studies on osmotic hemolysis is emphasized. It is shown by expts. in which these factors are properly sepd. that a slight but measurable retardation of osmotic hemolysis may be produced by low concns. of urethans G. G

**The ultrafiltration of serum and plasma.** Chlorine, potassium, sodium, calcium and magnesium contents of the ultrafiltrates from serum and plasma. Jeanne Lévy and Marie M. Pacu. *Bull. soc. chim. biol.* 15, 1317-20 (1933); cf. C. A. 27, 4256.—Methods are described. All the Cl, 95% of the K, about 90% of the Na and (60-70% of the Mg of both serum and plasma are ultrafilterable. Serum Ca is 64% and plasma Ca 72% ultrafilterable. With 27 references. Proteins and cations of blood serum. Jeanne Lévy and F. Gallais. *Ibid.* 1340-5.—The non-ultrafilterable fractions of Na and K of serum are equal to the fractions of these cations fixed in the proteins pptd. from the serum by EtOH. While 32% of the serum Ca is non-ultrafilterable, 61% of it is fixed in the proteins pptd. by EtOH. L. E. Gilson

**Effect of heat on enzyme activity.** S. Trautmann and L. Ambard. *Compt. rend. soc. biol.* 114, 10-11 (1933), cf. C. A. 28, 787<sup>1</sup>.—The increase in activity of an amylase soln. with rise in temp. is affected by NaCl. With but 1 mg. NaCl per l. the activity-increase factor for 10° rise is 1.04; with 1 g. NaCl per l. the factor is 2.14. The influence of NaBr is similar but weaker and that of NaI still weaker L. E. Gilson

**Further study of actions at a distance on rabbit bone marrow.** Eugénie Soru and R. Brauner. *Compt. rend. soc. biol.* 114, 1201-2 (1933); cf. C. A. 28, 502<sup>2</sup>.—Mitogenic rays are given off by the system quinone-hydroquinone-methylene blue and also by fresh lemon juice and tomato juice. L. E. Gilson

**Action of some pure metals on the growth of fibroblasts in vitro.** G. Ménégally, D. Odiette and P. Mover. *Compt. rend. soc. biol.* 114, 1287-90 (1933)—Minute disks of pure metals were placed in drop cultures of chick embryo fibroblasts. Cu, Fe and Mg were very toxic; Zn, Ag, Ta, Sn, Ni and W were somewhat toxic and Au, Al and Pb non-toxic. None of the metals stimulated growth. L. E. Gilson

**The absorption spectrum of visual purple and visual yellow.** The "after fading" of visual yellow in the dark V. Hosoya. *Arch. ges. Physiol. (Pflügers)* 233, 57-66 (1933).—Absorption spectra are given for solns. of visual pigments. The max. absorption for visual purple in different solvents is 510 mμ and is unaffected by fading

Arthur Grollman

**The enzymic hydrolysis of acetylcholine.** R. Ammon. *Arch. ges. Physiol. (Pflügers)* 233, 486-91 (1933).—The enzymic hydrolysis of acetylcholine was followed in a Warburg app. The inhibiting effects of certain drugs (physostigmine, guayacine, etc.) indicate the existence of a specific cholinesterase. Arthur Grollman

**Physiological and thermal investigations on rapid substances.** S. Michael and G. Limmer. *Arch. ges.*

*Physiol. (Pflüger)* 239, 645-51 (1933); cf. *C. A.* 27, 742.—An attempt was made to correlate the sensitivity of the tongue to chem. substances with the heats of soln. of these substances. The tongue is sensitive to temp. differences of 1° to 2° and hence can differentiate a mixt. of 5%  $\text{KNO}_3$  in  $\text{NaBr}$  from pure  $\text{NaBr}$  by their different heats of soln.

The importance of potassium to plant and animal life. F. Honcamp. *Ernähr. Pflanze* 29, 373-7 (1933); cf. *C. A.* 27, 5760.—The previous discussion is concluded.

John O. Hardesty

Differential inactivation of insulin. Burt Davis, Jr., James M. Luck and Albert G. Miller. *Biochem. J.* 27, 1643-7 (1933).—Inactivation of insulin by acid-alc. and by soft x-rays shows that the phosphate-lowering activity of insulin is the most resistant to destruction. Massive doses of insulin inactivated by x-rays produced hyperglucemia. Insulin owes its multiple activity to a no. of "active groups," which vary in stability toward activating agents.

Benjamin Harrow

Effect of deamination on the combination curves of serum albumin and globulin. E. B. R. Prideaux and D. E. Woods. *Proc. Roy. Soc. (London)* B114, 110-23 (1933).—The deamination products of these serum proteins have combination curves of the same type as those of the original proteins. However, displacements may occur, because of loss of  $\text{NH}_2$  groups, principally by lysine. Some introduction of NO groups also takes place.

Joseph S. Hepburn

Crystalline chlorocruorin. Jean Roche and H. Munro Fox. *Proc. Roy. Soc. (London)* B114, 161-7 (1933).—Cryst. oxychlorocruorin was prepd. from the blood of the polychete worm, *Sporoglyphis spallansani*. In the absorption spectrum of oxychlorocruorin, the axes of bands occurred at 6025, 5625, 5150, 4450, 3600 and 2750 Å. On elementary analysis, chlorocruorin yielded C 49.2, H 7.3, N 15.4, S 2.6, Fe 1.2%. The chlorocruorin mol. contained more S, Fe and hematin, and less protein than the hemoglobin mol. The protein of chlorocruorin was not identical with globin. The band axes in the absorption spectrum of CO-chlorocruorin were at 594 and 434 mμ. For further details cf. *C. A.* 28, 181<sup>1</sup>.

Problems of modern enzyme chemistry. Richard Willstätter. *Chem. Rev.* 13, 501-12 (1933).—The Willard Gibbs Medal Address for 1933.

Louise Kelley

Ultracentrifugal study of crystalline pepsin. J. S. I. Philpot and Inga-Britta Eriksson. *Nature* 132, 932-3 (1933).—Cryst. pepsin, prepd. by a method closely resembling that of Northrop (*C. A.* 24, 5318), was examd. in the ultracentrifuge. The velocity method gave a sedimentation const. of  $3.3 \times 10^{-13}$  as a mean of 7 detns.; the equil. method gave a mol. wt. of 35,500 as a mean of 2 detns. The mol. is spherical, and in wt. and shape belongs to the same class of proteins as ovalbumin, Bence-Jones protein and insulin. The ultracentrifuge also yielded information as to the homogeneity of the preps. studied. Some well-crystd. preps., even after thorough washing, contained appreciable quantities of particles, some slightly smaller than the main group and some so small as to be non-centrifugible. Most of these smaller particles were removed in the 1st stage of purification (pptn. with  $\text{MgSO}_4$ ), as shown by the rise in the mean value of the sedimentation const. of the centrifugible part, by the decrease in the non-centrifugible part and by the increase in sharpness of the sedimentation boundary.  $\text{MgSO}_4$  was a more selective precipitant than  $(\text{NH}_4)_2\text{SO}_4$  and its selectivity increased with diln. The next 2 stages (pptn. with  $\text{H}_2\text{SO}_4$  and crystn. by cooling from 45°) raised the sedimentation const. to  $3.0-3.3 \times 10^{-13}$  and further improved the sharpness of the boundary. In all the expts. the  $p_H$  was kept at 4-5 during centrifuging, by dil. acetate buffers; 0.2 N  $\text{NaCl}$  was added to suppress the Donnan effect. A  $p_H$  of a little above 0 apparently had no instantaneous effect on the mol. wt., but only produced slow acid hydrolysis. In this respect the pepsin protein is unique. An exposure of 10 min. to  $p_H$  9, followed by  $p_H$  3.0, caused the formation of about 80% of an aggregate having a sedimentation const. of about 12, while the rest

became very inhomogeneous. This treatment corresponds to the instantaneous alk. inactivation which Northrop and others (*C. A.* 25, 5908) have shown to be partly reversible.

Louise Kelley

Diatase in liver. Eduard H. Majer. *Z. ges. expil. Med.* 90, 865-8 (1933).—The diastatic activity of liver is completely extractable by phosphate buffers. M. L.

The influence of photocatalysts on the action of enzymes. Guido Guerrini. *Boll. soc. ital. biol. sper.* 8, 1357-80 (1933).—The actions of 16 photocatalytic substances were studied on *S. cerevisiae* in the presence of glucose, by taking the amt. of  $\text{CO}_2$  liberated as the index of activity. The results showed that photocatalysts in the presence of light have an inhibiting action on enzymes, but the inhibition is manifested only in high concns. In low concns., with the exception of Nile blue, Magdala red, benzoflavine and trypanflavine, they exert a stimulating action. The mode of action of the photocatalysts is, therefore, a function of the amt. used. There is no relation between photocatalytic action, hemolytic titer and spectroscopic behavior of the substances studied.

Peter Masucci

The decolorization of methylene blue produced by milk or animal tissue. Augustin Boutaric and Tony Jacquinot. *Bull. acad. méd.* 109, 114-18 (1933); cf. *C. A.* 27, 187.—The effect of the addn. of antioxidants, bases, acids or salts on the time of decolorization of methylene blue by  $\text{CH}_3\text{O}$  is the same whether in the presence of milk or animal tissue.

A. E. Meyer

The influence of serum on the decolorization of methylene blue by liver tissue and milk. Augustin Boutaric and Tony Jacquinot. *Bull. acad. méd.* 109, 522-5 (1933).—The decolorization of methylene blue by glycerol-liver ext. in presence of  $\text{NaHCO}_3$  and by milk, both in the presence of  $\text{CH}_3\text{O}$ , is increased by addn. of serum. However, the effect is not much different from that obtained with salts alone in the concn. as present in serum. Sera contg. anti-toxin vary widely in relation to their sp. qualities.

A. E. Meyer

The enzyme-activating (zymosthenic) action in vitro of some mineral waters on the glucolytic enzyme of the blood. M. Loeper, A. Mougeot and V. Aubertot. *Bull. acad. méd.* 109, 256-7 (1933); cf. *C. A.* 27, 741.

A. E. Meyer

Serum proteins prepared by the acetone or salt method. Ch. Achard, Augustin Boutaric and Maurice Piettre. *Bull. acad. méd.* 109, 618-27 (1933).—Serum proteins pptd. either with  $\text{Me}_2\text{CO}$  or  $\text{Na}_2\text{SO}_4$  have been investigated with reference to viscosity of solns., sensibilization of colloidal  $\text{Fe}(\text{OH})_3$ , surface tension, etc. The salt method leads to simple equil. variable by many phys. factors.

A. E. Meyer

The influence of the  $p_H$  and the buffer effect of salts containing solutions of cocaine hydrochloride on the maintenance of the physiological action during sterilization and aging. Jean Régner and Robert David. *Bull. sci. pharmacol.* 40, 650-7 (1933).—Buffer solns. composed of  $\text{Na}_2\text{CO}_3$  and  $\text{NaH}_2\text{PO}_4$  or  $\text{NaH}_2\text{PO}_4$  and  $\text{Na}_2\text{HPO}_4$  do not change when heated, with exception of the first one at high alk. ranges. No change occurs when 1% cocaine is dissolved in these solns. The alk. and neutral solns. lose the anesthetic activity completely by heating; the acid soln. loses most of it; only very weakly buffered acid solns. show no loss. The  $p_H$  shifts to the acid side by heating. Solns. satd. with  $\text{CaCO}_3$  or  $\text{MgCO}_3$ , which are close to neutrality, retain their potency during sterilization but deteriorate afterward and are inferior to solns. of cocaine in  $\text{H}_2\text{O}$ . All solns. which preserved their activity establish an equil. at a  $p_H$  3.8, and the loss during heating is the higher, the more resistance against this acidification is exerted by the salts present.

A. E. Meyer

Comparison of human pancreatic and liver esterases. R. Ammon and E. Tabor. *Biochem. Z.* 247, 26-31 (1933).—The esterase from human pancreas hydrolyzes preferably the l-esters in *dl*- $\text{PhCHOHCO}_2\text{Me}$  and *dl*- $\text{PhCHOHCO}_2\text{Pr}$ . The enzyme is unaffected by the initial substrate concn. or by the addn. of zymokinin. The

pancreatic powder readily synthesizes  $\text{PrCO}_2\text{Bu}$  and  $\text{Bu}$  oleate. Regeneration after inactivation of pancreatic powder by heat is doubtful. In expts. with a combination of the pancreatic and liver enzymes, the hydrolysis of  $\text{PhCHOHCO}_2\text{Me}$  by the pancreatic esterase is independent of that by the liver enzyme. S. Morgulis

Determination of the dry substance of the retina from different animals. Richard W. J. Müller. *Biochem. Z.* 267, 43-4(1933).—Desiccated retina from guinea pigs, sheep, pigs and cows constitutes about 12% of the fresh wt., but that from rabbits and dogs is about 16%. From the study of the dry wt. the av. thickness of the retina from pigs was calcd. as 0.25-0.305 mm. and that of cow retina 0.22-0.31 mm. S. Morgulis

The methyl and ethyl esters of hematoprosthetic and of a combination of the composition,  $\text{C}_{40}\text{H}_{56}\text{N}_4\text{O}_4\text{Fe}$ , and the problem of the number of carbon atoms in the prosthetic group of the blood pigment. Alfred Herzog. *Biochem. Z.* 267, 48-56(1933).—The prepn. of Me and Et esters of hematoprosthetic brings evidence that the nucleus contains 33 C atoms and that when a larger C no. is obtained this is due to the retention of C atoms originally belonging to the globin portion. S. Morgulis

The refraction of light by hemoglobins from different animals. Stefan Schönberger. *Biochem. Z.* 267, 57-63(1933).—For  $\lambda = 656.3 \text{ m}\mu$ , H<sub>a</sub> line, the  $n$  of horse hemoglobin is 194, dog 203 and cow 209. Oxyhemoglobin crystals in  $\text{H}_2\text{O}$ , dil.  $\text{NH}_4\text{OH}$  or  $\text{NaHCO}_3$  has no refraction. The refraction of CO-hemoglobin is the same as that of oxyhemoglobin. S. Morgulis

Adsorption of pepsin by tricalcium phosphate. L. Utkin. *Biochem. Z.* 267, 64-8(1933).—Pepsin is readily adsorbed by freshly pptd.  $\text{Ca}_3(\text{PO}_4)_2$ . S. Morgulis

Kinetics of kidney phosphatase. II. Erik Jacobsen. *Biochem. Z.* 267, 89-101(1933); cf. *C. A.* 26, 4617.—The rate of hydrolysis by kidney phosphatase depends upon concns. of enzyme, substrate and  $\text{H}_2\text{PO}_4$  within the  $p\text{H}$  range of 6.9-9.2. However, at  $p\text{H}$  9 the rate increases markedly with rising substrate concns. The  $\text{H}_2\text{PO}_4$  diminishes the rate of enzymic hydrolysis, the relative inhibition depending upon the substrate/ $\text{H}_2\text{PO}_4$  ratio. While this inhibition decreases as the  $p\text{H}$  rises, the relative inhibition becomes greater. All these kinetic phenomena are incorporated in a formula. S. Morgulis

Light absorption of oxyhemoglobin and of carbonyl-hemoglobin in neutral solution. Vilma Sebesta and Alfred Herzog. *Biochem. Z.* 267, 157-66(1933).—Spectrophotometric studies show for oxyhemoglobin absorption maxima at 575.2 and 541.3  $\text{m}\mu$  and a (false) min. at 557.5  $\text{m}\mu$ ; for carbonylhemoglobin, either natural or synthetic, the maxima are at 566 and 537  $\text{m}\mu$  and the min. at 551  $\text{m}\mu$ . S. Morgulis

Effect of metals on enzymes. III. Martin Jacoby. *Biochem. Z.* 267, 167-8(1933); cf. *C. A.* 27, 4260.—Shaking urease with Se in air does not result in an irreversible, oxidative destruction of the urease, its inactivation being due probably to the formation of inactive complexes. S. Morgulis

Lactic acid formation in the auricle preparation of the rabbit under different conditions. F. Gottdenker and M. Wachstein. *Biochem. Z.* 267, 192-201(1933).—The av. survival time of auricle preps. from rabbits in a  $\text{N}_2$  atm. in unbuffered Ringer soln. is 6 min., in buffered Tyrode soln. without sugar 17 min. and with sugar 37 min. The formation of lactic acid is increased during anaerobiosis independently of the nature of the nutritive soln. and the lactic acid diffuses out from the tissue. In long expts. under aerobic conditions the lactic acid disappears completely. S. Morgulis

Enzymic hydrolysis of gluco-glucosheptonic and of galacto-glucosheptonic acid. Pietro Pratesi. *Biochem. Z.* 267, 238-42(1933).—The enzymic hydrolysis of maltose-carboxylic acid and of lactose-carboxylic acid, both of the compn.  $\text{C}_{12}\text{H}_{20}\text{O}_{11}$ , has been detd. The former is hydrolyzed up to 40% by yeast maltase, and the latter by  $\beta$ -galactosidase from *Saccharomyces fragilis* or by emulsin about 88-90%. S. Morgulis

The elementary chemical composition of living organ-

isms and the periodic system. A. Vinogradov. *Compt. rend.* 197, 1673-5(1933).—A graphical representation of the quant. at. compn. of living matter as a function of the at. nos. of the elements. W. J. Peterson

Specific characteristics of proteins. N. N. Ivanov. *Izvestiya Tsentral. Nauch.-Issledovatel. Inst. Pishchev. Vsesoyuz. Prom.*, Separate 1931, 36 pp.—Properties and characteristics which are useful in the differentiation of various proteins are discussed, with data for proteins from rice, blood serum of various animals, salmon muscle and soy beans. Denaturation expts., thermal and by solvent treatment, are described. Among the properties for which values are given are amino acid content, N distribution, compn. of Ag salts, presence of free  $\text{NH}_2$  groups, and behavior toward aq.  $\text{NaOH}$  or  $\text{NaCl}$ . N distribution and other properties are tabulated for legumelin, glycine A and B, and glutelin of soy-bean protein. J. F. S.

Alcoholic fermentation of *D*-glucose in deuterium water. Eugene Pascu. *J. Am. Chem. Soc.* 56, 245-6(1934), cf. *C. A.* 28, 744<sup>9</sup>.—Alc. fermentation of glucose in 100%  $\text{H}_2\text{O}$  is about 9 times slower than in ordinary distd.  $\text{H}_2\text{O}$ , in 60%  $\text{H}_2\text{O}$  the value was 1.6. The retarding effect of the heavy  $\text{H}_2\text{O}$  may be due to a decreased activity of the zymase complex occasioned by an irreversible, partially destructive action of the heavy  $\text{H}_2\text{O}$  on the enzyme. C. J. West

Some pharmacological experiments with deuterium. David I. Macht and Mary E. Davis. *J. Am. Chem. Soc.* 56, 246(1934).—When  $\text{H}_2\text{O}$  is employed in concns. of 1:2000 or less, no striking physiol. or pharmacol. effect are noted, except possibly a slight inhibitory effect on germination of some seeds. C. J. West

Ultracentrifugal study of the action of papain on ovalbumin. The Svedberg and Inga-Britta Eriksson. *J. Am. Chem. Soc.* 56, 409-12(1934).—A no. of detns. of the sedimentation const. and mol. wt. have been carried out on products obtained by digesting samples of pure crystalline ovalbumin with activated and unactivated papain at 40°. An attempt has been made to sep. the different mol. species out of the mixt. of disintegration products by means of fractional dialysis and fractional pptn. with  $(\text{NH}_4)_2\text{SO}_4$ . The fractions thus obtained have been studied in the ultracentrifuge. The 3 lines of attack have all led to the result that the action of activated papain on native ovalbumin gives rise to 3 kinds of disintegration products: non-centrifugible substance, which probably contains lower polypeptides and  $\text{NH}_2$  acids; a centrifugible substance of a sedimentation const. about  $0.6 \times 10^{-13}$ , which has a mol. wt. of the same order as the protamines and finally a substance of sedimentation const. about  $2.7 \times 10^{-13}$ . This latter product having the same mol. wt. as ovalbumin is probably formed by the loosening of some of the bonds within the ovalbumin mol., thus causing it to assume a highly dissymmetrical shape. It may represent the 1st step toward the breaking up of the mol. into individual parts. Unactivated papain has no influence on the sedimentation const. of ovalbumin, nor are any non-centrifugible products formed. C. J. West

Supposed direct spectroscopic observation of the "O-transporting enzyme." D. Keilin. *Nature* 132, 78<sup>9</sup> (1933).—Bands at 590  $\text{m}\mu$  and 630 or 636  $\text{m}\mu$ , reported by Warburg and Negelein (*C. A.* 27, 4268) for the "O-transporting enzyme" observed in a thick suspension of *Bacterium pasteurianum* (I), have been found by K to vary in different strains of I; to occur in *Bacillus proteus* (II) and *Azotobacter chronococcus* (III); also to be unaffected in III by satn. with  $\text{CO}$  even though III has a much higher respiratory activity than I. A band in II and III at 630  $\text{m}\mu$ , which fades on shaking with  $\text{O}_2$  and reappears upon reduction, is due to  $\text{Fe}^{++}$ , not  $\text{Fe}^{+++}$ , in the pigment. By treating bakers' yeast with acid and  $\text{Na}_2\text{S}_2\text{O}_4$ , K. obtained a cytochrome deriv., probably of its component a, showing bands at 590  $\text{m}\mu$  and 630  $\text{m}\mu$  which consequently are not characteristic for an "O-transporting enzyme." Anne E. White

Isolation of heparoflavins. Kurt G. Stern. *Nature* 132, 784-5(1933); cf. *C. A.* 27, 3231.—The water-sol. yellow-red pigment previously sepd. from catalase preps. has

now been isolated in a cryst. state from horse liver and designated *hepatoflavin* (I). Protein material is pptd. from concd. aq. ext. of fresh horse liver by adding an equal vol. of alc. The  $pH$  is adjusted to 4-5 by AcOH and the flavin adsorbed by fuller's earth, desorbed by a mixt. of pyridine, MeOH and  $H_2O$ . Further elaborate purification procedure yields a brown microscopically cryst. product which is recrystd. from dil. AcOH. In aq. soln. I is lemon-yellow, showing green fluorescence in ultraviolet light; absorption bands are at 2630, 3650 and 4420 Å. I is spectroscopically identical with Warburg's and Christian's yellow oxidation enzyme (C. A. 27, 1846).

Amylase preparations. Kalle & Co. A.-G. Brit. 399,998, Oct. 19, 1933. A starch-degrading enzyme prepn. especially for desizing is made by adding a salt of a P acid other than  $H_2PO_4$  to the enzyme or its soln. Among examples are (1) pancreas amylase and  $Na_2P_2O_7$ , and (2) bacteria amylase and Na glycerophosphate, the  $pH$  being adjusted to 6.5. Cf. C. A. 27, 4551.

## B—METHODS AND APPARATUS

STANLEY R. BENEDICT

The glutathione of the tissues after administration of "Tiargirio." Giuseppe Paradiso. *Arch. farmacol. sper.* 56, 487-501(1933).—It is again shown that starch suspension is not a good indicator in the iodometric detn. of glutathione in tissue exts. For best results with Tunncliffe's indicator (Na nitroprusside) P. proceeds thus: Mix in each of a series of test tubes 10 cc. of tissue ext. with 2 cc. of 10% Na nitroprusside. Add increasing vols. of 0.01 N I soln. such that each tube receives 1.5 times as much as the preceding. Finally superpose  $NH_4OH$  and observe the 1st tube in which no purple ring forms immediately. The glutathione content is calcd. from the I added to this tube. Normal values found for dog and rabbit in mg. of reduced glutathione per 100 g. of fresh tissue were: dog, liver 219, heart 64, blood 11.5; rabbit, liver 253, blood 38.7. In animals injected with "Tiargirio" (a Hg dithio-succinate of indefinite chem. compn.) the glutathione content of the tissues was the same. This absence of response is attributed to the stability of the S-S linkage in the compd. administered.

Lewis W. Butz

The extraction of cholesterol from blood. Otto Mühlbock. *Z. physiol. Chem.* 222, 233-4(1933).—Contrary to the assertion of Milbradt (C. A. 27, 2972), cholesterol may be extd. quantitatively from whole blood by Bloor's 3:1 mixt. of EtOH and Et<sub>2</sub>O without preliminary hemolysis.

A. W. Dox

A simple method for determining fructose in the blood. Richard Stöhr. *Z. physiol. Chem.* 222, 261-9(1933).—Two cc. of protein-free blood filtrate, prepd. according to Folin-Wu, is treated with 2 cc. of the phosphomolybdic

acid reagent and the mixt. boiled for 25 min. The mixt. is then titrated with 0.01 N  $KMnO_4$ , the end point being the disappearance of the blue color. A small correction is applied because of other reducing substances present in practically const. amt. Fructose in mg. % is obtained from the formula: (cc. 0.01 N  $KMnO_4$  - 0.05 cc.) 500/2.05 if the Folin-Wu reagent is used, and (cc. 0.01 N  $KMnO_4$  - 0.06 cc.) 500/2.70 if the Folin reagent is used. For detn. of glucose in the presence of fructose, the total sugar is detd. by one of the usual reduction methods and the fructose value subtracted.

A. W. Dox

The determination of cystine. B. J. Krijgsman and E. F. Bouman. *Arch. néerland. physiol.* 18, 458-71 (1933).—The detn. of cystine by the method of Folin and Looney is not satisfactory for blood. By means of the step photometer the Sullivan method for the detn. of cystine-cysteine has been elaborated for use with blood. Only the total cystine values, however, are free from objections. Blood from hungry rats contains only traces of cystine. After feeding, the cystine content may increase to 14 mg %. Twenty-six references. F. L. D.

Some dicarboxylic acids as components of fixing fluids. Conway Zirkle. *Protoplasma* 19, 564-77(1933).—The following dicarboxylic acids were investigated: oxalic, malonic, succinic, glutaric, malic and tartaric. Their fixing properties are unlike those of the fatty acids and resemble those of trichloroacetic, lactic, glycolic, glyceric and gluconic acids. The ability of the acids to influence  $CH_2O$  fixation is conditioned by the rate at which they penetrate the specimen. The rate is correlated with the relative fat sol., the more fat-sol. acids penetrating faster.

F. L. Dunlap

A critical study and review of the method of microincineration. Gordon H. Scott. *Protoplasma* 20, 133-51 (1933).—"A full interpretation of findings in terms of cellular physiology and pathology must await the development of more precise methods for the identification of the elements *in situ*. A procedure for quant. measurements of the ash has been developed and has demonstrated its utility in explt. and morphological studies under way. New methods for the identification of the salts are being investigated. It is of prime importance that the fixation of the tissues used for microincineration be as free from sources of error—both theoretical and practical—as possible. Thus far the technics described in this paper appear to be the best available. While microincineration may supplant some histochem. procedures and add to the efficacy of others it should be applied in conjunction with every sound technic, chem. and phys., at our disposal in order to arrive at a clearer understanding of vital processes." Seventy-four references. F. L. Dunlap

Aldehydes as cytological fixatives. Conway Zirkle. *Protoplasma* 20, 169-79(1933); cf. C. A. 27, 3232.—Root tips of *Zea mays* were fixed with  $CH_2O$ , AcH, EtCHO, PrCHO, HCONH<sub>2</sub>, and  $CCl_3CHO$ . Fixing fluids were then made by combining these compds successively with AcOH,  $HCO_2H$ , Cu propionate, Cu lactate, Müller's fixative, Cu dichromate, Cr sulfate and picric acid, and root tips were fixed in each mixt. In all 54 fixatives were tested. Twenty-five references. F. L. Dunlap

A micro method for the determination of blood iron. Fr. Rappaport and E. Hohenberg. *Klin. Wochschr.* 12, 1810-11(1933).—The blood or tissue is ashed, oxidized with  $H_2O_2$  to the  $Fe^{+++}$  form, the I liberated from KI is distd. into NaOH in the presence of Na sulfite, the NaI so formed is oxidized to  $NaIO_3$  and titrated with thiosulfate.

Harry Eagle

The determination of gastric and intestinal paralytic agents. Erich Heese and Georg Zimmermann. *Klin. Wochschr.* 12, 1986-8(1933).—The retarding effect upon the passage of  $BaSO_4$  through the intestinal canal of mice is used as the criterion of activity. The results parallel those obtained in patients.

Harry Eagle

The determination of morphine in excretions, excretions and tissues. Philipp Ellinger and Heinrich Seeger. *Arch. expit. Path. Pharmacol.* 174, 160-7(1933).—Body fluids or weakly acid tissue exts. are dried on quartz sand, extd. with  $CHCl_3$  and the ext. and the sand washed with

0.025 N HCl. This aq. ext. is made alk. with NaOH, partially neutralized with CO<sub>2</sub> gas, thoroughly shaken with AmOH, and the AmOH ext. in turn shaken with 0.02 N HCl. This final ext. is pptd. in the usual manner with phosphomolybdic acid. The loss during purification is 5-10%, and the error of the method with pure morphine is 3%.

Chromic fixation in alcoholic media. I. Some theoretical considerations and a method for the preparation of a chrome-alcohol stock solution. Henry C. Waterman. *Stain Tech.* 9, 23-8(1934). II. Certain possible substitutes for osmium tetroxide in chromic fixing reagents. Preliminary experiments with iodine in chrome-alcohol reagents. *Ibid.* 26-31.

Staining of neuroglia. Fr. Proeschner. *Stain Tech.* 9, 23-8(1934).—The chemistry of Weigert's glia staining method is critically discussed.

Precipitation of calcium as the oxalate from citrated blood. L. Brull and R. Poverman. *Bull. soc. chim. biol.* 15, 1281-9(1933).—The addn. of 1% of Na citrate to solns. of pure CaCl<sub>2</sub> does not interfere with the complete pptn. of Ca as oxalate, while 3% interferes slightly. For the detn. of Ca in serum not more than 1% of Na citrate should be present. In the case of whole blood 0.5% does not interfere. Allowing citrated blood to stand 4 hrs. before analyzing does not cause any decrease in determinable Ca due to diffusion into the corpuscles. L. E. G.

Detection of nicotine by Roussin's reaction. J. A. Labat. *Bull. soc. chim. biol.* 15, 1339-43(1933).—Methods of detecting small quantities of nicotine by the formation of red crystals of Iodonitine, C<sub>10</sub>H<sub>14</sub>N<sub>2</sub>I<sub>2</sub>.HI, are described.

Histospectrographic detection of antimony in human organs after treatment with antimony compounds. A. Policard and J. Boucomont. *Compt. rend. soc. biol.* 114, 1076-7(1933); cf. C. A. 27, 245.—By the method previously described Sb was readily detected in lung and liver tissue. The spleen contained traces and the blood none.

Microdetermination of sodium in serum or plasma. A. D. Marenzi and Rebecca Gerschmann. *Compt. rend. soc. biol.* 114, 1212-14(1933).—An improved modification of Salit's method (C. A. 26, 5116) is described.

Spectrographic determination of phlorizin in whole blood in vitro. A. Lambrechts and G. Barac. *Compt. rend. soc. biol.* 114, 1862-3(1933); cf. C. A. 27, 5358.—The phlorizin is extd. from the sample by Me<sub>2</sub>CO and detd. by the method previously described.

A source of error in the determination of blood urea by Moog's sodium hypobromite method. Armando Laroze. *Rev. chim. pura applicada* 7, 97-101(1932).—In Moog's method the blood is defecated with CCl<sub>4</sub>CO<sub>2</sub>H and the filtrate neutralized, with phenolphthalein indicator. Later, when the alk. soln. of NaOBr is added, the EtOH of the indicator soln. reacts to form CHBr<sub>3</sub>, which in turn slowly reacts with the excess of NaOH present to form CO and NaBr. Ten drops of EtOH produce about 0.2 cc. of CO, sufficient to cause an error of about 100% in the detn., but 3 drops or less causes no appreciable error.

An arrangement for the direct measure and registration of the [H<sup>+</sup>] of flowing blood. G. Frühling and Hans Winterstein. *Arch. ges. Physiol. (Pflügers)* 233, 479-85(1933).—A description of an app. for recording p<sub>H</sub> with a glass electrode inserted in a blood vessel.

The determination of the basal metabolism by the tatra-nomogram. D. Balázsy. *Deut. med. Wochschr.* 59, 1433(1933).—A mech. nomogram was constructed for calcg. the basal metabolism by Read's formula.

The determination of the acidity (p<sub>H</sub>) of viscid and mucous substances such as sputa. G. Gollnow and J. Koch. *Deut. med. Wochschr.* 59, 1860-1(1933).—The usual colorimetric and electrometric methods for detg. p<sub>H</sub> are described.

Estimation of hematin iron and the oxidation-reduction equivalent of cytochrome c. R. Hill and D. Kellin. *Proc. Roy. Soc. (London)* B114, 104-9(1933).—The hematin

Fe can be detd. colorimetrically by oxidation of org. matter with H<sub>2</sub>O<sub>2</sub>, reduction of the Fe with Na<sub>2</sub>S<sub>2</sub>O<sub>4</sub>, and development of the red color with *o*-dipyridyl. This method can also be used for detn. of the Fe content of cytochrome c, since the latter contains only hematin Fe. Study was made of the reduction of oxidized cytochrome c by ferrous salts in the presence of Na tartrate and Na<sub>2</sub>CO<sub>3</sub>, and of the oxidation of partially reduced cytochrome c by ferricyanide, with a Thunberg vacuum tube, and Zeiss microspectroscope to follow the course of the reaction. Both reactions were nearly quant., and involved 1 equiv. per hematin equiv. of the cytochrome

Joseph S. Hepburn  
The usefulness of the colorimetric blood-sugar method of Crecellus-Seifert. Georg Sommerlad. *Munch. med. Wochschr.* 80, 1557-8(1933).

A new simplified method of preparing estrous hormone from urine and a new phenomenon. Masao Ito and Seiji Hayazo. *Munch. med. Wochschr.* 80, 1969(1933).—The method depends on adsorption. On long storage a sudden increase of the activity of the prepns. occurred.

A micro method for the determination of uronic acids. Bernard Burkhart, Lorenz Baur and Karl P. Link. *J. Biol. Chem.* 104, 171-81(1934).—In the method described for the detn. of uronic acids the desirable features of Bustin's method (C. A. 26, 2040) are employed along with certain parts of the app. described by Clark (C. A. 26, 2395) for the microdetn. of OR groups. The decarboxylation with HCl is performed at a bath temp. of 133-6° over a period of not less than 2 hrs. Both titrimetric and gravimetric methods are described but the gravimetric is preferred as it is less tedious and appears to be more accurate. Samples of 9-11 mg. are used. The method is recommended only for pure uronic acids or their derivs.

A new method for the detection and estimation of minute amounts of lead in biological materials. John R. Ross and Colin C. Lucas. *Can. Med. Assoc. J.* 29, 649-50(1933).

—Urine (100 cc.) is treated with 3 cc. strong NH<sub>4</sub>OH and 1 cc. satd. (NH<sub>4</sub>)<sub>2</sub>HPO<sub>4</sub>, and the ppt. of mixed phosphates in which the Pb is completely entrained is centrifuged off. The ppt. is dissolved in N HCl by making just acid to Congo red. The Pb is then pptd. by H<sub>2</sub>S and centrifuged with entrainment on a small amt. of filter-paper fiber. After digestion with 0.1-0.2 cc. HClO<sub>4</sub> and a few drops of HNO<sub>3</sub>, 2 cc. H<sub>2</sub>O and 0.5 cc. 10% NH<sub>4</sub>C<sub>2</sub>H<sub>3</sub>O<sub>2</sub> are added. The Pb is again pptd. as the sulfide and removed by centrifuging, after adding a little filter-paper pulp. To the soln. of the PbS in warm N HCl there is added N NH<sub>4</sub>OH until just alk. to bromothymol blue. Then 1 cc. of dithizone soln. in CCl<sub>4</sub> (1 to 2 mg. in 50 cc., according to the amt. of Pb expected to be present) and 5 drops of 20% NaCN are added and the soln. is shaken vigorously in a sepg. funnel. The red salt of the Pb dithizone in the CCl<sub>4</sub> is then drawn off. A second 1-cc. portion of dithizone soln. is then added and extd. as before and the red Pb dithizone drawn off. The extn. is continued until no further red color appears in the lower layer. The red lead dithizone soln. is then washed free of excess dithizone by shaking 2 cc. 0.1 N NH<sub>4</sub>OH. The red dithizone soln. is then converted back to the green by shaking with 1/2 cc. 6 N HCl. The depth of color is proportional to the amt. of Pb present. By comparison in the Duboscq colorimeter with known standards made up in a similar way its strength can be detd. The method as used for tissue requires preliminary ashing in a muffle furnace in which the temp. does not exceed 450°. For spinal fluid CaCl<sub>2</sub> (0.2 cc. of 5% for 10 cc. spinal fluid) is added in the preliminary entrainment. By this procedure satisfactory recovery of Pb was made from normal and pathol. urines and other body fluids and tissues. (The authors have provided the abstractor with certain addnl. details needed for a useful abstr.)

G. H. W. Lucas  
A method for the microdetermination of lipides in the blood and tissues. Gabriele Monasterio. *Boll. soc. ital. biol. sper.* 8, 1299-1304(1933).—Ext. 2 cc. of serum or plasma successively with 40-, 20- and 20-cc. portions of Bleer's solvent (alc.-ether 5:1). Evap. the exts., take

up the residue in  $\text{CHCl}_3$ , filter through a small wad of cotton into a small volumetric flask and make up to 10 cc. with more  $\text{CHCl}_3$ . (a) Evap. the  $\text{CHCl}_3$  from 2 cc. The residue represents the total lipid fraction. (b) Evap. 2 cc. more of the  $\text{CHCl}_3$  soln. to 0.5 cc., add 7 cc. acetone and 3 drops of satd. alc.  $\text{MgCl}_2$ , mix thoroughly, stopper and allow to stand 6 hrs. Centrifuge the ppt., wash twice with acetone and take up in four 2-cc. portions of boiling  $\text{CHCl}_3$ . Filter through cotton and evap. The residue represents the phosphatide fraction. (c) Evap. another 2-cc. portion of the  $\text{CHCl}_3$  soln. to 0.5 cc. Add 1 cc. of 1% alc. digitonin soln., allow to stand at least 6 hrs. and centrifuge; wash the ppt. twice with 95% alc. and dry on the water bath. This is the free cholesterol fraction. (d) To another 2-cc. portion of the  $\text{CHCl}_3$  soln. add 2 cc. of 3%  $\text{NaOEt}$ , heat the mixt. to  $70^\circ$  for 1 hr., neutralize with 1 cc. of 6% alc.  $\text{HCl}$  and evap. Ext. the residue 5 or 6 times with 2-cc. portions of  $\text{CHCl}_3$  and filter into a 30-cc. graduated glass-stoppered cylinder. Evap. to 4 cc. and mix; evap. 2 cc. to 0.5 cc. and add 1 cc. of 1% digitonin soln. The procedure is then the same as that for free cholesterol. This fraction represents the total cholesterol. To the dried residues obtained in (a), (b), (c) and (d) add 5 cc. of Nicloux's  $\text{AgNO}_3\text{-K}_2\text{Cr}_2\text{O}_7$  reagent. Run a 5th tube contg. 5 cc. of the reagent alone as a control. Heat to  $160^\circ$  for 15 min. Transfer the material in the centrifuge tubes (b) and (c) to larger test tubes to facilitate oxidation. Heat all the tubes an addnl. 45 min. to  $160^\circ$ . When oxidation is complete, cool the tubes and titrate the unused chromic acid iodometrically. The no. of cc. of chromic acid used is divided by the various reducing coeffs. of the lipides: for the phosphatides 3.10, for cholesterol 5.93, for digitonin-cholesterol 2.55, for neutral fats 3.54. Thus the values are obtained in mg. which multiplied by 250 (500 for (d)) give the amts. of each fraction in 100 cc. of blood serum. The neutral fats are obtained by subtracting from the total lipides the sum of the values for total cholesterol and phosphatides. For cholesterol it is better to divide the no. of cc. of chromic acid used by 10.48 instead of by 2.55. For detg. lipides in tissues, triturate 1-2 g. of the organ ext. with 3 portions of boiling acetone (about 40 g. of acetone per g. of organ) and evap. the acetone filtrate. Transfer the tissue residue to a micro Soxhlet app. and ext. with ether for 12 hrs. Add the ether ext. to the dried acetone residue and evap. the whole to dryness. Take up in  $\text{CHCl}_3$  and treat as described for blood serum.

Peter Masucci

**Microdetermination of the different lipid fractions in the central nervous system.** Michele Mitolo. *Arch. ital.* 32, 451-59(1933).—The method is based on the sepn. of the lipids by means of successive extrns. The petr. ether ext. contains cholesterol and unsatd. phosphatides (lecithin, myelin, cephalin). Cholesterol is detd. in  $\frac{1}{2}$  of the ext. by evapn. and application of the reaction of Liebermann. Det. the P in another third by incineration of the residue and the use of the colorimetric method of Bell-Doisy-Briggs. Evap. the last third, emulsify in abs.  $\text{EtOH}$ ; scp. the insol. cephalin by centrifugalization, det. the P of lecithin and myelin in the clear liquid and calc. the cephalin by difference. Ext. the residue from the petr. ether extrn. with pyridine, which dissolves sphingomyelin, phrenosin, kersin cerebrosides and sulfatides. Divide the ext. into 3 parts and centrifuge. Ppt. the cerebrosides from the soln. with  $\text{Me}_2\text{CO}$ , keep cold overnight and filter; dissolve the ppt. in cold  $\text{KOH}$ . Det. the galactose, obtained by hydrolysis of the cerebrosides, by the method of Kimmelstiel. Det. the galactose of the sulfatides in the ppt. from 2 centrifuge tubes. Dissolve the ppt. in the third tube in  $\text{EtOH}$  and scp. the sphingomyelin in the soln. as its Cd compd. Incinerate the latter and det. the P colorimetrically. The technic of the method is described. A. E. Meyer

**Iodometric determination of protein decomposition products.** L. Utkin. *Biochem. Z.* 267, 69-73(1933).—Place the soln. to be analyzed in a 50 cc. volumetric flask and neutralize with  $N$   $\text{NaOH}$  to a rose color with phenolphthalein. Add 5 cc. 0.4  $M$   $\text{CuCl}_2$ , 4 cc.  $N$   $\text{NaOH}$  and

10 cc. borate buffer of  $\text{pH}$  8.8 (prepd. from 150 cc. 0.1  $M$  borax and 10 cc.  $N$   $\text{HCl}$  dild. to 200 cc.), and water to the 50 cc. mark. Shake, pour through a dry filter and discard the first 5 cc. of filtrate. The filtrate is blue if amino acids or low peptides are present, but with higher peptides a violet color is obtained. Acidify 10 cc. filtrate with 0.5 cc.  $\text{AcOH}$ , add 2 cc.  $\text{KI}$  and 1 cc. 1% starch and titrate with 0.01 or 0.005  $N$   $\text{Na}_2\text{S}_2\text{O}_8$ . Prep. the  $\text{KI}$  soln. by dissolving 40 g. in 80 cc.  $\text{H}_2\text{O}$ , acidifying with 2 cc.  $N$   $\text{HCl}$  and boiling 1 hr. on a water bath. Add to this 1 g.  $\text{Zn}$  dust and shake until all color disappears, make alk. with 5 cc.  $N$   $\text{NaOH}$ , filter and dil. to 100 cc. with  $\text{H}_2\text{O}$ . In the titration each cc. 0.01  $N$   $\text{Na}_2\text{S}_2\text{O}_8$  = 0.28 mg.  $N$  with most amino acids, or 0.14 mg.  $N$  with peptides or diamino acids. On account of the poor soly. of the  $\text{Cu}$  compds. of some of the amino acids the soln. should not contain more than 1 mg. amino acid per cc. The use of lactate, citrate and tartrate should be avoided because these interfere with the reaction. The method is very suitable for the study of the enzymic hydrolysis of protein but not for the study of the splitting of low peptides or dipeptides. S. Morgulis

**A new reaction for testing and for the colorimetric determination of vitamin A.** Eugen Rosenthal and Johann Erdélyi. *Biochem. Z.* 267, 119-23(1933).—A red-violet color is produced when vitamin A is heated with 0.5% pyrocatechol and cold satd.  $\text{SbCl}_3$  in  $\text{CHCl}_3$  soln. Abs.  $\text{CHCl}_3$ , free from  $\text{H}_2\text{O}$  and alc., is required. The oil is dild. with  $\text{CHCl}_3$  and to 1-2 cc. of the soln. 1 cc. of the pyrocatechol and 2-3 cc. of the  $\text{SbCl}_3$  soln. are added. The tube is at once placed for 1-2 min. in a water bath at  $60^\circ$ . The pyrocatechol soln. must be prepd. fresh. The color which is like that of a dil.  $\text{KMnO}_4$  soln. is more permanent than the blue color developed in the Carr-Price reaction. For detns. since the color is, under proper conditions, proportional to the vitamin concn., the color is matched against a 0.01%  $\text{KMnO}_4$ . The time of heating must be rigorously controlled. S. Morgulis

**A painless histamine skin test: an experimental study.** Samuel Perlow. *Ann. Internal Med.* 7, 561-5(1933).—An intradermal injection of 0.1 cc. of 1:2000 in 0.5% procaine is given. It is best read in 10 min. J. T. M.

**Thermometer for measuring the temp. of the skin** (U. S. pat. 1,942,516-17) 1.

**Handbuch der biologischen Arbeitsmethoden. Bd. XIII.** Edited by Emil Abderhalden. Heft 1. Auswertungsmethoden für Pockenlymphnen und Pockensera, by Stravros Zurukzoglou. Pp. 1141-1190. Heft 2. Das Anaphylatoxin, by E. Friedberger and J. Weisfeller. Pp. 1191-1242. Berlin: Urban & Schwarzenberg. M. 5.80. Reviewed in *Am. J. Pub. Health* 23, 1217(1933); cf. *C. A.* 28, 1375<sup>4</sup>.

CHARLES B. MORREY

**The dehydrogenase activity of *Escherichia coli* on the higher fatty acids.** F. P. Mazza and A. Cimmino. *Atti accad. Lincei* 17, 1086-91(1933) See *C. A.* 28, 194<sup>4</sup>.

A. W. Contieri

**The lipoids of tubercle bacilli. XXXVI.** The polysaccharides of *Mycobacterium leprae*. M. S. Newman and R. J. Anderson. *Z. physiol. Chem.* 200, 1-4(1933); cf. *C. A.* 28, 193<sup>4</sup>.—The crude polysaccharides isolated from the  $\text{EtOH-Et}_2\text{O}$  ext. of moist living *Mycobacterium leprae* contain at least 2 different sugars. The acetates obtained by acetylation in pyridine soln. were sepd. into a cryst. and an amorphous fraction. The cryst. portion consisted of trehaloseoctaacetate which after sapon. gave the characteristic rhombic crystals of trehalose. Sapon. of the amorphous portion yielded a non-crystg. polysaccharide which gave the pentose color reaction and a pos. precipitin reaction with immune serum. A. W. Dox

**The applications of fluorescence spectroscopy and spectrography in bacteriology.** C. Dhérif, S. Glücksmann and L. Rapetti. *Compt. rend. soc. Biol.* 124, 1250-3(1933).—Discussion. L. E. Glaser

The lytic action of certain biliary salts on the gonococcus. M. Maino. *Boll. soc. ital. biol. spec.* 8, 1289-91(1933).—The addn. of Na taurocholate (3-4 drops of a 1-5% soln.) to ascites-agar prevented the growth of the gonococcus. Added to blood agar, it prevented the development of streptococcus. Dilns. of 1:20-1:50 of Na taurocholate produced lysis of the gonococcus, while 1:20-1:150 caused lysis of the streptococcus. A 5% soln. of Na taurocholate applied locally to gonorrheal pus gave good results. Peter Masucci

Formation of histamine from *l*-histidine by bacteria. Kinsaburo Hirai. *Biochem. Z.* 267, 1-5(1933).—Histamine was obtained from *l*-histidine under the action of a tyramine-producing strain of *Es. coli*. Practically the same quant. results were obtained with an *Es. coli* strain which produces *p*-hydroxyphenylpropionic acid. S. Morgulis

Formation of hydrogen peroxide by *Lactobacillus bulgaricus*. Claude Fromaget and Jean Roux. *Biochem. Z.* 267, 202-3(1933).—The fermentation of sugar by *L. bulgaricus* is inhibited because of the accumulation of  $H_2O_2$ . The formation of  $H_2O_2$  does not occur in a  $N_2$  atm. where fermentation stops only when the sugar is exhausted. The formation of  $H_2O_2$  increases with the  $O_2$  content. S. Morgulis

The propionic acid bacteria. II. Classification. C. H. Werkman and Russell W. Brown. *J. Bact.* 26, 393-417(1933); cf. *C. A.* 26, 1635.—A key for identification is given. John T. Myers

The classification of dysentery-coli bacteriophages. III. A correlation of the serological classification with certain biochemical tests. F. M. Burnet. *J. Path. Bact.* 37, 179-84(1933).—There are sharp differences between bacteriophages in regard to rate of photodynamic inactivation by methylene blue, ability to lyse in the presence of citrate and rate of inactivation by strong urea solns. Phages falling in a single serological group are approx. uniform in response to these tests. Strong urea solns. inactivate the large particle phages rapidly and with one exception were much less active on small particle phages. Several acidine dyes can be used for the photodynamic inactivation of suitable phages. J. T. M.

The importance of adequate reduction of peptone in the preparation of media for the pneumococcus and other organisms. Hedley D. Wright. *J. Path. Bact.* 37, 257-82(1933).—Difficulty in prep. broth suitable for cultivating pneumococci is largely due to incomplete reduction of peptone. This can be obviated by adding peptone to the broth before applying heat, thus exposing it to the powerful reducing action of meat infusion during steaming. This is the important factor in Hüntoon's hormone broth. The presence of oxidized peptone renders broth relatively unsuitable for many aerobes and for *Cl. tetani*. John T. Myers

Halophilic bacteria. L. M. Horovitz-Vlasova and M. I. Livshitz. *Izvestiya Tsentral. Nauch.-Issledovatel. Inst. Pishchevoi Vkusovoi Prom.*, Separate 1931, pp. 39-46; cf. *C. A.* 26, 4624.—Of 35 halophilic organisms (16 from brines, 4 from pickled hides, 5 from salted intestine, 4 from salt, 4 from air and 2 from caviar) 4 were found to be of the obligate and 30 of the facultative halophilic types, 1 being between obligate and facultative, namely, *Micrococcus citreus agilis*, which will grow without NaCl but only very slowly. The bacteriol. characteristics of the halophilic organisms are described. J. F. Smith

Mechanism of the respiration of pneumococci. M. G. Sevag. *Ann.* 507, 92-110(1933); cf. following abstr.—The  $O_2$  consumption was measured in the Barcroft-Warburg app.; the optimum of enzymic activity lay at  $pH$  8 with  $M/15$  phosphate buffer at  $35.5^\circ$ ; 5 cc. was used, made up of 1 cc.  $M/5$  substrate soln., 2.5 cc. phosphate and 1.5 cc. bacteria suspension. The  $O_2$  consumed by EtOH and PrOH was so small that they were not studied. With glucose (I) and lactic acid (II) contg. virulent pneumococcus type I (III), the  $O_2$  consumed during 10-20 min. is converted almost quantitatively into  $H_2O_2$ ; during 60-120 min. the values are 61.5-77.1%; with non-virulent type I(IV), the corresponding values are all smaller. The  $O_2$

consumptions of I and II with other virulent and non-virulent types and the amts. of  $O_2$  transformed into  $H_2O_2$  during 180 min. are detd. The end products are AcOH and  $CO_2$ ; AcCHO, II,  $AcCO_2H$  or AcH could not be detected in the case of I or  $AcCO_2H$  or MeCHO from II. In the oxidation of II, the intermediate product may be  $MeC(OH)(O_2H)CO_2H$ , which gives AcOH,  $CO_2$  and  $H_2O$ . The ratio  $CO_2$  evolved:  $O_2$  consumed during oxidation of II is 0.52-0.77 for all the pneumococci studied. With III or IV the value is 0.73 for both I and II; this is decreased to about 0.45 by addn. of catalase and increased to about 1.3 by addn. of  $AcCO_2Na$ . The  $O_2$  consumption of I and II with all the types is increased by varying amts. (27-1772%) by addn. of  $AcCO_2Na$  or catalase; the amts. of  $CO_2$  evolved increase also. These oxidations are accelerated by 0.004-0.02 *N* KCN, especially when young cultures are used. Addn. of KCN to I or II with  $AcCO_2Na$  also increases the activity. C. J. West

Mechanism of the respiration of pneumococci. II. M. G. Sevag. *Biochem. Z.* 267, 211-37(1933); cf. preceding abstr.—Expts. with various pneumococcus strains show that at the end of 10 min. practically all the absorbed  $O_2$  is converted to  $H_2O_2$  but with the prolongation of the expt. the quantity of the latter decreases so that the  $H_2O_2$  found corresponds to only 30-60% of the  $O_2$ . This is due to its immediate reaction with pyruvic acid. The duration of the enzymic activity and the extent of the oxidation of glucose or lactic acid correspond to the extent of the reaction between  $H_2O_2$  and pyruvic acid, as does also the virulence or avirulence of the pneumococci. Virulent strains have a higher  $H_2O_2$  content than the avirulent strains. The difference between the theoretical amt. of  $H_2O_2$  and that actually found is practically a measure of the reaction of pyruvic acid with the formation of AcOH and  $CO_2$ . S. Morgulis

Dissociation constant of nitrogen-nitrogenase in Azotobacter. Hans Lineweaver, Dean Burk and W. Edwards Deming. *J. Am. Chem. Soc.* 56, 225-30(1934).—The fixation of N at ordinary temps. and pressures by *Azotobacter*, as a function of N pressure, corresponds to 1 *N*. mol. combining reversibly with 1 enzyme mol. *E* (nitrogenase) to form a compd.  $N_2E$  whose thermodynamic disson. const.,  $K_{N_2} = (E)(N_2)/(N_2E)$ , is  $21.5 \pm 0.2$  vol % (0.215  $\pm$  0.002 atm.). This const. is highly characteristic, being independent of wide variations in the following important factors, the 1st 4 of which are sp. in the fixation process: concn. of Ca, Sr and oxalate;  $pH$ ;  $O$  pressure, concn. of Fe,  $V_{N_2}$  (max. velocity of irreversible decomn. of  $N_2E$  to form protein, at satg. N pressures) and certain physiol. factors (species, *Azotobacter* concn., culture age, and date of expt.). Statistical treatment of the collected data, involving Pearson's "Chi" test, was carried out to substantiate the fixation mechanism and related constns. were obtained. The importance of employing this seldom-used test in analyzing chem. and phys. data is indicated. The molal heat and free energy of the disson. of  $N_2E$  are 0 within exptl. errors of about 1000 and 100 cal., resp. C. J. West

Piorkowski, Suse: Untersuchungen über die Keimtönde (oligodynamische) Wirkung des in der Zahnheilkunde verwandten Wurzelfüllmaterials aus chemisch reinem Silber. Thesis, Breslau. 1931. 26 pp.

THOMAS G. PHILLIPS

The effect of growing corn and soy beans in combination on the percentage of dry matter in the two crops. R. G. Wiggans. *J. Am. Soc. Agron.* 26, 59-65(1934).—The difference in percentage of total dry matter between corn grown alone and in combination with soy beans is insignificant but the percentage of dry shelled grain is greater for the corn grown alone. The percentage of total dry matter in soy beans grown with corn as compared to the percentage when grown alone depended on the season, and very probably on other factors, such as available N,  $P_2O_5$ , etc., and available  $H_2O$ . J. R. Adams

**Investigation of a biological reaction by spectrum analysis.** Walther Gerlach. *Sisber. math. naturw. Abt. Bayer. Akad. Wiss. München* No. 2, 315-16(1933).—A Cu strip inserted in a potato blackens a wide zone if the potato is healthy, a narrow zone otherwise. Spectrum analysis shows that Cu displaces K, the amt. of Cu decreasing and K increasing with distance from the foil. Mg, Ca, B, P, Mn and occasionally Fe and other elements were found in varying amt. Mn increases toward the skin.

Janet E. Austin

**Alcohol resistance of Spirogyra cells of different ages.** Friedel Weber. *Protoplasma* 20, 15-19(1933).—The cells of one and the same *Spirogyra* filament show different resistivities to a 16-20% alc. The old growing cells are more resistant than the younger. The reverse is true toward urea.

F. L. Dunlap

**Effect of x-rays on the protoplasm, nucleus and chondriome of living plant cells after observations on the living.** G. A. Nadson and E. J. Rochlin. *Protoplasma* 20, 31-41(1933).—The expt. was conducted on the living cells of the epidermis of the onion (*Allium cepa*). F. L. D.

**Form of plasmolysis and ion action.** N. Cholodny and F. Sankevich. *Protoplasma* 20, 57-72(1933).—The form and course of plasmolysis were investigated of cells of *Spirogyra*, *Rhodo discolor* and *Allium cepa* which had been previously treated with hypotonic and isotonic solns. of the chlorides of  $\text{NH}_4$ , Na, K, Mg, Ca and Ba and then plasmolyzed with a cane-sugar soln. The cations investigated arrange themselves according to their action on protoplasm in the following series:  $\text{NH}_4 < \text{Na} < \text{K} < \text{Mg} < \text{Ca}$ .

F. L. Dunlap

**Influence of the reproductive gland hormone on the flower and yield of plants.** Hans Goebel. *Arch. Pharm.* 271, 552-8(1933).—The estrogenic principles, which are formed in the reproductive glands of animals, also occur in the plant kingdom, those from this latter source being designated *tokokinins*. The reproductive gland hormones and tokokinins are similar in action, the former acting on plants in the same manner as the tokokinins produced in the plants themselves. Treatment of hyacinths, callas, orchids, corn and tomatoes with the hormone induced a more rapid growth and increase in the quality and no. of the flowers and fruit. W. O. E.

**Effect of variations in the nutrient media upon nitrogen, phosphorus and potassium contents on plants with special reference to the tomato.** R. P. Bartholomew, V. M. Watts and Geo. Janssen. *Ark. Agr. Expt. Sta., Bull.* 288, 42 pp(1933).—Sand culture expts. showed that analysis of variance definitely indicates the factors which cause significant differences in the amt. of dry matter produced. A perfectly physiologically balanced soln. is impossible to obtain under practical conditions. Nutrient solns. varying greatly in chem. compn. produced similar results. A limitation in the amt. of K in a nutrient soln. contg. an abundance of N produces a very leafy type of plant. The amts. of N, P and K absorbed by plants receiving all elements essential for growth in the neutral soln. were controlled to a great extent by the concn. of those elements in the nutrient media. A deficiency of K may result in an increased absorption of N and P by the leaves of the tomato plant and a deficiency of P may increase the absorption of N by stems. Abundant N may increase the amt. of P taken up by leaves of the tomato plant, and an abundant supply of K may increase the absorption of P by the stems. The absorption of Ca and Mg was not appreciably influenced by the amt. of N, P or K absorbed by the plant. It appears likely that antagonistic action of elements may take place in the metabolic centers as well as at the surface of the absorbing membranes. The use of percentage compn. of a plant may lead to erroneous conclusions, because it does not include the growth factor which is represented by the amt. of dry matter produced. Liebig's "law of the min." is not applicable to fertilization with K salts.

C. R. Fellers

**Changes in composition of Florida avocados in relation to maturity.** Arthur L. Stahl. *Fla. Agr. Expt. Sta., Bull.* 259, 61 pp(1933); cf. C. A. 27, 786.—Phys. and chem. characteristics of avocados were detd. throughout

the life cycle during 3 growing seasons. It was impossible to correlate closely any single characteristic with maturity. The maturity pressure tester was found impracticable. The  $\text{Et}_2\text{O}$  ext. increases rapidly while the fruit is immature, and more slowly as maturity is approached. The changes in the sugar, protein and ash contents are too small and variable to be used as measures of maturity. The moisture content varies with rainfall, and affects the proportions of other ingredients. The sp. gr. of the avocado decreases with the development of the fruit. There is an inverse correlation between oil content and sp. gr. Satisfactory maturity in the Guatemalan, hybrid or late maturing varieties was observed when the sp. gr. of the fruit reached 0.98 or lower, and in the W. Indian or early varieties, at 0.96 or lower. In the Waldin variety the sp. gr. was still above 0.98 when fully mature as to taste. The fat content of the Guatemalan varieties was 2-3 times that of the W. Indian varieties. Fruits held in storage until soft show an increase in oil and hydrolyzable sugars and a decrease in sp. gr., moisture and free and total sugars over those examd. while the fruit was hard. C. R. F.

**Some properties of curly-top virus.** Henry H. P. Severin and Julius H. Freitag. *Hilgardia* 8, 1-48(1933).—This mosaic disease of sugar beets is transmitted by leaf hoppers. The juices extd. from the blades and beet roots contained the virus. Inactivation of the virus occurred after the extd., centrifuged and supercentrifuged diseased beet-root juice was exposed to air at room temp. for 72 hrs. or heated to  $80^\circ$  for 10 min. The virus in beet juice adjusted to  $p_{\text{H}}$  5-6 lived at least 100 days in an anaerobic jar. Freezing the virus at  $-18^\circ$  for over 11 months did not inactivate the virus. The chem. nature of the virus is unknown. C. R. Fellers

**Relation of anther color and the proportions of starch-filled pollen grains in sugar cane.** Thomas Bregger. *J. Puerto Rico Dept. Agr.* 17, 139-43(1933).—There is a pos. relationship between pollen fertility as indicated by the I test and the degree of anther coloration in the sugar cane. Pollen samples taken from dried flowers 9 months after the fresh samples have been taken are similar in their I reaction. C. R. Fellers

**Influence of smoke and ethylene on the fruiting of the pineapple.** Antonio G. Rodríguez. *J. Puerto Rico Dept. Agr.* 16, 5-18(1932).—The practice of using smoke on pineapple plants in the field resulted in a general flowering of all plants and in early fruit production. The quantity of smoke apparently was unimportant. The age of the plants was likewise unimportant. One or more constituents in smoke, and not the slightly increased temp., are responsible for the early bloom. The smoke was not toxic to the plants, and large-sized fruits were obtained as a result of smoking. Treatment with smoke of pineapple plants gave no appreciable response. Slips and suckers treated with ethylene previous to planting flowered 6 months before the control plants, but the fruits were small. The ethylene treatment modified metabolism and induced flower formation. Possibly the use of ethylene for the treatment of pineapple plants in fields may be practical and may replace smoke. C. R. Fellers

**Absorption of ash constituents by citrus trees.** H. C. Henriksen. *Puerto Rico Agr. Expt. Sta., Annual Rept.* 1932, 18-19(1933); cf. C. A. 27, 520.— $\text{LiNO}_3$  was used as a sol. salt in a study of the absorption of salts by the roots, leaves and bark of citrus trees. Conclusions: The ash constituents may be absorbed to some extent by all the roots, even by those which have passed the fibrous stage. The rate of movement of the ash constituents in a citrus tree allows them to reach all parts of the tree within 48-72 hrs. after application is made. The ash constituents move only through the tissue supplied by a definite part of the root system. This emphasizes the need of a uniform distribution of fertilizer salts in the soil. Water was more important than fertilizers in starting new growth in citrus trees. There was less shedding of bloom in the fertilized trees. C. R. Fellers

**Germination of seed corn and its relation to the occurrence of molds during germination.** A. N. Hume and C. J. Franks. *S. Dak. Agr. Expt. Sta., Bull.* 275,

2-18(1933).—Reduction in germination was definitely correlated with increased moldiness over a 5-year study. Moldiness was correlated with high moisture content.

C. R. Fellers

Chemical investigations of the tobacco plant. I. Chemical changes that occur in leaves of Connecticut shade-grown tobacco during early stages of curing. Hubert B. Vickery, George W. Pucher, Alfred J. Wakeman and Charles S. Leavenworth. *Carnegie Inst. Wash., Pub. No. 445*, 1-36(1933).—Rapid dehydration of the leaf tissue occurred; a full yellow color appeared when 66.3% of the H<sub>2</sub>O had evapd., and a full brown color when 87.4% of the H<sub>2</sub>O had evapd. Approx. 21.7% of the org. solids present in the leaf at the start of curing were lost during that process, apparently by conversion into volatile products. Of the total carbohydrate, 67% was lost; total sol. carbohydrate and fermentable carbohydrate first increased slightly, then decreased markedly; unfermentable carbohydrate decreased slowly. The ether ext. decreased, first slowly, then more rapidly, so that approx. 42% of its initial mass had disappeared at the yellow stage; an increase occurred as the brown stage developed. The nitrate content increased by 50% during the green stage, then remained const. A slight synthesis of nicotine, followed by an appreciable loss, occurred. Proteolysis to the amino acid stage took place; 52% of the N insol. in boiling H<sub>2</sub>O was converted into a sol. form; this digestion was most rapid during the green stage, and had practically ceased at the brown stage. The resultant amino acids were, in part, deaminized, and the amide N was thereby increased. This amide N had 2 degrees of stability, part being decompd. by boiling with H<sub>2</sub>O at  $p_H$  3-4, the remainder requiring hydrolysis by dil. acid. NH<sub>3</sub> accumulated in amt. greater than that accounted for by deamination of amino acids. II. Chemical changes that occur in leaves of Connecticut shade-grown tobacco during culture in distilled water. *Ibid.* 37-70.—Mature excised tobacco leaves were subjected to culture in dim light in distd. H<sub>2</sub>O for periods of 0-303 hrs. Rapid imbibition of H<sub>2</sub>O produced an approx. 12% gain in wt. A high degree of turgidity was maintained for over 200 hrs., then a rapid loss of H<sub>2</sub>O and a destruction of chlorophyll occurred. Org. solids evidently were converted into volatile products and lost; the loss was approx. 18% at the beginning of chlorophyll destruction, and 35% at the termination of the expt. Decreases occurred in total H<sub>2</sub>O-sol. carbohydrate, fermentable carbohydrate and unfermentable carbohydrate. A sudden decrease of approx. 30% in ether ext. took place as chlorophyll degeneration began. Nitrates first increased by approx. 65%, then decreased to the level in fresh leaves, apparently to form NH<sub>3</sub>. Nicotine slowly decreased. Approx. 61% of the N compds. insol. in boiling H<sub>2</sub>O underwent proteolysis to amino acids. Both types of amide N (see above) were produced; and NH<sub>3</sub> accumulated (after chlorophyll degeneration began) in amt. greater than that due to deamination of amino acids. In the turgid leaves, carbohydrate was metabolized in preference to protein. Comparison of the curing expts. and the H<sub>2</sub>O-culture expts. showed that dehydration definitely retarded total metabolism (measured by loss of org. solids), increased the rate of proteolysis and of loss of ether ext., apparently decreased the rate of carbohydrate oxidation, and prevented reduction of synthesized nitrate. The early stages of dehydration greatly stimulated amide synthesis. Loss of org. solids was a phenomenon of respiration. Nicotine played a small but definite part in general metabolism. III. Determination of carbohydrates in tobacco leaf extracts. George W. Pucher. *Ibid.* 71-7.—The soln. is prepd. and total reduction is detd. by the method of West, Scharies and Peterson (cf. C. A. 23, 2999) modified by addn. of Na<sub>2</sub>WO<sub>4</sub> and substitution of Ba(OH)<sub>2</sub> for BaCO<sub>3</sub> in the clarification. Unfermentable sugar is detd. after removal of fermentable sugar by means of yeast. Fermentable sugar is obtained by difference.

Joseph S. Hepburn

Formation and decomposition of chlorophyll in the leaves of winter and spring cereals. M. Kh. Challaikhan. *Compt. rend. acad. sci. U. R. S. S. [N. S.]*, 1933, 127-8 (in English

129-30).—Plantlets of winter and spring wheats were grown in moist sawdust at 25° in a thermostat with light (100-w lamp) and dark compartments. The plantlets developed exclusively at the expense of nutritive substances in the endosperm of the seeds. The chlorophyll content was ascertained as early as the stage of the first well-developed leaf, i. e., 7-8 days after sowing. When wheat and barley were raised in continuous elec. light, the leaves of the winter varieties accumulated more chlorophyll than those of the spring. With etiolated sprouts grown for 7 days in the dark and then exposed to light, more chlorophyll formed in the leaves of winter wheats than in those of spring wheats. Green sprouts were tested for chlorophyll content and were then placed in the dark for 5-10 days. After this treatment the amt. of decompd. chlorophyll in the winter wheats was 42-73% and in spring wheats 73-90% of the original amts. of chlorophyll. L. K.

Inducing rubber formation in plants by ultra-violet rays. V. A. Novikov and E. Kh. Herber. *Compt. rend. acad. sci. U. R. S. S. [N. S.]*, 1933, 131-3 (in English 134-6).—Seeds of the tau-sagyz rubber plant were soaked in distd. water for 18 hrs. at 25°, dried and irradiated with a quartz Hg lamp under varying conditions. After irradiation the seeds were allowed to germinate at 25° for 2 days, and then the activity of the catalase was detd. by the method of Jollys. In all irradiated seeds the catalase activity increased abruptly. Irradiation by ultra-violet rays of leaves of the tau-sagyz and *Asclepias*, previously satd. with 3% sucrose soln., caused these plants to continue the formation of rubber in the dark in a 3% sucrose soln. Non-irradiated leaves, both satd. and unsatd. with sugar, not only formed no new rubber in the dark, but even lost the rubber that they had contained. The irradiated leaves not satd. with sugar did not produce any rubber. During the vegetation expts., plants from irradiated seeds were not attacked by aphids; they also shed their leaves later and recovered their foliage earlier, indications of increased life tonus as a result of irradiation. Louise Kelley

Amylopectin as nutritive material for molds. Heinrich Hardtl. *Biochem. Z.* 267, 6-10(1933).—Amylopectin was found to be a good source of C. S. Morgulis

Studies of the chemistry of plant tumors. IV. Peroxidase of plant tumors. G. Klein and W. Zies. *Biochem. Z.* 267, 22-5(1933); cf. C. A. 27, 325.—A considerable increase in the peroxidase activity of tissue, affected by tumor growth is shown in comparison to normal tissue. S. Morgulis

Nutritive value of the mold mycelium. J. T. Skinner, W. H. Peterson and H. Steenbock. *Biochem. Z.* 267, 169-78(1933).—The digestion coeffs. for protein, lipide and crude fiber of molds were 68, 69, 77 and 48, 51, 81 for *A. fischeri* and *A. sydowi*, resp. The N of the different molds cannot support growth or provide for the maintenance of young rats, but addn. of tndol N to small amts. of yeast or casein prolongs life and stimulates initial growth. Replacing half the mold mycelium by an equal amt. of starch retarded the growth of young rats kept on good rations, while addn. of mold mycelium to a ration of low N exerts a demonstrable favorable effect. The dry mycelium contains enough vitamin B to prevent polyneuritis, and to maintain growth provided it supplies 20%, but in an amt. of only 5% it is ineffective. S. Morgulis

Studies on vitamin production in plants. I. Artturi I. Virtanen, Synnöve v. Hausen and Saara Saastamoinen. *Biochem. Z.* 267, 179-91(1933); cf. C. A. 27, 1657.—The total quantity of carotene of a plant increases rapidly up to the time of blooming and then diminishes continuously until the ripening of the fruit. The relative contents of carotene of plants grown at opt.  $p_H$  are much greater than of those grown at higher acidity, and the greatest carotene content is found under conditions where the N supply is sufficient to secure max. growth. In fact it is postulated as a general principle that max. carotene content and max. growth go hand in hand so that the former must be regarded as an essential growth factor in the plant. It is not known what chem. transformation carotene undergoes during the period when its quantity diminishes. The changes in vitamin C content of the plant are more or

less similar to those of the carotene, and it likewise reaches its max. when growth is most active. In the pea, furthermore, the vitamin C content continues to increase during the blooming and begins to decline only in the late stages of ripening.

S. Morgulis

**Carotenoids of red yeast (*Torula rubra*).** E. Lederer. *Compt. rend.* 197, 1694-5(1933).—Four carotenoids were obtained from red yeast. Three hydrocarbons were adsorbed on  $Al_2O_3$ , extd. with petr. ether, then purified from a mixt. of petr. ether and MeOH. Carotenoid I recrystd. from a mixt. of benzene and MeOH appeared identical with  $\beta$ -carotene in m. p., cryst. structure and absorption spectrum bands in  $CS_2$  soln. at 521, 484 and 451  $m\mu$ . Carotenoid II is new and the name *torulene* is proposed for it. It is readily sol. in petr. ether, difficultly sol. in EtOH and shows absorption spectrum bands in  $CS_2$  at 566, 522, 491 and 461  $m\mu$  and in petr. ether and abs. EtOH at 523, 491, 460 and 430  $m\mu$ . Carotenoid III readily decompd. and was not purified. Carotenoid IV appears to be anhydroxylactone, similar to astacin, and resembles it in chem. properties. It dissolves in alc. NaOH and on acidification with AcOH it may be extd. with petr. ether, but not with MeOH. In  $CS_2$  soln. it shows a wide band extending from 600 to 535  $m\mu$ .

James C. Munch

**Conversion of nitrates to ammonia by *Aspergillus*.** D. Bach and D. Desbordes. *Compt. rend.* 197, 1772-4 (1933); cf. C. A. 28, 1378.—The assocn. of  $NH_4OH$  is complete at  $pH$  5.5, which corresponds to the  $pH$  of the contents of many cells. Nonionized  $NH_4OH$  is excreted by the cell. When *Aspergillus* is growing in solns. of  $KNO_3$  or  $NH_4NO_3$ , the nitrate ion penetrates the cell, is reduced to  $NH_4OH$  and reexcreted, making the outside soln. more alk.

James C. Munch

**Yield and protein content of hard red spring wheat under conditions of high temperature and low moisture.** L. R. Waldron. *J. Agr. Research* 47, 129-47(1933).—A study was made of the effects of drought and heat on yield and protein content of wheat grown on a fertile soil under conditions of a light incidence of disease. Of the 9 correlation coeffs. calcd. involving protein content, 7 are minus and significant. Under the conditions of the expt. high-protein content is secured at the expense of other desirable characters such as yield and wt. per bushel. In only one instance which involved the date of heading was the correlation coeff. with protein both pos. and significant.

W. H. Ross

**Biochemical studies on potato wart disease.** W. Szymanski. *Prace Wydz. Chorób Roslin Państw. Inst. Naukow. Gospod. Wiejsk. w Bydgoszczu (Trans. Phytopath. Sect. State Inst. Agr. Bydgoszcz)* 13, 141-62(1933); *Rev. Applied Mycol.* 12, 718.—Dry weight of potato tuber tissue infected with wart disease was less than that of healthy tissue but the ash content was higher. Warted tissue contained much the greater percentage of mineral constituents, especially Fe, Mn, Cu and N. It is suggested that these elements stimulate the proliferation of the warted tissue in infected tubers. Oden E. Sheppard

**Physical and chemical factors influencing the moment of chromosome reduction in the smut fungi.** W. Hütting. *Z. Botan.* 26, 1-26(1933); *Rev. Applied Mycol.* 12, 150-1.—The urethans impeded or suppressed reduction division in the first division of the promycelium while various other alkali salts stimulated the process in a more or less irregular fashion, the Na salts being exceptional in that they exerted a fairly const. inhibitory action at all concns. tested. Changes in vapor pressure, osmotic pressure or H-ion concn. of the medium were without influence.

Oden E. Sheppard

**Examination of starch and hemicellulose extracts from apple wood.** Henry Otterson and W. E. Tottingham. *Plant Physiol.* 8, 561-4(1933).—The starch ext. obtained by salivary digestion (after removal of sugars and fats) of 1-yr. branch growth of apple trees under different cultural treatments gave as av. values: ash 18, crude protein 10, uronic anhydride 23, pentosan 12 and "true" starch 39%. The compensated value for starch was obtained by subtraction of the pentose equiv. of the "true" pentosan from the total reducing power. Similarly the av. values for the

hemicellulose ext. obtained by boiling with 2%  $H_2SO_4$  for 1 hr. were: ash 13, crude protein 3, uronic anhydride 21, pentosan 25 and "true" glucosan 15%. No consistent correlation exists between any or all of the carbohydrate constituents and the cultural history of the tissue. The "true" glucosan content varied independently of the "true" starch content. The hemicellulose fraction seems to be less definitely and directly related to plant performance than in the starch fraction.

Walter Thomas

**Detection and estimation of formaldehyde within the cell of a green plant by the Allison apparatus.** Anna L. Sommer, Edna R. Bishop, and Irene G. Otto. *Plant Physiol.* 8, 564-7(1933).—The unicellular algae *Chlorella* were used in the expts. and the presence of H.CO.H was established by the Allison app. (C. A. 26, 5661). The work is preliminary but suggests great possibilities, not only in further photosynthetic studies, but in detg. various metabolic products of small organisms sufficiently transparent to allow enough light to pass through for work with the Allison app.

Walter Thomas

**Lupine studies. VI. Alkaloids of Lupinus corymbosus.** Heller. I. James F. Couch. *J. Am. Chem. Soc.* 56, 155-6(1934); cf. C. A. 26, 2825.—*Lupinus corymbosus* (air-dried) yields 7.66% moisture at 125°. Extn. with EtOH and of the EtOH-sol. residue with  $H_2O$ , pptn. with basic Pb acetate, removal of the Pb with  $H_2S$  and shaking the alk. filtrate with  $CHCl_3$  gives *hexalupine*,  $C_{15}H_{25}N_2O \cdot 1/3H_2O$ , m. 197-8°,  $\alpha_D^{25}$  126.1° (EtOH, c 4.795 g.); *di-HCl salt*, crystallizes with 8 mols.  $H_2O$ ,  $\alpha_D^{25}$  106.5° ( $H_2O$ , c 3.192 g.); heating at 125° gives a *mono-HCl salt*, m. 136-8°; *aurichloride*,  $C_{15}H_{25}N_2O \cdot 1.5HAuCl_4 \cdot 2.5H_2O$ , golden, m. 204° (decompn.); *picrate*, lemon yellow, m. 245-6°. A new system of naming alkaloids from lupines is proposed, in which a numerical system affixing the Greek numeral prefixed to the generic word lupine is used; monolupine from *L. caudatus*, dilupine and trilupine from *L. barbiger*, tetralupine and pentalupine from *L. palmeri*, instead of possibly caudatine, barbicine and barbiginine, palmerine and palmeridine.

C. J. West

**Sugar metabolism and the ability of molds to accumulate acids.** T. Chrzaszcz and D. Tiukow. *Polish Agr. Forestal Ann.* 26, 71-86[85-6 in German](1931).—Different groups, and even different species of molds, consume varying amts. of sugar. The amt. of acid accumulated by different species is a characteristic property of the species and is independent of the sugar consumption. Max. accumulation of acid takes place within 10-14, usually in 10 days. The ratio of the amt. of acid accumulated and of sugar consumed, termed the "ability to accumulate acid," can be used for identification of the mold species. The sugar consumption and acid accumulation should be expressed in relation to 1 g. of the dry substance of molds.

J. Wiertelak

**Control of "yarovization."** A. Rikhter, V. A. Rantzan, and M. Pekker. *Compt. rend. acad. sci. U. R. S. S.* 1933, 72-4(in English 75-7).—The authors were seeking control indexes for this process. Yarovized seeds of winter wheat, in comparison with controls, showed a gradual increase in amylase and protease activity throughout the days of treatment; peroxidase, however, attained maxima on the 15th and 30th days, and catalase on the 20th and 25th days. Respired  $CO_2$  and  $pH$  reached a peak on the 15th day. Sections of embryos were dyed with toluidine blue at various  $pH$  values. The control seeds gave min. dyeing on the acid side, and the treated seeds on the alk. side.

J. J. Williamson

**Possible chemical nature of tobacco mosaic.** E. Barton-Wright and Alan M. McBain. *Nature* 132, 1008-4 (1933).—A phosphate ext. of diseased leaves of *Nicotiana glauca* was highly infectious. The acetone ppt., at  $pH$  5, of this ext. was also infectious, and could be divided into 2 fractions, a protein and a cryst. material. Although the latter was mostly phosphate, it contained org. matter but no N, and was highly infectious. Sap from healthy leaves did not produce a ppt. with acetone.

J. J. Williamson

**Chemistry of certain beet hybrids.** Eugène Bougy. *Publ. inst. belg. amélioration betterave* No. 5, 147-226(1933).—

Sugar beets (A), fodder beets (B), and their hybrids are similar in content of reducing sugar, ratio of insol. N to dry substance, sol. alky. of ash and ratio of org. and total N to the wt. of fresh substance. They differ in abs. sucrose content and vascularization. In comparison with B, in either fresh or dry substance A contains less mineral and amino N, ash and Cl, less org. and total N, more insol. N, less sol. and more insol. bases in ash, more CaO and MgO in ash per g. of ash, and a lower CaO/MgO ratio. The higher sucrose content of A is relatively dominant in the  $F_1$  hybrids, but this depends largely on the direction of crossing;  $B \times A$  is richer in sucrose than  $A \times B$ ; the same largely applies to crosses of A with *Beta maritima*. The assocn. of the other chem. characters of the  $F_1$  hybrids tends to follow the same rule, that is, the characteristics of  $A \times B$  tend toward those of B, whereas  $B \times A$  tends to resemble A. In the second and following generations the progeny are less homogeneous in their chem. characters. O. W. Willcox

Biol. aspects of the genetics of wheat (Fleurent) 12. Biogenetics in the terpene series (Hall) 10.

Opitz, Franz; Beitrag zur Kenntnis der Holzatzung. Thesis, Dresden. 1931. 46 pp.

## E—NUTRITION

PHILIP B. HAWK

Experimental evidence of an additional substance essential to mammalian nutrition. L. N. Ellis. *Proc. Soc. Exptl. Biol. Med.* 31, 339-40 (1933).—Young rats were fed 3 diets which contained increasing concns. of vitamin G; inferior growth was assocd. with the higher concns. of that vitamin; the growth rate was restored by feeding the Bourquin and Sherman vitamin-G-deficient diet (cf. C. A. 25, 5896). This diet evidently contains an essential growth substance, closely allied to Reader's vitamin B<sub>4</sub> (cf. C. A. 24, 402, 5801) and the factor reported by Halliday (cf. C. A. 26, 4086). The alc. ext. of whole wheat is the most probable carrier of this substance. C. V. Bailey

The mode of action and administration of vitamin D. Cornelius Daly. *Proc. Soc. Exptl. Biol. Med.* 31, 368-9 (1933).—Standard rachitic rats were given subcutaneous injections of histamine (0.005-0.5 mg.) twice daily for 21 days without beneficial effect. The results support the findings of Bauer, *et al.* (cf. C. A. 25, 3039) and Hottinger (cf. C. A. 24, 5806), who were unable to explain the healing action of vitamin D on the basis of an increased formation of acid in the gastrointestinal tract. The oral and subcutaneous administrations of vitamin D were equally satisfactory when continued over a period of 21 days; when the equiv. of the 21 doses was given in 1 dose or in 3 doses in 10 days, the subcutaneous method brought about complete cure whereas the ingested vitamin D caused only moderate or advanced healing. C. V. Bailey

The calcium content of striated muscle and of the liver of normal or starved guinea pigs or animals suffering from acute and chronic scurvy. A. Michaux. *Compt. rend.* 197, 1453-5 (1933).—The Ca content of the muscle of normal guinea pigs was 0.057 and 0.267 g. per 1000 of fresh and dry tissue, resp.; of scorbutic guinea pigs 0.233 and 1.023 g. and of starved animals 0.310 and 1.311 g. On a scorbutic diet rich in Ca the muscle of guinea pigs suffering from acute scurvy contained 0.407 g. Ca per 1000 g. of fresh tissue and 2.114 g. per 1000 g. of dried tissue while that from guinea pigs suffering from chronic scurvy contained 0.353 g. per 1000 g. of fresh tissue and 2.236 g. per 1000 g. of dried tissue. The total Ca found in the liver in scorbutic and thirsting guinea pigs was less than in normal. Rachel Brown

The significance of the thyroid glands for the effect of vitamin D and the genesis of rickets. A. Nitschke. *Klin. Wochschr.* 12, 1793-7 (1933).—A review. H. E.

The mechanism of the action of a salt-free diet. Calcium distribution in the blood. H. Schwartz. *Arch. exptl. Path. Pharmacol.* 173, 558-70 (1933).—A NaCl-free diet does not affect the total serum Ca of rabbits, but does

cause an increase in the protein-bound Ca at the expense of the inorg. Ca. A NaCl-rich diet has the opposite effect. These findings are correlated with the anti-inflammatory effect of salt-free diets. Harry Eagle

Action of irradiated ergosterol on the blood calcium of animals in a state of chronic parathyroid insufficiency. Franz Mathieu. *Compt. rend. soc. biol.* 114, 1375-7 (1933).—Thyroparathyroidectomized male dogs were kept alive by injections of Ca salts. Several months after the operation, large doses of Vigantol caused a small increase in blood Ca, sometimes preceded by a slight decrease. L. E. Gilson

Incidence of dermatitis among rats deprived of vitamin B<sub>2</sub>. Margaret H. Roscoe. *Biochem. J.* 27, 1533-6 (1933).—Dermatitis occurred in 108 out of 191 rats deprived of vitamin B<sub>2</sub>. The av. time taken for symptoms to develop was 10 weeks. Vitamin B<sub>2</sub> content of various materials compared by their power to promote growth and to cure dermatitis, respectively. *Ibid.* 1537-9.—The amts. of yeast ext., egg-white filtrate or meat needed to cure dermatitis are proportional to the daily doses needed to promote a given wt. increase. Benjamin Harrow

The heat-stability of vitamin B<sub>2</sub>. III. The rate of destruction at various reactions of vitamin B<sub>2</sub> contained in different materials. Margaret H. Roscoe. *Biochem. J.* 27, 1540-4 (1933).—No difference is found in the stability to heat and weak alkali of vitamin B<sub>2</sub> as contained in watery yeast ext. (I), marmite soln. (II) or a watery liver ext. (Eli Lilly, No. 343) (III). Heating for 1 hr. at 120° at  $pH$  8.7-7.2 causes a loss in I, II and III of 50% of their original vitamin B<sub>2</sub> potency. Vitamin B<sub>2</sub> is relatively heat-stable in acid soln., and the rate of destruction is rapidly increased with increasing alky. Cf. preceding abstr. Benjamin Harrow

Factors affecting the development and regeneration of visual purple in the mammalian retina. Katharine Tansley. *Proc. Roy. Soc. (London)* B114, 79-103 (1933).—Regeneration of visual purple apparently depends upon normal circulation in the retina and choroid, and healthy outer limbs of the rods. In vitamin A deficiency in the dog and the rat, chem. changes occur in the outer limbs of the rods, and production of visual purple ceases. Joseph S. Hepburn

The threshold for the renal excretion of inorganic phosphates in the sheep. R. H. Watson. *Australian J. Exptl. Biol. Med. Sci.* 11, 197-207 (1933).—The approx. renal threshold was 7.5 mg. P/100 cc. serum, with a pasture or chaff diet. It decreased upon fasting, with a lower  $pH$  value of the urine. C. G. King

Necessary versus optimal intake of vitamin G (B<sub>1</sub>). H. C. Sherman and L. N. Ellis. *J. Biol. Chem.* 104, 91-7 (1934).—“Food mixts. equally rich in other known nutrients and with vitamin G values, adjusted to 4 different levels (0.4, 0.9, 1.3 and 2.2 units per g.) were fed to rats from the end of infancy to the completion of the breeding record. The improvement from the enrichment in vitamin G of an already adequate diet was chiefly apparent in the superior vitality of the young and the extension of the period between the attainment of maturity and the onset of senility. There was increased growth both of the original young animals and of their offspring, though all of the growth rates involved in the expts. were well below the records of very rapid growth which have been observed by other investigators in recent years. The moderate increases in growth rate with increasing intake of vitamin G were evidently related to increases of vitality. This is indicated, on the one hand, by the fact that those receiving more vitamin G and growing more rapidly showed evidence of superior adult vitality as far into middle life as these expts. were continued; and, furthermore, their young showed superior vitality both in their growth rates before and after weaning and in their ability to cope with the emergency of being transferred to a vitamin-G-deficient diet. These findings make clear that the optimal intake of vitamin G is much above the amt. which is easily demonstrable as strictly necessary. It is probable that the true optimum is higher than the highest level here fed.”

Vitamin G was furnished in the form of skim-milk powder. A. P. Lothrop

## F—PHYSIOLOGY

HOMER W. SMITH

The hormone content of the corpus luteum and its effect upon the luteal stratum. M. Maino. *Arch. ist. biochim. ital.* 5, 211-24(1933).—From the corpus luteum was extd. a luteinic hormone which gave rise to Bouin and Ancel's reaction in the mucosa of the uterus. Its action on the uterus was quite different from that exerted by the follicular hormone. E. S. G. Barron

The blood in normal pregnancy. I. Blood and plasma volumes. Wm. J. Dieckmann and Carl R. Wegner. *Arch. Internal Med.* 53, 71-86(1934).—During the first third of gestation blood and plasma vols. increase so that by the 13th week the gains are 16 and 18%, resp. At term the increase in vol. is 23% and in plasma 25%, a condition termed "oligocythemic hypervolemia." The increase almost disappears within 8 weeks after parturition. The increase during pregnancy is probably a mechanism to permit fetal respiration. J. B. Brown

Insulin and sugar tolerance in thin people. Harry Blotner. *Arch. Internal Med.* 53, 153-8(1934) J. B. B.

The classification of the body constituents by water content. Harold G. Close. *Brit. Med. J.* 1934, 1, 98-100.—A classification of tissues based on their water and Cl contents is described. Cf. *C. A.* 28, 516<sup>1</sup>. J. B. B.

The hematopoietic response to intramuscular injections of concentrated human gastric juice. Paul J. Fouts, O. M. Helmer and L. G. Zerfas. *Brit. Med. J.* 1934, 1, 141-3.—Human gastric juice, concd. by vacuum distn., is not active in hematopoiesis. J. B. Brown

The diurnal rhythm in water and mineral exchange. Robert C. Manchester. *J. Clin. Investigation* 12, 995-1008(1933).—There is a diurnal rhythm in mineral and water balance; urine vol. and urinary Na, K and Cl are greater during the day, and there is a neg. water balance. A pos. water balance occurs at night. Other urinary constituents show only slight fluctuations. Rise in sp. gr. at night is assocd. with increased concn. of N compds., although actually smaller amts. of these are excreted during that period. The diurnal differences seem to be dependent upon the differences between the waking and sleeping states of consciousness. J. B. Brown

The proteins of blood and subcutaneous lymph in dogs. A. A. Weech, E. Goettsch and E. B. Reeves. *J. Clin. Investigation* 12, 1021-30(1933).—In dogs there is a definite relationship between the albumin to globulin ratios of serum and lymph. Two theories to account for the entrance of serum proteins into the lymphatics are discussed. J. B. Brown

Permeability of capillaries to plasma lipoids. Evelyn B. Man and John P. Peters. *J. Clin. Investigation* 12, 1031-9(1933).—In man the capillary walls are impermeable not only to proteins, but also to cholesterol, phosphatides and compds. of satd. and slightly unsatd. aliphatic acids. J. B. Brown

The oxygenation of concentrated versus normal bloods. G. B. Ray, C. I. Thomas and J. E. Strong. *J. Clin. Investigation* 12, 1051-62(1933).—The tension of O required to produce a given satn. is the same in normal and polycythemic bloods. When these bloods are perfused through the surviving lung the former becomes completely oxygenated while the latter is never fully satd., because

the polycythemic blood (and hence the hemoglobin) passes through the lungs more rapidly and also because there is delayed diffusion because of capillary dilatation. J. B. Brown

A note on the calculation of water exchange. L. H. Newburgh, F. H. Wiley and M. W. Johnston. *J. Clin. Investigation* 12, 1151-2(1933).—A reply to Peters, Kydd and Laviates (cf. *C. A.* 27, 4286). J. B. B.

The rate of excretion of urine in subjects with different amounts of renal tissue. David A. Rytand. *J. Clin. Investigation* 12, 1153-68(1933). J. B. Brown

The blood lipides in the postabsorptive state and after the ingestion of fat in normal human subjects and in a case of disseminated cutaneous xanthomata. I. L. Chaikoff, T. H. McGavack and A. Kaplan. *J. Clin. Investigation* 13, 1-13(1934).—Ingestion of 100 g. olive oil in normal individuals in the postabsorptive state is followed by marked variations in blood fatty acids. In 6 out of 7 cases there was no effect on cholesterol level. The lipemia in a case of cutaneous xanthomata was studied and the effect of olive-oil ingestion shown to be normal. J. B. Brown

Some problems of the origin, circulation and absorption of the cerebrospinal fluid. Louis B. Flever. *Quart. Rev. Biol.* 8, 397-422(1933).—A review with extensive bibliography. J. B. Brown

The changing concept of ovarian rhythms. Olive Swezy. *Quart. Rev. Biol.* 8, 423-33(1933).—A review. J. B. B.

The acid-base equilibrium of inhabitants of the tropics. III. The alveolar carbon dioxide tension and the concentration of hydrogen ions and the carbon dioxide content of the blood in various groups in the tropics. W. Radama, G. M. Streef and J. V. Klerks. *Arch. néerland. physiol.* 18, 536-77(1933); cf. *C. A.* 27, 3981.—It is probable that on an av. the alveolar CO<sub>2</sub> tension in white men in the tropics is lower than in temperate zones. The daily variations of the alveolar CO<sub>2</sub> tension in the tropics and those in temperate zones present a different aspect. In general, the CO<sub>2</sub> tension falls in the course of the tropical day and in many persons it shows a characteristic sudden rise about 4:30 P. M. There is probably some connection between this phenomenon and the radiance of the sun. Exposure to the direct radiance of the sun generally causes the alveolar CO<sub>2</sub> tension to decrease. In this respect there are strongly pronounced individual differences. The decrease of the alveolar CO<sub>2</sub> tension in the course of the tropical day is a consequence of increased lung ventilation. There is a real difference in blood reaction between native servants and Europeans; the blood of the servants is more acid. The values detd. gasometrically for the p<sub>H</sub> agreed well with those found electrometrically in the same blood samples. The figures obtained colorimetrically as well as electrometrically and gasometrically for the blood reaction of Europeans in the tropics are on the whole more on the alk. side than the figures given in the literature for the temperate zones. Fifty-four references. F. L. D.

Outline of a physico-mathematical theory of excitation and inhibition. N. Rashevsky. *Protoplasma* 20, 42-56 (1933).—"The fundamental assumption is made, that every nerve contains 2 antagonistic substances (or groups of substances), one exciting and the other inhibiting. It is assumed that an elec. current passing through a nerve causes a transport of those substances, either to the cathode or to the anode. The excitation at any place of the nerve is supposed to happen whenever the ratio of the concn. of exciting and inhibiting substances exceed at that place a critical value." "The connection of the present theory with the 'chemical' theory of central inhibition is discussed and a suggestion for the explanation of the rebound phenomenon offered." F. L. Dunlap

The effect of the nervous system upon the [kidney] threshold for sugar excretion. M. B. Handelsman and K. Oberdisse. *Arch. expl. Path. Pharmacol.* 174, 80-7 (1933).—Complete denervation of the kidney in dogs has no effect upon the threshold value for the excretion of urinary glucose or the tendency to alimentary glucosuria. Harry Eagle

Catalytic processes in the liver. Franz Delhougne.

*Arch. expul. Path. Pharmacol.* 174, 88-91(1933).—A decrease in the carbohydrate (glycogen) content of the liver (P, tolylenediamine, bile-duct ligation, phlorizin) entails a decrease in the glutathione content as well, presumably a manifestation of decreased catalytic processes.

Harry Eagle

Colloids in the gastric juice and their determination by the [Zsigmondy] gold number method. Franz Delhougne. *Arch. expul. Path. Pharmacol.* 174, 92-5(1933).—The colloid content varies inversely with the acidity.

Harry Eagle

The intermediate carbohydrate-protein-fat metabolism with relation to liver function. Werner Gneiting. *Klin. Wochschr.* 12, 1807-10(1933).—In normal individuals the metabolism of galactose or glycine is not affected by the simultaneous ingestion of the other substance; in hepatic disease, they affect each other significantly. The addition of fat to the mixt. has no further effect.

Harry Eagle

Experiences with the thyrotropic substance of the anterior pituitary lobe in pregnancy, especially in cases with kidney damage. Hans Peter Muller. *Klin. Wochschr.* 12, 1899-901(1933).—Although the hormone normally stimulates the thyroid gland, it cannot be used during pregnancy as a substitute for thyroid medication, as for some unknown reason it fails to exert its normal action.

Harry Eagle

Parathyrotropic action of anterior pituitary extracts. K. J. Anselmino, Fr. Hoffmann and L. Herold. *Klin. Wochschr.* 12, 1944(1933).

Harry Eagle

The adrenaltropic action of anterior pituitary extracts. K. J. Anselmino, Fr. Hoffmann and L. Herold. *Klin. Wochschr.* 12, 1944(1933).

Harry Eagle

The intestinal action of orasthin. Hermann Schroeder and Fritz Kuhlmann. *Klin. Wochschr.* 12, 1961-2(1933).—Orasthin, the uterus-active principle of the posterior pituitary lobe, stimulates contraction of the large intestine of human beings after subcutaneous injection, without affecting the small intestine.

Harry Eagle

Variations in the blood choline level during normal pregnancy and in pregnancy toxemias. H. Rufinger and J. Gottlieb. *Klin. Wochschr.* 12, 1981-3(1933).—The blood choline concn., normally low in pregnancy (1.4-1.9 mg. %), increases within 1-2 hrs. post partum to a little over 3 mg. %. In cases of nephritic toxemia the choline concn. falls to as low as 0.87 mg. %. The blood and urine of an eclamptic patient, injected into cats, caused a prolonged increase in blood pressure (20-40 min. Hg).

Harry Eagle

The adrenotropic hormone of the pituitary. Arthur Jores. *Klin. Wochschr.* 12, 1989-90(1933).—A preliminary report.

Harry Eagle

The detoxicating hormone of the liver (yakriton). XII. Detoxication of chloroform by yakriton. Akira Sato and Shigeo Yanagawa. *Tohoku J. Exptl. Med.* 22, 342-5(1933); cf. Yoshida, C. A. 27, 4571. XLII. Effect of yakriton on excretion of alkaloid; insufficiency and hyper-sufficiency of the liver. Kyumatsu Asakura. *Ibid.* 346-51. XLIII. Prophylactic effect of yakriton against tolylenediamine hemoglobinuria. Matsuichi Yoshida. *Ibid.* 352-4. XLIV-XLV. Effect of yakriton on the blood picture. Morie Chiba and Shigeo Yanagawa. *Ibid.* 355-66. XLVI. Effect of yakriton in counteracting heart dilatation. Akira Sato. *Ibid.* 367-70. XLVII. Effect of yakriton in arsenamine poisoning. Matsuichi Yoshida. *Ibid.* 371-8. XLVIII. Therapeutic effect of yakriton for tolylenediamine icterus. Matsuichi Yoshida. *Ibid.* 379-84.

Harry Eagle

The cholesterol concentration of the blood of rabbits after unilateral and bilateral adrenalectomy. Hyoro Tada. *Tohoku J. Exptl. Med.* 22, 385-94(1933).—The increase in blood cholesterol is more marked after bilateral adrenalectomy, reaching a max. of 25-75% in 5-7 days; it may last for 3-4 weeks.

Harry Eagle

Effect of season on fat test and milk production on dairy cows. F. B. Headley. *Nev. Agr. Expt. Sta., Bull.* 131, 5-11(1933).—The butter fat was highest in milk in winter and lowest in July and Aug. This variation is not due to difference in feed, because cows on unchang-

ing rations show the same changes. Five cows which had an av. fat test of 3.6 at 4 years had an av. test of 3.35 at 10 years of age. After calving 1 month, the herd gave milk with 3.7% fat, 3.44 during the second month and 3.4 the 3rd month; a gradual increase then followed until the fat content was 4.1% during the last month. The time of year at which a cow freshens materially affects the amt. of milk produced during the first 150 days of the milking period. The greatest production was obtained when the cows freshened in Jan. and the smallest when they freshened in Sept.

C. R. Fellers

Biochemistry of creatinephosphoric acid. Effect of section of the nerves on the creatinephosphoric acid content of muscles. Alexandre Palladin and R. Sigalova. *Bull. soc. chim. biol.* 15, 1263-71(1933).—Rabbits and guinea pigs were used. The sciatic nerve of one hind leg was cut, then the same muscles from each hind leg were analyzed 24-48 hrs. later. In all cases the water, total N and total creatine showed no change, but the creatinephosphoric acid was greatly increased, sometimes doubled, in the muscles with sectioned nerves.

L. E. Gilson

Constitution of muscle proteins. I. Effects of total starvation and protein starvation. Andrée Rôche. *Bull. soc. chim. biol.* 15, 1290-1307(1933).—See C. A. 27, 5397.

L. E. Gilson

Protein starvation and the nitrogenous extract of muscles. Andrée Roche. *Compt. rend. soc. biol.* 114, 1185-7(1933).—In rats protein starvation caused a 21% increase, and total starvation a 39% increase, in the water-sol. N of the muscles.

L. E. Gilson

Cholesterol content of horse serum. D. Brocq-Roussau, G. Roussel and G. Gallot. *Compt. rend. soc. biol.* 114, 1075(1933).—The averages found were: horses, 1.112 g per l.; non-pregnant mares, 0.983; mares 4 months pregnant, 1.201; mares 5-10 months pregnant, 1.308.

L. E. Gilson

Expansion of melanophores caused by a mixture of red corpuscles and extract of the anterior hypophysis. G. T. Popa and Una Fielding. *Compt. rend. soc. biol.* 114, 1139-40(1933).—The anterior lobe of a sheep hypophysis was kept in contact with rabbit blood 2-5 days in a refrigerator. An aq. ext. of the mixt. caused melanophore expansion in frogs. Possibly the melanophore-expanding action of ext. of the posterior hypophysis is due to a substance formed from blood in the anterior lobe and subsequently stored in the posterior lobe and adjacent tissues.

L. E. Gilson

Purine metabolism of hypophysectomized dogs. Bernardo Braier. *Compt. rend. soc. biol.* 114, 1209-12(1933); cf. C. A. 27, 3248. —Hypophysectomized dogs on various diets excreted 31-50% less uric acid, 31-55% less purine bases and 32-38% more allantoin than control dogs. The total N excreted in these forms was very slightly greater in the hypophysectomized dogs.

L. E. Gilson

Role of the adrenals in the resynthesis of glycogen after fatigue. R. G. Dambrosi, L. F. Leloir and A. Novelli. *Compt. rend. soc. biol.* 114, 1219-21(1933).—In dogs, 24-48 hrs. after removal of the adrenals the muscles still have a normal glycogen content, but after severe fatigue the glycogen is very slowly regenerated. Injections of glucose do not hasten glycogen regeneration but injections of adrenal cortex hormone restore the glycogen to its normal level. Role of the liver in the resynthesis of muscle glycogen after fatigue. R. G. Dambrosi. *Ibid.* 1222-4. —Removal of the liver decreases the rate of glycogen resynthesis. Injections of glucose speed resynthesis. Role of the pancreas in the resynthesis of muscle glycogen after fatigue. *Ibid.* 1224-6. —Removal of the pancreas greatly retards the resynthesis. Insulin restores the normal condition. Effect of section of the vagus or splanchnic nerves on the resynthesis of muscle glycogen in dogs. *Ibid.* 1228-30. —Cutting the nerves has no effect. Roles of the pancreas and the vagus in the resynthesis of muscle glycogen in cats after fatigue. *Ibid.* 1230-2. —Removal of the pancreas decreases the rate of resynthesis. Cutting both vagi has no effect.

L. E. Gilson

Diagnosis of pregnancy in mares. D. Brocq-Roussau,

G. Roussel and G. Gallot. *Compt. rend. soc. biol.* 114, 1242-3(1933).—The urine of non-pregnant mares causes no change in blood cholesterol when injected into rabbits. Urine from pregnant mares was injected into 24 rabbits. In 6 there was a decrease in blood cholesterol and in 18 an increase.

L. E. Gilson  
Endocrinology of gestation in the rabbit. R. Courrier and R. Kehl. *Compt. rend. soc. biol.* 114, 1317-20(1933); cf. C. A. 26, 3550.—The action of the corpus luteum is discussed.

L. E. Gilson  
Formation of bicarbonates in perfusion liquids containing carbon dioxide. A. Schwartz and F. Schmid. *Compt. rend. soc. biol.* 114, 1326-9(1933).—When the legs of frogs were perfused with Ringer or isotonic glucose soln. bicarbonates were formed in the soln. Apparently bases not ordinarily diffusible are exd. from the tissues.

L. E. Gilson  
Action of the corpus luteum on the blood calcium of female dogs with chronic parathyroid insufficiency. Franz Mathieu. *Compt. rend. soc. biol.* 114, 1373-4(1933); cf. C. A. 28, 515.—The injection of corpus luteum hormone causes a further decrease in blood Ca. This effect is independent of the action on the reproductive app. While most of the properties of corpus luteum hormone are antagonistic to those of the estrogenic hormones its hypocalcemic property is similar to that of the latter.

L. E. Gilson  
Chlorine content of the blood in the afferent and efferent vessels of the principal viscera of the dog. J. Bottin. *Compt. rend. soc. biol.* 114, 1380-9(1933).—Analytical data and discussion. Blood chlorine of dogs during periods of mixed diet and fasting. Its relation to the corpuscle and plasma volumes. *Ibid.* 1389-91. Experimental production of a marked hypochloremia in a dog, with survival of the animal. *Ibid.* 1392-4.—Normal dog blood contains 3.2 g. Cl per l. A dog was kept without food and given 0.9% K<sub>2</sub>CO<sub>3</sub> soln. to drink as desired. After 4 weeks blood Cl was 1.64 g. per l. The change in blood Cl was very similar to that observed in intestinal obstruction, but since the dog survived it is probable that in intestinal obstruction death is not the result of Cl deficiency.

L. E. Gilson  
Nerve ganglion and melanophore reactions. R. Collin and P. Florentin. *Compt. rend. soc. biol.* 115, 162-3(1934).—Exts. of ganglions contg. visceromotor neurons (from normal and pregnant cats and guinea pigs) sometimes caused melanophore expansion when injected into frogs.

L. E. Gilson  
Lactic acid formation of striated muscle induced by galvanic currents. F. Lippay and Charles Rand. *Arch. ges. Physiol.* (Pflügers) 233, 17-34(1933).—Gastrocnemii of frogs, paralyzed by KCl, produce lactic acid when galvanic currents are passed through them. This acid production, in the absence of contraction, is not due to thermal effects.

Arthur Grollman  
The glycogen metabolism of muscle and its nervous influences. I. Glycogen formation in denervated muscles. J. Baum and E. Pichler. *Arch. ges. Physiol.* (Pflügers) 233, 35-42(1933).—Denervated frog muscle forms glycogen in winter. During summer glycogen is formed only in the presence of insulin. Glycogen can still be formed by the denervated muscles of depancreatized or hepatectomized frogs. II. A glycogenolytic reflex. J. Baum, W. Christen and E. Pichler. *Ibid.* 43-50.—When one gastrocnemius is removed, the glycogen content of the opposite muscle is reduced. This reflex is absent after sympathectomy of the 2nd muscle. III. A proprioceptive glycogenolytic reflex. O. Loewi and E. Pichler. *Ibid.* 51-6.—Changes in the glycogen content of muscle produced by strychnine after sympathectomy are due to reflex proprioceptive impulses.

A. G.  
The penetration of glucose into erythrocytes. Walter Fleischmann and H. Kaunitz. *Arch. ges. Physiol.* (Pflügers) 233, 149-58(1933).—Colorimetric detn. of vol. changes indicates the rapid diffusion of glucose into erythrocytes, even at low temps.

Arthur Grollman  
Respiration and carbohydrate metabolism of isolated organs in angiotomized dogs. I. E. S. London, N. P.

Kochneva, A. M. Dubinskii and A. S. Katzva. *Arch. ges. Physiol.* (Pflügers) 233, 160-80(1933). A. G.

The excretion of sugar by the isolated frog kidney. R. Höber. *Arch. ges. Physiol.* (Pflügers) 233, 181-98(1933).—Sugars are reabsorbed by the 2nd segment of the renal tubule in the order: glucose > galactose > mannose > fructose > xylose > arabinose. The last named is scarcely retained by the kidney.

A. G.  
The permeability of the renal tubule of the frog kidney for organic nonelectrolytes. F. E. Schmengler and R. Höber. *Arch. ges. Physiol.* (Pflügers) 233, 199-221(1933).

The action of the follicular hormone on the ovary and the interrelations of the ovarian sex hormones and the anterior pituitary. M. A. Magath and R. M. Rosenfeld. *Arch. ges. Physiol.* (Pflügers) 233, 311-28(1933); cf. C. A. 28, 1087.

Arthur Grollman  
The innervation of "permeability" in frog lungs. J. Weiser and J. Riemüller. *Arch. ges. Physiol.* (Pflügers) 233, 380-94(1933).—Vagotomy increases the permeability of the frog lung to trypan blue.

Arthur Grollman  
Acid-base equilibrium under diminished atmospheric pressure. R. Wittkower. *Arch. ges. Physiol.* (Pflügers) 233, 607-21(1933).—The CO<sub>2</sub>-combining power of the blood is reduced and the CO<sub>2</sub>-dissocn. curve is markedly altered when animals are transported to high altitudes.

Arthur Grollman  
Further studies on the physiology of high altitudes. A. Loewy and E. Wittkower. *Arch. ges. Physiol.* (Pflügers) 233, 622-44(1933).—Rapid ascent to altitudes of 2450 to 2650 m. resulted in discernible changes in the reaction of the skin to stimuli, reflex activity, position of the diaphragm, etc. These changes occurred despite protection from the abnormal radiations, humidity and cold of high altitudes and are, therefore, attributable solely to the effects of low O<sub>2</sub> tension.

Arthur Grollman  
The occurrence of an acetylcholine-like substance in the blood of the adrenal vein after stimulation of the splanchnic nerve. W. Feldberg and B. Minz. *Arch. ges. Physiol.* (Pflügers) 233, 657-59(1933).

A. G.  
Fermentable sugar in fasting urine. Victor J. Harding and David L. Selby. *Biochem. J.* 27, 1598-608(1933).—Some substance removable by yeast from both glucose and fructose exists in normal human fasting urine.

B. H.  
Mechanical effort in relation to gaseous exchange, heart rate and mechanics of respiration. Francis G. Benedict and Cornelia G. Benedict. Carnegie Inst. Wash., Pub. No. 446, 1-83(1933).—Study was made of the metabolism of 7 university-trained subjects (6 men, 1 woman) during repose, attention (closing an elec. contact at a given signal) and mental effort (usually multiplication of pairs of 2 figure digits for 4 consecutive periods of 15 min. each). Metabolism was the same during repose and attention. Among the results produced by mental effort were increased heart rate, markedly altered respiration, a small increase in CO<sub>2</sub> exhalation, increases of approx. 4% in both O<sub>2</sub> consumption and heat production, a considerable increase in apparent total ventilation of the lungs and a slight increase in the apparent R. Q. The increased O<sub>2</sub> consumption and heat production were due to the increased muscular activity of the respiratory and circulatory app. Mental effort *per se* had no significant influence on energy metabolism.

J. S. H.  
Metabolism and the inorganic elements. Joseph S. Hepburn. *Hakemannian Monthly* 68, 886-67(1933).—A review (with a bibliography of 107 references) of recent work on the occurrence of Al, Sb, As, Ba, Bi, B, Br, Ca, Cl, Cr, Co, Cu, F, Ge, Au, I, Fe, Pb, Li, Mg, Mn, Hg, Ni, P, K, Rb, Se, Si, Ag, Na, Sr, S, Sn, Ti, V and Zn in water and in the food, tissues and excretions of man, and on the function of certain of these elements.

Joseph S. Hepburn  
Solubility of enamel. J. C. Forbes. *J. Dental Research* 13, 849-58(1933).—The soly. of finely ground teeth and enamel in H<sub>2</sub>O, in the presence or the absence of CO<sub>2</sub>, is increased by MgSO<sub>4</sub>. The Mg concn. in saliva normally is so low that it is not an important factor in the etiology of dental caries. In the absence of Ca ions

and phosphate ions,  $\text{CO}_2$ , even in low concns., has a definite solvent action on enamel; but the presence of 3 mg. Ca and 14 mg. P per 100 cc. of soln. prevents decalcification at  $p_H$  values of 6.4 and above; slight decalcification occurs at  $p_H$  5.7, even with an initial Ca concn. of 6.6 mg. per 100 cc. Decalcification occurs in the presence of glucose and acidogenic organisms, slowly at  $p_H$  7.3, readily at  $p_H$  5.7, at intermediate rates at intermediate  $p_H$  values.

The physiology of the gall bladder. A. C. Ivy. *Physiol. Rev.* 14, 1-102(1934).—A general review with extensive bibliography, covering the phenomena of absorption, concn. and evacuation of bile in many animal species and man.

E. R. Long

The comparative physiology of the kidney in relation to theories of renal function. E. K. Marshall, Jr. *Physiol. Rev.* 14, 133-59(1934).—A general review with bibliography, covering excretion and absorption in several anatomical portions of the kidney.

E. R. Long

The nature of the sugar of normal urine. II. The behavior of carbohydrates in bromine water and the ketose of normal urine. Mark R. Everett, Beatrice G. Edwards and Fay Sheppard. *J. Biol. Chem.* 104, 11-28(1934); cf. *C. A.* 26, 4089.—Quant. studies were made of the action of Br on the reducing power of sugars and non-sugars. Enough Br was added to 1% aq. solns. in glass-stoppered flasks to insure the presence of a small excess of liquid Br throughout the expt. The mixts. were kept in the dark at const. temp. of 25°. After definite intervals the excess Br was removed by washed air and aliquots were analyzed by both the Sumner and Folin-Wu methods after neutralizing with silicate-free KOH soln. to  $p_H$  7. The Sumner/Folin-Wu ratio of glucose equivs. is of value in the identification of sugars. Amino sugars, methylpentoses and higher oligosaccharides are easily confused with ketoses unless their oxidation curves are studied. The existence of new reducing derivs. of *l*-fucose, inulin, dextrin oligosaccharides and *d*-glucosamine has been demonstrated but they have not yet been isolated. The oligosaccharide impurities of dextrans and sol. starch are aldoses. New glucose equivs. are given for amylotriase, *d*-glucuronic acid, *d*-mannoketoheptose and *d*-mannheptose. The major portion of the so-called sugar of normal urine is resistant to Br and hypolodite oxidation and is properly designated as *uroketose*. A portion of the hydrolyzable urine sugar is more easily

oxidized; it is also easily hydrolyzed by acids and differs from both dextrans and glucuronates, both of which are undoubtedly present in small amts. Ketose color tests are in general unsatisfactory. The major portion of the free sugar of  $\text{H}_2\text{WO}_4$  blood filtrate is oxidized as aldoses are, but a 2nd substance is also present. Forty-five references.

A. P. Lothrop

The metabolism of sulfur. XXI. Comparative studies of the metabolism of *l*-cystine and *dl*-methionine in the rabbit. Robert W. Virtue and Howard B. Lewis. *J. Biol. Chem.* 104, 59-67(1934); cf. *C. A.* 27, 5398.—Rabbits catabolize *dl*-methionine and *l*-cystine readily when they are administered in equiv. amts. orally and subcutaneously. A substance having the reactions of a disulfide and giving a pos. cyanide-nitroprusside reaction but not the Sullivan test for cystine is present in the urine after administration of *dl*-methionine. If the amino group is blocked as in benzoylmethionine, oxidation is checked and it appears (as with cystine) that normal oxidation of the S occurs only if the  $\alpha$ -amino group is free. "It is suggested that a primary reaction in the catabolism of methionine is demethylation and that the pos. cyanide-nitroprusside tests obtained may be due to the presence of small amts. of homocystine, formed by demethylation of methionine and oxidation of the resulting mercapto deriv. to the disulfide."

A. P. L.

The oxidation of the stereoisomers of cystine in the animal body. Vincent du Vigneaud, Harold A. Crafts and Hubert S. Loring. *J. Biol. Chem.* 104, 81-9(1934); cf. *C. A.* 27, 530. —*meso*- and *dl*-Cystine are oxidized by rabbits to a degree midway between that of *l*- and *d* cystine (82 and 45%, resp.). The possible significance of these findings to the theories of the intermediary metabolism of cystine is discussed.

A. P. Lothrop

Creatinuria among adolescent males. Arthur B. Light and Clark R. Warren. *J. Biol. Chem.* 104, 121-8(1934). Urine specimens (24 hr.) were obtained from adolescent boys in a private school under various conditions on an uncontrolled diet. Creatine was found in specimens from 35 of 81 normal boys from 14 to 19 yrs. of age. The percentage showing creatinuria was fairly const. at ages from 14 to 17, dropped perceptibly between 17 and 18 and was present in only 1 out of 6 boys between 18 and 19. The av. creatine excretion for each yearly period declined with increasing age. On a high protein diet 5 subjects showed far less excretion while resting in bed than on the following day on a lower-protein diet while attending classes and engaging in exercise. A marked increase occurred on the 1st day of muscular activity following confinement to bed for illness or injury followed by a progressive decrease on each succeeding day, indicating the fitness of the skeletal muscles to meet the demands of exercise as an addnl. factor in the phenomenon of creatinuria among adolescent males. A certain lethargy and aversion to phys. exercise were observed among the older subjects still excreting creatine.

Experimental studies in sodium chloride metabolism IV. The metabolism of several diuretics. Hiroshi Sato. *J. Gastroenterol.* 5, 85-90(1933); cf. *C. A.* 27, 5800.—Salyrgan and pituitrin act as diuretics in rabbits and remove NaCl from the body. Blocking the reticulo-endothelial system with lithium carmine inhibits the action of salyrgan.

C. M. McCay

Experimental studies in the absorption of pigment by the intestines. I. Shigekazu Kawawaki. *J. Gastroenterol.* 5, 101-7(1933).—Pigments were introduced into the intestines of dogs and their appearance in the urine, bile and lymph was recorded. Ninety-five % of the numerous dyestuffs tested were absorbed. Absorption depended upon diffusibility. The dye appeared in the thoracic lymph 3-20 mins. after it is injected into the intestine. It attains a max. concn. in 1 hr. II. The behavior of the lymphatic vessels. *Ibid.* 108-10. Pigment absorption is mainly by the blood vessels.

C. M. McCay

The gastric juice of natives of the Japanese South Sea Island. I. The gastric juice of healthy persons. Kyoze Nagasaki. *J. Gastroenterol.* 5, 111-14

(1933).—The usual clin. detns. were made upon samples of gastric juice from 25 men and 20 women, natives of the Japanese South Sea Islands. A rice gruel test meal was used. Gastric contents were 30–60 cc. The free HCl and total acidity were 18.5 and 19.4, resp. Total Cl ranged from 0.3 g. % to 0.44 g. %. Upward flow of bile was found in half the cases. C. M. McCay

The behavior of dyestuffs toward blood and organ pulp. Ryuichi Ohta. *Japan. J. Gastroenterol.* 5, No. 3, *Biol. Untersuch. Farbstoffe* 113–22(1933).—Known amts. of dyestuffs were mixed with blood sera. The diffusion in agar was then measured. Tables of dyes and their affinities for blood fractions are given. Organ pulps combine more readily with basic than with acid dyestuffs. This explains why these are excreted with more difficulty. C. M. McCay

Dye excretion through the liver and kidneys. Yoshio Yano. *Japan. J. Gastroenterol.* 5, No. 3, *Biol. Untersuch. Farbstoffe* 123–7(1933).—Acid dyes are excreted through the kidneys if they diffuse readily in serums. Of dyes excreted with difficulty by the liver and kidneys only the acid ones can be detected for a long period in the blood. The output of basic dyes is related to their affinity for red cells as well as diffusibility in serums. Lipide soly. of basic dyes interferes with a direct relation between diffusibility and excretion. C. M. McCay

Serum differences of various animal species. Hisao Igarashi. *Japan. J. Gastroenterol.* 5, No. 3, *Biol. Untersuch. Farbstoffe* 128–31(1933).—The binding capacity of various serums for dyes was greatest for human beings followed in turn by rabbit. Goat, cow, pig and horse serums were weaker. The weakest serums were pigeon and chicken. The differences were most marked for acid dyes. C. M. McCay

Excretion of dyes through the liver and kidneys. Yoshinori Tada. *Japan. J. Gastroenterol.* 5, No. 3, *Biol. Untersuch. Farbstoffe* 143–86(1933).—Most dyes injected intravenously into dogs appear in the urine or bile. Diamingoldgrün and dianilin black R do not appear. If dyes are excreted in both urine and bile they appear in the urine first. The more diffusible the dye the greater the concn. in the urine and the shorter the time of excretion. Dyes with low diffusibility pass the kidneys poorly but the inverse is not always true. Ligation of the bile duct will not lead to compensatory excretion of such dyes as Congo red 4R by the kidneys unless both the liver and kidneys tend to excrete the dye normally. In the latter case the max. rate of excretion by the kidneys is not exceeded but the time is prolonged. Ligation of the blood supply to the kidneys shows the same relationships develop as those from ligation of the bile duct. The concn. of dye in the blood and that in the urine and bile have a direct relation. For a specific dye the normal kidneys and liver have a fixed excretory power. C. M. McCay

The osmotic pressure of organs after the intravenous injection of distilled water. Italo Simon. *Boll. soc. ital. biol. sper.* 8, 1295–6(1933).—A series of rabbits, previously fasted for 12 hrs., was injected intravenously with 25, 50, 60, 100, 140, 180 and 191 cc. of distd. water per kg. body wt. and at a velocity which did not kill the animals. After the injection, the animals were bled to death and immediately, cryoscopic detns. were made on the heart, brain, kidneys, heart and blood serum. A table giving the value of  $\Delta$  for each organ and for each amt. of water injected is given. Briefly, the kidneys up to 60 cc. of water per kg. was the organ which showed the least lowering of the osmotic pressure, but in doses above 100 cc. the osmotic pressure was the lowest of any organ. The brain showed the least diminution of osmotic pressure in all doses. Peter Masucci

Physicochemical characteristics of retroplacental blood. I. Alkaline reserve, velocity of sedimentation and cell resistance. L. Puccioni, A. De Niederhäusern and P. Roncallo. *Boll. soc. ital. biol. sper.* 8, 1312–14(1933).—The most important characteristics of retroplacental blood were compared to those of peripheral blood from the same

woman while in labor; in a few cases, it was compared to those of funicular blood. The alk. reserve of retroplacental blood in 19 out of 20 cases was lower than the peripheral, ranging from 0.43 to 0.23% with an av. of 0.32%. The values for the peripheral were 0.48–0.20 with an av. of 0.38%. The velocity of sedimentation of retroplacental blood was 0.24 cc. max., 0.05 cc. min., av. 0.08 cc.; the peripheral values were 0.46 max., 0.10 cc. min., av. 0.27 cc. The min. resistance  $R_s$  of peripheral blood was not uniform. The av.  $R_s$  was 0.50. The resistance of retroplacental blood ranged from 0.48 to 0.60, av. 0.50. The resistance  $R_s$  of peripheral blood varied from 0.36 to 0.40, av. 0.38; that of the retroplacental ranged from 0.36 to 0.42, av. 0.40. The resistance  $R$  of the peripheral blood varied from 0.30 to 0.38, av. 0.34; that of the retroplacental varied from 0.30 to 0.40, av. 0.36. II. Index of refraction, viscosity, surface tension, cryoscopy. A. De Niederhäusern, L. Puccioni and P. Roncallo. *Ibid.* 1314–16.—Retroplacental blood, as detd. by the Zeiss refractometer, contained an av. of 7.50% proteins, peripheral an av. of 8.02% and funicular an av. of 6.36%. The av. viscosities were, resp.: 1.66 that of distd. water, 1.60. The av. surface tensions were, resp.: 68.06, 69.09, 69.3 dynes/cm. The av. cryoscopic consts. were, resp.:  $-0.52^\circ$ ,  $-0.53^\circ$ ,  $-0.53^\circ$ . Peter Masucci

The selective activity of certain hystiocyte elements on urea. The function of the so-called reticulo-endothelial or reticulo-hystiocyte system. Giuseppe Vercellana. *Boll. soc. ital. biol. sper.* 8, 1337–9(1933).—Guinea pigs and pigeons were injected intravenously with urea and simultaneously or shortly afterward with India ink. The animals were killed, and small pieces of the brain, lung, liver, spleen, kidney and intestine placed in a soln. of xanthidrol. After 12–24 hrs. they were removed, repeatedly washed in abs. EtOH, then in xylene, imbedded in paraffin, sectioned and stained. In the presence of urea, microscopic examn. showed typical xanthidrolurea crystals. The endothelial cells of the liver (Kupffer cells) and kidneys showed the most abundant presence of urea. Peter Masucci

The basophilic properties of red blood corpuscles. Giuseppe Vercellana. *Boll. soc. ital. biol. sper.* 8, 1339–42(1933).—The tendency of red blood corpuscles to acquire basophilic properties was investigated. Oxidizing agents, O, ozone, have a tendency to render the corpuscles basophilic; reducing agents, H, CO<sub>2</sub>, SO<sub>2</sub> and CH<sub>3</sub>COH, increase the already acidophilic property of the corpuscles. This difference in behavior to stains is ascribed to changes in normal  $p_H$  of hemoglobin; the  $p_H$  is lowered by processes of oxidation, thus increasing the slight acidity of Hb, while the  $p_H$  is increased by reducing processes, thus making Hb distinctly alk. In oxidation, Hb dissociates as an acid into H<sup>+</sup> and a negatively charged protein radical, thereby acquiring an affinity for basic dyes, in reduction processes; Hb dissociates as a base into OH<sup>-</sup> and a positively charged protein radical in which case it acquires an affinity for acid dyes. In the human and animal organism, diseases of the blood or other conditions may increase markedly the oxidative processes of the corpuscles so that some of the corpuscles become completely or partially basophilic. Peter Masucci

The influence of the liver on heart function. Bruno Bassani. *Arch. ital. biol.* 90, 26–32(1933); cf. C. A. 28, 1093<sup>4</sup>.—The favorable action exercised by blood coming from the liver on the heart is not due to glucose or bile substances. The active substance is quickly absorbed by the heart. A. E. Meyer

Kidney function judged by the relation of the urea in the blood to that in the 24-hour urine. Jules Cottet. *Presse méd.* 41, 457–60(1933).—The ratio mg. urea in blood (100 cc.): g. of urea in the urine multiplied by 10 was used as an index. Variations from 1.11 to 18.92 were observed. A. E. Meyer

The sex-stimulating preputiary hormones in the body fluids of pregnant women. A. Brindeau, H. Hinglais and M. Hinglais. *Presse méd.* 41, 705–8(1933).—The biol. detn. of the gonadotropic preputiary hormone gives satisfactory results in the rabbit. Figures obtained dur-

ing pregnancy are given. The test permits diagnosis of mole and of the death of the fetus. A. E. M.

Relation between respiration and gelatinase content of the skin and pigmentation. S. Blaszc. *Biochem. Z.* 267, 11-17(1933).—See C. A. 27, 786. S. Morgulis

Studies on muscle autolysis. III. Changes in the reaction, surface tension, viscosity and refraction. I. A. Smorodintzev, N. Shirokov and N. N. Krylova. *Biochem. Z.* 267, 18-21(1933); cf. C. A. 28, 1094<sup>1</sup>.—The  $p_z$  of preserved muscle decreases, reaching a min. in 24 hrs. The viscosity of the exts. from autolyzed meat decreases and the surface tension increases, attaining min. and max. values, resp., 12-24 hrs. after slaughter. The refraction remains unaltered. These changes are not materially affected by a variation in temp. from 4° to 25°.

S. Morgulis

Effect of carbohydrates on tissue respiration. Bruno Kisch. *Biochem. Z.* 267, 32-42(1933).—Expts. with glucose, xylose, arabinose, rhamnose, levulose, mannose, galactose, lactose, maltose, sucrose and glucosamine show that the respiration of each tissue is affected differently; furthermore, that the effect on different tissues of the same animal or on the same tissue from different animals likewise varies. The respiration was detd. by the Warburg method.

S. Morgulis

Distribution and transformation of ethyl alcohol in the organism of the dog. Erik M. P. Widmark. *Biochem. Z.* 267, 128-34(1933).—The relation between the amt. of consumed alc. and its concn. in the blood which for the human is expressed by the formula  $A = pr(c_1 + \beta t)$  quite generally holds also for the dog. In the above formula  $A = g.$  of alc. consumed;  $p =$  body wt. in kg.;  $c_1 =$  blood alc. concn. at the time  $t$  expressed in mg. per 1000 mg. blood; and  $t =$  time since the consumption of the alc.;  $r$  and  $\beta$  are const., the former to correct for the body mass and is obtained from the relation  $r = A/pc_1$ , i. e., the concn. extrapolated to 0 time, while  $\beta$  is the const. measuring the velocity with which the alc. concn. in the postabsorptive condition decreases in mg. %/min.

S. Morgulis

Effect of composition of the food on the alcohol content of the blood. Erik M. P. Widmark. *Biochem. Z.* 267, 135-42(1933).—Further evidence of the probable combination of alc. with amino acids which accounts for the fact that the simultaneous administration of alc. and glycine or alanine brings about a lower concn. of alc. in the blood than the administration of alc. on an empty stomach.

S. Morgulis

Effect of adrenal cortex on sugar absorption. W. Wilbrandt and L. Lengyel. *Biochem. Z.* 267, 204-10(1933).—Although glucose and xylose are practically equally diffusible, yet in the normal rat the former is more easily absorbed. Absorption is governed not merely by physicochem. conditions but also by another factor which can be inhibited by  $CH_3CO_2H$ . Furthermore, in adrenalectomized rats the absorption of glucose is much decreased but that of xylose is unaffected. Adrenaline has no influence but the adrenal cortex prepn. of Swingle and Pfiffner (C. A. 25, 3045) restores the normal rate of absorption of glucose. The adrenal cortex hormone thus governs the chem. factor of absorption.

S. Morgulis

Corpus luteum hormone. K. Ehrhardt and W. Weigel. *Endokrinologie* 13, 225-33(1933).—Blood and urine from the second half of the menstrual cycle, corpora lutea of pregnancy, placental tissue, urine from early pregnancy, and urine from women with chorion epithelioma were used in this study. The tissue was implanted and from the urines ether exts. were prepd. and injected either intramuscularly, intraperitoneally or subcutaneously, but all of the tests gave neg. results. Further tests for the corpus luteum hormone were carried out with press juice and ether exts. from various plant materials (buds, fruits, seedlings, etc.) also without any result. The hormone was found to be unaffected by radiation (ultra-violet, infra-red or x-ray) but is easily destroyed by trypsin. S. M.

Artificial severing of the seminal ducts and its effect on the testes of sexually mature and senile rats. Ernst R. Welcker. *Endokrinologie* 13, 234-50(1933).—The

1 efferent vessels between the testis and epididymus were tied off in rats, either unilaterally or bilaterally, both in young or senile animals. Most commonly the affected testis showed calcification but never regenerative processes.

2 Growth experiments on tadpoles with cystine and auxin. Bengt Sylvén. *Skand. Arch. Physiol.* 67, 129-36(1933).—Cystine, but not cysteine, increases the rate of growth of tadpoles. The results with auxin are still very indefinite.

S. Morgulis

Standard metabolism of female rats before and after ovariectomy in experiments with and without narcosis Axel M. Hemmingsen. *Skand. Arch. Physiol.* 67, 137-69(1933).—The body temp. of normal rats is subject to  $\infty$  much variation that the standard metabolism must be corrected for temp. In the rat the standard metabolism seems to vary with the previous environmental temp. The influence of age is questionable, but the relation between body wt. and metabolism varies, especially if standard conditions are not fulfilled. It seems probable that in the rat the standard metabolism bears a definite (proportional) relationship to a fractional power either of the body wt. or of the body surface. The influence of the estrous cycle, of ovariectomy and of treatment of spayed animals by ovarian exts. on the standard metabolism has not been satisfactorily solved.

S. M.

Endocrine factors in the causation of the creatinuria of pregnancy. I. Schrire and H. Zwarenstein. *Nature* 133, 27-8(1934).—After castration or in pregnancy the anterior pituitary gland hypertrophies, increasing the formation of creatine. Stimulation of the gonads inhibits the change of creatine to creatinine; excess creatine appears in the urine as such as well as increasing the creatinine content. Residual corpora lutea re-enforce the inhibitory action of the ovaries on this transformation so the excess creatine is excreted as such, and the creatinine excretion is not increased.

James C. Munch

Influence of infusoria on digestion in ruminants. M. I. Dyakov, T. V. Vinogradov, M. P. Vinogradov and A. N. Bereninov. *Izvestiya Tsentral. Nauch.-Issledovatel. Inst. Pishchevoi Vkusovoi Prom.*, Separate 1931, 24 pp.—In feeding tests with sheep the digestion coeffs. were detd. with and without infusoria, for total dry matter, org. matter, nitrogenous matter, fat, inorg. matter and N-free ext. The differences due to presence of infusoria were too small to indicate any favorable influence on digestion.

Julian F. Smith

7 The metabolism of the retina and of the gray brain substance. Camillo Sellei and Pál Weinstein. *Magyar Orvosi Arch.* 34, 538-41(1934).—The metabolism of the retina and of the gray brain substance are characteristic for their high respiratory heat production and their vitality even under anaerobic conditions. Pasteur's reaction cannot be applied to these tissues; an embryogenetic relationship, however, is suggested.

H. T.

8 The blood-sugar content of healthy Korean adults. Y. C. Lee and C. Y. Choi. *Korean Med. J.* 3, 65-70(1933).—Blood-sugar contents of 34 healthy adult males and 50 adult Korean women were detd. Blood samples were taken before breakfast from the arm vein and the blood sugar was detd. by Hagedorn-Jensen's method. In males, the min. value was 0.09% and the max. 0.109%. Over 82% ranged between 0.09 and 0.11%. In females, the min. was 0.079%, and the max. was 0.128%. Over 68% of all individuals showed values between 0.09 and 0.11%. The av. in each sex was thus 0.107%. According to these results, the Korean, who is known to take more carbohydrates in his daily diet than the occidental, shows a content of blood sugar very little higher than that of the European, American or Chinese.

## G—PATHOLOGY

H. GIDEON WELLS

A reducing substance in tumors. Leslie J. Harris. *Nature* 132, 605(1933); cf. *C. A.* 27, 4561.—Titration and feeding expts. confirm the previous suggestion of H. that the high reducing capacity of tumor tissue for 2,6-dichlorophenol-indophenol is not due wholly to vitamin C, but to the presence of *reducytin* an unusually powerful reducing substance hitherto unrecognized. P. D. A.

Nitrogen metabolism in white mice in the course of tumor development. I. A. Parfentjev. *Proc. Soc. Exptl. Biol. Med.* 30, 1064-7(1933); cf. *C. A.* 27, 3514.—The urine of the normal mouse contains approx. 1.4 g. percent of a chondromucoid-like protein. In the course of the growth of Sarcoma 180 the protein decreased and tended to disappear from the urine; urea decreased; the excretion of other urinary constituents remained practically unchanged. Possibly the protein is conserved and used in the metabolism of the rapidly growing tumor. C. V. Bailey

Uric acid exchange in pulmonary tuberculosis. M. Pellegrini. *Arch. ist. biochim. ital.* 5, 225-70(1933).—Blood uric acid and urinary uric acid are in general lower than normal in cases of pulmonary tuberculosis. There is a certain relation between the uric acid exchange and the general condition of patients. E. S. G. Barron

Hyperglucemia after lumbar puncture. H. Schönfeld. *Jahrb. Kinderheilk.* 138, 174-8(1933). B. C. A.

Abnormalities of calcium deposition in diabetes mellitus. Howard F. Root, Priscilla White and Alexander Marble. *Arch. Internal Med.* 53, 46-53(1934).—Various types of abnormalities of Ca deposition are found in diabetes. Lack of Ca may be ascribed to its deficiency in the diet and to chronic acidosis causing undue loss. Blood P and Ca are normal. In certain cases arteriosclerosis, cataracts and calculi occur. Adequate Ca in the diet should be supplemented with vitamin D. J. B. Brown

Some observations on achlorhydria and anemia. Stanley J. Hartfall. *Brit. Med. J.* 1934, I, 136-41. J. B. B.

Amino nitrogen changes of the blood in nephritis. Esben Kirk. *J. Clin. Investigation* 12, 1091-1102 (1933).—Elevation of plasma amino N is frequent as renal disease becomes more advanced. The correlation is irregular. The rise is probably not due to renal failure but rather to a breakdown in amino acid metabolism elsewhere. J. B. Brown

Electrolytes in human tissue. III. A comparison of normal hearts with hearts showing congestive heart failure. Walter E. Wilkins and Glenn E. Cullen. *J. Clin. Investigation* 12, 1063-74(1933); cf. *C. A.* 28, 1069.—The right and left ventricles of 17 human hearts, including both normal and diseased, were analyzed. The water content of the right ventricle was slightly higher than the left, and was higher in both ventricles with congestive heart failure. Other differences in P, Na and K were found. J. B. B.

Magnesium metabolism in hyperparathyroidism. Harold A. Bulger and Florence Gausmann. *J. Clin. Investigation* 12, 1135-42(1933).—In hyperparathyroidism there is a neg. Mg balance. The parathyroid hormone does not influence the Mg level in the blood and the effect on Mg metabolism may be secondary to that on Ca metabolism. J. B. Brown

Relationship between the oxygen consumption and nitrogen metabolism. III. In polycythemia vera. Adelaide Barer, W. D. Paul and C. W. Baldridge. *J. Clin. Investigation* 13, 15-28(1934); cf. *C. A.* 27, 2993.—The changes following administration of PhNHNH<sub>2</sub> to 2 subjects with polycythemia vera were as follows: a temporary neg. N balance due to increased urea excretion; a slightly increased proteinuria; retention of the Fe liberated by destruction of red cells; formation of urea and bilirubin more rapidly than they were excreted; intermittent urobilinuria; decrease in blood viscosity. J. B. B.

Calcium and phosphorus metabolism in certain diseases of bone. Walter de M. Scriver and Eleanor M. Venning. *J. Clin. Investigation* 13, 139-53(1934).—In 4 cases of Paget's disease, one of bone cyst and one of bone sarcoma Ca metabolism was within normal limits. There was no evidence of parathyroid dysfunction. J. B. Brown

The diazo reaction of the blood. I. Gitaro Nakayama. *Japan J. Med. Sci. II Biochem.* 2, 215-27(1933).—The blood of men and animals gives the Leimdörfer-Charnass diazo reaction. In those diseases in which Ehrlich's diazo reaction is strongly pos. in the urine, the blood reaction generally falls off or disappears entirely. The reaction depends on the erythrocytes as plasma and serum do not give it. Neither fever nor inanition had any noticeable effect. The blood diazo reaction tends to weaken in acute inflammation in which an increased sedimentation rate and the Costa reaction are observed. The factor responsible for the blood diazo reaction is resistant to acid but is readily destroyed by alkali. It is extd. with dil. HOAc and CCl<sub>3</sub>COOH and is pptd. by phosphotungstic acid. The adrenal capsule and liver and milk expts. give a pos. reaction. II. The carrier of the diazo reaction in serum and urine. *Ibid.* 229-35.—In the blood in kidney deficiency urochromogen was recognized as the cause of the Andrew serum reaction. The indican test was mostly pos. possibly because of an imidazole substance. In the urine of tuberculosis a similar substance was recognized. The amt. of residual N had little relation to the serum diazo reaction. III. The carrier of the diazo reaction in the red blood cells. *Ibid.* 237-44.—The blood and red cells which give a more intensive diazo reaction are rich in residual N. Ergothioneine is a possible cause of the diazo reaction. The intensity of the blood reaction

parallels the concn. of ergothionine. A no. of other substances such as adrenaline, tryptophan and imidazole derivs. and the digestion products of nuclear substances can be substituted.

Rachel Brown

The composition of globin in healthy and anemic human beings. Konrad Lang. *Arch. expil. Path. Pharmacol.* 174, 68-8(1933).—Globin normally varies considerably in its tryptophan content, and to a less extent, in the cystine content. The tyrosine is remarkably const. In secondary (regenerative) anemias, there is a characteristic increase in arginine and decrease in histidine. In aplastic and pernicious anemia, marked changes in compn. were observed, suggesting the formation of a pathologically altered hemoglobin.

Harry Eagle

Kidney function in diabetes insipidus. The effect of Pituit, diurnal and nocturnal filtration. The effect of adrenaline. Poul Iversen, Erik Jacobsen and Jøns Bing. *Arch. expil. Path. Pharmacol.* 174, 69-76(1933).—A case study.

Harry Eagle

The gas metabolism of the [dog] heart during cardiac insufficiency. II. Cardiac insufficiency caused by derivatives of barbituric acid [numal, somnifen, pernocton] and by avertin. A. Rühl. *Arch. expil. Path. Pharmacol.* 174, 96-110(1933); cf. *C. A.* 28, 822<sup>9</sup>.—The O consumption decreases despite cardiac dilatation and the R. Q. increases, the latter a manifestation of partially anoxidative processes as a source of energy. The increased O debt is in part due to edematous changes in the capillary walls preventing O diffusion. As further evidence for anoxidative processes, the insufficient heart consumes less O per unit work than the normal heart. Increased functional performance seems to be assocd. with an increased capacity for O consumption. The max. O consumption is suggested as the best index of the cardiac "sufficiency."

Harry Eagle

Myasthenia gravis. The effect of treatment with glycine and ephedrine. Walter M. Boothby. *Arch. Internal Med.* 53, 39-45(1934).

J. B. Brown

The treatment of hay fever with the specific grass-blossom propeptane or pollen by mouth. Erich Urbach. *Klin. Wochschr.* 12, 1797-801(1933).—The effective constituent in the peroral desensitization of hay fever patients is a protein present in the leaves as well as in the pollen.

Harry Eagle

The common appearance of skin infections caused by yeast and yeast-like fungi in diabetics. W. Engelhardt and W. Haupt. *Klin. Wochschr.* 12, 1805-6(1933).—The optimum glucose concn. for the *in vitro* cultivation of the yeasts and fungi in question is 150-200 mg % approx. that attained in the skin of severe diabetics. This lends credence to the theory that it is the glucose as such which predisposes to skin infections by yeasts and yeast-like fungi in diabetics.

Harry Eagle

The inhibitory action of the urine from cases of cardiac insufficiency upon [the metamorphosis of tadpoles caused by] thyroxine. Andreas Hofmann and Otto Lutterotti. *Klin. Wochschr.* 12, 1941-2(1933).

Harry Eagle

The alkali reserve in Basedow's disease. E. Altenburger and A. Boger. *Klin. Wochschr.* 12, 1983-5(1933).—Although there is a tendency to acidosis in some cases of Basedow's disease, this is not related either to the clinical condition of the patient or to the elevation of basal metabolism.

Harry Eagle

Mineral metabolism in bursitis calcarea. Tsunehiko Aoki. *Tōhoku J. Expil. Med.* 21, 556-92(1933).—A detailed case report with an extensive bibliography.

Harry Eagle

The lactic acid metabolism in ileus. I. The time course of the lactic acid level in ileus. Jiro Izumi. *Tōhoku J. Expil. Med.* 22, 201-16(1933).—After ligation of the intestine in rabbits at the pyloric level, the blood lactic acid concn. begins to rise in 3-6 hrs., reaching a max. value of 50-60 mg % immediately before death (approx. 20 hrs.). The more distal the ligation, the longer is the latent period before the lactic acid begins to increase, the slower and less pronounced the rise, and the longer the animals remain alive. If the obstruction is placed at

the lower portion of the rectum, the lactic acid may not increase at all, and the animals survive for 100-150 hrs. II. The lactic acid metabolism in the liver in ileus. *Ibid.* 217-26.—Normally, the lactic acid concns. of the arterial, portal and hepatic venous blood decrease in the order named. After expil. ileus, and particularly after ligation at the duodenal level, all 3 values increase, but the relative increase in the hepatic vein is greater, the order of decreasing concn. now being hepatic vein, arterial, portal. These results are ascribed to an impaired resynthesis of lactic acid in the liver, an increased formation of lactic acid from hepatic glycogen, and a disturbed lactic acid metabolism in the organs drained by the portal vein.

Harry Eagle

The peculiarity of thyroid extracts in Basedow's disease with respect to the increased oxygen consumption. III. The peculiarity of the oxygen consumption of rabbits injected with a goiter extract from Basedow's disease Kenji Saito. *Tōhoku J. Expil. Med.* 22, 227-51(1933), cf. *C. A.* 28, 817<sup>9</sup>.—The injection of a splenic ext. or irradiation of the splenic area has a relatively slight and transient effect upon the increased O consumption observed in rabbits after the injection of goiter exts. Such rabbits, however, react promptly to KI in doses which have little or no effect in normal rabbits (0.25-0.5 mg./kg.) If the rabbits are rendered hyperthyroid by the injection of thyroxine, "thyroglandol" or exts. of normal thyroid gland, they react promptly either to splenic exts., splenic irradiation or KI. The effect of I in decreasing the O consumption of rabbits, whether normal or hyperthyroid, is temporary; repeated doses may cause an increased O metabolism and toxic manifestations. The increased susceptibility of hyperthyroid animals to I is unexplained.

Harry Eagle

Immunobiological study of fats. I. The formation of antibodies against lipids in tuberculous rabbits. Yasuhide Tokunoyama. *Tōhoku J. Expil. Med.* 22, 252-62(1933).—Repeated intravenous injections of hydnocarpus oil, liver oil, tristearin, tripalmitin and triolein into rabbits caused the appearance of complement-fixing antibodies in very low titer, the antibody response decreasing in the order named. In order to prevent death upon intravenous injection, some of the lipids were emulsified with an elec. homogenizer. The antibody response was greatly increased by mixing the lipid with pig serum prior to injection. Although there was a certain degree of cross-reaction, the antibodies so formed were more or less specific for each lipid. In general, the antibody response seemed to be more pronounced in animals inoculated with human tuberculosis bacilli at about the same time as the first injection. II. The effect of enteral and parenteral lipids upon the serum lipase of normal and tuberculous rabbits. *Ibid.* 263-92.—The intravenous or parenteral injection of liver and hydnocarpus oil caused a significant increase in the serum lipase. Capric acid and tristearin were less effective, and tripalmitin and triolein had no effect. The addn. of pig serum to the lipid prior to injection decreased the effect upon serum lipase; simultaneous inoculation with tuberculosis bacilli greatly increased the lipase response to lipids. Cholesterol caused a decrease and lecithin a slight decrease in serum lipase. Reticuloendothelial blockade (India ink) caused a decrease, and prevented the normal reaction to injections of liver oil. No significant changes in serum lipase were observed after the enteral administration of lipase. There is an extensive bibliography.

Harry Eagle

Silicosis and silicotuberculosis. Louis C. Boislimer. *J. Mo. State Med. Assoc.* 30, 309-16(1933); *U. S. Pub. Health Eng. Abstracts* 13, IHS, 6(Nov. 18, 1933).—Theoretical considerations as to how SiO<sub>2</sub> dust acts in the human lungs.

C. R. Fellers

Blood pH in cancer. G. Benetato and Marie Benetato-Modival. *Compt. rend. soc. biol.* 114, 329-31(1933).—The H electrode of Michaelis was used on oxalated plasma at 38°. The pH ranges were: normal persons 7.32-7.38, incipient cancer cases 7.37-7.48, well-developed cancer 7.27-7.49 (av. of 49 cases 7.35), advanced cases with cachexia 7.21-7.52. In various cases of benign tumors

examd. the plasma  $p_H$  was always within the normal limits.

**Action of sodium oleate on diphtheria toxin.** P. Nélis. *Compt. rend. soc. biol.* 114, 591-4(1933).—Na oleate destroys diphtheria toxin. Some of Vincent's conclusions concerning cryptotoxins are criticized. Reply. H. Vincent. *Ibid.* 594-5; cf. C. A. 27, 5107. L. E. G.

**Action of certain compounds on Staphylococcus toxin.** P. Nélis. *Compt. rend. soc. biol.* 114, 598-601(1933); cf. C. A. 27, 3747.—The effects of quinine salts and various org. and inorg. acids on the toxin were studied.

**Calcium metabolism in chronic rheumatism.** F. Coste, A. Grigaut and P. Charmant. *Compt. rend. soc. biol.* 114, 895-7(1933).—In practically all cases examd. blood Ca and Ca metabolism were normal. L. E. G.

**Influence of syphilitic serums on Kottmann's reaction.** Pierre Simonin and J. R. Helluy. *Compt. rend. soc. biol.* 114, 1025-6(1933).—Serums giving a pos. Bordet-Wassermann reaction frequently react like myxedematous serums when Kottmann's test for thyroid dysfunction is applied.

**Antishock action of sparteine and soluble camphor derivatives.** Fernand Mercier, A. Krijanovsky and J. Andarelli. *Compt. rend. soc. biol.* 114, 1181-2(1933); cf. C. A. 27, 5107.—Sparteine camphosulfonate protects guinea pigs from exptl. anaphylactic shock. Either sparteine sulfate or Na camphosulfonate, used alone, has a similar but much weaker action.

**The chloride content of gall-bladder bile in catarrhal jaundice.** Etienne Chabrol, R. Charonnat, Marcel Cachin and Jean Cottet. *Compt. rend. soc. biol.* 114, 1238-9(1933).—The gall-bladder bile of normal dogs contains little or no Cl. In normal and nephritic human beings bladder bile usually contains much less Cl than liver bile; in cases of catarrhal jaundice the bladder bile usually contains much more Cl than the liver bile.

**Ratio of lipolytic power to antitoxic power of normal and antidiphtheritic horse serum.** Z. Gruzewska and G. Loiseau. *Compt. rend. soc. biol.* 114, 1244-5(1933).—By purification (protein removal) of the serum the antitoxic power can be reduced to almost nothing with little change in the lipolytic power. Lipase seems to play no part in the phenomenon of immunity.

**Colloid goiter produced experimentally by folliculin.** L. Karp and B. Kostkiewicz. *Compt. rend. soc. biol.* 114, 1339-40(1933).—Typical histological pictures of colloid goiter were produced in female rabbits by injecting 50 rat units of folliculin daily for 16-53 days.

**Experiments on the chemotherapy of experimental tuberculosis in guinea pigs by phenol, alone or mixed with alcoholic extracts of various organs.** C. Ninni. *Compt. rend. soc. biol.* 115, 10-13(1934).

**Possibility of obtaining a stable alcoholic antigen for the diagnosis of animal trypanosomiasis by complement deviation.** G. Zottner. *Compt. rend. soc. biol.* 115, 19-20(1934).—A method of prepn. is described.

**Calcium content of the serum of asthmatics during critical seizures.** Andrée Drilhon. *Compt. rend. soc. biol.* 115, 23(1934).—Some asthmatics excrete abnormal quantities of Ca in the urine. The serum Ca of asthmatics during severe paroxysms was 14-28 mg.%; that of normal persons detd. by the same method (Guillaumin's) was 9.4-10.6 mg. %.

**Separation of the agglutinin and the antiseptic power of antistreptococcus serum by dissociation of the bacterial antibody complex.** P. Sédallian and J. Clavel. *Compt. rend. soc. biol.* 115, 60-1(1934).—Technic used for dissociating the specific streptococcus antibody complex.

**Hyperazotemia—pathogenesis, classifications.** Giovanni Ferro-Luzzi. *Minerva med.* 1933, II, 570-82.—Two series of cases, 12 with diminished glomerular filtration and 21 with normal glomerular filtration, were studied by the Rehberg test for renal function. Urea concn. of resorbed liquid was calcd. on the basis of a new formula  $R_u = (F'Ns - U.Nu)/R'$ , where  $R_u$  is urea concn. in

g./100 cc. of liquid resorbed;  $F'$  is glomerular filtrate in cc./min., according to Rehberg formula;  $U$  is the urine eliminated in cc./min.;  $Ns$  is azotemia in g./1000;  $Nu$  is urea concn. in urine in g./1000. From the results, the author adds a new division, "azotemia of tubular origin," to the pathogenic classification which he discusses.

**Uric acid and arthritic diathesis.** G. Usseglio and G. Ceresa. *Minerva med.* 1933, II, 597-607.—Uricemia (colorimetric method) and uricuria (Folin-Shafer) were studied in 1 normal person, 1 case of gout, 4 asthmatics, 2 chronic eczemas, 4 patients with hypertension and 1 with ischialgia, before and after intravenous injection of 0.50 g. uric acid. After the injection uricemia remained within normal limits while uricuria did not vary enough to be considered important pathologically.

**Determination of purpurin by fluorescence and data on the copropurpurin content of urine in normal and pathological conditions.** Enrico Vigliani. *Minerva med.* 1933, II, 674-83.—Copropurpurin was detd. fluorimetrically with the Pulfrich photometer and Hanau quartz lamp. This method was found extremely sensitive and recommended for regular lab. use. Normal copropurpurin, individually const., ranged between 0 and 50-60  $\gamma$  daily while in saturnine intoxications, blood, liver and some febrile diseases and some cases of diabetes it was pathologically increased.

**Glucemic curve in cardiopathy after intravenous injection of glucose.** E. Massobrio and L. Barberis. *Minerva med.* 1933, II, 729-34.—Four normal individuals, 3 cases of compensated and 6 of uncompensated cardiopathy were tested for glucemia (Cruto method) during fasting and 30, 60, 90 and 150 min. after intravenous injection of 20 cc. 50% glucose soln. Normal individuals showed a max. increase (28%) in glucemia 30 min. after injection, then a drop to slightly below the initial figure at 90 min. followed by a rise to slightly above the initial value. In cases of compensated and uncompensated cardiopathy the glucemic curves of the former showed lower values but almost paralleled the latter. In the former the max. rise is 39% while in the latter it is 46% and in both the drop parallels the normal curve up to 60 min., then continues more slowly and gradually, never quite reaching the initial value.

**Comparative investigation of urine and serum proteins in nephritis.** Elsie M. Widdowson. *Biochem. J.* 27, 1321-31(1933).—Studies on the N distribution, racemization, osmotic pressure and specific refraction of urine and serum proteins from nephritic patients indicate that the corresponding urine and serum proteins from any one patient are identical.

**The nature of antigens.** J. G. Fitzgerald. *Trans. Roy. Soc. Can., Sect. 5*, 27, 1-9(1933).—A review.

**The mechanism of the formation of phytobezoars, with special reference to the persimmon call.** Shoichi Izumi, Kichiji Ishida and Masaki Iwamoto. *Japan. J. Med. Sci. II Biochem.* 2, 21-35(1933).—Phytobezoars must be classified into 2 groups: (1) iniobezoar and (2) opobezoar. The first form mechanically by the twining together of fibers. The opobezoar consists of fruits. The persimmon is unique in that it forms concretions in the stomach. This is due to the presence in the fruit of sol. shibuol, to which the astringency of the fruit is ascribed. Sol. shibuol is coagulated by mineral acids, and hence by the HCl of the gastric juice. The mode of the opobezoar formation is accordingly essentially chem. Sol. shibuol is localized around the calyx and under the skin of the ripening fruit, but the seed is free from it, and is not responsible for the formation of opobezoar in the stomach. As the persimmon ripens in the process of curing the sol. shibuol is transformed into coagulated, in which form it loses both its astringency and its property to form opobezoar. With proteins, starches, bile salts, etc., shibuol forms insol. and non-putrescible adsorption complexes. It also adsorbs enzymes and thus impedes enzymic activity.

**Oxyproteic acid in the urine of different pathologic**

conditions. Hikoya Tsutsui. *Japan. J. Med. Sci.* 11 *1* *Biochem.* 2, 185-7(1933).—An extensive table is appended presenting the results obtained with the urine of patients affected with about 23 different pathol. conditions.

B. S. Levine

Hemolytic phenomena. Hector Diacono. *Arch. inst. Pasteur Tunis* 21, 557-641(1932); 22, 47-121, 212-309, 376-442(1933).—A review of phys., chem., biol. and immunological hemolysis with 569 references. M. L.

Theory of diabetes mellitus. E. Grafe. *Münch. med. Wochschr.* 80, 1918-22(1933).—Lecture. M. L.

The existence of antigenic determinants of diverse specificity in a single protein. I. Tyrosine- and histidine-diazoarsanilic acids as haptens. Sanford B. Hooker and Wm. C. Boyd. *J. Immunol.* 25, 61-9(1933).—The results of a quant. study of the inhibition reaction, with dyes of different degrees of resemblance to the haptens concerned, are not incompatible with the conception that the injection of a single "complete" protein coupled with diazotized arsanilic acid leads to the production of 2 different antihaptens, one corresponding more closely to the tyrosinediazoarsanilic acid group, the other to the histidinediazoarsanilic acid group. In the case of the "deficient" protein gelatin, the coupled protein seems to give rise to only one of these antihaptens. E. R. Long

Local organ hypersensitiveness. V. The fate of antigen and the appearance of antibodies during the development of hypersensitiveness in the rabbit eye. Beatrice C. Seegal, David Seegal and Deborah Khorazo. *J. Immunol.* 25, 207-20(1933).—When 0.15 cc. of undild. egg white is injected into the anterior chamber of the rabbit eye traces may be found for as long as 8 days. The egg white can never be demonstrated in the serum or the anterior chamber fluid of the opposite uninjected eye. The injection of 0.15 cc. of undild. egg white into the anterior chamber is followed by the appearance of precipitins against egg white in the serum. Precipitins may also be found in the aq. humor of the injected eye, though they do not always appear there. They never appear in the anterior chamber fluid before they appear in the serum. Precipitins are never found in the anterior chamber fluid of the opposite uninjected eye. When 0.2 cc. of egg white is injected into rabbits in a single dose subcutaneously, intravenously or intracutaneously no precipitins against this antigen appear in the serum. When the same amt. of egg white is dild. and injected in 4 doses subcutaneously or intravenously the serum contains precipitins against egg white to the same titer as that obtained by injecting 0.2 cc. of the antigen into the anterior chamber of the eye. E. R. Long

The volume of precipitate in precipitin reactions. F. S. Jones and Ralph B. Little. *J. Immunol.* 25, 381-96(1933).—In precipitin-antigen titrations the greatest quantity of ppt. was formed at one point. The quantity varies proportionately with change in quantity of either antigen or immune serum. With cow serum and its precipitin it was not possible to show that either antigen or antibody was completely utilized. Where a single antigen, such as egg albumin, was employed with its precipitin, there occurred within a narrow zone complete binding of both antigen and antibody, while in either direction one or the other was still present in active form. E. R. Long

Species specificity of fibrinogens. Harold B. Kenton. *J. Immunol.* 25, 461-70(1933).—Pigeon, sheep, horse and rabbit fibrinogens were tested with homologous and heterologous antisera, and on the basis of specificity of sensitization could not be considered of identical protein structure. "Group" antibody reactions occurred only with sheep and beef fibrinogen. E. R. Long

Effect of the injection of glucose upon green bile. Kelsahun Kanasaki. *Japan. J. Gastroenterol.* 5, 91-100(1933).—The bile of a patient suffering from liver cirrhosis was green. This color changed to yellow 30-45 min. after the injection of a hypertonic glucose soln. C. M. McCoy

The increase in the isoelectrostatic power of serum in relation to the electric charge of the agglutinated red cor-

puscles. Claudio Pulcher and Luigi Biancalana. *Boll. soc. ital. biol. sper.* 8, 1143-4(1933).—Serum from group A agglutinated strongly red corpuscles of group B in a diln. of 1:16 but weakly in a diln. of 1:25. The red corpuscles when suspended in the serum A underwent a diminution of the elec. charge of 16%. The donor of serum A was given a transfusion of 4 cc. of blood from B. The agglutinating titer of A after 8 days increased to 1:60. The elec. charge of the red corpuscles B suspended in A diminished 28.2%. A 2nd transfusion of 4 cc. of blood was made. Eight days later the agglutinating titer of serum A was 1:70 and the elec. charge of the corpuscles B suspended in the serum A decreased 33.8%. These results show that there is a quant. relationship between the agglutinating power of a serum and the diminution of the elec. charge on the red corpuscles. \* Peter Masucci

Glucose, sucrose and formaldehyde as inhibiting agents in isoelectrostatic. Mario Rigoni. *Boll. soc. ital. biol. sper.* 8, 1176-81(1933).—Glucose in a concn. of 11 g. and sucrose in a concn. of 20 g. per 100 cc. of blood inhibit the specific seroreactions of the blood groups (agglutination). The vital properties of the red corpuscles are not destroyed and the reaction is reversible. HCOH in a concn. of 0.35 g. per 100 cc. of blood has a similar action. This property of the sugars may eventually find therapeutic applications in blood transfusion. P. M.

The protective and desensitizing action of colloids in vivo. Luigi Robuschi. *Boll. soc. ital. biol. sper.* 8, 1285-9(1933).—A suspension of India ink introduced into the circulation along with neohirudin remains in the circulation a longer time than a similar suspension introduced without neohirudin. *In vitro*, however, neohirudin lacks this protective action; a mixt. of equal parts of the suspension and 1% neohirudin is flocculated by the same concn. of AlCl<sub>3</sub>. Conversely, the high stability *in vitro* of an India ink suspension contg. gelatin does not appear *in vivo*. The conclusion is that the increased circulation period of the suspension caused by neohirudin which by analogy might be considered a process of colloidal protection *in vivo* is only an apparent one; in reality, the action of neohirudin consists in impeding the sensitization of the labile proteins (fibrinogen) by the suspension. P. M.

The presence of a melanophor-dilator principle in the urine in some diseases. Its use as a pituitary function test. R. Collin and P. L. Drouet. *Bull. acad. méd.* 109, 794-802(1933).—Injection of 3 cc. of the morning urine into the lymphatic sac of the frog (*R. temporaria*) causes the appearance of a dark color of the tegument within 1 to 3 hrs., if the reaction is pos. It was observed during menstruation and in hyperthyroidism. A. E. Meyer

Chlorine disequilibrium in surgical shock. F. Leguen, B. Fey, Palazzoli and Lebret. *Bull. acad. méd.* 109, 879-83(1933).—Cl disequil. is a principal factor in surgical shock. A. E. Meyer

Duodenal ulcer with pylorospasm and increase in blood urea. Hans Kjaergaard. *Acta Med. Scand.* 80, 489-98(1933).—A case is described in which there was a marked rise in blood urea accompanying pylorospasm, which responded favorably to the injection, twice daily for 5 days, of a 1. of salt soln. S. Morgulis

Blood sugar and glucosuria in exophthalmic goiter. Wm. T. Andersen. *Acta Med. Scand.*, Suppl. LIV, 206 pp.(1933).—Spontaneous glucosuria has been demonstrated in practically every exophthalmic goiter patient examd. Although in uncomplicated cases of exophthalmic goiter the fasting blood-sugar level is normal, the av. from a no. of observations is a little above normal. The alimentary glucemia is increased in intensity and in duration, especially in the more severe cases. Thyroidectomy results in a diminution of the markedly increased glucemias, whereas the more moderately increased glucemias are hardly affected at all. The sugar-excretion threshold is somewhat below normal, but without any evidence of renal glucosuria, and is again raised after thyroidectomy. Diabetic patients suffering from exophthalmic goiter show improvement after thyroidectomy while diabetics with myxedema show an aggravation of their

condition under the influence of thyroid medication.

S. Morgulis

**Chemical nature of brain antigen. II. Further studies on the preparation of pure hapten.** Hermann Rudy. *Biochem. Z.* 267, 77-88(1933); cf. *C. A.* 28, 1400\*.—By further purification procedures it has been established that the hapten obtained by alc. extn. of brain is P-free and resistant to alkali, and is neither a sterol, cerebroside nor creatine. The hapten is a lipid-sol. substance scarcely sol. in H<sub>2</sub>O which on removal of its impurities becomes more or less H<sub>2</sub>O-sol. In the crude ext. the hapten is not dialyzable but in the sapond. fraction considerable dialysis takes place. From these results it is concluded that the hapten is adsorbed on lipid material.

S. Morgulis

**Relation between the structure of the antigen and the specificity of the antibodies. VIII. Changes in the specificity of the cholesterol in its transformation into an antigen complex.** E. Burger. *Biochem. Z.* 267, 143-50 (1933); cf. *C. A.* 27, 5414.—Immunization expts. show that the antibodies produced in response to injections of a mixt. of serum + lipid contg. cholesterol are not the same as the antibodies formed to diazotized cholesterol amino benzoate coupled with protein. It is believed that the specificity of the protein, without being destroyed, has been altered by its condensation with the cholesterol-*p*-aminobenzoate.

S. Morgulis

**The minute volume of the heart in experimental acidosis.** Gunnar Norlir. *Skand. Arch. Physiol.* 67, 170-6 (1933).—When the alveolar CO<sub>2</sub> tension is reduced to about 6 mm. Hg by the use of NH<sub>4</sub>Cl the min. vol. of the heart is appreciably increased, even by more than 50%, this increase being primarily due to the poor utilization of the blood O<sub>2</sub>.

S. Morgulis

**Presence of a principle affecting the suprarenal cortex in the urine of cancerous patients.** Max Aron. *Compt. rend.* 197, 1702-4(1933).—The injection of 50 to 60 cc. of urine from patients with cancer into rabbits weighing between 1 and 1.5 kg. produced a marked increase in lipides in the suprarenal cortex, chiefly spongiocytes. By adding 3 or 4 vols. of acetone the active principle was pptd., redissolved in physiol. saline soln. and sterilized with tricresol. Injections of this concd. material in amounts equiv. to 400 to 750 cc. of urine produced positive reactions in 50% of several hundred tests. The injection of quantities corresponding to 750 to 1000 cc. of urine of non-cancerous subjects gave negative results. This is not a specific test but confirmatory results obtained several times on successive samples from each patient increase the accuracy of the test.

James C. Munch

**Renal glucosuria.** A. F. Fowler. *Ann. Internal Med.* 7, 518-29(1933).—A case of renal glucosuria with ketosis was studied in a child 4.5 years old.

John T. Myers

**Xanthoma accompanied by hypercholesterolemia occurring in an otherwise normal individual, and in an individual with acromegaly and diabetes.** Thomas H. McGavack and H. Clare Shephardson. *Ann. Internal Med.* 7, 582-604(1933).—Disturbed carbohydrate utilization is not a necessary antecedent to altered fat metabolism. Insulin has no value in the treatment of non-diabetic xanthoma but is useful in the diabetic type. Thyroid is useful in the non-diabetic type. A low fat and low caloric diet is useful in both types.

John T. Myers

**Factors influencing the pathogenicity of bacteria.** F. H. Teale. *J. Path. Bact.* 37, 185-232(1933).—Washed spores of ordinarily pathogenic bacteria multiply but do not secrete toxins in the animal body, but if highly virulent may prove fatal, because they may create the necessary conditions in tissues for growth. The products of tissue damage can activate infection. Aggressins do not confer immunity. Hypersensitization to bacterial protein may cause severe symptoms even after repeated injections. There is no relation between antitrypsin in blood and tissues, and virulence of an infecting organism. In the tissues of an immunized animal, S forms are not readily changed to R forms.

John T. Myers

**A case of multiple myelosis with generalized amyloid-like deposits and unusual renal changes.** M. L. Rosen-

heim and G. Payling Wright. *J. Path. Bact.* 37, 332-4 (1933).

John T. Myers

**The total calcium content of the blood, and the elimination of calcium in the urine, in cases of chronic and acute scurvy.** A. Michaux. *Compt. rend.* 197, 865-7(1933).—Guinea pigs were fed a diet producing scurvy. The Ca content of the blood increased, Ca excreted in the urine decreased, during the course of the expt.

W. G. R.

**Histologic studies on fat and glycogen metabolism in the liver during experimental diseases.** György Andai. *Magyar Orvosi Arch.* 34, 502-11(1934).—In a no. of pathol. conditions characteristic changes of the liver fat and liver glycogen were found.

Henry Tauber

**The role of the reticulo-endothelial system in the production of fibrinogen.** Antal Leszler and László Pauliczky. *Magyar Orvosi Arch.* 34, 512-16(1934).—The first dose of curmine injected into rabbits caused an increase of fibrin, while subsequent doses diminished it. The effect is suggested to be due to an irritation of the reticulo-endothelial system.

Henry Tauber

**Variations of the different protein fractions in the blood of eczematous children.** Dezső Steiger-Kazal. *Magyar Orvosi Arch.* 34, 517-20(1934).—The serum was fractionated with (NH<sub>4</sub>)<sub>2</sub>SO<sub>4</sub>, and total N, 2 albumin and 2 globulin values, resp., were obtained. The total N was diminished. The albumin was increased at the expense of the globulin.

## H—PHARMACOLOGY

A. N. RICHARDS

**Pharmacological and clinical studies of a new substance for the treatment of leprosy.** A. Ambrogio. *Arch. ist. biochim. ital.* 5, 321-94(1933).—A new deriv. of chaulmoogra oil "Iodomografa IBI," an I ester of chaulmoogric acid, has been pharmacologically and clinically studied. It can be used with advantage in the treatment of leprosy, is suited to a perfect gradual dosing, and can be given for

periods of weeks. The dose employed was 0.50-1.50 cc. of the ester.

E. S. G. Barron

**Reaction of the organism to the intracutaneous injection of tuberculin.** C. Luchini, M. Belli and C. Gerbi. *Arch. ist. biochim. ital.* 5, 485-536 (1933).—The intradermic reaction of tuberculin produces, at the max. of the dermic reaction, a diminution on the total proteins of the blood serum; an increase in the globulin content and a diminution of the osmotic pressure of the serum.

E. S. G. Barron

**The action of phlorizin on the excretion of glucose, xylose, sucrose, creatinine and urea by man.** Herbert Chasis, Norman Jolliffe and Homer W. Smith. *J. Clin. Investigation* 12, 1083-90 (1933).—The min. requirement of phlorizin by man for complete phlorizinization, i. e., raising of the glucose clearance to xylose clearance, is 10-20 mg. per kg. A dose of 65 mg. did not raise the glucose clearance above that for xylose, and one of 59.4 mg. did not cause deviation between the xylose and sucrose clearances. With the largest dose given there was no significant depressive action on the ratio creatinine:xylose clearance.

J. B. Brown

**Salt and water in the treatment of diabetic acidosis.** David M. Kydd. *J. Clin. Investigation* 12, 1169-83 (1933).—Treatment of diabetics with insulin and carbohydrate alone is unsatisfactory. NaCl gives a rapid recovery with hyperchloremia, retention of Cl until the base level is normal, followed by excretion of chloride with excess base.

J. R. Brown

**The effect of diiodotyrosine on the basal metabolism in myxedema.** Willard O. Thompson, Joseph M. Alper, Phebe K. Thompson and Lois F. N. Dickie. *J. Clin. Investigation* 13, 29-36 (1934).—The intravenous administration of diiodotyrosine was without effect on the basal metabolism of patients with myxedema. This compd. is not the limiting factor in thyroxine formation in individuals with very small amts. of active thyroid tissue nor can it be synthesized to thyroxine outside the thyroid.

J. B. Brown

**The influence of the acid secretion of the stomach on variations in the blood-sugar level after administration of casein and hydrochloric acid.** S. Marino and P. Romeo. *Arch. farmacol. sper.* 56, 407-42 (1933).—No direct relation exists between the blood-sugar level and the degree of gastric acidity during starvation. Therefore it is not possible to diagnose hypo- or hyperacidity from the blood-sugar detn. The administration of casein, HCl and casein + HCl produces changes in the blood sugar which depend on gastric acidity. Casein (35 g.) produced hyperglycemia in all subjects with a max. after 1.5-2 hrs. It was more pronounced in hypoacidity cases. Casein (35 g.) + 150 cc. of 4% HCl produced a slight hyperglycemia in hypoacidity, while in hyperacidity the increase in blood sugar was greater than when casein alone was given. These changes were observed after 1 hr. HCl (150 cc. of 4%) produced hyperglycemia in subjects with hyperacidity with a max. after 1 hr. In hypoacidity there was accentuated hypoglycemia with minima at 0.5-1 hr.

Lewis W. Butz

**The physiological and pharmacological action of sulfur. I. The general effect and the blood picture.** Francesco M. Chiancone. *Arch. farmacol. sper.* 56, 467-76 (1933).—Repeated injections into young dogs of a sol. S prepn. aided growth, raised the hemoglobin content of the blood and increased the resistance of the erythrocytes to hypotonic solns.

Lewis W. Butz

**Eosin and tissue respiration.** Ricciotti Del Zoppo. *Arch. farmacol. sper.* 56, 536-42 (1933).—Intravenous injection of eosin into rabbits produced a diminution in the internal respiration of the tissues. Cell resistance, red cell count and hemoglobin content were not affected.

Lewis W. Butz

**The effect of adrenaline upon [circulation in] the dog liver.** Ernst Rüegg. *Arch. expul. Path. Pharmacol.* 171, 716-32 (1933).—The intraarterial injection of adrenaline into dog livers perfused with beef blood causes an increased arterial pressure and decreased outflow due to arterial contraction. Intraportal injection may have a

similar effect upon the portal pressure and outflow or it may have the reverse effect, during which the liver decreases in size. On isolated strips of beef or cat portal veins adrenaline always causes contraction. H. E.

**The carbohydrate metabolism in dogs after the prolonged administration of carbohydrate.** Leo Falin. *Arch. expul. Path. Pharmacol.* 174, 12-27 (1933).—The prolonged administration of glucose and sucrose to dogs caused a less pronounced hyperglycemic response to glucose and an accentuation of the hypoglycemic phase, variable changes in the hyperglycemic response to adrenaline and a decreased sensitivity to insulin. The hyperglycemic response to the administration of sucrose was, at first decreased (53rd day), but later returned to normal.

Harry Eagle

**The white blood cells. II. The effect of vegetative poisons upon the differential count in human beings.** G. Roessler. *Arch. expul. Path. Pharmacol.* 174, 28-41 (1933).—The effects of atropine, adrenaline, Ca, gynergen, pilocarpine and choline are analyzed. There is an extensive bibliography. III. Central and peripheral regulation of the blood picture. *Ibid.* 45-50. H. E.

**Comparative pharmacological studies on the calcinosis factor and parathyroid hormone. II. Observations on human beings.** F. Holtz, J. Gürsching and H. Kraut. *Arch. expul. Path. Pharmacol.* 174, 51-62 (1933); cf. C. A. 27, 758.—Parathyroid hormone and the calcinosis factor formed during the irradiation of ergosterol were compared for their effect upon calcification, their effect upon the blood Ca and SiO<sub>2</sub> content, toxic symptoms upon overdosage, and their value for substitution therapy in cases of postoperative tetany. In general, the effects were qualitatively similar.

Harry Eagle

**The effect of small doses of arsenic upon the metabolism.** Franz Delhougne. *Arch. expul. Path. Pharmacol.* 174, 77-80 (1933).—Arsenic in therapeutic doses causes an increased formation of glycogen in the liver and muscles of white rats.

Harry Eagle

**Acute somnifen poisoning.** Hans Glatzel and Frida Schmitt. *Arch. expul. Path. Pharmacol.* 174, 111-17 (1933).—A case report with a review of the literature. The symptoms resemble those of barbituric acid poisoning, with motor excitation ascribed to the allyl and amine groups. Coramine was successfully used therapeutically. Based on their barbituric acid contents, somnifen seems to be less toxic than barbital.

Harry Eagle

**Crystalline insulin. IV. The effect of crystalline insulin upon the metabolism of diabetics.** M. Bürger and A. Patzold. *Arch. expul. Path. Pharmacol.* 174, 118-29 (1933); cf. C. A. 28, 1405<sup>6</sup>.—The intravenous injection of cryst. insulin (15γ/kg.) into diabetics increases the oxidative processes. An immediate increase in the O consumption is followed by a 2nd increase in 1-3 hrs. The latter is ascribed to the exhaustion of available carbohydrate, and is assocd. with a significantly lower R. Q. Despite the unreliability of the R. Q. as a quant. measure of the metabolic processes, this decrease seems to be due to the oxidation of fats and unidentified acid org. substances, resulting in slight alkalosis. V. The inactivation of insulin by the blood. M. Bürger and H. Kohl. *Ibid.* 130-42.—Normal human blood and, to a much less degree, cell-free serum, inactivates insulin within several hrs. at 37°. Inactivation of the blood or serum at 50° destroys this property. The blood of leucemic patients is more active than normal blood, and this increased activity decreases in equal proportion to the white blood cell count after therapeutic Röntgen irradiation. The active factor may be the proteolytic enzymes of the white cells.

Harry Eagle

**The absorption of ethereal oils through the skin.** Hans Paffrath. *Arch. expul. Path. Pharmacol.* 174, 143-50 (1933).—After the cutaneous application of "pertussin balsam," ethereal oils can be demonstrated in the expired air and, in smaller quantities, in the urine. H. E.

**Is morphine excreted into the stomach after parenteral administration?** Philipp Ellinger and Heinrich Serger. *Arch. expul. Path. Pharmacol.* 174, 168-72 (1933).—Gastric secretion in dogs begins to decrease immediately after

the subcutaneous injection of morphine (10–50 mg./kg.), stops completely within 2–3 hrs., and slowly resumes thereafter. Morphine does not appear in the gastric juice, either in normal dogs or those habituated to the drug.

Harry Eagle

Changes in the hydrogen-ion concentration of the blood and in the mineral metabolism during anesthesia. III. The effect of acidosis and alkalosis upon the course of the anesthesia. Jan Bečka. *Arch. expl. Path. Pharmacol.* 174, 173–81(1933); cf. C. A. 27, 5815.—Morphine anesthesia causes alkalosis; other anesthetics (EtCl, ether, CHCl<sub>3</sub>, barbituric acid derivs., hypnal, avertin, urethan, amylene hydrate) cause acidosis. Counteracting this acidosis, as by the intramuscular injection of a proprietary colloidal Mg(OH)<sub>2</sub> prepn. 2–3 hrs. before the administration of the narcotic, generally deepens the anesthesia and often reduces the quantity of the drug necessary for anesthesia. In the case of barbital, however, alkalosis counteracts the anesthetic action, possibly because of the formation of the undissociated salt instead of the free diethylbarbituric acid. Increasing the acidosis, as by the administration of glucose, H<sub>3</sub>PO<sub>4</sub> or NH<sub>4</sub>Cl, increases the toxic symptoms and causes death in the expl. animal.

Harry Eagle

The anti-inflammatory action of [colloidally dispersed] camilla oil. Bergljot Krüger-Nilsen. *Arch. expl. Path. Pharmacol.* 174, 197–207(1933).

Harry Eagle

Subdividing the therapeutic dose of antimony. F. Eichholtz and A. Erhardt. *Arch. expl. Path. Pharmacol.* 174, 208–9(1933).—The therapeutic dose of foadin (3.4 mg Sb per kg. in cat opisthorchiasis), dangerously close to the lethal dose, remains effective if distributed over a 4-day period, but loses effectiveness if distributed over 8 days. The same relationship holds for Sb oxalate. H. E.

Factors affecting Röntgen therapy. F. Eichholtz, H. G. Zwerg and L. Kluge. *Arch. expl. Path. Pharmacol.* 174, 210–16(1933).—Insulin accentuates the inhibitory effect of Röntgen rays upon the growth of rat sarcoma; this may be related to the increased lactic acid content of the tumor caused by the insulin. Preliminary treatment of the animals with adrenaline reverses the usual inhibitory effect of irradiation, causing increased growth instead.

Harry Eagle

The dependence of the effect of uterus-stimulating agents (histamine and ergotamine) upon the concentration and the temperature of the reaction. Werner Lipschitz and Fritz Klar. *Arch. expl. Path. Pharmacol.* 174, 223–44(1933).

Harry Eagle

Radiothorium in leucemias and animal experiment. I. Zadek. *Klin. Wochschr.* 12, 1813–16(1933); cf. C. A. 28, 1108<sup>1</sup>.—A review.

Harry Eagle

The use of sodium citrate in hemophilia. W. M. Krüner. *Klin. Wochschr.* 12, 1906–8(1933).—Five case reports in which the subcutaneous injection of isotonic solns of Na citrate (3.5%) seemed to have some effect in stopping hemorrhage. Where feasible, it was injected around the actual site of bleeding. Its use in conjunction with transfusion is recommended.

Harry Eagle

The [therapeutic effect] of cortical adrenal extract upon psoriasis. Preliminary report. Theodor Grüneberg. *Klin. Wochschr.* 12, 1908–9(1933).

Harry Eagle

The increased serum lipase caused by thyroxine, and its inhibition. I. Julius Bauer and Max H. Hoffman. *Klin. Wochschr.* 12, 1933–4(1933).—Lipoid exts. of blood added to the diet of rats inhibit the increase of serum lipase otherwise caused by the injection of thyroxine. Olive oil has a similar but less pronounced inhibitory action.

Harry Eagle

The effect of splenic substances upon the cholesterol content of the blood. Erwin Schliephake. *Klin. Wochschr.* 12, 1936–8(1933).—The injection of splenic ext. (pro-splen) into human beings tends to increase the blood cholesterol if it was previously low, to depress it if it was previously high. Short-wave irradiation of the splenic area generally causes an increase after an initial fall of about an hr.'s duration.

Harry Eagle

The effect of beryllium and its compounds upon the organism. I. Stefano M. Fabroni. *Klin. Wochschr.* 12,

1963–4(1933).—The intravenous injection of Be(OH)<sub>2</sub> into rabbits has no demonstrable toxic or harmful effect, despite storage of the colloid in the reticulo-endothelial system.

Harry Eagle

The effect of reticulo-endothelial blockade with ink upon the purine metabolism of dogs. Friedrich Chrometzka. *Klin. Wochschr.* 12, 1968–9(1933).—The excretion of purine bases is increased, and also that of uric acid and an unidentified precursor of allantoin, while the excretion of allantoin is decreased. The allantoin/uric acid ratio falls from a normal value to 20/1 to as low as 2/1. The results are interpreted on the basis of a delayed purine metabolism, due to the reticulo-endothelial blockade and its effect upon the liver.

Harry Eagle

The decomposition of cocaine and atropine in the animal body. H. A. Oelkers and W. Rartz. *Klin. Wochschr.* 12, 1985–6(1933).—The rate of decompn. of atropine and cocaine injected into mice corresponds to the rate of sapon. *in vitro* in borate buffers at pH 7.4–7.5.

Harry Eagle

The primary cause of death brought about by some preparations of the digitalis group in mice and rats. Chikao Kinukawa. *Tohoku J. Exptl. Med.* 22, 314–25(1933).—With digitoxin and a pharmaceutical digitalis prepn. the primary cause of death is respiratory failure. With strophanthin and a strophanthus prepn., the primary cause of death is also respiratory, but the circulatory system is also somewhat affected. With rhodein and another rhodea prepn., the primary cause of death is probably circulatory, although the respiratory app. is also profoundly affected. In using mice or white rats for testing the circulatory action of various members of the digitalis group, it is therefore important to use artificial respiration.

Harry Eagle

The effect of camphor upon the size of the pupils in rabbits. Chikao Kinukawa. *Tohoku J. Exptl. Med.* 22, 326–34(1933).—Initial mydriasis (sympathetic stimulation) is followed by miosis (parasympathetic stimulation). In the later convulsive stage there is marked mydriasis (sympathetic excitation and parasympathetic atony); and in the paralytic stage there is moderate mydriasis due to paralysis of the parasympathetic center.

Harry Eagle

Derivatives of 8-aminoquinoline as antimalarial preparations. II. Influence of the length of chain in position 8. O. Magidson and I. Th. Strukov. *Arch. Pharm.* 271, 569–80(1933); cf. C. A. 27, 5112.—The compds. 6,8-MeO(Et<sub>2</sub>N(CH<sub>2</sub>)<sub>n</sub>NI)(C<sub>6</sub>H<sub>4</sub>)<sub>2</sub>N (n = 2, 3, 4 and 5) were studied. The max. chemotherapeutic index (I) was found when n = 3. In clinical tests with this compd. 90% of the cases were cured at the tertian and quartan stage of the disease; in malaria tropica cure resulted in half the cases. It is superior to plasmoquin in being less toxic and in causing secondary phenomena less often. It kills chiefly the gametes. Introduction of a —OH group into the side chain decreased I to 14. The introduction of Et on the 8-amino N completely destroyed the therapeutic effect. Substitution of the piperidino group for the Et<sub>2</sub>N group decreased I to 6. 6,8-(Et<sub>2</sub>NCH<sub>2</sub>CH<sub>2</sub>O)(H<sub>2</sub>N)C<sub>6</sub>H<sub>4</sub>N was inactive. The chemotherapeutic effects of the principal compds. described have been studied in bird malaria (*Plasmodium praecox*) in 2 species of finch. The present investigation involved among other things the prepn. and characterization of the following: Et<sub>2</sub>NCH<sub>2</sub>CH<sub>2</sub>CH<sub>2</sub>OH, b<sub>10</sub> 84–5°, yields with CCl<sub>4</sub> in dry C<sub>6</sub>H<sub>6</sub> 1-diethylamino-3-chloropropane-HCl, m. 62–4° (free base, b<sub>10</sub> 82°, b. 169–71°, d<sub>20</sub> 0.980), which, heated 48 hrs. with 6-methoxy-8-aminoquinoline in abs. EtOH, gave among other products 6-methoxy-8-(γ-diethylaminopropylamino)quinoline, bright yellow viscous oil, b<sub>10</sub> 198–201° (meconate, yellow powder, m. 133–4° (decompn.)). The toxic dose is 1:40,000; I = 26.5. 6-Ethoxy-8-(γ-diethylaminopropylamino)quinoline, bright yellow viscous oil, b<sub>10</sub> 238–41°, b<sub>10</sub> 214–18°; toxic dose 1:1500, I = 13.3. Di-Et 8-diethylaminoethylmalonate, b<sub>10</sub> 136–42°, d. 0.9821, n<sub>D</sub><sup>20</sup> 1.4386. Et γ-diethylaminobutyrate, b<sub>10</sub> 103–5°, d<sub>15</sub> 0.9103, n<sub>D</sub><sup>15</sup> 1.4342. 4-Diethylaminobutanol, b<sub>10</sub> 90–2°, d<sub>15</sub> 0.9103, n<sub>D</sub><sup>15</sup> 1.4474. 4-Diethylaminobutyl chloride gave, on warming with 6-methoxy-8-aminoquinoline, 6-methoxy-8-(γ-diethylaminobutylamino)quinoline (HCl salt orange-yellow,

- hygroscopic needles); toxic dose 1:1500,  $I = 10.6$ . *Di- $\gamma$ -diethylaminopropylmalonate*,  $b_p$  149–51°, oil of disagreeable odor,  $d_{20}^{20}$  0.9724,  $n_D^{20}$  1.4416. *Et  $\gamma$ -diethylaminovalerate*,  $b_p$  130–1°,  $d_{20}^{20}$  0.9040,  $n_D^{20}$  1.4354. *5-Diethylaminopentanol*,  $b_p$  131°,  $d_{20}^{20}$  0.8842,  $n_D^{20}$  1.4642. *6-Chloroamyl-diethylamine-HCl*, m. 55–6°. *6-Methoxy-8-( $\gamma$ -diethylaminoethylamino)quinoline*, bright yellow viscous oil,  $b_p$  210–21° (dimeconate, m. 120–2°),  $I = 25$ . *6-Ethoxy-8-( $\gamma$ -diethylamino- $\beta$ -hydroxypropylamino)quinoline*,  $C_{18}H_{27}O_2N_3$ , very thick orange-yellow oil,  $b_p$  240–5°,  $I = 15$ . *6-Ethoxy-8-( $\gamma$ -piperidinopropylamino)quinoline*, bright yellow oil,  $b_p$  227–32°,  $I = 6$ .  *$\gamma$ -N-Piperidinopropylene glycol*, m. 67–8°. *6-Ethoxy-8-ethylaminoquinoline*, m. 53° ( $HCl$  salt m. 200–1°), yields with  $HNO_3$  an intensely green cryst. nitroso compd. *6-Ethoxy-8-[( $\beta$ -diethylaminoethyl)ethylamino]quinoline*, yellow oil,  $b_p$  192–3°,  $I = 0$ . *6-Ethoxy-8-[( $\gamma$ -diethylamino- $\beta$ -hydroxypropyl)ethylamino]quinoline*,  $b_p$  207–12°,  $I = 0$ . *6-( $\beta$ -Diethylaminoethoxy)-8-nitroquinoline*, m. 47.5°. *6-( $\beta$ -Diethylaminoethoxy)-8-aminoquinoline* (*di-HCl salt*, m. 209–12°; *HCl salt of Ac deriv.*, m. 141°; *HCl salt of Bs deriv.*, m. 57°). *6-( $\beta$ -Diethylaminoethoxy)-8-(benzoyl-ethylamino)quinoline-2HCl*, yellow, m. 182–3°. *6-( $\beta$ -Diethylaminoethoxy)-8-(N-diethylaminoethyl-N-benzoylamino)quinoline* (*HCl salt* m. 83°). W. O. E.
- Some amines, derived from phenol ethers, which reverse certain pharmacodynamic actions of adrenaline. Jeanne Lévy and Erwin Ditz. *Compt. rend. soc. biol.* 114, 971–4(1933).—Ten new compds. of the type  $C_6H_5-OCH_2CH_2NRR'$  or  $MeOC_6H_4OCH_2CH_2NRR'$  were prepd. All were found to diminish, suppress or reverse the pharmacodynamic action of adrenaline. Cf. following abstr.
- L. E. Gilson
- Sympathetic action of some amines derived from phenol ethers. D. Bovet and P. Maderni. *Compt. rend. soc. biol.* 114, 980–2(1933).—Three more compds. of the type described in the preceding abstr. were prepd. and found to antagonize the action of adrenaline. L. E. G.
- Experimental production of hypercholesterolemia in rabbits in a state of chronic uranum nephritis. P. Mauriac and L. Servantie. *Compt. rend. soc. biol.* 114, 1105–8(1933).—Normal rabbit blood contains 0.5 g. cholesterol per l. By repeated injections of an oil soln. of cholesterol into normal rabbits a max. blood cholesterol content of 2.5 g. per l. was attained. But when rabbits were kept in a state of chronic nephritis by administration of U salts it was found possible to raise the blood cholesterol to 7.5 g. per l. by the injections. L. E. Gilson
- Experimental hypothermia produced by sparteine ethylphenylbarbiturate. Fernand Mercier and C. Rizzo. *Compt. rend. soc. biol.* 114, 1183–5(1933).—Sparteine sulfate has little or no effect on the temp. of the guinea pig. Na ethylphenylbarbiturate produces hypothermia and sparteine ethylphenylbarbiturate has a similar but more powerful action. L. E. Gilson
- Variations in the mineral elements of the plasma during ether anesthesia. A. D. Marenzi and Rebecca Gerschman. *Compt. rend. soc. biol.* 114, 1226–8(1933); cf. C. A. 27, 3984. Ether anesthesia causes a large decrease in  $CO_2$  and K, a small decrease in Mg and Ca, an increase in P, and little or no change in Na and Cl in the plasma of dogs. L. E. Gilson
- Comparison of the actions of nicotine and sparteine on the secretion of the submaxillary glands. René Hazard and Lise Wumser. *Compt. rend. soc. biol.* 114, 1240–2(1933). L. E. Gilson
- Action of benzene on leucocytes. Experiments with horses. E. Lemétayer. *Compt. rend. soc. biol.* 114, 1282–3(1933).—By subcutaneous injection of 5–10 cc. thiophene-free benzene daily for 5 days the leucocyte count was increased about 70%. The greatest increase was in the polynuclear forms. Action of quinine on the leucocyte count of the horse. *Ibid.* 1284–5.—Quinine-HCl had little or no effect. L. E. Gilson
- Sympathetic effects of "Pao Pereira." Raymond-Hamet. *Compt. rend. soc. biol.* 114, 1309–13(1933).—Pao Pereira is the bark of *Geissospermum laeve* Baillon, a Brazilian species of Apocynaceae. It contains the alkaloids geissospermine and pereirine. An ext. of the bark has a powerful sympathetic action of the quinine rather than the ergotamine-yohimbine type. Inhibiting action of geissospermine on the utero-motor effects of adrenaline. Rothlin and Raymond-Hamet. *Ibid.* 1314–15. L. E. Gilson
- Pharmacodynamic study of the action of lobeline in infants. Effects on the tachycardia of acute anterior poliomyelitis and infantile acrodynia. Raymond Meyer. *Compt. rend. soc. biol.* 114, 1322–6(1933). L. E. G.
- Ammonia excretion of dogs with uranum nephritis. C. Roersch. *Compt. rend. soc. biol.* 114, 1358–7(1933).—Chronic nephritis induced by U salts is accompanied by a 50%, or greater, decrease in urinary  $NH_3$ . L. E. G.
- Phlorizin content of whole blood during phlorizin diabetes in dogs. A. Lambrechts. *Compt. rend. soc. biol.* 114, 1363–5(1933); cf. C. A. 28, 527<sup>1</sup>.—After intravenous injection, about 80% of the phlorizin disappears from the blood in 5 min., and 95% in 30–40 min. L. E. Gilson
- Stimulating action of dinitroresol and dinitrothymol on cell metabolism. C. Heyman and H. Casier. *Compt. rend. soc. biol.* 114, 1384–5(1933).—Dinitrophenol, dinitronaphthol, dinitroresol and dinitronaphthol all produce hyperthermia and a great increase in tissue metabolism. The toxicity decreases in the order given; hence the last 2 are preferable for exptl. work. Numerous references are given. L. E. Gilson
- Comparative action of diiodotyrosine and Lugol's solution in hyperthyroidism. E. Delcourt-Bernard. *Compt. rend. soc. biol.* 114, 1397–1400(1933); cf. C. A. 27, 135. Expts. with 12 cases are discussed. Diiodotyrosine offers no advantages over inorg. I in the treatment of hyperthyroidism. L. E. Gilson
- Action of "Neptal" on the lipid equilibrium and the fats of the kidney tissue of the dog. C. Achard, J. Veran, M. Bariéty and E. Hadjigeorges. *Compt. rend. soc. biol.* 115, 6–7(1934); cf. C. A. 27, 1938. Injections of Neptal caused changes in the staining properties of the kidney-cell lipids similar to those previously reported as produced by theobromine. Neptal is a 9.2% soln. of the hydroxy-mercuripropylamide of *o*-carboxyphenoxyacetic acid. L. E. Gilson
- Action of apocodeine on dog intestine in situ and the resemblance of this action to that of sparteine. Raymond-Hamet. *Compt. rend. soc. biol.* 115, 24–6(1934); cf. C. A. 27, 1948. The antagonism of pilocarpine and apocodeine and its analogy to that of pilocarpine and tropine and that of pilocarpine and sparteine. *Ibid.* 121–4. L. E. Gilson
- Influence of general anesthetics on the urea content of the blood. King-Li-Pin and Woo-Ping-Soung. *Compt. rend. soc. biol.* 115, 55–6(1934).—In rabbits the normal blood urea is 0.35 g. per l. During general anesthesia it rises to an av. of 0.556 in the case of  $Et_2O$ , 0.464 for  $CHCl_3$ , and 0.6 for urethan. L. E. Gilson
- Influence of potassium on the growth of white rats. A. Leulier and G. Vanhems. *Compt. rend. soc. biol.* 115, 57–8(1934); cf. C. A. 28, 201<sup>1</sup>.—Young rats failed to grow and died in 12–24 days when fed a diet const. only 0.13 g. K per kg. but otherwise complete. L. E. G.
- Intoxication by amino acid nitriles. Protection by sodium thiosulfate. A. Desgrez and C. Sanné. *Compt. rend. soc. biol.* 115, 119–21(1934).—The M. L. D. of  $\alpha$ -aminopropionitrile for rabbits is about 0.025 g./kg. intravenously. Rabbits were protected from 0.05 g./kg. by 0.04 g./kg., or a little over 1 equiv., of  $Na_2S_2O_3$ , injected subsequently. Probably the CN group is converted into  $NaSCN$ . L. E. Gilson
- Paralyzing action of diethylaminomethylbenzodioxan on the vasomotor reflexes of the carotid sinus. G. de Vleeschhouwer. *Compt. rend. soc. biol.* 115, 187–9(1934). L. E. Gilson
- The mechanical properties of the arteries of skeletal muscle and their reaction to adrenaline. F. E. v. Tavel. *Arch. ges. Physiol. (Pflügers)* 233, 111–25(1933). A. G.
- The mechanical properties of renal arteries and their

- reaction to adrenaline. V. Kollbrunner. *Arch. ges. Physiol. (Pflügers)* 233, 126-36(1933). A. G.
- Caffeine contracture of striated muscle after inhibition of lactic acid formation. F. David. *Arch. ges. Physiol. (Pflügers)* 233, 222-8(1933).—In the absence of lactic acid, caffeine contracture is more pronounced than normally. Arthur Grollman
- Effect of phlorizin on sugar absorption. E. Wertheimer. *Arch. ges. Physiol. (Pflügers)* 233, 514-28(1933).—Phlorizin strongly inhibits the alimentary absorption of galactose, fructose and dextrose, but not of xylose and arabinose. The absorption of mannose and dihydroxyacetone is only slightly affected. A. G.
- Hypophysis and anaerobic carbohydrate metabolism. The lactic acid of the blood. J. A. Collazo, J. Puyal and Isabel Torres. *Arch. ges. Physiol. (Pflügers)* 233, 503-13(1933).—Small doses of pituitary liquid (pituitrin, pitresin or pitocin) decrease the lactic acid content of the blood. It is only large doses which cause the increase reported by previous observers. Arthur Grollman
- The chemotherapy of cancer. O. Schürch. *Deut. med. Wochschr.* 59, 1494-6(1933).—Thirty-two carcinomatous patients were treated with a 0.5% soln. of Pbl, dissolved in 10% aq. Ca gluconate. Only a temporary improvement (due to the Ca gluconate) was observed. Arthur Grollman
- The mechanism of lead poisoning. An acute case of lead poisoning. A. Schretzenmayr. *Deut. med. Wochschr.* 59, 1601-3(1933). Arthur Grollman
- Experimental studies on colloidal lead poisoning. E. Merlini. *Arch. ist. biochim. ital.* 5, 395-410(1933). E. S. G. B.
- The relation of the clinical picture of lead poisoning to the lead content of the blood and urine. E. Bass. *Deut. med. Wochschr.* 59, 1665-8(1933).—Analysis of the Pb content of the blood and urine has a diagnostic and prognostic value clinically. Arthur Grollman
- The question of injury to the organism by the use of salves containing cholesterol and vitamin D. A. M. Memmesheimer. *Deut. med. Wochschr.* 59, 1681-2(1933). Arthur Grollman
- Effects of amines on oxidations of the brain. Juda H. Quastel and Arnold H. M. Wheatley. *Biochem. J.* 27, 1609-13(1933).— $\beta$ -Phenylethylamine,  $\beta$ -phenyl- $\beta$ -hydroxyethylamine, tyramine, indole, isoamylamine and mescaline strongly inhibit the oxidation of glucose, Na lactate and Na pyruvate by the brain; but do not affect the oxidation of Na succinate. Neurine, cadaverine, putrescine, ethylamine and histamine have little effect on the oxidation by the brain of glucose, Na lactate or Na succinate. Benjamin Harrow
- Further studies on the pharmacological properties of onium salts. H. R. Ing and Winifred M. Wright. *Proc. Roy. Soc. (London)* B114, 48-63(1933).—The curariform properties of sym. onium salts of N, P, As, S and I, and of quaternary ions derived from pyridine, quinoline and strychnine were studied by use of isolated frog nerve sartorius preps. Anomalous curariform properties were not confined to Et-onium ions. Of 32 onium cations tested, only those contg. 3 Me groups produced contraction of the frog rectus abdominis muscle. The size of the cation may influence the pharmacodynamic properties of an onium salt. Joseph S. Hepburn
- Effect of salts on cell permeability as shown by studies of milk secretion. Geoffrey L. Peskett. *Proc. Roy. Soc. (London)* B114, 167-80(1933).—Evidence exists of a correlation between the ratio Na:diffusible Ca in blood and the ratio solids-not-fat:fat in milk, both in a group of cows and in individual animals. "It is suggested that variations in the proportions of these salts in the blood cause changes in the compn. of milk by affecting the relative permeabilities to lipid and non-lipoid of the mammary cell membranes." Joseph S. Hepburn
- The injury to carbohydrate metabolism in chronic lead poisoning. Ludwig Schmidt-Kehl. *Munch. med. Wochschr.* 80, 2003-4(1933).—The retention of fructose is diminished in rabbits poisoned with Pb. Milton Levy
- Pharmacological studies of dyes employed clinically. Toru Kuraya. *Japan. J. Gastroenterol.* 5, 133-42(1933).—Toxicity to frogs and mice is shown by paralysis. Tables of M. L. D. values for a series of dyes are given. C. M. McCay
- Toxicology of dyestuffs. Konan Shi. *Japan. J. Gastroenterol.* 5, 142(1933).—A table is given which divides dyes into 3 classes upon the basis of toxicity. C. M. M.
- Hypoglycemia from trypsin. Gabriele Monasterio. *Boll. soc. ital. biol. sper.* 8, 1297-8(1933).—Small doses of trypsin (5-50 mg.) previously incubated 2-6 hrs. at 37° injected intravenously into rabbits produced a slight but definite hyperglucemia; doses of 100 mg. produced no noticeable effect, while doses of 0.5 g. produced a marked hypoglycemia often resulting in convulsions which were relieved by glucose; still greater doses, 1.0 g., produced a less marked hyperglucemia. Rabbits were injected with 0.5 g. doses intravenously or subcutaneously; the former animals showed a marked hypoglycemia; the latter, a marked hyperglucemia. These results indicate that an *in vivo* neutralization of insulin by trypsin is not possible. Peter Masucci
- Preliminary studies on the distribution of neurotropic drugs between the various lipoids of the encephalo-spinal centers. G. Biancalani. *Boll. soc. ital. biol. sper.* 8, 1325-30(1933).—Dibromostearin and NaBr were administered to adult dogs in increasing doses such that the amt. of Br was the same for the 2 compds. The animals were killed; the brain, spinal cord, liver, muscles and subcutaneous fat were removed, ground, and extd. with ether. Exts. and residue were dried and incinerated. Results of Br detn. by the Engel method showed that for dibromostearin the largest amt. of Br was present in the fat with decreasing amts. in liver, spleen, muscles, brain and spinal cord; for NaBr, there was no Br in fat and only traces in the other tissues. In the brain and cord, regardless of which compd. was administered, the largest amt. of Br was found in the acetone-sol. portion, not assocd. with cholesterol, but in the non-satd. phosphatides and water-sol. fractions. For dibromostearin, the Br content of the phosphatides was about twice that of the protein fraction; for NaBr, the reverse was found. P. M.
- The action of mineral water containing calcium sulfate; pressure variations at the level of the carotid sinus. D. Santenoise, C. Franck, L. Merklen and M. Vidacovitch. *Bull. acad. méd.* 109, 80(1933). A. E. Meyer
- Poisoning produced by apiol adulterated with o-tolyl phosphate. M. Tiffeneau. *Bull. acad. méd.* 109, 121-5(1933). A. E. Meyer
- General disturbances produced by radium. Léon Imbert and Raymond Imbert. *Bull. acad. méd.* 109, 229-36(1933).—Guinea pigs living in a high concn. of Ra irradiation lose wt. and die within 6-7 weeks. Liver damages and gastric ulcers are post-mortem findings. A. E. Meyer
- The influence of tobacco and nicotine on the coronary vessels. Ch. Laubry, J. Walser and L. Deglaude. *Bull. acad. méd.* 109, 595-8(1933).—The coronary vasoconstrictor effect is negligible. The action is entirely on the nervous system. A. E. Meyer
- The effect of carbon dioxide introduced intraperitoneally or rectally on respiration and circulation. M. Loeper, André Lemaire, A. Mougeot and V. Aubertot. *Bull. acad. méd.* 109, 598-602(1933).—The method is more effective than percutaneous application and does not carry the danger of suffocation, as inhalation. A. E. Meyer
- The action of thyroid and pituitary extract on blood composition and diuresis; combined action of thyroid extract and theobromine. L. Langeron, M. Paget and J. Leduc. *Bull. acad. méd.* 109, 843-6(1933).—The ratio plasma vol.:corpuscle vol. is increased by thyroid if it was lower than normal, but it remains unchanged in normal conditions. Diuresis and Cl elimination decrease. The diuretic effect of thyroid and theobromine is much larger than that of theobromine alone. Pituitary decreases the amt. of fluids in blood and the diuresis; it is antagonistic to the thyroid. A. E. Meyer
- The action of some cardiotonics on the isolated ventricle of the snail. A. Beaune and V. Balaceanu. *Bull. sci.*

- pharmacol.* 40, 658-62(1933).—Digitalin has little effect on the muscle; it affects especially the frequency of the rhythm. The systolic stop effected by it is reversible by washing with Ringer's soln. Ouabain has a direct effect on the muscle and its tonus. Caffeine has a neg. chronotropic action. The stimulation of the muscle has a max. at concns. from 1:1000 to 1:5000. A. E. Meyer
- Vagotonin and regulation of arterial pressure. P. Couturat. *Presse méd.* 41, 426(1933).—The action is mediated by the nervous system. A. E. Meyer
- Local cutaneous reactions of histamine. G. Roussy and M. Mosinger. *Presse méd.* 41, 805-8(1933).—Local skin reactions produced by histamine are recommended for the study of peripheral vasomotor function. A. E. M.
- Glycerol and the combination glucose-mercuric chloride in the treatment of varicose veins. Armand Bacharach. *Presse méd.* 41, 709-10(1933). A. E. M.
- The pharmacology of Althea. Henri Leclerc. *Presse méd.* 41, 738(1933). A. E. Meyer
- The combination of amyl nitrite with sodium thiosulfate in the treatment of potassium cyanide poisoning. Alfredo Buzzo and Rogelio E. Carratalá. *Semana méd.* (Buenos Aires) 1933, II, 1772-5; cf. *C. A.* 27, 4305.—Inhalation of  $\text{AmNO}_2$  combined with intravenous injections of  $\text{Na}_2\text{S}_2\text{O}_5$  gives an effective treatment in KCN poisoning. The former causes the formation of methemoglobin, which gives a stable compd. with CN and facilitates the action of the  $\text{Na}_2\text{S}_2\text{O}_5$ . Though  $\text{NaNO}_2$  is still more effective,  $\text{AmNO}_2$  has the advantage of easy application. A. E. Meyer
- Diiodotyrosine in the treatment of hyperthyroidism. Donato Boccia and Antonio E. Torre. *Semana méd.* (Buenos Aires) 1933, II, 1917-19.—Diiodotyrosine is in hyperthyroidism only an assisting remedy, which must be given over a prolonged period. A. E. Meyer
- Sparteine and camphor in the treatment of heart disease. Emile Goujoux. *Semana méd.* (Buenos Aires) 1933, II, 1927-31.—Favorable results obtained with sparteine camphorsulfonate are reported. A. E. Meyer
- Intraspinal bismuth treatment in neurosyphilis. Roque Orlando and Walter Grobli. *Semana méd.* (Buenos Aires) 1933, II, 1992-8. A. E. Meyer
- Avertin narcosis. Adolfo A. Finocchietti. *Semana méd.* (Buenos Aires) 1933, II, 1998-2025. A. E. Meyer
- Results obtained in foreign countries with the treatment of exophthalmic goiter with fluorine. León Goldemberg. *Semana méd.* (Buenos Aires) 1933, II, 2106-11. A. E. Meyer
- Aniline poisoning by cutaneous absorption. Carlos Burdes. *Semana méd.* (Buenos Aires) 1934, I, 104-5.—Description of a case. A. E. Meyer
- Clinical investigations into the effect of intravenous injection of insulin. VI. The hypoglycemic symptoms in diabetes. Kaj Roholm and Th. E. Hess Thaysen. *Acta Med. Scand.* 80, 528-49(1933); cf. *C. A.* 25, 2485.—In 98 out of 101 expts. on persons with normal glucose metabolism the intravenous injection of 12 insulin units brings on insulinism symptoms. In diabetics with injections of 12 or 24 units the incidence of insulinism occurred in 20 and 57%, resp. This difference is attributed to the fact that insulinism symptoms develop only when the glucemia level drops to about 50 mg. % in about 50 min. Otherwise there is no difference in the nature of the response of normal or diabetic persons. S. Morgulis
- The therapeutic action of amino acids on spontaneous rat cancers. F. Vlès and A. de Coulon. *Compt. rend.* 197, 1779-81(1933).—Twenty-four mice in which tumors had spontaneously appeared were fed a mixt. of 15.5 g. of l-cystine, 5.7 g. of dl-alanine, 7.5 g. dl-proline, 8.3 g. each of powd. pig stomach and powd. upper intestine, 12.3 g. of dried pancreas, 28.8 g. of powd. skin, 0.4 g. of thyroid gland, 1.1 g. of whole pituitary gland, 2.9 g. of dried testicle and 0.6 g. of dried suprarenal glands. Ten of the mice showed disappearance of tumors, 3 showed amelioration, while growth was aggravated in 6 mice. James C. Munch
- The action of chemical agents on the skin. Rene Chesneau. *Rev. gen. mat. color* 38, 1-9(1934).—In general there is no well-defined connection between mol. constitution and degree of harmful action on the skin. For diazo solns., cutaneous action is greater the higher the mol. wt.; sulfonation reduces this virulence. Certain substances that are harmless by themselves affect the skin in reducing baths. The characteristic action on the skin and its treatment are described for numerous substances. Halsey E. Silliman
- The toxicity of organic solvents (various esters, acetone and methanol). F. Flury and W. Wirth. *Arch. Gewerbepath. Gewerbehyg.* 5, 1-90(1933).—The toxicities of the vapors of the following org. solvents were studied: MeOAc, EtOAc, PrOAc, BuOAc, i-AmOAc, PhOAc, diethyl ester of phthalic anhydride, Me glycol acetate, MeOH,  $\text{Me}_2\text{CO}$  and ethylene glycol. All caused irritations of the mucosa of the eye and the respiratory tract which sometimes resulted in considerable inflammation. The esters are not as harmless as is generally believed. The Me derivs. are especially toxic because of the formation of MeOH within the animal. Henry Tauber
- The toxicity of acid copper carbonate sprays on the animal organism. I. Brodskii. *Arch. Gewerbepath. Gewerbehyg.* 5, 91-107(1933).—Acid Cu carbonate shows its effect, within a very short time, on the respiratory organs, the gastrointestinal tract, the cardiovascular system and, in rare cases, on the central nervous system. Henry Tauber
- Pharmacological investigation of "Senso," a Chinese drug from the dried skin secretion of the frog. I. Yoshito Kobayashi. *Proc. Imp. Acad.* (Tokyo) 9, 552-5(1933).—The chemistry of this drug has been studied by Kondo and Ikawa (*C. A.* 27, 1887, 3940).  $\psi$ -Bufotalin shows a digitalis-like cardiac action in a diln. of 1:1,000,000,000, while at 1:10,000,000 it has a poisonous action; the fatal dose for cats is 0.25 mg. per kg. body wt. The Ac deriv. acts on the heart in a diln. of 1:30,000,000 but is not poisonous in a diln. of 1:1,000,000.  $\psi$ -Bufotalin bromide is active in a diln. of 1:1,000,000,000,000,000 but is not toxic in a diln. of 1:1,000,000; the fatal dose for cats is over 19 mg. per kg. Acetyl- $\psi$ -bufotalin chloride is active in a diln. of 1:5,000,000,000 but not toxic at 1:1,000,000. Monoacetyl- $\psi$ -bufotalin,  $\text{C}_{28}\text{H}_{45}\text{O}_7$ , is active in 1:10,000,000; monoacetyldesacetyl- $\psi$ -bufotalin chloride is slightly less active than the mother substance but is about equally toxic (1:1,000,000). Anhydro- $\psi$ -bufotalin chloride is active in 1:100,000,000.  $\psi$ -Bufotoxin is active in 1:500,000,000. Desacetyl- $\psi$ -bufotalic acid and -bufotalonic acid are active in dilns. of 1:20,000-40,000; the Me ester has a slightly stronger action. Tetrahydro- $\psi$ -bufotalin is active in a diln. of 1:20,000. C. J. West
- Chemical composition and pharmacological action of buckwheat (*Polygonum hydropiper* L.). W. R. Witanowski and H. P. Kryńska. *Wiadomości Farm.* 60, 563-6(1933).—The dry substance of *P. hydropiper* L. contains an acrid ethereal oil amounting to 0.13-0.07%. It is obtained by steam distn. of the ether ext. of the plant, as distn. of the dry substance causes decompn. of the oil. The ethereal oil contains polygonone, which yields a cryst. thiosemicarbazone m. 194-5°. Its Ag salt is amorphous. The extd. oil lowers the blood pressure of mammals to a higher degree than sabinol, the lowering of the blood pressure being effected rather by widening of the blood vessels of the intestines than weakening of the heart muscle. The oil diminishes the tension of non-striated muscles of the intestines and the uterus. J. W.

## I—ZOOLOGY

R. A. GORTNER

**Identification and estimation of tryptophan in the hemolymph of the silk worm.** Luigi Mamoli. *Giorn. chim. applicata* 15, 437-8(1933).—By means of the reaction of Vanosene as modified by Purth and Nobel (C. A. 15, 377), the presence of tryptophan is proved in the hemolymph of the silk worm and its content are found to be 0.152%. It is probable that in silk worms and in other insects as well, the digestion of proteins extends to the liberation of the individual amino acids. A. W. Contieri

**The chemistry of marine animals. I. The sponge *Microciona prolifera*.** Werner Bergmann and Treat B. Johnson. *Z. physiol. Chem.* 222, 220-6(1933).—The red sponge, *Microciona prolifera*, found in Long Island Sound, contains a sterol which constitutes 1.25% of the dry wt. and 7.8% of the  $R_2O$  ext. This *microcionasterol*,  $C_{27}H_{46}O$ , m. 126-7°,  $[\alpha]_D^{25}$  -19.76°, is not identical with the spongosterol or chonasterol isolated from other sponges. Its acetate m. 125-6°,  $[\alpha]_D^{25}$  -24.76°; propionate m. 128°, benzoate m. 143°,  $[\alpha]_D^{25}$  -10.72°. Titration with  $BzO_2H$  shows 1 double bond.  $PCl_5$  converts it into a chloride, m. 104-5°, which is reduced by  $AmOH-Na$  to the hydrocarbon *microcionastene*  $C_{27}H_{46}$ , m. 61-2°, analogous to cholesterol. A. W. Dox

**The metabolism of the eggs of the sea urchin. I. The influence on respiration and lactic acid formation through dyestuffs.** A. W. H. van Herk. *Arch. néerland. physiol.* 18, 578-602(1933).—If a soln. of methylene blue, chrysoidin or Janus green is added to a suspension of unfertilized sea-urchin eggs (*Sphaerechinus granularis*) there is an increase in respiration, which at a concn. of 1:100,000 amounts to about 100% of the normal value. This increase is less with the fertilized eggs. Before and after fertilization the cells have the same R. Q. (0.92). Methylene blue and chrysoidin do not change this, but with the unfertilized eggs, it is increased from 0.92 to 1.09, depending on the amt. of dye and the time of the expt. Because of the great utilization of O in fertilized cells, no change is observed. The mean value of the R. Q. after addn. of glucose (end concn. 1.5%) is 0.60; a strong formation of lactic acid is also observed. Janus green increases the lactic acid formation. The changes in the amt. of lactic

acid do not agree with that of the total sum of all the acids. F. L. Dunlap

**Influence of sulfhydryl and its sub-oxidized derivatives on the developmental cycle of hydranths of the genus *Obelia*.** Frederick S. Hammett. *Protoplasma* 19, 510-40(1933).—"These results with the marine hydroid *Obelia geniculata* extend in several directions the application of the postulate that growth by increase in cell no. is regulated by a naturally occurring chem. equil. composed of the sulfhydryl and sub-oxidized derivs. They not only add another species to the roster, but since the form is representative of almost the most primitive type of multicellular animal organization, they broaden considerably the phylogenetic range of action of the principle. The results give clean-cut demonstration that the site of direct action of the chem. equil. is specifically on the proliferation phase as contrasted with the subsequent processes of differentiation and organization. A type of reproduction occurs in this material which is designated as recurrence since it is the repetitive production of a succession of organisms on the distal end of one and the same pedicle. Its property is the maintenance of colony integrity in the face of the functional decline of its constituent members. The expression of recurrence like all other types is accelerated by sulfhydryl and retarded by the sub-oxidized derivs. It underlies and determines the functional duration of the existing hydranths. For the first time demonstration is made of the proliferation-retarding property of a naturally occurring sub-oxidized SH deriv. of a naturally occurring sulfhydryl compd. (cysteine)." Fifteen citations. F. L. Dunlap

**Osmotic behavior of the sea-urchin egg as a criterion of its permeability.** V. A. Dorfman. *Protoplasma* 19, 578-86(1933). F. L. Dunlap

**Procedure of metabolism during the first mitosis of sea-urchin eggs.** John Runnstrom. *Protoplasma* 20, 1-10(1933); cf. C. A. 27, 2500.—After the first period immediately after fertilization, in which acid cleavage products are formed, a period follows in which these products disappear, at least in part. During this period (about 15-45 min.) alkali is set free, which can bind  $CO_2$ . The quotient free  $CO_2/O_2$  is lessened. During the period after the disappearance of the nucleus (45-75 min. after fertilization) the bound  $CO_2$  increases slowly, whereby the quotient free  $CO_2/O_2$  again becomes higher. The O utilization, according to findings with the eggs of *Paracentrotus*, is greater during the second quarter-hour after fertilization than during the first. In the later periods of mitosis the O utilization sinks somewhat but increases again shortly before or by the division. Twenty-six references. F. L. Dunlap

**Studies on the oxidation-reduction potential of protozoan cultures. I. The effect of -SH on *Chilomonas paramecium*.** Theo. L. Jahn. *Protoplasma* 20, 90-104(1933).—Pos. evidence is offered of an acceleration of cell division by -SH in bacteria-free cultures of *Chilomonas paramecium*. When  $H_2O_2$  is added to a standard culture medium no growth is obtained, but relatively rapid growth occurs if both peroxide and a high concn. of -SH are added. The antagonistic action of -SH and peroxide is explained on the basis of the oxidation-reduction potentials involved. This might explain, at least to some extent, the "specific" action of the -SH radical. Methylene blue is less toxic to *Chilomonas paramecium* in tubes sealed with oil than in unsealed tubes. This might be explained as being due to the higher oxidation-reduction potential in the unsealed cultures or to the oxidation accelerative power of methylene blue in the presence of O. Autocatalysis and allelocatalysis might be explained on the basis of adjustments in oxidation-reduction potential. Fifty-seven references. F. L. D.

**Resistance of fish to toxic compounds under various experimental conditions. Sensitizing action of thermol.** Léon Binet and G. Morin. *Compt. rend. soc. biol.* 114, 608-11(1933).—Marine gobies (*Gobius lota*) were made much more sensitive to the action of strychnine, paraldehyde, or tribromoethanol by keeping them for 1 hr. in a 1:75,000 soln. of thermol (2,4-dinitrophenol). L. E. G.

**Composition of *Sipunculus hemerythrin*.** Jean Roche.

*Compt. rend. soc. biol.* 114, 1188-9(1933); cf. *C. A.* 27, 2690.—The crystal. compd. contains C 53.3, H 6.5, N 16.8, S 1.7 and Fe 1.0%.  
L. E. Gilson

Action of adrenaline, ergotamine and tyramine on the isolated median ventricle of the squid, *Loligo pealii*. Z. M. Bacq. *Compt. rend. soc. biol.* 114, 1358-60(1933); cf. *C. A.* 27, 140.—Adrenaline soln. ( $1 \times 10^{-4}$ ) causes an increase in rate and amplitude of beats. The effect lasts about 1 min. Ergotamine ( $1 \times 10^{-4}$ ) produces a similar effect which lasts 20 min. The effect of tyramine is similar but very weak. Reactions of the isolated median ventricle of *Loligo pealii* to acetylcholine, atropine and potassium, calcium and magnesium ions. *Ibid.* 1360-1.—Acetylcholine,  $\text{Ca}^{++}$  and  $\text{Mg}^{++}$  inhibit the automatism of the ventricle. The chronotropism and inotropism are increased by  $\text{K}^+$ . Atropine, even in large doses, does not overcome the effects of acetylcholine. L. E. Gilson

Changes produced by sapid substances in the sensory areas of the palate of surviving frogs. A. C. Bruni. *Boll. soc. ital. biol. sper.* 8, 1332-4(1933).—Sapid substances, AcOH, quinine-HCl and sucrose in concns. such that they do not alter the movement of the cilia, produce appreciable morphological changes in the cytoplasm of certain cells of the palate of the surviving frog when examd. under a microscope. The sensory organs of the frog palate and tongue are really organs of taste.

Minnesota lakes and their productiveness of fish food (Johnson) 14.

## 12—FOODS

F. C. BLANCK AND H. A. LEPPER

Exchanges of diffusible substances in the preparation of food products. I. Preparation of cacao. R. Whymp. *Chimie & industrie* 30, 507-17(1933).—In the normal fermentation of cacao beans the temp. rises 20-5° during the 1st 72 hrs. and at the same time the  $\text{H}_2\text{O}$  content diminishes; from 72 to 144 hrs., if the mass has been well mixed to avoid overheating, the temp. falls from 50° to 40° and the beans reabsorb  $\text{H}_2\text{O}$ . Slight fluctuations occur in the tendency of the beans either to lose  $\text{H}_2\text{O}$  during the 1st period or to absorb it during the 2nd. These variations apparently are not related to the temp. but seem rather to be due to modifications in the permeability of the teguments. In the course of a 6-day fermentation the  $p_{\text{H}}$  values of the teguments and pulp increase continuously (e. g., from 3.6 to 6.5), while during the same period there is a variable, but general, decrease in the  $p_{\text{H}}$  of the kernels (e. g., 6.3, 5.3, 6.1). The variation in the  $p_{\text{H}}$  of the kernels seems to coincide with their tendency either to absorb or to lose  $\text{H}_2\text{O}$ . By pushing fermentation to its limit the  $p_{\text{H}}$  of the kernels becomes equal to that of the teguments and pulp. The value of the  $p_{\text{H}}$  of the kernels depends also on the formation *in situ* of org. acids, and not solely on the absorbed pulp. The coloring matter of cacao and the modifications which it undergoes during fermentation were studied by means of  $\text{FeCl}_3$  and U acetate papers, on account of their color reactions with tannins. The red color produced by a drop of aq. ext. of fresh Calabacillo kernels on  $\text{FeCl}_3$  paper is always accompanied by a blue tint; the resultant is a purple that is quite distinct from the red obtained with the ext. of true Forastero cacao under the same conditions; Criollo cacao gives a pale rose, and certain varieties of mottled white cacao give no red color. A 6-day fermentation was followed day by day by means of  $\text{FeCl}_3$  paper; the red zone surrounding the dark central spot due to tannins changed, in the case of Calabacillo cacao, from deep purple to very light pink on the 6th day, and at the same time progressive disappearance of tannins from the kernels was observed. U acetate paper gives very irregular results. It may be mentioned, however, that aq. exts. of fresh Calabacillo kernels, prepd. at 90° or 100°, give a blue color, which turns red only at the end of 24 hrs., while exts. of the same cacao prepd. at lower temp., immediately give a pronounced red. It would seem from the absorption spectra that the red color obtained with fresh Calabacillo beans is due largely to an acid phloroglucinol-pentosan deriv. No pyrogallol or gallic tannin could be detected in fresh Calabacillo and Forastero cacaos; but a pos. reaction for pyrocatechol was obtained in each case. By following the exchanges of soln. which take place in the kernel in the course of fermentation as a function of the fermentation of the outer pulp, it was found that the tannins giving a black, blue or green color with  $\text{FeCl}_3$  disappear progressively (but not completely) from the kernels in

the course of a 6-day fermentation and pass into the teguments, where they are fixed. Production of undesirable substances and molds (in fermentations pushed to the limit) was also studied. Evolution of  $\text{NH}_3$  during the mold phase and formation of amines from  $\text{NH}_4\text{OAc}$  apparently explain the disagreeable characteristics of the beans.  
A. Papineau-Couture

Role of nitrates in certain food industries. P. Mazé and P. J. Mazé. *Compt. rend. soc. biol.* 115, 15-16(1934).—The use of nitrates in meat-curing brines is discussed. Nitrates in the human diet. *Ibid.* 16-17.  
L. E. Gilson

The use of bran as a food for man. Eudo Monti. *Atti I° congr. intern. panificazione Roma 1932*, 228-35(1933).—Bread made with specially prepd. bran, added to the extent of as much as 20% to flour, contains 3 times more water-sol. protein than does ordinary bread. Fully 90% of the phosphates is assimilated. Analyses of bread made with variously treated bran and flour mixts. are given. These analyses include  $\text{H}_2\text{O}$ , ash, salt, P, N, sugars, fat, of both sol. and insol. portions.  
J. A. LeClerc

New diabetic foods. Emilio Daho. *Atti I° congr. intern. panificazione Roma 1932*, 174-7(1933).—"Emida" diabetic foods are composed of a mixt. of definite vegetable substances extd. from the green plant and contain vitamins, P compds., inorg. salts, and enzymes capable of acting on carbohydrates. Wheat gluten is not a constituent. "Emida" yields 350 cal. per 100 g.  
J. A. LeClerc

Cereal chemistry. A review of progress. Thomas H. Fairbrother. *Food Manuf.* 9, 5-10(1934). E. H.

Artificial drying of grains is necessary for their storage and their use in panification. Stefano Camilla. *Atti I° congr. intern. panificazione Roma 1932*, 272-80(1933).—The artificial drying of wheat gives practically the same quality of flour as that produced from wheat dried normally for 1 month. The wheat was analyzed for  $\text{H}_2\text{O}$  and 80% sol. and insol. protein. The flour was analyzed for  $\text{H}_2\text{O}$ , gluten, gliadin and glutenin. J. A. LeClerc

Nutritive value of slightly germinated grains. G. Tallarico. *Atti I° congr. intern. panificazione Roma 1932*, 349-57(1933).—A review of some of the important literature bearing upon the differences (chem. and physiol.) between germinated and non-germinated seeds. Feeding expts. with animals were conducted with both germinated and non-germinated grain as basic food, the former producing the greater growth.  
J. A. LeClerc

The Steinmetz process of milling. Stephen Steinmetz. *Atti I° congr. intern. panificazione Roma 1932*, 169-72, 472-6(1933).—A general description of the machine and process used for cleaning and grinding the wheat so as to retain the max. of minerals and vitamins. S. claims that there is no food poorer in minerals and vitamins than the fine, and for the most part, chemically bleached flour

of today. Wheat cleaned by the Steinmetz process contains the aleurone layer intact, only the fibrous part of the bran having been removed. The whole of this wheat, ground into flour, is used in bread making.

J. A. LeClerc  
Necessity for an international standardization of methods of analysis of wheat, flour and bread. Arnaldo Luraschi. *Atti I° congr. intern. panificazioni Roma 1932*, 123-28(1933).—A general discussion of the various methods employed in the different countries and also the standards that have been adopted.

J. A. LeClerc  
Control of wheat, flour, and bread. Arthur Fornet. *Atti I° congr. intern. panificazioni Roma 1932*, 296-303 (1933).—General discussion. About a score of illustrations help to describe the app. used. The oven recommended can bake four 100-150 g. loaves at one time.

J. A. LeClerc  
Unification of methods for the analysis of flour and grain. Pisani-Borg. *Atti I° congr. intern. panificazioni Roma 1932*, 118-23(1933).—The methods used in different labs. vary considerably, e. g., moisture is detd. by different chemists in an ordinary oven or in a vacuum-heated oven from 100° to 110° for 6-15 hrs. The factor for N may be 5.8 or 6.25; sometimes the protein is given without stating the factor used. The methods for ash detns. are described.

J. A. LeClerc  
The characteristics of the grades of Canadian hard red spring wheat and their value for blending purposes. P. J. Birchard. *Atti I° congr. intern. panificazioni Roma 1932*, 477-85(1933).—For the purpose of grading wheat in Canada, there have been established 2 main classes—statutory grades and com. grades. The statutory grades are defined by an Act of Parliament and are not subject to change from year to year as are the com. grades. The statutory grades are Manitoba No. 1 Hard, Manitoba No. 1 Northern, Manitoba No. 2 Northern, Manitoba No. 3 Northern, and Manitoba No. 4 Northern. The best wheat is graded as No. 1 Hard. The requirements for the other grades are successively just a little lower. The com. grades are usually nos. 5 and 6 but occasionally "Special" grades are established. The com. grades include types of wheat contg. various percentages of kernels damaged by adverse weather conditions, such as frosted, immature, shrunk, bleached, sprouted wheat, etc. All grades of wheat are further classified as straight grade, tough or damp according to the amt. of moisture they contain: straight if moisture is less than 14.5%; tough if more than 14.5 and less than 17%; and damp if more than 17%. Protein is also considered in grading of the wheat. The quantity is controlled by regulating the percentage of hard red vitreous kernels in each of the statutory grades and the quality by limiting the varieties which may enter the 2 higher grades. Canadian hard wheat (Manitoba northern) possesses certain characteristics which render it particularly valuable for blending with the softer wheats of other countries. Flours resulting from such blends produce loaves of increased vol., better texture and higher absorption, while, at the same time, the general baking quality is also improved as shown by the outward appearance of the loaf. Tables are given which show the results of baking blends of Canadian flours with flours from Germany, England and France.

L. H. Bailey  
The composition and baking quality of wheat grown in Roumania. G. Andronescu. *Atti I° congr. intern. panificazioni Roma 1932*, 76-9(1933).—In 1930, some 282 samples of wheat grown in various parts of the country were analyzed and the results tabulated according to the type of soil upon which they were grown. These wheats were milled and the flours analyzed and baked and the results tabulated. The wheats averaged 77.2 kg. per hectare; 34.6 g. per 1000 kernels, 31.2% flinty kernels; 3.5% impurities; 91.2% viability; 11.4% H<sub>2</sub>O; 9.6% protein; and yielded from 68.1 to 74.0% flours. The flours had the following compn.: 12.85-13.37% H<sub>2</sub>O; 8.19-8.99% protein; 22.87-26.69% wet gluten; 8.47-9.85% dry gluten; 60.35-64.36% gluten hydration; 0.547-0.612% ash on 13.5% H<sub>2</sub>O basis; the  $p_H$  varied

from 5.4 to 5.9. Water absorption of flour varied from 58.0 to 63.4%; the loaf vol. from 632 to 791 cc.

J. A. LeClerc  
Biological, chemical and economic aspects of the genetics of wheat. E. Fleurent. *Chimie & industrie* 30, 1263-81(1933).—After a historical review, F. discusses the conditions of the application of the genetics of wheat and the evaluation of the products obtained: (1) biol. and tech. conditions which impose a given gluten content, which there is no interest to exaggerate; (2) chem. conditions which show that, the more nearly does the fermentation of bread approach pure alc. fermentation, which corresponds to a min.  $p_H$  of 3, the better the baking qualities. In conclusion, F. shows the beneficial consequences of these conditions on the wheat problem from the double standpoint of food and cultivation.

A. Papineau-Couture  
The application of genetics to wheat and bread production. E. Fleurent. *Compt. rend.* 197, 1695-7 (1933).—From the protein standpoint there is no advantage in exceeding the min. values of 7-7.5% gluten in whole wheat or 9-9.5% in flour, which represent a good baking value. Secondary alc. fermentation produces acids which do not affect gluten if the  $p_H$  does not become more acid than 3.0. If it does, the colloidal dispersion of gliadin is affected. Yeast gave a superior bread to that produced with leaven.

J. C. M.  
The influence of variety and environment upon the quality of wheat. Fritz Schnelle. *Atti I° congr. intern. panificazioni Roma 1932*, 183-4(1933); cf. C. A. 27, 4866.—General discussion.

J. A. LeClerc  
Valuation of the quality of wheat and of flour. Karel Křtinsky. *Atti I° congr. intern. panificazioni Roma 1932*, 114-16(1933).—The criteria best adapted for the detn. of wheat quality are discussed. Among these are (1) H<sub>2</sub>O, (2) purity, (3) wt. per bu., (4) percentage of flint wheat or hardness; (5) yield in flour. The indications of baking quality are (1) the gluten content; (2) the nature of the gluten.

J. A. LeClerc  
The quality of gluten. Karel Křtinsky. *Atti I° congr. intern. panificazioni Roma 1932*, 116-18(1933); cf. C. A. 27, 4314.—The quality of gluten considered as (1) very elastic, (2) elastic, (3) of medium elasticity, (4) slightly elastic and (5) lacking in elasticity, is detd. in a special simple app., the results from which approximate those obtained by the Hankoczy machine.

J. A. LeC.  
The rapid determination of gluten quality in wheat and flour by means of fermentation. P. Pelshenke. *Atti I° congr. intern. panificazioni Roma 1932*, 334-7(in German 433-6)(1933); cf. C. A. 28, 833<sup>1</sup>.—Form 5 g. finely ground wheat and 0.25 g. yeast into a dough-ball with water. Place the dough-ball in a cylinder (approx. 6 cm. in diam. and 7 cm. high) contg. 75 cc. H<sub>2</sub>O and allow to ferment at 31-33°. The time in min. from the beginning of fermentation to the collapse of the dough-ball is the measure of gluten quality. The time may vary, e. g., from 15 min. to nearly 300 min., depending upon the quality of the gluten.

J. A. LeC.  
Food value of gluten. Silvestro Baglioni. *Atti I° congr. intern. panificazioni Roma 1932*, 208-15(1933).—Review of the more important literature. Gluten is a more complete protein than the corresponding protein of corn or rice.

J. A. LeClerc  
The plasticity of gluten. Pierre Barhade. *Atti I° congr. intern. panificazioni Roma 1932*, 247-61(1933).—A description of the aleurograph for the determination of the quality of the gluten of flour.

J. A. LeClerc  
Ergometry, measure of the strength of flours. Giovanni Issoglio. *Atti I° congr. intern. panificazioni Roma 1932*, 308-11(1933).—The app. and prepn. of the dough-disk are described. It is possible by use of the app. to det. the resistance and elasticity of the flour as well as the amt. of work expended during the swelling.

J. A. LeC.  
Refinement of flour. Otto Czadek. *Atti I° congr. intern. panificazioni Roma 1932*, 285-7(1933).—A general discussion of flour bleaching.

J. A. LeClerc  
The production and composition of wheat flour in Argentina. Carlos Girola. *Atti I° congr. intern. pani-*

*fiaciones Roma 1932, 143-5(1933).*—General information regarding acreage, production, yield, exports, milling capacities, etc. Flour contains over 14% protein, 14% H<sub>2</sub>O on the av. The yield in flour is over 70%.

J. A. LeClerc

**Evaluating the quality of flour by means of an automatic machine the farinograph.** C. W. Brabender. *Atti I° congr. intern. panificazione Roma 1932, 98-103(1933); cf. C. A. 28, 833<sup>1</sup>.*—There are 2 important factors in testing flour: (1) the resistance of gluten to the CO<sub>2</sub> formed during fermentation and (2) the production of this same CO<sub>2</sub> in optimum quantity. Both of these factors can be reduced to a simple formula which expresses the baking quality of a flour. A description of the curves obtained with various flours is given. J. A. LeClerc

**Problems of flour bleaching.** E. Bertarelli. *Atti I° congr. intern. panificazione Roma 1932, 80-92(1933).* General discussion of bleaching and flour improvement. B. describes the various gases, liquids and solids used for these purposes—their compns., the amts. used and found in treated flours, their functions and the results of their applications. J. A. LeClerc

**Microcolorimetric examination of flour, dough and bread.** P. Bruère. *Atti I° congr. intern. panificazione Roma 1932, 106-7(1933).*—The successive application of bromocresol green and "fenozafframina" makes it possible to distinguish under the microscope the gluten (blue), the cellulose (red) and the starch (uncolored).

J. A. LeClerc

**Determining the bread-making value of flours. The pneumodynamometer.** L. Borasio and F. De Rege. *Giorn. risicoltura 22, 97-111(1932).*—An app. is described for detg. the mech. characteristics of any material that is impermeable to air but reducible to membranous form. The app. is especially suited to detg. the elasticity and tenacity of dough and gluten. A. R. Merz

**Rice flour in bread making.** Luigi Borasio. *Atti I° congr. intern. panificazione Roma 1932, 262-7(1933).* The rice flours used varied in compn. as follows, depending upon the degree of milling: ash 1.35-0.48, fat 1.80-0.25, fiber 1.10-0.30, P<sub>2</sub>O<sub>5</sub> 0.68-0.20, phytin P<sub>2</sub>O<sub>5</sub> 0.40-0.00, lecithin P<sub>2</sub>O<sub>5</sub> 0.01 trace, catalase value 38.0-1.5, vitamin units 0.40 trace. From 5 to 15% of rice was used with 95-85% wheat flour. J. A. LeClerc

**Modern processes of bread making and flour improvement.** Joseph Chevalier. *Atti I° congr. intern. panificazione Roma 1932, 108-11(1933).* A general discussion regarding the  $pH$  most favorable for the hydrolysis of the starch and the proper examn. of the gluten.

J. A. LeClerc

**The functions of vitamins (B) in flour and bread; chemical control of vitamins.** Raffaele Pajetta. *Atti I° congr. intern. panificazione Roma 1932, 182-3(1933).* The action of vitamin B is identical with that of phytase. A method is suggested for the detn. of phytase in the presence of phosphates. J. A. LeClerc

**Baking in Germany.** M. P. Neumann. *Atti I° congr. intern. panificazione Roma 1932, 73-6(1933).*—The proportion of water to flour is of prime importance for the proper fermentation of the dough. The same consistency of doughs from different flours does not produce the same effect on vol. or grain. Studies were made of absorption and the colloidal changes resulting as detd. by the Hankoczy-Brabender app. Direct fermentation is preferred over leaven for flour of low gluten content. Rye fermentation is discussed. Baking problems of absorption for proper fermentation, role played by ovens, etc., are discussed. J. A. LeClerc

**Compressed yeast and leaven in baking.** Raffaele Pajetta. *Atti I° congr. intern. panificazione Roma 1932, 45-7(1933).*—Bread made from the same flour by the use of leaven and of compressed yeast (1%), resp., had the following compn. on the dry basis: N in crust 2.25, 2.25; N in crumb 2.25, 2.25%; N in flour 2.18%; sugar as maltose in crust 1.97, 2.76; in crumb 2.25, 5.77%; in flour 1.57%; dextrin in crust 0.78, 0.61; in crumb 0.23, 0.77; in flour 1.60%; acid as lactic in crust 0.43,

0.17%; in crumb 0.72, 0.30%; in flour 0.21%.

J. A. LeClerc

**Supplementary leavening in bread making.** Manuel Lopez-Pico. *Atti I° congr. intern. panificazione Roma 1932, 312-15(1933).*—A general discussion of the process of fermentation during bread making, what constitutes good fermentation and the effect of extraneous substances

J. A. LeClerc

**The use of rational fermentation in bread making by means of selected yeast.** Stefano Camilla. *Atti I° congr. intern. panificazione Roma 1932, 281-4(1933).*—General.

J. A. LeClerc

**The use of diastatic products in baking.** Renato Felicetti. *Atti I° congr. intern. panificazione Roma 1932, 40-5(1933).*—The addn. of 1% of malt flour hastened fermentation and increased the vol. of the dough in 5 hrs. by 22%. The temp. of the sponge box was 30-32°, the temp. of the H<sub>2</sub>O used was 20°; the diastatic power of the malt flour was 8500° (Pollack). (Pollack's diastatic power is the amt. of reducing sugars in g., expressed as maltose, produced by the diastase contained in 1 kg. of substance when acting upon arrowroot starch for 30 min. at 40°.) The diastatic power of some 200 samples of flour varied from 2910 to 10,200, av. 6800. J. A. LeC.

**Diastase in bread fermentations.** Andrea Ponte. *Atti I° congr. intern. panificazione Roma 1932, 49-52(1933).*—There are 3 stages in bread making, (a) prepn. of the dough, (b) fermentation, (c) baking. A general discussion of bread and bread making, fermentation, the role of enzymes, etc.

J. A. LeClerc

**Bread from mixed cereals.** V. Ducceschi. *Atti I° congr. intern. panificazione Roma 1932, 291-5(1933).* A general discussion in regard to the various substitutes for flour, their effects on loaf characteristics, the amts. that can be used from a practical standpoint, their physiol. effects and the necessity for proper legislation. Special mention is made of rice, rye, soy beans and dried milk.

J. A. LeClerc

**Chemistry of starch and bread making. XIV. Is the starch in starch pastes crystalline or amorphous?** J. R. Katz and J. C. Derksen. *Z. physik. Chem. A167, 129-36(1933); cf. C. A. 27, 5213.*—Starch paste with 2 or more parts of H<sub>2</sub>O per part of starch has an amorphous x-ray spectrum that is not distinguishable from that of H<sub>2</sub>O at 80°. Upon cooling to room temp. the B-spectrum is obtained. With wheat or rye, but not potato, starch and a small amt. of H<sub>2</sub>O an intermediate stage is found showing the I'-spectrum. Freshly baked bread either at 80° or room temp. shows the same effect. G. M. Murphy

**The increase in yield in the manufacture of macaroni.** Ludwig Adorjan. *Atti I° congr. intern. panificazione Roma 1932, 132(1933).*—An increase in absorption by the semolina may be brought about by refrigeration, by heat, by irradiation, as well as by chem. means. J. A. LeC.

**Oxidative changes of milk and dairy products. The oily tallowy taste.** M. A. Gondos. *Lait 14, 25-30(1934).*—The development of the oily tallowy taste in dairy products was considered to be due to oxidation of the contained fat. The conditions which operated to affect this oxidation were (1) compn. of the fat, a high content of unsatd. acids predisposing to a rapid oxidation, (2) the presence of oleinase in the fat, (3) contamination of dairy products with heavy metals which catalyze the activity of the oleinase and (4) the relative richness of dairy products in certain reducing substances which acted as natural protective agents against oxidation. Control of some of these factors is attained by choice of the proper ration. A high content of unsatd. acids in the fat can be prevented by eliminating press-cake from the ration.

**Use of fresh hay instead of beets, sugar-house or distg. waste increases the content of antioxidizing material.** Proper pasteurization and elimination of contamination with metals may prevent the action of oleinase. Where none of these measures is possible, the addn. of reducing substances is suggested. A special bacterium of high reducing power has been developed for this purpose.

A. H. Johnson

**Influence of change to pasture on the composition of**

milk. Adolf Faltin. *Kisérletügyi Közlemények* 36, 186-91 (1933).—Contents of fat, fat-free dry matter and whey, and refraction of milk decreased on transferring cows to pasture from the stable. The degree of change varied according to the individual cows and was as high as is generally believed. Sometimes even an increase of fat content was observed. S. S. de Finály

The iodine content of milk. I. Effect of desiccation and storage. Z. M. Hanford, G. C. Supplee and Roe E. Remington. *J. Dairy Sci.* 17, 15-18 (1934).—The I content of milk dried by the atm. double-roller process is not less than that of milk slowly evapd. to dryness at 60-80° after the addn. of NaOH. Change of acidity within a range suitable for drying by the roller process does not affect the recovery of added I. No apparent loss of I from dried milk results from storage for as long as 7 months. II. Variations in the mixed milk of herds. Roe E. Remington and G. C. Supplee. *Ibid.* 19-28.—One hundred and seventeen samples from 8 collecting points in South Carolina dried by the roller process varied in I content from 143 to 1872 parts per billion, with a mean value, of  $572 \pm 10$ . Nine similar samples from New York and six from Wisconsin averaged resp. 285  $\pm$  24 and 322  $\pm$  22. The I content of feeds grown in South Carolina is given. Philip D. Adams

Metallic contamination (of milk) in processing. W. L. Davies. *Milk Ind.* 13, 55-7 (1933).—The natural Cu content of milk is 0.30-0.75 p. p. m. The presence of 1.5 p. p. m. Cu in milk kept at 0-5° is sufficient to taint the milk within 24 hrs., a "tallowy" flavor being developed. To det. the sources of contamination in a processing plant, the contents of Cu and Fe have been detd. at the following stages: (a) raw milk, (b) after the pasteurizer, (c) after the holder, (d) after the cooler, (e) the bottled product. The increase in Cu content during the process is generally accompanied by an increase in Fe content, but the amt. of Fe taken up does not appear to affect the flavor of the milk. The Fe content of raw milk varies from 1.18 to 2.52 p. p. m. No contamination is received by hot milk of uniform temp., contg. no dissolved O<sub>2</sub>, if the holder is properly tinned. B. C. A.

A new method for direct count of microorganisms in milk. V. M. Bogdanov. *Lait* 14, 37-48 (1934).

A. H. Johnson

Contribution to the study of the acidity of abnormal milks. R. Vuillaume. *Lait* 14, 12-25 (1934).—Colostrum milks, milks of retention and milks from cows infected with mastitis were examd. for their titratable acidity,  $p_H$ , chloride, lactose and fat contents and for their coagulation times with rennin. A few of these milks exhibited higher acidities than normal, but more often there was a reduced acidity and a higher  $p_H$  value. The milks of reduced acidity coagulated slowly or not at all with rennin. The addn. of CaCl<sub>2</sub> or CO<sub>2</sub> to these milks sometimes reduced their coagulation times.

A. H. Johnson

Critical preheating temperatures for inhibiting rancidity in homogenized milk. F. J. Doan. *Milk Dealer* 22, No. 11, 40-2, 64 (1933); cf. C. A. 27, 5432.—Samples of 3, 6 and 9% milk were heated to temps. between 38° and 71° for periods of 30, 15 and under 1 min., homogenized at 907 kg. pressure, then immediately cooled and held at 1.5-4.5° for 24 hrs. Titratable acidity,  $p_H$  and surface tension were detd. on these and on unheated or unhomogenized check samples. The lipase was inactivated by heating 30 min. at 53-55°, 15 min. at 56-58°, or under 1 min. at 62-64°. The lipase was apparently primarily in the milk plasma rather than in the fat.

F. L. Seymour-Jones

Substances adsorbed on the fat globules in cream and their relation to churning. III. Analysis of the adsorbed protein. Hilda F. Wiese and L. S. Palmer. *J. Dairy Sci.* 17, 29-33 (1934); cf. C. A. 27, 1954.—"Membrane" protein of washed cream is characterized by a high percentage of arginine and low percentage of cystine and histidine. It is not identical with casein, lactalbumin

or globulin, or the alc.-sol. protein of milk, but resembles haptin (cf. Hattori, C. A. 23, 4277). Philip D. Adams

Evaluation of market creams on the basis of their content of albumin. János Trambics and Gyula Szabados. *Kisérletügyi Közlemények* 36, 221-6 (1933).—To 2 g. cream add 3 cc. CaCl<sub>2</sub> soln. (d. 1.14) to prevent foaming and det. N according to Kjeldahl. Calc. albumin as Kjeldahl N  $\times$  6.37. Good creams contained 3.0 to 3.7% albumin calcd. on fat-free matter. Mixed-milk cream contg. more than 4.0% albumin should be considered adulterated. Cream of industrial dairies should contain at least 22% fat. S. S. de Finály

Composition of ice-cream powders. István Szanyi. *Kisérletügyi Közlemények* 36, 235-7 (1933).—Detailed chem. analyses of 12 different ice-cream powders are given. They consisted chiefly of wheat starch or a rubber-like swelling material and org. acids, together with aniline dyes and taste-improving agents. Their use is quite unjustifiable. S. S. de Finály

Variations in the Reichert-Meissl, Polenske and iodine numbers and refractometer values of Hungarian butters according to different seasons and the correlation between these constants of milk fat. Sándor Péter and István Kron. *Kisérletügyi Közlemények* 36, 192-202 (1933).—Reichert-Meissl nos. of butter were slightly lower in summer. The refractometer readings (at 40°) were 40.5-42 in the winter, 42-44.5 in the summer. No connection was found between R.-M. nos. and refractometer values, though usually too low refractometer readings were associated with unusually high R.-M. nos. The I no. = 4 times (refractometer reading at 40° minus 40.4) plus 26. Limits of I no. were 20.6 and 46.0. Green fadders produced higher Polenske and R.-M. nos. When winter fadders were used the correlation found by Polenske could not be confirmed. S. S. de Finály

Two surface defects of butter—"primrose" color and "toppiness." C. R. Barnicoat. *New Zealand J. Sci. Tech.* 15, 199-203 (1933).—"Fat-aldehyde" was detd. on a surface layer of butter 0.5 mm. thick, and values up to 3.04 were obtained. Surface taint is due to oxidation. The porous nature of the wrappings must be largely responsible. "Primrose" color is a surface desiccation which alters the structure and appearance of the butter. P. S. Roller

The detection of the Escherichia-Aerobacter group in butter. M. Grimes. *J. Dairy Sci.* 17, 11-13 (1934).—Litmus-milk inoculations incubated at 21° and 37° are recommended as preferable to lactose broth. Eosin-methylene blue plates are used for confirmation.

Philip D. Adams

The Tausel-Thaler ketone rancidity test. J. Pritzker and Rob. Jungkuntz. *Chem.-Ztg.* 57, 895-6 (1933).—The discovery of Fortner and Rotsch (C. A. 27, 5997) that fresh butter reacts pos. to the Tausel-Thaler rancidity test (C. A. 26, 3394; 27, 479) was confirmed by P. and J., who also found that *biacetyl* was neg. and *acetylmethylcarbinol* pos. to the test. Any butter therefore contg. the latter will react pos. though it contains none of the Me alkyl ketones assocd. with rancidity. To destroy acetylmethylcarbinol without destroying any Me alkyl ketone which may be present, P. and J. distil the sample with 30% FeCl<sub>3</sub> soln. Tests showed that the volatile fatty acids in butter do not give the test. H. K. Salzberg

A study of the relationships between hydrogen-ion concentration, titratable acidity and quality in Cheddar cheese. L. W. Brown and Walter V. Price. *J. Dairy Sci.* 17, 33-45 (1934).—Electrometric measurements of H-ion concn. in the whey during the manuf. of Cheddar cheese do not indicate significant changes in the acidity any more accurately than titration. The quality is closely related to the acid development during the cheese-making process. Philip D. Adams

Further observations on slow development of acidity in cheese manufacture. H. R. Whitehead. *New Zealand J. Agr.* 47, 376-8 (1933); cf. C. A. 27, 8258.—Certain samples of milk contained strains of lactic streptococci which differed from the normal strains only in their power

to produce during their growth in milk some substance which acted as a powerful inhibitory agent on the subsequent growth of normal lactic streptococci in pasteurized milk but not in raw milk; these strains had no inhibitory effect on *Es. coli* and *B. subtilis*. Pasteurized milk contg. these strains developed little or no acidity.

K. D. Jacob  
Preventing gaseous fermentation of process cheeses by biological methods. Ottó Gratz. *Kísérletügyi Közlönyek* 36, 171-9(1933).—Addn. of lactic acid bacteria and lactose did not always protect the cheese from the deteriorating effect of butyric acid bacteria. S. S. de F.

The prevention of gaseous fermentation of process cheeses. I. Examination of the behavior of gas-producing butyric acid bacteria toward heat. József Csizsár. *Kísérletügyi Közlönyek* 36, 180-5(1933).—Germination of *B. sporogenes* did not cease after 72 hrs. at 60°, 24 hrs. at 70° and 2.5 hrs. at 80°. The organism was killed in 50 min. at 90° or in 6 min. at 100°. *B. putrificus* ceased to germinate after 70 min. at 60°, 60 min. at 70°, 50 min. at 80-90° or 6 min. at 100°. Spores of *B. saccharobutyricus* cease to germinate after 90 min. at 60°, 80 min. at 70-80°, 50 min. at 90° or 4 min. at 100°. Since process cheese cannot be treated at such temps. heat treatment cannot be applied to prevent gaseous fermentation. S. S. de Finály

Causes of black spots on the tin wrappers of process cheeses. József Berkó. *Műegazdasági Kutatások* 6, 308-12(1933).—The blackening is slower at lower temps. Citric acid (0.5% soln.) caused black spots in 1-2 days. Application of a very small drop of 10% citric acid caused within a day a black point that increased in 4 days so as to cover the whole Sn sheet. Cheeses made of moldy, second-class material become black more easily. The use of lacquer-covered Sn sheets is proposed.

S. S. de Finály  
Changes in chemical composition of Cantonese eggs in holding. Melecio T. Legaspi. *Philippine Agr.* 22, 509-20(1933).—The hens were fed uniformly for a considerable period and 200 eggs, half fertile and half infertile, weighing 41 g. each, were stored under normal room conditions for 63 days. Analyses were made at the end of each week on 20 eggs. Both fertile and infertile eggs contained practically the same wt. of ash, protein and fats at all ages but the moisture content of the edible portion decreased gradually from 74 to 67%.

A. L. Mehring  
The manufacture of lactic-acid casein of low ash content. Jean Pien and S. Herschdoerfer. *Lait* 14, 30-7(1934).—Casein of minimum ash content was produced when an acidity of more than 65-70° Dornic was developed by fermentation at a low temp. Under such conditions of acid development the heating may be to any temp., preferably to a low temp. to facilitate washing of the curd but not so low as to allow loss of casein.

A. H. Johnson  
Microchemical researches on chalky and colored rice and the localization of the components. L. Borasio. *Giorn. risicoltura* 22, 111-13(1932).—A table gives the values for the moisture, ash, protein, gluten, fat, cellulose and non-nitrogenous ext. of 5 varieties of chalky and colored rice. Chalky rices, erroneously termed glutinous, lack gluten but contain more dextrin, e. g., 3.5%, than normal rices. The fats of rice are localized in the external teguments. Proteins and P-contg. substances are mostly in the external layers but appear in decreasing quantity in the interior of the grain. A. R. Merz

Culinary uses of soy beans. M. P. Dubyanskaya and P. V. Aleksandrov. *Izvestiya Tsentral. Nauch.-Issledovatel. Inst. Pishchevoi Vyssovoi Prom.* Separate, 1931, 79 pp.—Soy beans, if soaked in water 12-16 hrs., cook in 3.75 hrs. at 100°, 2.5-2.75 hrs. at 102-102.5° or about 1 hr. at 111°. The temp. rise must be effected by pressure, not by adding NaCl or NaHCO<sub>3</sub> to the water. Soy-bean flour spoils so easily that it is unsuitable for making macaroni and other alimentary pastes. Instead of the flour it is best to use the boiled beans in biscuit, cake, pastry, etc.; keeping qualities are then good. There are nu-

merous uses for the whole boiled beans, and soy products are useful in many sweetened foods. J. F. S.

Desirable methods of handling and storing potatoes. Ora Smith. *Am. Potato J.* 10, 176-83(1933); cf. C. A. 27, 3992.—Prestorage of potatoes, immediately after harvesting, at 45-46°F. and high humidity for 11-12 days caused greater shrinkage and decay during storage than did prestorage at 65-68°F. and high humidity. At no time during storage did the atm. of potato cellars show a low concn. of O or excessively high concn. of CO<sub>2</sub>. In general, a pos. relation existed between low shrinkage losses of potatoes and high av. relative humidity, low av. temp., and low evapg. power of the air surrounding the bin during storage. K. D. Jacob

Physicochemical changes produced by the cooking of potatoes. Marion D. Sweetman. *Am. Potato J.* 10, 169-73(1933); cf. C. A. 27, 1684.—Cooking of potatoes does not cause the bursting of cell walls but permits ready mech. disintegration of the tuber tissue by sepn. of cells. The process is characterized by partial gelatinization of the starch, soln. of some of the pectic substances, increased digestibility of the cellulose, coagulation of most of the protein, and more or less caramelization of the sugar. Probably constituents present in smaller proportions are also important in their effects on culinary quality. Fourteen references. K. D. J.

The copper test for the differentiation of healthy and decomposed potatoes. H. Bechhold, Walther Gerlach and F. Erbe. *Angew. Chem.* 47, 26-30(1934).—Raw potato mash dissolves 8-20 γ of Cu per g. of mash, in a N atm. On the av. healthy tubers dissolve a little more Cu than decomposed ones, but the difference is not considerable. Therefore, the tubers (healthy and decompd.) must contain an oxidizing agent, which permits the soln. of a limited amt. of Cu. The same mash which dissolved 8 γ of Cu in a N atm. dissolved 20 γ of Cu in air, a considerably greater amt. A mash treated with Cu for 7 hrs. in a N atm. will dissolve addnl. Cu when exposed to air. The Cu is dissolved in the liquid portion of the mash and is not adsorbed at the tissue elements. The Cu dissolved in the Cu test (Cu strip inserted into tuber) occurs only in the blackened tissue and is evenly distributed without a concn. gradient. The Cu concn. in the blackened tissue is the same for healthy and decompd. tubers. After the blackening, which is a chain reaction, has been started in the healthy tuber by cell injuries, caused by introducing the Cu strip, the Cu acts as catalyst in the blackened region. In the decompd. tuber the propagation of the chain reaction does not occur. In the Cu test the penetration of the Cu is not the cause but the consequence of cell changes which are deep-seated in the healthy tuber but not in the decompd. kind. Spectroanalytical tests showed that the K normally present is displaced by the Cu. Seven references. K. K.

Examination of some Hungarian onions. A modified method for the determination of crude fiber. Zoltán Sándor. *Műegazdasági Kutatások* 6, 274-82(1933).—The contents of moisture, matter extractable with cold water, with ether and with petr. ether, total N, crude and pure proteins, sugars, crude fiber, N-free ext., ash and HCl-insol. ash were detd. in several samples of Hungarian *Allium schoenoprasum*, *A. cepa*, *A. sativum* var. vulgare, *Raphanus sativus* var. radicola and *Cochlearia armoracia*. For the detn. of crude fiber, the method of Weender was modified by substituting for filtration centrifuging, for 10 min. at 3000 r. p. m., adding alkali and filtering through a previously dried and weighed paper. The ignited and weighed filter gives the content of crude fiber. The modification cannot be used for flour since the colloidal flour suspension cannot be sepd. by centrifuging at 3000 r. p. m. S. S. de Finály

The use of unfermented grape juice in alimentation. Marcel Labbé. *Bull. acad. méd.* 109, 299-309(1933).—The compn., prepn. and sterilization of grape juice are discussed. A. E. Meyer

Ethylene coloring of citrus fruit. H. Clark Powell and I. Matthews. *Univ. Pretoria Series* 1, No. 25, 20 pp. (1933).—Equipment for the C<sub>2</sub>H<sub>4</sub> coloring of citrus fruit

is described and illustrated. In the absence of continuous heating during the coloring period the  $\text{CO}_2$  content of the rooms contg. fruit increased approx. 0.2%/hr. When continuous heating was required to maintain the necessary temp., the  $\text{CO}_2$  content of the rooms was kept at a low level, owing to leakage from the continual air circulation between the heating units and the rooms. K. D. J.

**Studies in zymasis. IV. The accumulation of zymasic products in apples during senescence.** John C. Fidler. *Biochem. J.* 27, 1814-21(1933); cf. *C. A.* 25, 4945.—Zymasis is the process of zymase cleavage of carbohydrates that leads to the production and accumulation of EtOH (and often AcH) in plant tissues and the simultaneous production of  $\text{CO}_2$ . Little zymasis occurs in Newton Wonder and Bramley's Seedling apples at the beginning of the storage season and up to the beginning of the change from green to yellow-green, when these varieties are stored in air at 1-4°. Senescence is accompanied by a change in the respiratory metabolism of the cells of the fruit, leading to the accumulation in an apple stored in air of considerable amts. of EtOH and smaller amts. of AcH (that is, the alc. no. of the apple rises). Increase of temp., which accelerates the rate of senescence in an apple, leads to an increase in the alc. no. of the apple. V. Seasonal fluctuations in zymasis and in carbon dioxide/alcohol number ratios in apples in the absence of oxygen. *Ibid.* 1822-8.—Zymasis in  $\text{N}_2$  follows the same seasonal curve as  $\text{CO}_2$  output in air. In any one season, the ratio  $\text{CO}_2$ /alc. no., which is about equal to the ratio  $\text{CO}_2$ /EtOH fluctuates widely about a mean value (of the order 100/80-85 for Newton Wonder and Bramley's Seedling apples). VI. Zymasis by apples in relation to oxygen concentration. Meirion Thomas and John C. Fidler. *Ibid.* 1929-42.—Apples were exposed to mixts. of  $\text{N}_2$  and  $\text{O}_2$  at 23° at different times during the developmental and storage life of the fruit. Rising  $\text{O}_2$  concns. progressively retard zymasis. Early in the storage season no EtOH is produced when the  $\text{O}_2$  value is 1-3%. In old apples, EtOH may accumulate even in 100%  $\text{O}_2$ . The rates of  $\text{CO}_2$  production and of  $\text{C}$  loss fall from max. values in  $\text{N}_2$  to min. values in 3-5%  $\text{O}_2$  early in the storage season, but in 8-10%  $\text{O}_2$  for older apples. Benjamin Harrow

**Carbonated apple juice.** D. C. Carpenter. *Natl. Bottler's Gas.* 52, No. 620, 50-4(1933).—Organoleptic tests indicated that carbonated juices were preferred. Observers were inconsistent in reporting scorched tastes in unpasteurized as well as pasteurized juices. Tables are given for the compn. of sediments from the juices. Flash heating (180°F. for 20 sec., cooling immediately to 60-70°F.) followed by filtration through filter cell, then through a Seitz filter, gave a brilliantly clear, sterile juice, which showed no sediment after storage for 2 years. Sediment was pronounced in pectinol-treated juices after 4 months. In clarified-treated juices sediment was slight after 4 months, objectionable after 8 months. Juices treated with gelatin-tannin were entirely clear after 8 months. Ester recovery of over 90% was secured with a Pfaudler fruit juice concentrator and ester impregnator. Several tables are given. J. H. Toulouse

**The use of citrus juices in making carbonated beverages.** W. E. Haier. *Natl. Bottler's Gas.* 52, No. 622, 50-2 (1934).—Citrus fruit juices are used as the base of many carbonated beverages. The process of prep. the juice is described. Directions concerning the proper use of the juices include: storage of ingredients before use, bottle cleaning and rinsing, use of pure materials, and adherence to the manufacturer's formula. J. H. Toulouse

**Some problems in the production of quality beverages.** Max Levine. *Natl. Bottler's Gas.* 52, No. 620, 57-9 (1933).—The presence of substances in sugar which promote the growth of yeast is undesirable for the manuf. of carbonated beverages. Sanitation is extremely important. Cl solns. can be used for general sterilizing purposes and are most effective when used warm rather than cold or hot. Quality beverages must not contain microorganisms or foreign flavors. Air content of the gas should be low. J. H. Toulouse

**Product control methods.** J. H. Toulouse and O. E. Gore. *Natl. Bottler's Gas.* 52, No. 622, 41-5(1934).—Directions are given for the testing and control in carbonated beverage manuf., with discussion of the technic. Special attention is given the control of sugar (*sucrose*) and  $\text{CO}_2$  concns., and the testing of bottle-washing soln. Twelve tests are covered. J. H. T.

**The characters of Sicilian honey.** Felice Sorgès. *Chim. ind. agr. biol.* 9, 398-9(1933).—Sicilian honey (lemon and orange honey) contains ash 0.031-0.179 (alky. of the ash, 0.3-0.7 cc. 0.1 N KOH), albumins coagulated by heat 0.308-0.581, albumins coagulated by tannin 0.305-0.702, acids (calcd. as formic) 0.105-0.294, sucrose 1.56-2.8, glucose 70.9-77.2, volatile matter (with  $\text{H}_2\text{O}$  vapor) 0.02-0.11%. G. A. Bravo

**Walnuts—curing and storage trials.** J. B. Hamond. East Malling Research Sta., *Ann. Rept.* 1931, 28(1932).—When deshucked and washed walnuts were stored at 36°F. for 6 months, the least deterioration occurred in those nuts that had been bleached in  $\text{CaOCl}_2$  and packed in coconut fiber or salt. Kernels high in oil remained considerably more plump than those of av. oil content. K. D. Jacob

**Cold-storage experiments with pecans—a preliminary report.** G. H. Blackmon. National Pecan Assoc., *Rept. Proc. 31st Ann. Convention* 1932, 88-96.—Pecans can be kept in a fresh condition from 1 season to the next when stored at 32°F. or lower, if the nuts are placed in storage as soon as they are thoroughly dry and before the oil begins to break out. Kernels packed in glass jars contg. N or  $\text{CO}_2$  and stored at 42°F. or lower were in fair to good condition after 6 months, while those packed in a vacuum showed some rancidity at 37°F. and higher. Kernels packed in glass jars contg. O and stored at 32°F. for 6 months were more or less rancid and had a very dark reddish color. K. D. Jacob

**Chemical and microscopic examination of anise.** László Benedek. *Kisérletügyi Közlemények* 36, 216-220 (1933).—Twenty samples of anise contained ash 6.1-33.2, sand 0.5-24.2, alc. ext. 7.6-23.1 and ethereal oils 0.4-2.8%. Previous extn. of seeds can only be detd. by microscopic examn. Seeds extd. with alc. are light gray; those treated with steam, dark gray. S. S. de Finály

**Roasted coffee.** Jeno Mótusz. *Kisérletügyi Közlemények* 36, 204-10(1933).—Normal roasted coffee contains 0.5-1.0% surface oil. Beginning 1-2 days after roasting, coffee berries sweat for about 4 weeks. This sweating is not prevented by shellacking. To det. glossing agents the petr. ether method is better than Gur'y's ether method, because the fat const. can be detd. more easily. S. S. de Finály

**A new sampling tube for feeding stuffs and seeds.** F. Mach. *Deut. Landw. Presse* 60, 195(1933).—When the instrument inverted in the material to be sampled is withdrawn, the point seps. from the handle and picks up 50-100 g. of sample. K. C. Beeson

**Sapukaja nut (Freise) 27.** Biol. reaction by spectrum analysis (Gerlach) 11D. Does fertilization influence the baking quality of bread grain? (Neumann, Lemmerzahl) 15. App. for cooling margarine, etc. (Brit. pat. 399,252) 1.

#### THESES

**Matthäi, Heinrich:** Verwendung des Trifruktosangehalts des Roggens zur quantitativen Bestimmung von Roggen- in Weizenmehl. Frankfurt. 1931. 58 pp.

**Prowosnik, Lothar:** Erfahrungen über die Fütterung saugender Stuten in der schlesischen Praxis und ihre Erfolge (zugleich Futtermittel- und Pferdemilch-Analysen). Breslau. 1931. 65 pp.

**Staudt, Erich:** Über den Einfluss von Wärme und Feuchtigkeit auf die chemische Zusammensetzung des Weizenkornes, unter Berücksichtigung enzymatischer Tätigkeit. Zurich. 1931. 60 pp.

Weis, H.: Der Unterschied im histologischen und chemischen Bau zwischen Frisch- und Gefrierfleisch und seine Verwertung bei der Lebensmittel-Kontrolle von Wurst und Hackfleisch. Hannover. 1931. 38 pp.

Preserving food. Ralph E. King (to The British Thomson-Houston Co. Ltd.). Brit. 398,735, Sept. 21, 1933. Air, at 35-45°F. and with a relative humidity of 80-85%, is circulated by a fan over the food at 20-300 ft. per min., the cooling element for the air operating at a temp. sufficiently close to the temp. of the air in the food-preserving cabinet to produce and maintain the required humidity. App. is described.

Preserving food. John Brewis. Brit. 399,648, Oct. 12, 1933. Meat, fish, etc., are preserved by coating with a film of a hydrogenated animal fat and (or) vegetable oil which hardens at ordinary temps. A small amt. of edible paraffin and (or) glycerol may be added. In a modification paper or fabric impregnated with the oil, etc., is applied to the commodity before the oil, etc., has set.

Health biscuits. Alfred Bullard. Brit. 398,360, Sept. 14, 1933. Agar-agar is dissolved in boiling H<sub>2</sub>O and the soln. mixed with coarse ground wheat and other cereals in approx. the proportions wheat 10, barley 2, oats 1 and agar-agar 0.5 parts. The mixt. is dried in an oven, ground into meal, sweetened with sugar, honey, etc., shaped and baked.

Milk preparations. Hansatische Mühlenwerke A.-G. Brit. 398,329, Sept. 14, 1933. In prepg. concd. milk products (0.1% or over of lecithin is added prior to or during concn. The prepus. may be used in the manuf. of margarine and chocolate.

Deodorizing and dehydrating fluids such as cream.

<sup>1</sup> Philip F. Rust (one-half to Industrial Equipment Co.). U. S. 1,943,146, Jan. 9. Live steam in whirling motion is introduced into a vacuum chamber, and a fluid under treatment such as cream is introduced into the top portion of the envelope of expanded steam so that it will descend outwardly and downwardly through the steam. App. is described.

Butter. Paul Feremutsch. Brit. 398,666, Sept. 21, 1933. See Ger. 574,770; Swiss 159,136 (C. A. 27, 4600) App. is described.

Apparatus and method for drying eggs and other liquid food products which are admixed with salt, sugar, casein, gums, glycerol or other material which forms a coating on the dried particles and retains therein a gaseous ingredient such as carbon dioxide which is also added to the product. Samuel Tranin. Brit. 399,492, Oct. 4, 1933.

<sup>3</sup> Roasting coffee. Edward J. Dent (to American Coffee Corp.). U. S. 1,943,211, Jan. 9. During the roasting period coffee in a roaster is subjected to a continually rising temp. beginning at approx. a roasting temp. and continuing until the temp. of the roaster reaches a relatively higher degree such as 150-190°, and roasting is then continued at a more slowly rising temp. until a still higher temp. such as about 200° is attained indicating completion of the roasting. App. is described.

<sup>4</sup> Feed for supplying vitamins, etc. Charles F. Schnabel. U. S. 1,942,943, Jan. 9. Immature grasses grown in rich soil, in the sun, and cut at a stage of growth where joining has not yet occurred, are dried in such a manner as to retain substantially uninjured the original chlorophyll content of the grasses (as by drying in the sun). The product is especially suitable for a poultry feed.

### 13—GENERAL INDUSTRIAL CHEMISTRY

HARLAN S. MINER

Chemical engineering and its industrial significance. W. B. Gibbs. *Science Progress* 28, 405 19(1934).—A concise survey of the entire field of chem. engineering, with an enumeration of the requisite subjects for a curriculum in chem. engineering. Joseph S. Hepburn

Conditions in the heavy chemical industry. P. Parrish. *Chem. Age* 29, 591 3(1933). E. H.

The chemical industry of Austria in 1933. I. Pollak. *Oesterr. Chem.-Ztg.* 37, 1 2(1934). E. H.

Chemistry in the new Germany. I. Science and industry. A. Binz. *Angew. Chem.* 47, 1 2(1934). II. The problem of Germany's raw material supply. Willy Bauer. *Ibid.* 2 4. III. Chemistry, the problem of raw materials and national economy. L. Ubbelohde. *Ibid.* 4 7. IV. Chemical problems of bast fiber research. Schilling. *Ibid.* 7-11. Thirty-four references. K. K.

Research pays profits—experiences in successful and unsuccessful research. H. W. Gillett. *Metals & Alloys* 5, 23 7(1934). D. Schaaf

Legal pitfalls for the chemical engineer. J. Davidson Pratt and G. S. W. Marlow. *Trans. Inst. Chem. Engrs.* (London) Adv. Copy, Jan. 8, 1934, 28 pp. E. H.

Means of transportation in the chemical industry. R. Hänchen. *Metallborse* 24, 1-2, 33 5, 65-6, 97-8, 131 (1934). E. H.

A survey of the materials commonly used in the chemical industry. F. Cellin. *Metallborse* 23, 1454 5, 1487, 1523, 1554-5, 1586-7, 1619(1933).—Information is assembled in tabular form on the temp. at which they may be used and the construction materials suitable for use with the common inorg. acids, org. acids and alkalies. E. H.

American Society for Testing Materials, Tentative Standards, 1933, 1136 pp.; cf. C. A. 27, 1418.—Tentative specifications, phys. and chem. methods of testing, recommended practices, definitions and (or) rules (together with some tentative revisions of standards) are given for various kinds of steel and steel articles, Zn-coated steel articles, wrought Fe, cast Fe, magnetic testing, ferrous metals and alloys, Al and Al alloys, Mg

and Mg alloys, brass and bronze, Cu wire and cable, die castings, elec.-heating and elec.-resistance alloys, nonferrous metals, cement, lime, gypsum, brick, building stone and tile, clay and concrete pipe, concrete and concrete aggregates, coke, timber, shipping containers, naval stores, oils and thinners, varnish and varnish materials, lacquer and lacquer materials, paints and pigments, petroleum products and lubricants, road materials, waterproofing and roofing materials, elec. insulating materials, rubber products, textile materials, slate, thermometers and coal. G. G.

American Society for Testing Materials, Standards, 1933, two parts, 2300 pp.; cf. C. A. 25, 2210.—Standard specifications, phys. and chem. methods of testing, definitions, charts, and (or) recommended practices are given for various kinds of steel and steel articles, Zn-coated steel articles, ferrous metals and alloys, wrought Fe, pig Fe and Fe castings, Al and Mg alloys, Cu and Cu alloys, Pb, Ni, solder metal, white metal, Zn, deoxidizers, elec.-heating and elec.-resistance alloys, nonferrous metals, cement, lime, gypsum, brick, building tile, fire tests, refractories, pipe and drain tile, concrete and concrete aggregates, coal, coke, timber, timber preservatives, naval stores, pigments, oils and thinners, varnish and varnish materials, lacquer and lacquer materials, preservative coatings, putty, paint, petroleum products and lubricants, road materials, waterproofing and roofing materials, elec. insulating materials, rubber products, textile materials, slate, thermometers and sieves. G. G.

<sup>9</sup> Equations of the diffusion of water in the drying process. A. V. Luikov. *Trans. Thermo-Tech. Inst. Moscow* 1933, No. 7, 49-52.—A math. analysis. A. A. B.

Avoiding the formation of emulsions. G. Fester. *Angew. Chem.* 47, 32-3(1934).—Several manipulative prescriptions for avoiding emulsion in extn. processes are given, with special emphasis upon the use of Ca(OH)<sub>2</sub> powder in aq. emulsions. K. K.

Heat transfer for fluids in turbulent flow in pipes.

R. Chandler. *J. Inst. Petroleum Tech.* 20, 51-72(1934).

E. H.

A new formula for the determination of the heat-transfer coefficient from the liquid to the walls of the tube in a turbulent movement. E. P. Shubin and S. F. Kop'ev. *Trans. Thermo-Techn. Inst. Moscow* 1933, No. 8, 35-38.—A crit. discussion is given of the formulas of Kraussold, Merkel, ten Bosch and others. A. A. B.

Danger of carbon monoxide poisoning in industry and mines under normal working conditions. Koelsch. *Arbeitschutz* 1933, 80-1; *Chimie & industrie* 30, 579; cf. C. A. 27, 3541.—Analysis of a large no. of samples of air taken from a wide variety of working places showed the presence of slightly over 0.01% CO (considered as the lowest toxic limit) in only 1/3 of the samples. A. P.-C.

Acute pulmonary edema following exposure to war gases. Andre Kling. *Compt. rend.* 197, 1782-4(1933).—Cl, Br, phosgene, diphosgene and triphosgene react with cholesterol or with lung pulp to furnish a well-crystd. chlorocarbonic ester of cholesterol. During this reaction the hydrophilic character of the fats in the cells of the lungs is destroyed. This explains the acute pulmonary edema which results from the loss of hydrophilic character with the disappearance of the free sterols. J. C. M.

Heat insulators and methods of testing them. F. Kofler and M. Brandt. *Wärme* 56, 230(1933); *Chimie & industrie* 30, 566.—A brief description. A. P.-C.

University patent policies. Archie MacInnes Palmer. *1 Patent Office Soc.* 16, 96-131(1934). E. J. C.

Part played by HF in the noxiousness of the Meuse Valley fog in 1930 (Mage, Batta) 15. Purifying gases such as carbon dioxide. Floyd J. Metzger (to Air Reduction Co.). U. S. 1,942,485, Jan. 9

The gas is compressed in stages with removal of impurities, at least a portion of which result from the compression, by treatment after the final compression at the pressure attained in the final stage and at a temp. above the crit. temp. of about 31° and up to about 175° with a soln. of an alkali metal permanganate to remove odor- and taste-imparting substances.

Condensing gases and vapors. Carbo-Norit-Union Verwaltungs-G. m. b. H. (Erwin Reismann, inventor). Ger. 587,511, Nov. 4, 1933 (Cl. 12s. 3.02). App. for obtaining gases and vapors difficult to condense, from mixts. expelled from adsorbents such as active C or SiO<sub>2</sub>, is described.

Separating gaseous mixtures. Carbo-Norit-Union Verwaltungs-G. m. b. H. Brit. 399,680, Oct. 12, 1933. In a process in which several adsorbents in different stages of exhaustion are arranged in parallel, all the adsorbents

are charged for the same length of time, but the rate of flow of gas to each one is controlled in accordance with its capacity. Throttling devices for effecting control are described.

System for separating gases by liquefaction. Mapag Maschinenfabrik Augsburg-Plattling A.-G. and Mathias Frankl. Brit. 399,405, Oct. 5, 1933. O, etc., is evapd. in a rectifier in the sepn. of air, etc., by the heat of an unliquefied part of the gas mixt., cooled in an expansion engine or otherwise.

Apparatus and method for transferring liquefied gas from one container or vessel to another. N. V. Maschinenre-en Apparaten Fabrieken. Brit. 399,112, Sept. 28, 1933.

Drying solutions and emulsions. Johan M. Visser. Brit. 400,000, Oct. 19, 1933. See Fr. 746,203 (C. A. 27, 4321).

Emulgators. Chemische Fabrik R. Baumheier A.-G. (Rudolf Kern, inventor). Ger. 584,949, Sept. 28, 1933 (Cl. 23c. 2). Emulgators are prepd. by swelling casein with alkali or NH<sub>4</sub>OH, mixing the product with resin- or fatty acid soaps, and stirring or kneading the viscous product to a spinnable mass. The mass may be allowed to stand for a time before kneading.

Carbon resistors. Elektrische Glühlampenfabriken Kremenezky A.-G. Brit. 399,907, Oct. 19, 1933. In mfg. elec. resistances of high ohmic value by depositing C on an insulating carrier from a gaseous C compd., deposition of amorphous C at low temps. is prevented by using C compds., such as CH<sub>4</sub>, having a high decompn. temp., e. g., 800-900°. The process may be hastened by admitting more readily dissociable compds. When the temp. has risen sufficiently to prevent formation of amorphous C, excess C on the carrier is removed by admitting CO<sub>2</sub> at a temp. so low that disocn. of the CO formed is prevented.

Ignition plugs. Siemens & Halske A.-G. Brit. 399,752, Oct. 12, 1933. An electrically heated filament, e. g., of Mo or W, is enclosed in a body of pure metal oxide, e. g., Al<sub>2</sub>O<sub>3</sub>, fused at above 1600°, or a mixt. of such oxides.

Heat-transmitting media. N. V. de Bataafsche Petroleum Maatschappij. Brit. 399,441, Oct. 5, 1933.

The media comprise high-boiling alkylated aromatic compds. Suitable compds., obtained by alkylating C<sub>6</sub>H<sub>6</sub> and C<sub>10</sub>H<sub>8</sub>, comprise tri-isopropyl, di-sec. butyl, mono-sec. butyl, di-methylethynaphthalene and di-tertiary amyl benzene. Hydrogenated compds. may be used.

Heat-transferring media. Gesellschaft für Drucktransformatoren (Koenemann-Transformatoren) G. m. b. H. Brit. 399,757, Oct. 12, 1933. The media comprise mixts. of molten metallic chlorides contg. ZnCl<sub>2</sub>, e. g., ZnCl<sub>2</sub> 75, KCl 15 and NaCl 10% or ZnCl<sub>2</sub> 70, KCl 12, NaCl 8, LiCl 5 and FeCl<sub>3</sub> 5%, having m. ps. 180° and 140°, resp.

Respirators. Joseph de Saint-Rapt and Georges Decombe. Brit. 399,390, Oct. 5, 1933.

Gas masks, etc. John A. Sadd. Brit. 399,197, Sept. 25, 1933. Face-pieces for gas masks or respirators are made by coating rubber (compn.) onto a suitably shaped core and vulcanizing while exposed thereon. Brit. 399,496, Sept. 25, 1933, divided on 399,197, relates to a construction of the mask whereby moisture is removed from the inspired air.

Solid carbon dioxide production. Frank R. Zumbro (to Frick Co.). U. S. 1,943,232, Jan. 9. Various details of app. and operation are described.

Use of solid carbon dioxide for refrigeration. Frank Heywood (to Imperial Chemical Industries Ltd.). U. S. 1,941,744, Jan. 2. Various details of app. and air current heat interchange are described.

"Hold-over" solutions for refrigerating apparatus. Joseph Fleischer (to Frigidaire Corp.). U. S. 1,943,268, Jan. 9. A plurality of liquids are used together which are not completely miscible with each other so that although freezing takes place at a const. temp. the freezing

is not complete but leaves liquid interspersed between the crystals formed by freezing. For this purpose there may be used a mixt. contg. water 90 and BuOH 10%, a mixt. contg. water 80 and ethylene glycol mono-Et ether acetate ("cellosolve acetate") 20% or a mixt. of water 95 and diethylene glycol mono-Bu ether ("butyl carbitol") 5%.

**Insulating material.** David Traill and Imperial Chemical Industries Ltd. Brit. 399,888, Oct. 16, 1933. The material consists of a mixt. of a H<sub>2</sub>O-insol. cellulose ether and methylene diaralkyl or diaryl ethers, comprising methylene dibenzyl or diphenyl ethers and their lower alkyl or alkoxy derivs. Other ingredients of high elec. resistance, e. g., glyptal or PhOH-aldehyde resins, gums, resins or oils, rubber, pigments, fillers, e. g., powd. slate, ZnO, etc., may be present. Among examples (1) Et cellulose is mixed with methylene ditolyl ether and ZnO on heated rolls and (2) benzyl cellulose, methylene diphenyl ether and china clay are made up into a dope with xylene, PhMe and methylated spirit.

**Heat-insulating material comprising asbestos or slag fiber having a honey-comb structure.** Louis Weber. U. S. 1,942,013, Jan. 2.

**Heat- and sound-insulating boards and blocks.** Gilbert J. Ward (to Cheesman-Elliott Co.). U. S. 1,941,769, Jan. 2. The surface of a material of compacted, loosely-assocd. fibrous material, such as "Celotex," is uniformly impregnated with a relatively hard asphalt or the like so as not to change substantially the texture of the material and to leave an unimpregnated inner portion.

**Electric insulation suitable for magnetic cores of loading coils, etc.** Wm. C. Ellis (to Bell Telephone Laboratories, Inc.). U. S. 1,943,115, Jan. 9. Magnetic cores, etc., are formed of finely divided particles of magnetic material such as "permalloy" mixed with insulating material formed from colloidal clay, milk of magnesia and Na silicate (mixed in a volatile liquid such as water and evapd. to dryness).

**Impregnating and insulating electric cables.** Thomas N. Riley (to International Standard Elec. Corp.). U. S. 1,941,913, Jan. 2. A conductive core such as one of Cu is surrounded with insulation such as fibrous material, and after subjecting the insulated core to a drying operation under predetd. conditions of temp. and pressure and in which the temp. is raised and the pressure is lowered an impregnating medium such as methylnaphthalene is introduced into the cable, which may finally be varnished.

**Cables.** Greengate & Irwell Rubber Co. Ltd. and Reuben Povey. Brit. 398,811, Sept. 19, 1933. Cables are insulated with layers of unvulcanizable wax compd., contg. at least 50% wax, alternating with layers of varnished fabric or fabric proofed with the wax compd., the innermost layer being of the wax compd. applied directly upon the conductor or upon an interposed layer of asbestos. The outer layer of varnished or proofed fabric is covered by a braided fabric sheath coated with cellulose varnish or wax, over which may be applied a protective metal sheath. The wax compd. comprises a mixt. of paraffin, ozokerite or ceresin with rubber, gutta-percha or balata without vulcanizing agents.

## 14—WATER, SEWAGE AND SANITATION

EDWARD BARTOW

**Water supply of greater Dublin.** M. A. Moynihan. *J. Inst. Munic. Co. Eng.* 58, 1716(1932); *U. S. Pub. Health Eng. Abstracts* 13, W, 39 40(Apr. 8, 1933).—Slow sand filters of 220,000 sq. ft. of area are used to filter the soft peaty water (hardness 2°) which has caused considerable incrustant trouble in pipes. No pipes under 4 in. are laid. The consumption is 2.5 million gals. a day. Elaborate chem. analyses are given. C. R. Fellers

**Water supply of Sheffield.** J. K. Swales. *Munic. Eng.* 89, 581(1932); *U. S. Pub. Health Eng. Abstracts* 13, W, 39(Apr. 8, 1933).—The history of the Sheffield water supply is given. The softening and filtration plant comprises chem. feed app., reaction and pptn. tanks and gravity sand filters. All the water supplied is filtered and treated with chalk or lime to neutralize its acidity and prevent Pb-solvent or other corrosive action. The supply is used by 850,000 people. C. R. Fellers

**The Stour supply scheme of the South Essex Waterworks Company.** Bernard W. Bryan. *Water & Water Eng.* 35, 334-50(1933); *U. S. Pub. Health Eng. Abstracts* 13, W, 89(Sept. 23, 1933).—An area of 153 sq. miles, with a population of 460,000 and a daily consumption of 12.95 million Imp. gal. per day is served. The works consist of intake, siphon, low lift pumping station, sedimentation reservoir, primary and secondary filtration plants, high lift pumping station and distribution works. The unfiltered water is treated with NH<sub>3</sub> and Cl and then passes through a covered baffled contact reservoir of 680,000 Imp. gal. capacity. C. R. Fellers

**The Polchow works of the municipal waterworks at Stettin.** O. Zumbusch. *Gas- u. Wasserfach* 75, 236 (1932); *U. S. Pub. Health Eng. Abstracts* 13, W, 44 (Apr. 15, 1933).—The ground water of the Oder Valley is unsuitable for water supplies, and among the small works are 4 deep wells at Polchow which yield 4.8 million cu. m. a year. Analyses are given. The water passes through an open Fe-removal plant, is aerated and filtered. C. R. Fellers

**Development of underground water supplies in North Dakota.** G. H. Beard. *Trans. N. Dak. Water & Sewage Works Conf.* Nos. 1, 2, 3, 4, 236-49; *U. S. Pub. Health Eng. Abstracts* 13, W, 89(Sept. 23, 1933).—In

N. Dakota 75% of the population use ground water. In general, shallow wells are preferable because of the lower temp. of the water and also because of low cost of construction. Gravel-packed wells deliver more water and have a longer life. C. R. Fellers

**Alkali-alkaline ground water from chalk formation.** O. Luning and K. Brohm. *Z. Untersuch. Lebensm.* 66, 365-8(1933). F. L. Dunlap

**Mineral-water supply of the Mineral Wells Area, Texas.** Samuel F. Turner. *U. S. Geol. Survey Circ.* 6, 9 pp (1934). E. H.

**Kata-numa, a very strong acid-water lake on volcano Katanuma, Niyagi Prefecture, Japan.** S. Yoshimura. *Arch. Hydrobiol.* 26, 197-202(1933).—This lake situated in the crater of a volcano has a *p*<sub>H</sub> of 1.4. The acidity is due to H<sub>2</sub>SO<sub>4</sub>. Milton Levy

**A quarter century of progress in the purification of acid waters.** Edward C. Trax. *Proc. 8th Ann. Conference Water Purification, W. Va. Univ. Tech. Bull.* No. 6, 5-19(1933).—*Bituminous coal-mine drainage* free from acidity is very unusual. Since the prosperity of this area depends upon the mining and industrial enterprises the large streams will become economically most valuable as carriers of city sewage and industrial wastes. A typical acid drainage is highly mineralized, contg. mainly large amts. of sulfates of Fe, Al, Ca, Mg, Mn, as well as free H<sub>2</sub>SO<sub>4</sub>. These compds. are formed by oxidation of the sulfides. Many attempts to treat drainage at the mines by neutralization have failed because of high cost. Disposal by pumping into wells also failed, because of clogging of strata by pptd. Fe hydroxide. The most promising method thus far used has been the sealing of mines in such a manner that the S-bearing strata are submerged and air oxidation is retarded. The simplicity of the neutralization reactions involved has made unnecessary the introduction of any new chemicals during the past 25 years. Much progress has been made in chem. feeding and mixing and in sludge handling. The principal difficulties in control of treatment are the extreme variability in mineral content of raw water and the large amt. of chemicals required. Control measures must not be relaxed because

of the decrease in typhoid fever. Twenty-two references.

G. L. Kelso

The treatment of the Elk river for water supply. F. L. McLaughlin. Proc. 8th Ann. Conference Water Purification, *W. Va. Univ. Tech. Bull.* No. 6, 28-35(1933).—A flocculator of unusual design is employed. Chloramine-activated C treatment successfully prevents taste trouble from industrial phenol wastes. In one plant prechlorination and preammoniation are used without postchlorination. Under certain conditions the entire stream is treated with  $\text{CaSO}_4$  2 miles above the waterworks intake.

G. L. Kelso

A study of total solids, manganese and acidity and their courses downstream of north branch of the Potomac River. J. G. Patrick. Proc. 8th Ann. Conference Water Purification, *W. Va. Univ. Tech. Bull.* No. 6, 52-65(1933).—Detn. of total solids, org. matter, Mn, sulfates,  $\text{pH}$ , total acidity and alkyl. were made at 6 stations for 27 weeks on the Potomac and Savage Rivers and Piney Swamp Run. Results are tabulated and shown diagrammatically.

G. L. Kelso

Colorimetric methods for nitrate determination in water. Walter Lühr. *Z. Untersuch. Lebensm.* 66, 544-56 (1933).—It is shown that the method of Grandval and Lajoux for the colorimetric detn. of nitrate in potable water, wherein the dry residues are treated with phenol-sulfonic acid in an open porcelain dish, results in significant losses. These losses may be avoided by adding 2 drops of a 15%  $\text{NaOH}$  soln. to 10 cc. of the water to be evapd. and through the use of flasks. While this method gives serviceable results, because it is more troublesome to carry out and is less sensitive, it is considered inferior to the methods of Noll and Tillmans-Sutthoff. F. L. D.

Municipal water softening. W. H. Walker. *J. Am. Water Works Assoc.* 26, 77-98(1934).—See C. A. 27, 3270.

Treatment of the feed water for the Löffler boilers installed in the power plant of the Thermo-Technical Institute. Yu. M. Kostrikin. *Trans. Thermo-Techn. Inst. Moscow* 1933, No. 6, 28-32.—The Löffler steam boilers receive a feed water composed of a mixt. of condensate and water treated with soda lime. The untreated water has a hardness of 12-14° (German). The org. substances are removed by treatment with  $\text{Al}_2(\text{SO}_4)_3$  (50 g. per ton at 40-50°) and the water is treated in addn. with soda lime.

A. A. Boetlingk

Use of activated carbon without filtration. F. E. Stuart. Proc. 8th Ann. Conference Water Purification, *W. Va. Univ. Tech. Bull.* No. 6, 36-40(1933).—In one instance in the U. S. 3.5 p. p. m. Aqua Nuchar applied to a reservoir as a slurry from a boat removed tastes and odor and settled within 24 hrs. In England 5 p. p. m. of C applied to a lake from a motor boat removed tastes and odors, but required 48 hrs. to settle. In both cases settling was complete enough to prevent passing of C into the distribution system. Water-softening processes have been improved by addn. of activated C. G. L. K.

Loss of head and backwashing velocities for anthracite coal in water filters. Homer G. Turner and G. S. Scott. *Water Works and Sewerage* 80, 66-8(1933).—A series of reduced-scale expts. on several sizes of crushed, screened anthracite show that anthracite filters have a lower head-loss and require lower backwash velocity for equiv. expansion than the same sizes of sand.

G. H. Y.

Clarification of water supplies by filtration through anthracite. Homer G. Turner and G. S. Scott. *Water Works and Sewerage* 80, 135-6(1933).—A series of expts. to det. the efficiency of anthracite filters, as compared with sand, in the reduction of turbidity show a higher efficiency of removal of suspended matter for the anthracite filter. It is proposed that this superiority is

due to the angular shape of crushed anthracite particles.

G. H. Young

Attrition loss of anthracite in rapid filters. Homer G. Turner and G. H. Young. *Water Works and Sewerage* 80, 246(1933).—A lab.-scale test to det. the attrition loss of fine anthracite when subjected to const. rubbing and impact on backwashing indicates that an approx. annual loss of only 0.2% would be encountered under usual operating conditions.

The action of bacteria in the thermal springs of Aachen and Aachen-Burtscheid. A. Brussoff, F. Reinartz and A. Schloemer. *Z. Untersuch. Lebensm.* 66, 446-53 (1933).—The lime deposits in 2 thermal springs in Aachen-Burtscheid are of bacterial origin.  $\text{SiO}_2$ -depositing and Fe-storing bacteria are also involved in its formation.

F. L. Dunlap

Simple apparatus for detecting sporadic colon bacilli in water. H. Hoek. *Z. Hyg. Infektionskrankh.* 112, 715(1931); *U. S. Pub. Health Eng. Abstracts* 13, W, 42 (Apr. 8, 1933).—A layer of kieselguhr is deposited from a suspension on a filter plate made of the fineness of a Berkefeld filter candle. When a sufficient quantity of the water to be examd. has passed through the filter, the kieselguhr layer is removed. Examn. for *Es. coli* by means of sterile  $\text{NaCl}$  solns. or tap water to which *Es. coli* had been added showed that approx. 67% of the organisms were retained in the kieselguhr. The app. is recommended for simplifying the procedure in water-works and could be used for examg. water or other liquids for other microorganisms as well as for *Es. coli*. C. R. F.

New method for the isolation of *Es. coli* in water. G. Fleury. *Bull. soc. pharm. Bordeaux* 3, 193(1931); *U. S. Pub. Health Eng. Abstracts* 13, W, 42(Apr. 8, 1933).—One cc. of the water under examn. is added to 15 cc. of nutrient agar medium colored with Congo red. After 1-3 days' incubation at 25-30°, colonies of *Es. coli* appear blue and those of *Eberthella typhi* dark red. The bacteria commonly occurring in water can also be detd. by this method.

C. R. Fellers

Symposium on cement-lined water mains—solubility of lining. Robert S. Weston. *J. Am. Water Works Assoc.* 25, 1754-7(1933).—The presence of  $\text{CO}_2$  affects cement linings by dissolving  $\text{CaCO}_3$ , thereby increasing the hardness of the water. With high-Al cements some liberation of Al hydrate is possible. Changing the compn. of the cement or applying a waterproofing coating is considered more effective than treating the water. John R. Baylis. *Ibid.* 1757-61. —As long as  $\text{Ca}(\text{OH})_2$  exists in contact with Fe no corrosion of the pipes can take place. Because of the corrosive effect of most waters on Ca in the cement, painting is strongly favored, especially when the waters are soft. E. L. Chappell. *Ibid.* 1761-9.—Unless the cement is too high in sol. constituents the corrosive action of water will not impair its efficiency. It is felt that, aside from short initial changes, cement-lined pipe under normal conditions has little noticeable effect on the quality of water carried. A low-sol. cement-lined pipe having desirable qualities is referred to. F. E. Hale. *Ibid.* 1770-7.—Tests were made on uncoated and coated pipes, with tar, asphalt and high-alumina cement. Tar coatings while more effective than asphalt coatings were objectionable because of taste and odor. Results on the high-alumina cement are not yet available. Improved results will be obtained through care in application of the cement lining and thoroughness in application of the org. coating. D. K. F.

Minnesota lakes and their productiveness of fish food. Preliminary report. Maynard S. Johnson. *Minn. Agr. Expt. Sta., Tech. Bull.* 90, 3-31(1933).—Chem. and biol. data are given.

## 15—SOILS, FERTILIZERS AND AGRICULTURAL POISONS

M. S. ANDERSON AND E. D. JACOB

Professor A. A. J. de Sigmond and soil science. Róbert Ballenegger. *Mesőgazdasági Kutatások* 6, 403-5(1933). S. S. de Finály

Composition of the forest floor layers under different forest types on the same soil type. F. J. Alway, Joseph Kittredge and W. J. Methley. *Soil Sci.* 36, 387-98 (1933); cf. *C. A.* 27, 3547.—A chem. study is made of the forest floor of jack pine, Norway pine, white pine and maple-basswood. With all 4 types a progressive increase is found in the percentage of ash, lime and N,

together with a decrease in acidity, on passing from the litter to the duff and from the duff to the leaf mold. In chem. character the materials from maple-basswood differs widely from those from the pines, being much higher in lime and in N, P, K and S. The acidity of freshly fallen leaves from the different kinds of trees shows little variation but the duff and leaf mold of the maple-basswood is least acid. Freshly fallen leaves are closely similar in compn. to those of underlying litter. M. S. Anderson

Distribution of volatile matter, lime and nitrogen among

**litter, duff and leaf mold under different forest types.** F. J. Alway, W. J. Methley and O. R. Younge. *Soil Sci.* 36, 399-407(1933); cf. preceding abstr.—Litter, duff, leaf mold and surface soil were studied from 4 forest types, jack pine, Norway pine, white pine and sugar maple-basswood, all growing on Cass Lake fine sand. Detns. were made of the wts. per unit area of volatile matter, lime and N. Maple-basswood had the least litter and duff, but the most leaf mold. It also had the largest amts. of CaO and N. Both of these constituents were much less in each of the pines. The N content of the surface 2.75 in. of mineral soil was only 5-15% of the amt. in the overlying org. layers. The CaO per unit area sol. in aqua regia was greater in this surface layer than in the forest floor in each case. M. S. Anderson

**The course of the weathering processes in the marine clay deposits of Holland.** D. J. Hissink. *Műszaki Kutatások* 6, 467-73(1933) (in English).—Polder soils become slowly poorer in lime and humus. The N content increases somewhat. Av.  $P_2O_5$  content is 0.2%. Lime is slowly removed and replaced by Mg and by alkalis. The  $pH$  value decreases. S. S. de Finály

**A study of some salt-water-flooded soils on the eastern shore of Virginia.** Jackson B. Heister. *Soil Sci.* 36, 427-34(1933).—A study is made of soils of the bayside area of Virginia after a severe storm which flooded the land with salt water. The flooded soils freshly cultivated took up more NaCl than did the soils not cultivated. Considerable replaceable Ca was removed from the soil, whereas Mg was increased by flooding. After the salts were leached out of the flooded soil their  $pH$  values were distinctly higher than those of the corresponding natural soil. Germination studies with a variety of vegetables showed 0.2% NaCl to be injurious in light sandy soils low in org. matter. The addn. of  $Ca(NO_3)_2$  or lime decreased the toxic action. Lime facilitated leaching and stimulated plant growth. The presence of org. matter reduced the toxicity of NaCl to plants. M. S. Anderson

**The effect of additions of certain Colorado soils upon the nitrogen balance of a Tennessee soil.** C. A. Mooers, W. H. MacIntire and J. B. Young. *Soil Sci.* 36, 361-8(1933).—A study is made of the influence of 2 Colorado soils of high nitrifying and fixing capacities upon a Tennessee soil. Admixts. of 1% of Colorado soil with Cumberland clay was made in lysimeters. During the first year the outgo of ammoniacal and nitrite N was considerably increased in the presence of the Colorado soils. After the first year the outgo of N was exclusively in nitrate form and over the longer period of time the unusual properties of the Colorado soils were not maintained nor were they transmitted to the Tennessee soil. M. S. Anderson

**The effect of additions of certain Colorado soils upon the outgo of bases, chlorides and sulfates from a Tennessee soil.** W. H. MacIntire, W. M. Shaw, B. Robinson and K. B. Sanders. *Soil Sci.* 36, 435-46(1933); cf. preceding abstr.—Two calcareous soils from Colorado, the Grand Junction sandy loam and Rocky Ford clay, were mixed with Cumberland clay loam from Tennessee. The soil mixts. were made in lysimeters and the outgo of various ions was detd. Chem. analyses of each of the soils were made by 3 different procedures, by means of digestion with HCl, sp. gr. 1.115, leaching with 0.02 N HCl and extn. with  $H_2O$ . One lb. of Colorado soil was mixed with 100 lb. of the Tennessee soil and in some cases clover hay, limestone and NaCl were added. The addns. of both Colorado soils caused a 0.6% increase in the outgo of Ca, which was much less than the effect produced by clover hay. The outgo of Mg was increased by clover hay, depressed by limestone, and unaffected by NaCl addns. The large amt. of Na in the Grand Junction soil was rapidly leached out. Anion outgo was variable. In general, limestone and clover-hay supplements affected the leachings more than did the addns. of the western soils. M. S. Anderson

**The essential nature of alkali soils and methods for their reclamation.** W. P. Kelley. *Műszaki Kutatások* 6, 439-58(1933) (in English).—The Na content of

1 American alkali soils transforms the adsorption complex of the soil and the qualities of the soil, depending on the concn. and quality of salts. The soils also contain lime carbonates or silicates that have a good effect in reclamation. Reclamation consists of removal of noxious salts and replacing adsorbed Na by Ca. S. S. de F.

**Alkali soils of Spain: Their systematic place according to their chemical composition and vegetation.** Emile Huguet del Villar. *Műszaki Kutatások* 6, 510-21(1933) (in French).—Two types of Spanish alkali soils are (1) black, Mn-contg. and (2) red, poor in lime but not identical with terra rossa. Both contain significant amounts of Na and Mg, but relatively little exchangeable Ca. S. S. de Finály

**Newer results on the reclamation of calcareous alkali soils.** János Di Gléria. *Műszaki Kutatások* 6, 291-8(1933).—Alkali soils of the Great Hungarian Plain contg. both  $CaCO_3$  and  $Na_2CO_3$  can be reclaimed by combined treatment with "Acifer" and nitrogen fertilizers. "Acifer," a material contg. absorbed  $H_2SO_4$  and  $Al_2(SO_4)_3$ , when used alone improved the physical structure of the soil but did not increase the yield of hay. Greatest yields were obtained by using "Acifer N," in which  $HNO_3$  as well as  $H_2SO_4$  is absorbed. S. S. de F.

**A new method for estimating replaceable sodium and potassium in soils.** Amar Nath Puri. *Soil Sci.* 36, 355-9(1933).—Replaceable Na and K are extd. from soil by  $Ba(OH)_2$  soln. From 10 to 20 g. of soil is shaken with 100 cc. of 0.2 N NaOH for 2 hrs., filtered through paper on a Buchner funnel and the soil residue leached with 100-cc. portions of 0.1 N  $Ba(OH)_2$ , until a total of 1000 cc. is obtained. Phenolphthalein is then added to the ext. and  $CO_2$  passed through until the color disappears. After the insol. carbonates have settled the clear filtrate is titrated, with methyl orange as an indicator. This method gives total univalent bases, i. e., both Na and K. If desired, these may be converted to sulfates, ignited, and the K and Na contents calcd. M. S. Anderson

**Lysimeter studies at Aberdeen.** J. Hendrick. *Műszaki Kutatások* 6, 500-9(1933) (in English).—The N of  $NH_4$  fertilizers spread on the soil surface was found in the subsoil water as nitrate, without any material loss. The large amount of superphosphate added was fixed by the soil; the water contained no traces of  $P_2O_5$ . Small amounts of K were found in the water, which also contained much lime and Mg, although the original soil did not contain  $CaCO_3$ . About the same amount of nutrient was washed out by the filtering soil water in unfertilized plots, fertilized plots and plots treated with fertilizer plus lime. S. S. de Finály

**Water content of soil colloids as related to their chemical composition.** L. D. Bayer and Glen M. Horner. *Soil Sci.* 36, 329-53(1933).—The relationship between  $H_2O$  content and various chem. properties of soil colloids is studied. Colloids were treated with 6%  $H_2O_2$  to remove org. matter and were extd. with alternate treatments of 0.1 N HCl and 2%  $Na_2CO_3$  to remove free oxides of Al, Fe and Si. The  $H_2O$  adsorbed over 3.3%  $H_2SO_4$  was not greatly affected by the nature of the colloid but the hygroscopicity over 30%  $H_2SO_4$  increased with the  $SiO_2/R_2O_3$  ratio while the combined  $H_2O$  decreased. Adsorption of  $H_2O$  was also influenced by the cations with which the clays were satd. The order of influence was:  $H > Ca > Li \leq Mg > Na \leq Ba > K$ . Removal of org. matter and extn. with dil. HCl and with  $Na_2CO_3$  had little effect on  $H_2O$  adsorption. Water was removed by heating the colloids at various temps. from 60° to 800°. The temp.- $H_2O$  curves of soils and of bentonite were sigmoidal in shape with distinct points of inflection. These curves suggest that there are at least 2 kinds of  $H_2O$  retained by the colloid. It is suggested that combined  $H_2O$  should represent that which is a part of the crystal lattice of the colloid. Temp.- $H_2O$  loss curves indicate that the colloidal materials of various soils are different. The nature of the exchangeable cations affects  $H_2O$  removed below 250° but has slight effect at higher temps. The theory that the same base-exchange material is responsible for cation exchange in bentonite and in clay is

questioned in the light of the data presented.

M. S. Anderson

**Solubility laws and soil analysis.** Th. Seidel. *Mesőgazdasági Kutatások* 6, 481-48(1933)(in German).—Equations showing the relation of the soil components obtained by a single soil extrn. to those remaining in the soil can be used for the detn. of contents of sol. salts in soils, for the detn. of exchangeable H, for the explanation of hydrolytic and exchange acidity, for the detn. of T values, and for the detn. of K and  $P_2O_5$  in soils significant from the plant-physiological point of view. S. S. de F.

**A method for continuous automatic extraction of soils.** J. C. Russell. *Soil Sci.* 36, 447-50(1933).—An app. is described which is suitable for extg. soils with  $H_2O$  or with various solns. used for base exchange. About 50 cc. of  $H_2O$  is adequate to remove the sol. chlorides from a 40-g. sample of silt loam soil. Extrn. for base-exchange studies requires a vol. of 250 cc. of ext. from 20 g. of soil. Dried samples give much clearer exts. than the same soils in a moist condition. Saline soils often give muddy exts. and also may become impervious when the bulk of the sol. salts is removed. M. S. Anderson

**Modification of the  $pH$  value of agricultural soils by lime.** Maurice Dérivière. *Rev. matériaux construction trav. publics* 1934, 3-8.—A discussion of various methods for measuring the  $pH$  of soils and of the changes in  $pH$  effected by addns. of lime. Exptl. data are presented on 5 soils. Equil. after addn. was established after about 20-5 days. Fifty-four references. Karl Kammermeyer

**The migration of salts in soil.** Hans Erlenmeyer. *Chem. Erde* 8, 317-20(1933).—A filter plate was set on a mixt. of 100 g. of dry sand and 25 g. of  $NaNO_3$ . Water vapor diffusing through the sand from beneath after 61 days caused 1.39 g. of the hygroscopic salt to enter the filter. This result was not found for KCl. Conclusion: Migration of salts in soil may be effected by water vapor in the absence of ground or capillary  $H_2O$ . P. S. R.

**The measurement of temperature near the soil.** C. E. Brazier and L. Ehlé. *Compt. rend. acad. agr. France* 19, 1050-4(1933).—A discussion of the factors entering into the measurement of temps. near the soil (within a few cm.). The factors considered are the mass and nature of the thermometer liquid, shape of the reservoir, condition of the reservoir surface and radiation. The shape of the reservoir, whose surface must be in good condition, has little effect on the readings but it was found that Hg thermometers gave higher readings than alc. thermometers. Radiation has the most important effect on such detns. and causes high readings. In order to correlate these temps. with plant growth they must be better defined. J. R. Adams

**Coagulation of the soil fraction smaller than 0.002 mm. in diameter as effected by hydrogen ions of hydrochloric and acetic acids.** A. Musierowicz and L. Smolik. *Polish Agr. Forestal Ann.* 25, 303-12(1931)(312 in German).—Orthokinetic coagulation of a soil fraction smaller than 0.002 mm. in diam. is enhanced as the concn. of H ions of HCl and AcOH increases in the range:  $pH$  3.87-2.01. At equal  $pH$  values AcOH effects stronger coagulation than HCl. At smaller  $pH$ , a decrease of the degree of coagulation is observed with HCl. It could not be ascertained, whether this decrease is effected by chem. action of the acid, or by a change in the elec. charge of the soil particles. J. Wiertelak

**Neubauer indications for soil nutrients considered with respect to particular crops and fertility levels on an extensive series of East Prussian soils from estates differing in size and soil.** S. Goy. *Z. Pflanzenernähr., Düngung Bodenk.* 12B, 529-44(1933).—It is concluded that the growth of rye seedlings in the Neubauer test (cf. C. A. 18, 877) on soil samples is not an entirely satisfactory basis for fertilizer recommendations, since different crops vary so widely in their requirements. Comparison with yield records indicates that the interpretation of test data must not be too arbitrary; economic factors and cultural practices which cannot be considered in any test are important. C. J. Schollenberger

**Exhaustion of nitrogen and potassium from potato**

**mother tubers as influenced by deficiency of these nutrients in the soil.** Kazimierz Strzemieński. *Polish Agr. Forestal Ann.* 26, 191-204(1931)(203-4 in English).—The N and K store of the mother tuber is essential for the young plant in the first period of vegetation if grown in soil deficient in N or  $K_2O$ . E. g., the mother tuber supplied 84% of the total amt. of N and 97% of  $K_2O$  assimilated by young plants on plots deficient in N or  $K_2O$ , resp. J. Wiertelak

**Influence of soil reaction on the fertilizing effect of calcium cyanamide.** J. Krotowiczówna. *Polish Agr. Forestal Ann.* 25, 235-57(1931)(272 in German).— $CaCN_2$  added to soils of different acidities in pot expts. exhibited a good fertilizing action in the range  $pH$  4-8. The crop increase was slightly higher in acidic as compared with neutral soils. In heavy soils of varying  $pH$  values  $CaCN_2$  gives as good results as  $NaNO_3$ . J. W.

**Microbiology of the soil. VII. Nitrifying organisms.** S. Vinogradskii. *Ann. inst. Pasteur* 50, 350-432(1933); cf. C. A. 27, 1438.—The activity of nitrifying organisms is inhibited by certain org. nutrient-contg. materials, and nitrification does not occur until the microbial mineralization of these is practically complete.  $NH_3$ , even in small concns., retards the development of *Nitrobacter*, which does not become active until  $NH_3$  is almost entirely converted into nitrite. The isolation of a no. of species of nitrifying organisms on  $SiO_2$ -gel media is described. The general  $pH$  range of activity is 6.0-9.2. Certain species of *Nitrosomonas* tolerate  $pH$  < 6.0. The distribution and activity of certain species in soils of different types are recorded. H. C. A.

**Fixation and exchange of certain anions by soil colloids.** A. Demolon. *Mesőgazdasági Kutatások* 6, 474-9(1933)(in French).—In the flocculation of colloidal clay by K salts the limit value (i. e., the min. amt. of salt required) increased with the OH-ion concn. of the medium. The increase was rapid between  $pH$  7 and 8. The limit value at const.  $pH$  varies with the kind of ion. The inactive salts have small mols. and large diffusion capacities: the active salts have higher valencies, often being complexed and large mols. The adsorption of these by the clays increases their negative charge. The solution of assimilable  $P_2O_5$  is in part an exchange process. S. S. de F.

**A rapid method for identifying the bacteria in nodules of legumes.** F. M. Clark and Ray Hansen. *Soil Sci.* 36, 360-74(1933).—A rapid method for identifying the organisms in the nodules of legumes is described with the nodule as antigen. M. S. Anderson

**The relation of phosphorus to biological nitrogen fixation and conformity to the law of decreasing increment.** Robert A. Greene. *Soil Sci.* 36, 383-9(1933).—The P requirements of *Azotobacter* are very small. The relation of available P to N fixed follows the law of decreasing increment. Small addns. of phosphate to a soil deficient in P will produce a greater response than subsequent addns. which may be even larger. M. S. Anderson

**Symbiotic nitrogen fixation in the genus *Casuarina*.** Harold Mowry. *Soil Sci.* 36, 409-25(1933).—Trees of the genus *Casuarina* are among the non-leguminous plants having nodules on their roots. It is shown that such plants fix atn. N in the nodules and that the relation of the host and casual organism of the nodule is one of mutualistic symbiosis. M. S. Anderson

**Nitrogen fixation and nitrification in untreated and reclaimed alkali soils containing lime and soda.** I. Imre Prettenhoffer. *Kisérletügyi Közlemények* 36, 78-108(1933).—The structural changes caused by the reclamation improved the biol. qualities of soils. Alkali soils with a lower content of salts, chiefly of soda, showed after reclaiming a considerable increase of nitrification activity and almost reached the nitrate formation of excellent loamy soils without soda content. The best results were obtained when  $H_2SO_4$  or bauxite with sulfuric acid or  $CaSO_4$  was used for reclamation. Alkali soils which contained much more salts and soda showed less or no nitrification activity at all. The loss of ammonia was due to the essentially smaller basicity in reclaimed soils. S. S. de Finály

Further studies on the relation between the carbon assimilation and nitrogen fixation in leguminous plants. C. E. Georgi, F. S. Orcutt and P. W. Wilson. *Soil Sci.* 36, 375-82(1933).—Growth of red clover plants is more markedly influenced by the partial pressure of  $\text{CO}_2$  than by the total quantity available. Large increases in dry wt. and in N fixed accompany an increase of  $\text{CO}_2$  pressure from 0.03 to 0.1%. Clover plants supplied with glucose and sucrose in the nutrient soln. show an increase in both dry wt. and N fixed even in concns. of carbohydrate as low as 0.1%. However, higher concns. are more effective. The addn. of mannitol to inoculated red clover plants does not cause an increase in N fixed and when the concn. exceeds 0.25-0.50% the influence is detrimental. Red clover and sweet clover plants when inoculated with a non-homologous species of rhizobia die of N starvation even though carbohydrate is furnished the bacteria. This indicates that sol. N compns. capable of being used by the plant are not fixed by free living forms of rhizobia.

M. S. Anderson  
Double superphosphates. L. E. Berlin. *Minérals. Oudobr.* 1, 41-8(1932); *Chimie & industrie* 30, 600; cf. C. A. 28, 284<sup>9</sup>.—A discussion of their prepn. from apatite concentrates and from phosphorites. A. P.-C.

Comparison of the action of ground phosphorite and superphosphate. D. V. Druzhinin and Z. I. Stroganova. *Minérals. Oudobr.* 1, 53-70(1932); *Chimie & industrie* 30, 705.—In soils of low alky. (50-60% bases) application of a double dose of ground phosphorite gives better results with cereals than superphosphates. These soils also require an intense liming (up to 38%), and it is therefore necessary to det. in each case the nature of the fertilizer treatment required (lime or phosphorite) or the best method of combining the 2 so as not to weaken the effects of the phosphorite; e. g., in strongly acid soils (peat, etc.), a phosphorite treatment can be followed by a moderate liming. With soils in which the alky. varies from 60 to 70% bases, and which in addn. lack  $\text{P}_2\text{O}_5$ , a double dose of phosphorite gives at least as good results as a single dose of superphosphate; in such a case liming is of secondary importance. When the soil contains over 70% bases, superphosphate is preferable to phosphorite; but in the event of a pronounced  $\text{P}_2\text{O}_5$  deficiency use of phosphorite is still rational, especially if a cereal crop is followed by a clover crop.

A. Papineau-Couture  
The phosphoric acid requirement of Swiss cultivated soils. E. Truninger. *Phosphorsäure* 3, 420-8(1933).—In 74% of the expts. with phosphate-free-fertilizers, less than half the yield of hay ordinarily obtained by complete fertilization was found. In 48% of the cases where  $\text{K}_2\text{O}$  was omitted less than half the normal yield was obtained. The detn. of  $\text{P}_2\text{O}_5$  and  $\text{K}_2\text{O}$  in the ash of the first crop of hay showed that 75-88% of the soils were deficient in  $\text{P}_2\text{O}_5$ . The percentage decreased from 87-90% in 1921 to 74-87% in 1931, which corresponds with the increased use of Thomas slag. The  $\text{K}_2\text{O}$  deficiency was negligible.

K. C. Beeson  
The phosphate requirements of Java sugar-cane soils. G. A. Neeb. *Arch. Suikerind. III Mededeel. Proefsta. Java-Suikerind.* 41, 1031-88(1933).—Previous literature on the detn. of available  $\text{P}_2\text{O}_5$  in soils is reviewed. It was found that extn. with  $\text{H}_2\text{O}$  is the best method, but it is necessary to use varying ratios of soil to  $\text{H}_2\text{O}$ , from 1:100 to 1:0.75. The amts. of  $\text{P}_2\text{O}_5$  found by the ceruleomolybdate procedure were plotted against the ratios, and an approx. figure for the  $\text{P}_2\text{O}_5$  in the soil soln. was detd. by extrapolation. The curve also shows to what extent the soil is able to yield  $\text{P}_2\text{O}_5$  to the soil soln. The power of the soil to bind  $\text{P}_2\text{O}_5$  was detd. by shaking with a soln. of  $\text{Ca}(\text{H}_2\text{PO}_4)_2$ ; in about a month a new equil. between the  $\text{P}_2\text{O}_5$  in the soil and in the soil soln. is established. The increase in the  $\text{P}_2\text{O}_5$  concn. in the soil soln., caused by application of P fertilizer, could thus be measured. The phosphate content of the soil, and its power to bind  $\text{P}_2\text{O}_5$ , do not go parallel. A comparison between the  $\text{P}_2\text{O}_5$  soly. curves and the results of field tests showed good correlation for black, gray and grayish brown soils. In yellow, brown and red soils the power to bind  $\text{P}_2\text{O}_5$  appears to

give a better measure of the  $\text{P}_2\text{O}_5$  requirements than does the soly. curve. No relation was found between the  $\text{SiO}_2$  content of aq. soil exts. and the effect of  $\text{P}_2\text{O}_5$  indicated by field tests. In some cases a high concn. of exchangeable bases in the soil increased the  $\text{P}_2\text{O}_5$  content of the aq. soil exts. In the future the new method, which is tedious, should be applied only to soil types, but not to individual test plots, except in doubtful cases.

F. W. Zerbán  
Plant nutrients of Finnish soils. B. Aarnio. *Mezőgazdasági Kutatószok* 6, 432-8(1933)(in German).—The mechanical compn. and the ratio  $\text{SiO}_2:\text{Al}_2\text{O}_3$  vary in postglacial Finnish soils. They are low in N and in easily sol.  $\text{K}_2\text{O}$  and  $\text{P}_2\text{O}_5$ . Finnish forest soils are somewhat richer, peat soils much poorer.

S. S. de Finály  
Plant nutrients which the farmer supplies in fertilizers unintentionally or not at all. Werner Scholz. *Z. Pflanzenernähr., Düngung Boden.* 13B, 12-22(1934).—A review of knowledge concerning elements essential for plant growth but not generally considered in fertilizer analyses. Several hundred references.

C. J. Schollenberger  
The prolonged action of fertilizers. Henri Blin. *J. agr. prat.* 97, 381-2(1933).—An expt. is cited which shows the delayed or prolonged action of fertilizers on a stand of wheat following a sugar-beet crop. This delayed action is more marked after an abundant crop which will leave in the soil, in addn. to the unused fertilizer already there, a large amt. of unused residue, i. e., leaves, roots, etc.

J. R. Adams  
Fertilizer experiments on sodium-carbonate-containing alkali soils. Sándor Herke. *Mezőgazdasági Kutatószok* 6, 372-95(1933).—*Atropis limosa* grows tolerably well on alkali soils. In the soils studied, poor growth of *Atropis* was caused by N deficiency. Fertilization with N fertilizers caused a 500 to 9000% increase of *Atropis* harvest. Nitrate N and ammonia N were assimilated most easily; cyanamide N had a harmful effect. Ammonia N had in moist soils almost the same effect as nitrate N.

S. S. de Finály  
Influence of fertilizers on the quality of wheat. Erzsébet Rosenblüh. *Mezőgazdasági Kutatószok* 6, 346-51(1933).—Analyses are given of soils and of the wheat produced. K increased the seed wt. P diminished the amt. of gluten; N increased it. The unfavorable effect of P can be explained by the fact that the soils contained much more P than N and addn. of superphosphate made the ratio unfavorable. Plots contg. relatively less P showed the highest gluten contents when treated with complete fertilizers.

S. S. de Finály  
Does fertilization influence the baking quality of bread grain? M. P. Neumann and J. Lemmerz. *Z. Pflanzenernähr., Düngung Boden.* 12B, 544-51(1933); cf. C. A. 18, 2402.—The subject is briefly reviewed with the conclusion that the baking quality of flour from grain grown with com. fertilizers is not significantly different for that reason, and on the av. is certainly not inferior.

C. J. Schollenberger  
Decomposition of farm manure in the soil. M. V. Katabimov. *Minérals. Oudobr.* 1, 81-91(1932); *Chimie & industrie* 30, 705.—In the course of the decompn. in the soil of fresh straw farm manure, there is a certain decrease in the inorg. N content, due probably to its biol. fixation. This occurs during the 1st month; it is most pronounced when the dose of manure is 4%. On the other hand, it is less with fresh peat manure and practically nonexistent with fermented straw or peat manures. Ammonification of org. N increases slightly through decompn. of fresh manure, but is unaffected by fermented manures. Decompn. of fresh manures increases nitrification; the latter increases to a smaller extent by decompn. of fermented peat manure and is unaffected by fermented straw manure. Inorg. N is present in the soil in 2 forms during the decompn. of manures: ammoniacal and nitric; nitrous N is present only during the 1st month.  $\text{H}_2\text{O}$ -sol.  $\text{NH}_3$  is present only during the 1st 3 months, and constitutes only a negligible proportion of the absorbed  $\text{NH}_3$ . After 10-18 months, the amt. of nitrate N present in the soil is much greater

than that present in the original soil and manure. Addn. of  $\text{CaCO}_3$  to the soil considerably increases the inorg. N content by intensifying nitrification. Decompu. of manure also increases the proportion of  $\text{H}_2\text{O}$ -sol.  $\text{CaO}$ ; this is more pronounced with fresh than with fermented manures. The increase in the inorg. N content of the soil is most pronounced with straw manures. The  $\text{pH}$  of the soil varies but little during the decompu. of the manure. A. Papineau-Couture

Controlled manure fermentation. Paul Ehrenberg. *Z. Pflanzenernähr., Düngung Boden.* 12B, 551-4 (1933).—Review. Recent expts. indicate increased loss of N and dry matter with hot fermentation as compared with cold, with some gain in spreading qualities. A greater proportion of the N remains as  $\text{NH}_3$  with cold fermentation, but either treatment is superior to ordinary storage. Destruction of weed seeds is not an important factor, as few survive in manure, however treated. C. J. S.

Results of field experiments with blast-furnace slag. H. Kappen. *Z. Pflanzenernähr., Düngung Boden.* 13B, 22-36 (1934).—Increases in small grain, sugar beet and potato crops from field plots on various acid soils are taken as indexes to the comparative values of ground limestone and (or) burned lime, granulated, coarsely, medium or finely ground blast-furnace slag. These liming materials were applied according to  $\text{CaO}$  contents at light and heavy rates corresponding to each soil's indications for exchange and hydrolytic acidity, resp. Crop increases from liming were not in all cases significant; those from slag were usually equal or superior to those from limestone at equiv. rates. In these expts. with slag,  $\text{CaO}$  content appeared to be more important than fineness. At equiv. rates of application, burned lime was most effective in raising soil  $\text{pH}$ , limestone next and slag least; large applications of the latter had comparatively little effect in this respect. No adverse effects from  $\text{CaS}$  in slag were noted. Slag is considered to be of special value for light soils and peat, both as a source of  $\text{CaO}$  and colloidal  $\text{SiO}_2$ . C. J. Schollenberger

The action of potassium fertilizers upon undesirable nitrogen in the sugar beet. S. I. Lipman. *Nauk. Zapiski Tsukrovoi Prom.* 32, 101-12 (1933).—K fertilizers do not always decrease in beets the percentage of N interfering in sugar manuf. The action of K on the N content is detd. by the ratio of nutritive elements in the soil. In the presence of a large excess of N, small portions of K (with an increase of beet crop) increase the amt. of N in the beets. On the other hand, in the presence of a small amt. of N in the soil, K decreases the percentage of N in the beets. Among K fertilizers sylvinit is the most powerful in decreasing the N content in beets. V. E. B.

Ammoniation of waste sulfite liquor and its possible utilization as a fertilizer material. Max Phillips, M. J. Goss, B. E. Brown and F. R. Reid. *J. Wash. Acad. Sci.* 24, 1-5 (1934).—The authors present a preliminary report of their work on the pressure ammoniation of waste sulfite liquor with a view to its utilization as a fertilizer. A product contg. up to 10%  $\text{N}_2$ , of which only a negligible amt. was present as  $\text{NH}_4$  salts, was obtained. Ammoniation was carried out in 2 steel bombs, which revolved in an oil bath at temps. of 200° and 220° for periods of 4-20 hrs. Highest yields were obtained at 20 hrs. and 220°. The preliminary series of expts. used the ammoniated product as a fertilizer for growing millet under controlled conditions as compared with (1) superphosphate and muriate of potash, (2) dried blood, (3)  $\text{NaNO}_3$ - $(\text{NH}_4)_2\text{SO}_4$ . The product was superior to (1), but slightly inferior to (2) and (3). Further expts. indicated that the N in the ammoniated product was made available over a longer period of time than either the dried blood or inorg. salts. G. H. Young

Effects of hydrogen- and aluminum-ion concentration on conifer damping-off. L. W. R. Jackson. *Phytopathology* 23, 18 (1933). B. C. A.

Effect of sulfuric acid and aluminum sulfate on soil  $\text{pH}$ , when used for the control of damping-off of conifers. L. W. R. Jackson. *Phytopathology* 23, 18 (1933). B. C. A.

Sulfur in agriculture. Eum. Pons-Eacot. *Chimie & Industrie* 30, 533-4 (1933); cf. Bertrand and Silberstein, *C. A.* 27, 1441.—Preliminary field expts. carried out in Peru on cotton and vines confirmed as regards free S B. and S.'s findings as to the value of sulfates. The results are of particular importance as they indicate that the use of free S, either alone or in conjunction with  $\text{CaO}$ , can check cotton wilt and other plant diseases and can permit of continued cultivation of cotton in soil repeatedly fertilized with guano, in spite of the fact that the latter would naturally tend to increase the soil acidity continuously. A. Papineau-Couture

The part played by hydrofluoric acid in the noxiousness of the Meuse Valley fog in 1930. Joseph Mage and Georges Batta. *Chimie & Industrie* 30, 787-8 (1933); cf. *C. A.* 26, 3858.—A further explanation is given of the reasons why HF and other F compds. given off from a  $\text{P}_2\text{O}_5$ -fertilizer factory in the affected district could not be considered as the only or the main factor in the numerous deaths caused by the fog of Dec., 1930. A. P.-C.

The determination of the distribution of particle sizes in lead arsenate sprays. P. J. Clark. *New Zealand J. Sci. Tech.* 15, 183-7 (1933).—The sedimentation method of Calbeck and Harner was used with modifications. The amt. of suspension settling in the scale pan was found to be less than the theoretical amt., and the loss was different for different sizes. This effect was overcome by means of a cylindrical pan 9.1 cm. long suspended in a 2-l. beaker. The analyses of 3 sprays in the range 5 to > 74 microns are tabulated. P. S. Røller

A new method of combating heart and dry rot of beets. K. Meyer-Hermann. *Deut. Landw. Presse* 60, 194, 205 (1933).—Ten plats of sugar beets were treated with varying amts. of borax ranging up to 30 kg. per ha. by dissolving the borax in 10 l. of water and sprinkling it along the newly made drill. The no. of diseased beets was reduced in all cases, but a max. effect was obtained when 20 kg. of borax was used. The yield was doubled over that when no borax was used, and the no. of diseased beets was reduced 90%. The sugar content was increased from 6.46 to 7.05%, and the sugar yield was increased from 43.5 kg./ha. to 61.6 kg./ha. K. C. Beeson

Protection against tobacco diseases. I. Comparative examinations of physiological effects of mercury-containing disinfectants on tobacco seeds and microorganisms spread by means of seeds. György Komlóssy. *Kisérletiügyi Közlemények* 36, 134-61 (1933).—The disinfectant "Higor" did not kill *Alternaria*; "Higosan," Germisan, Tillantin and Uspulun did kill it. S. S. de Finály

Chlorates and the destruction of crowfoots. G. Fron. *J. agr. prat.* 97, 499-501 (1933).— $\text{NaClO}_3$  used for the destruction of plants of the crowfoot family in wheat fields attacks both the wheat and the weed. With the wheat the harmful effect is only temporary and on harvesting there is little difference between the yield from the treated and untreated wheat. While the destructive action on this group of weeds is slower it continues until the weeds, or at least the germinative power of their seeds, is destroyed. When  $\text{NaClO}_3$  is replaced by  $\text{KClO}_3$  the recovery of the wheat from the initial treatment is much more rapid. J. R. Adams

Destruction of the crowfoot in fields planted in cereals. G. Fron. *Compt. rend. acad. agr. France* 19, 892-8 (1933); cf. preceding abstr. J. R. Adams

Fertilizer. Kali-Forschungs-Anstalt G. m. b. H. (Oskar F. Kaselitz, Hans Friedrich and Fritz Pohle, inventors). Ger. 587,589, Nov. 6, 1933 (Cl. 18.4).  $MgNH_4PO_4 \cdot 3H_2O$  and  $MgNH_4PO_4 \cdot H_2O$  are pptd. by passing  $NH_3$  into solns. of  $H_3PO_4$  or alkali phosphates and Mg salts at ordinary or raised temps.  $MgO$  or  $MgOH$  may be used instead of Mg salts.

Fertilizer. G. Ober & Sons Co. Ger. 587,890, Nov. 9, 1933 (Cl. 18.1). Crude ground phosphate is made into a paste with aq.  $NH_3$  and treated with strong mineral acid, especially  $H_2SO_4$  or  $H_3PO_4$ , to form a fertilizer. App. for the process is described.

Fertilizer. Chemische Fabrik Kalk G. m. b. H. and Hermann Oehme. Ger. 587,954, Nov. 10, 1933 (Cl. 18.1). A mixed fertilizer is formed in a continuous

operation by treating  $Ca_3(PO_4)_2$  satd. with nonvolatile mineral acid, with a current of  $NH_3$ .

Insecticides. Wm. J. Flaskett. Brit. 399,898, Oct. 19, 1933. A liquid to be sprayed for destroying vermin consists of 1 lb. camphor dissolved in 1 gal turpentine.

Insecticide and insectifuge. Elmer W. Adams and George M. McNulty (to Standard Oil Co. of Ind.). U. S. 1,942,892, Jan. 9. A furoic acid ester such as the butyl or benzyl ester is used with a mineral oil to form a compn. suitable for combating flies, etc.

Bactericide and fungicide. Wm. J. Lipfert. U. S. 1,943,181, Jan. 9. A powder suitable for dusting on plants and trees comprises basic Zn sulfate mixed with  $Ca(OH)_2$ .

Larvicide. John C. Munday. U. S. 1,942,532, Jan. 9. A toxic inorg. salt such as Paris green has an oleaginous material such as Turkey-red oil adsorbed upon it to produce a waterproof and buoyant larvicide. Na amyl-xanthate also may be used.

Spraying liquids. J. D. Riedel-E. de Haen A.-G. (Ludwig Hess, inventors). Ger. 587,747, Nov. 7, 1933 (Cl. 45l. 3.01). In spraying liquids, especially for plant preservation,  $MeCl$  alone or mixed with solvents b. below  $100^\circ$ , such as  $EtCl$ , ether, etc., is used as the propellant.

Rotenone extraction from plant material. Howard A. Jones (dedicated to the free use of the Government and the people). U. S. 1,942,104, Jan. 2. Plant material such as tuba or cubé root is extd. with warm  $CCl_4$  and the extd. material is crystd.

Apparatus for mixing grain or seeds with a pulverulent preservative material. Wm. W. Christie. Brit. 399,821, Oct. 9, 1933.

## 16—THE FERMENTATION INDUSTRIES

C. N. FREY

Improvements in the production of absolute alcohol. H. Guinot. Intern. Sugar J. 36, 24-8(1934).—Figures are given showing that the cost of producing abs. alc. is no more than for ordinary 96.5% rectified spirits. A process is described, by means of which pure abs. alc. can be obtained from the mash by utilizing the plant and distg. equipment available at any distillery. W. L. O.

Purification of industrial alcohol. Study of the elimination of aldehydes. II. Mircea V. Ionescu and V. N. Georgescu. Bull. soc. chim. 53, 899-909(1933).—The authors investigated a large no. of the methods in use for the removal of aldehydes from rectified alc. Many of the methods were found unsatisfactory, principally because of incomplete retention of aldehydes by the reagents recommended or because of partial oxidation to aldehyde when the alc. is distd. in air at ordinary pressure. Their work shows that oxidation of alc. can be avoided by distn. under reduced pressure. Aldehydes were completely removed by *m*-phenylenediamine-HCl, the hydrochloride of semicarbazide, Na bisulfite, Schiff's reagent; they were removed to a lesser extent by Na sulfite. The first 2 reagents are especially recommended. C. N. F.

Production of pure lactic acid from molasses. A. A. Rozhdstvenskii. Sovet. Sakhar. 1933, No. 3-4, 37.—Best results were obtained by fermentation of molasses by means of *B. delbrückii* with addn. of 10% barley malt ext. The malt was added at  $45^\circ$  and this temp. maintained for 30 min.; the mixt. was then kept at  $52^\circ$  for 30 min., and at  $58^\circ$  for 1 hr., heated to  $62^\circ$ , and filtered.  $CaCO_3$  was used to fix the lactic acid. The product was treated with  $H_2SO_4$  and filtered, and the lactic acid distd. with superheated steam. Lab. tests gave a 25-30% lactic acid that satisfies pharmacopeial requirements. It is estd. that a 50-75% product could be obtained on the industrial scale. Lea Buthoeviden

Antifermentative action of the phenols in presence of substances which decrease the surface tension. Antonio Mossini. Chim. ind. agr. biol. 9, 895-7(1933).—The min. quantities of phenol, *p*-cresol, *m*-xyleneol, *p*-ethylphenol and thymol necessary to stop the fermentation of a fer-

menting soln. (Willstätter and Steibelt soln. with beer yeast) are, resp., 0.8, 0.65, 0.47, 0.28, 0.1%. By adding previously some substances able to diminish the surface tension, these percentages are reduced as follows: with Na stearate 0.67, 0.59, 0.4, 0.26, 0.07; with Na oleate 0.5, 0.36, 0.2, 0.2, 0.06; with Na sulfonate 0.1, 0.05, 0.03, 0.02, 0.01. G. A. Bravo

Clarification (of beer) by means of shavings. K. M. van Laer. Petit J. Brasseur 11, 496-7(1933); Chimie & industrie 30, 932.—The use of shavings had been largely abandoned because of the difficulty of sterilizing them. Introduction of modern types that could be easily sterilized (metallic plates, etc.) is returning them to favor. Their merits are briefly discussed. A. Papineau-Couture

Comparative studies on the nucleic acid in saké press cake and in beer yeast. III. The preparation of nucleic acid by the use of Japanese acid clay. Masaji Kimura. J. Soc. Chem. Ind., Japan 37, Suppl. binding 8-9(1934); cf. C. A. 27, 3028.—Japanese acid clay was used for the following reasons: (1) It sets free mineral acids in contact with neutral salts, (2) it serves as a good filter, and (3) it adsorbs protein and other substances. The nucleic acid was prepd. by one of the usual methods modified by the addn. of the clay. Six preps. were made and their analyses, which show good agreement, are reported.

Karl Kammermeyer

A vegetable extract for the purpose of appreciably increasing the fermentative power of yeast. Torquato De Vita. Atti I<sup>o</sup> Congr. intern. panificazioni Roma 1932, 288-90(1933).—The author used a 20% infusion of bran and compared it with a control composed of glucose 5 g.,  $NH_4NO_3$  10 g.,  $K_2HPO_4$  5 g.,  $MgSO_4$  2.5 g.,  $Ca_3P_2O_8$  0.5 g., 50%  $H_3PO_4$  1.6 cc., and water to 1000 cc.

J. A. LeClerc

The influence of various amino acids on the alcoholic fermentation of brewer's yeast. Yuzo Tozawa and Jiro Horimi. Folia Pharmacol. Japon. 17, No. 1, 87-96 (Breviaria 5-6)(1933).—In the concn. employed, only *d*-arginine and *l*-histidine exerted a depressant action on the sugar fermentation of brewer's yeast. Their combined

action was not synergistic. The addn. of other amino acids did not increase the action of these two, nor were combinations of other amino acids tried effective. Neither the nucleus nor the cell body of the yeast appeared to be influenced by the concn. (0.0%) of the *D*-arginine or *L*-histidine used.

G. H. W. Lucas

A successful method of yeast preservation. Rudolf Bertel. *Atti I° congr. intern. panificazione Roma 1932*, 399-401 (1933).—A description of the principles embodied in B.'s patents (cf. C. A. 27, 2758). J. A. LeClerc

Exchanges of diffusible substances in the prepn. of food products. I. Prepn. of cacao [by fermentation] (Whympster) 12. Materials for making gas, etc., [by fermentation] (Brit. pat. 398,601) 21.

Vinkenborg, Helena: Die Bedeutung des Acetaldehyds bei der alkoholischen Gärung. Thesis, Utrecht. 1931. 70 pp.

Dehydrating alcohol. Deutsche Gold- und Silber-Scheideanstalt vorm. Roessler. Brit. 399,281, Oct. 5, 1933. In obtaining dehydrated alc. by contacting the crude spirit with dehydrating material, e. g., KOAc, capable of increasing the alc. content of the spirit in the

vapor phase to about 95% and distg. off the alc., free from fusel oil, the fusel oil is prevented from accumulating in the system by withdrawal from the distn. column or by removal from the residual liquor. The app. described in Brit. 368,793 (C. A. 27, 5082) may be used.

Dehydrating and distilling alcohol. Deutsche Gold- und Silber-Scheideanstalt vorm. Roessler. Brit. 399,635, Oct. 12, 1933. Abs. alc. is obtained from mashes, worts, spent sulfite lye, etc., by sepg. the alc. and fusel oil from the vinasses in a preliminary concn. and then subjecting to complete dehydration and purification as described in 399,281 (preceding abstr.). App. is described.

Gluconic or citric acid. Konrad Bernhauer. Ger. 587,819, Nov. 30, 1933 (Cl. 12a. 11). The above acid, or their salts are prepd. by fermentation of carbohydrate contg. glucose, the acid being neutralized if desired, e. g., by CaCO<sub>3</sub>. The fermentation is carried out by a bacterium or a fungus, such as *Aspergillus*.

Spirits. Verein der Spiritus-Fabrikanten (Ernst Lubdet and Bruno Lampe, inventors). Ger. 587,781, Nov. 11, 1933 (Cl. 6b. 1.01). Spirits are obtained by mincing, mashing and fermenting potatoes, and finally distg. The potatoes may be pressed and the juice fermented.

Beer. Gottfried Jakob. Ger. 587,782, Nov. 8, 1933 (Cl. 6b. 14). App. for continuously hot-filtering and cooling beer wort is described.

## 17—PHARMACEUTICAL CHEMISTRY

W. O. EMERY

Mexican argemone. O. de Almeida Costa. *Bol. assoc. brasil. pharm.* 14, 489-500 (1933).—This is a Brazilian plant which contains an alkaloid, protopine (C<sub>20</sub>H<sub>19</sub>O<sub>2</sub>N) and an oil m. 15°. This oil is used as purgative.

E. S. G. Barron

Cacao's liver oil (preliminary note). O. de Lazzarini Peckolt. *Rev. brasil. med. pharm.* 9, 278-82 (1933).

E. S. G. Barron

Aminometry of alkaloids. D. Vorländer. *Ber.* 67B, 145 (1933); cf. C. A. 28, 992.—In previous expts. cinchonine and quinine were detd. as diacid amines, strychnine and brucine as monacid amines. No suitable indicator has been found for picric acid. Water-free benzenesulfonic acid and other aromatic sulfonic acids proved to be usable.

A. E. Beillich

Nitrous oxide: history and development. H. E. G. Boyle. *Brit. Med. J.* 1934, 1, 153-5. J. B. Brown

Argentometric determination of theobromine-sodium salicylate. Julius v. Mikó. *Pharm. Monatsh.* 14, 279-81 (1933).—The method of evaluation proposed by the Pharmacopoeial Commission in the Austrian Pharmacopoeia IX is a simple alkalimetric detn. for this substance based upon the principle that the Na held in combination is converted quantitatively into NaOH and titrated with HCl. This method has been found satisfactory in cases where 1 mol. theobromine is so combined as to yield 1 mol. NaOH and is not applicable when more or less than this amt. of NaOH is produced. A method which is said to be independent of the amt. of NaOH is proposed: Accurately weigh 0.5 g. (H<sub>2</sub>O content considered), dissolve in 10 cc. H<sub>2</sub>O contained in a 100-cc. graduated flask, add 1 cc. 5 N HNO<sub>3</sub> and allow to stand for a time. Add 2 cc. 5 N NH<sub>4</sub>OH, shake several times and add 30 cc. 0.1 N AgNO<sub>3</sub>. Rinse the neck of the flask with H<sub>2</sub>O, heat carefully to boiling for 15 min., using a small flame; cool and add H<sub>2</sub>O to mark. After shaking, filter, discard the 1st 25-cc. portion of the filtrate, measure 50 cc. of the remaining filtrate into a glass-stoppered Erlenmeyer flask, and add 10 cc. 5 N HNO<sub>3</sub> and 10 cc. FeNH<sub>4</sub>(SO<sub>4</sub>)<sub>2</sub> as an indicator; in order to prevent the resulting ferric salicylate from interfering with the color change, add 0.1 N NH<sub>4</sub>SCN until the aq. layer remains a pale rose color. Cc. 0.1 N AgNO<sub>3</sub> — cc. 0.1 N NH<sub>4</sub>SCN × 0.01801 = amt. theobromine in 50 cc. soln. This value × 400 = % theobromine in sample.

H. M. Burlage

Ergot. P. N. Schürhoff. *Pharm. Monatsh.* 14, 283-4

(1933).—A historical discussion with comments on the methods of assay.

H. M. Burlage

Preparation of cosmetic emulsions. H. Schonberger. *Riechstoff-Ind.* 8, 213-15 (1933).—A discussion.

H. M. Burlage

The autoxidation of ferrous salts and the permanence of their solutions. Emil Starkenstein and Richard Steiger. *Arch. expl. Path. Pharmacol.* 172, 104-18 (1933).—Acid solns. of the simple ferrous salts keep fairly well, although differences are to be noted. The ease of oxidation of neutral solns. increases in the order FeCl<sub>2</sub>, FeSO<sub>4</sub>, Fe-(AcO)<sub>3</sub>, FeHCO<sub>3</sub>. Ferrous citrate, lactate and gluconate oxidize much more rapidly. In the absence of acid, the Fe<sup>++</sup> is pptd. as Fe(OH)<sub>2</sub>, disturbing the equil. and allowing further oxidation. The complex-forming acids act in a similar sense by combining with the formed Fe<sup>+++</sup>. The more concd. the ferrous salt solns., the less pronounced is the hydrolysis and the less pronounced the tendency to oxidation. Increasing temp. promotes hydrolysis and oxidation. Light has no effect upon the simple ferrous salts, but tends to reduce the ferric salt formed in solns. of the ferrous salt. In the absence of O, or in a CO<sub>2</sub> atm., no oxidation of the ferrous salt solns. is observed. Removal of CO<sub>2</sub> from a soln. of FeHCO<sub>3</sub> causes pptn. of Fe(OH)<sub>2</sub> in the presence of air, and of FeCO<sub>3</sub> in its absence.

Harry Eagle

Microsublimation in drug examinations. Miklós Korányi. *Magyar Gyógyszerésztud. Társaság Értesítője* 9, 332-7 (1933).—A general address. S. S. de Finály

Determination of the ethereal-oil content of plants. Miklós Janicssek. *Magyar Gyógyszerésztud. Társaság Értesítője* 9, 372-6 (1933); cf. C. A. 27, 3777.—A general address treating in detail the question of cohobation water.

S. S. de Finály

Tinctures. Dezső Wéber. *Magyar Gyógyszerésztud. Társaság Értesítője* 9, 387-90 (1933).—Tinctures made by double maceration showed higher contents but were not so perfect as those made by percolation. S. S. de F.

Rapid method for titrimetric determination and separation of metals (aluminum and copper) in drug preparations by means of 8-hydroxyquinoline. Zoltán Csipke. *Magyar Gyógyszerésztud. Társaság Értesítője* 9, 437-44 (1933).—Solns. contg. Al and Cu in the presence of tartrate are made alk. with NaOH and the Cu is pptd. with 4% alc. soln. of 8-hydroxyquinoline. The mixt. is heated to 70° for 10 min., cooled, filtered, the ppt. dissolved in HCl

and titrated according to Haen with 0.1 *N* Na<sub>2</sub>S<sub>2</sub>O<sub>3</sub>. The filtrate is acidified with AcOH, heated to 60–5° and a 4% AcOH soln. of 8-hydroxyquinoline dropped in until the liquor becomes light yellow. Then 5 g. AcONa dissolved in 20 cc. water is added, the ppt. filtered and titrated with 0.1 *N* KBrO<sub>3</sub>.

S. S. de Finály

The analysis of antipyrine and some of its derivatives. Adrienne Dózsa. *Magyar Gyógyszerésztud. Társaság Értesítője* 9, 476–506(1933).—Antipyrine was detd. by pptn. as picrate with 0.05 *N* picric acid soln., drying at 120°, weighing, dissolving in boiling water and titrating with 0.1 *N* alkali. For detn. in the presence of pyrimidone picrate the method of S. Erikson is best, but even this is not absolutely correct. Pyrimidone is best detd. by the oxidimetric method of Schulek-Menyhárt. Since the condensation of melubrine and novalgine is reversible, these can be detd. on the basis of the formaldehyde and sulfuric acid developed. CH<sub>2</sub>O was detd. according to Schulek-Gervay, H<sub>2</sub>SO<sub>4</sub> by distn. Total S was gravimetrically detd. after ignition in a specially constructed calorimetric bomb. Melubrine and novalgine solns. undergo oxidation during storage. S. S. de Finály

Dental medicines: modern pharmacological and therapeutic principles applied to their use in general practice. James E. Aiguier. *Dental Cosmos* 75, 1184–97(1933).—A concise summary of the drugs used in dentistry.

Joseph S. Hepburn

Tobacco chemistry and tobacco cultivation in the years 1930–1932. Richard Kissling. *Chem.-Ztg.* 57, 981–2 (1933).

E. H.

The combination of 6-methyl-8-hydroxyquinoline hydrochloride with *o*-hydroxyquinoline hydrochloride as a disinfectant of the bile and urinary tracts. Louis Gaucher. *Bull. acad. méd.* 109, 109–14(1933).—Both substances have a high germicidal power, especially for *Es. coli* and *Eb. typhi*. The first substance is accumulated in the organism and develops a sp. action in coli infections. The sedative action on the mucous membranes, especially of the bladder, is an advantage. The toxicity is low and permits intravenous application. The av. dose is 0.25 g. 3 times daily.

A. E. Meyer

The determination of ecgonine. A. Goris and A. and C. Chalmers. *Bull. sci. pharmacol.* 40, 641–50(1933).—By the detn. of ecgonine preps. originally low in cocaine can be distinguished from products that have deteriorated by heat. Ecgonine can be estd. by the polarimetric method of de Jongh. Observation of the following conditions is of importance: The hydrolysis of the ecgonine esters must be performed by boiling the HCl soln. for at least 3 hrs. For decoloration use the smallest possible quantity of a special charcoal such as norite. De Jongh's formula corresponds to the ecgonine in soln., not to the HCl salt. Racemization or formation of anhydro-ecgonine does not occur during the manipulations.

A. E. Meyer

Analytical constants of authentic Bulgarian essence of rose. Robert Garnier and Sebastian Sabatay. *Compt. rend.* 197, 1748–50(1933).—Analyses of 9 authentic lots gave: EtOH 1.4–12%, d<sub>4</sub><sup>20</sup> 0.8704–0.8834, n<sub>D</sub><sup>20</sup> 1.4511–1.4667, steapoptene 1.2–19.9%; [α]<sub>D</sub><sup>20</sup> (1 dm.) –2.2° to –4.1°, acid no. 4.5–17.5, rhodinol 44.7–60.9%. One l. of EtOH was obtained from 200 kg. of flowers. No relationship was found between optical rotation and rhodinol content. A new azulenogenics sesquiterpene was found in the fraction distg. above geraniol-rhodinol, which is similar to the sesquiterpene from essence of geranium Bourbon. The Sabatay reaction with a CHCl<sub>3</sub> soln. of Br (C. A. 27, 3288) gave a greenish color with pure essence of rose and an intense blue color with the sesquiterpene. J. C. M.

Morphine, codeine and their derivatives. III. Morphine methochloride and codeine methochloride. Nathan R. Eddy. *J. Pharmacol.* 49, 319–28(1933); cf. C. A. 26, 4878.—Morphine methochloride (I), large colorless prisms with 2 H<sub>2</sub>O, loses the water in high vacuum at 100°. The hydrate, m. 287–9° (decompn.), sol. in 10 parts water, [α]<sub>D</sub><sup>20</sup> –84.8° (water). Codeine methochloride (II), fine prisms, very sol. in water, m. 260–5° (decompn.), [α]<sub>D</sub><sup>20</sup> –98.8° (water). Both I and II have less pharmacol.

action than their parent alkaloids, and both exhibit definite curare-like actions. The differences between I and II were similar to the differences between the parent alkaloids.

T. H. Rider

Standardization of dosage of sodium 5-ethyl-5-(α-methylbutyl)barbiturate (nembutal) for anesthesia in cats and dogs. H. C. Bazett and W. H. Erb. *J. Pharmacol.* 49, 352–61(1933).—The anesthetic dosage of nembutal for dogs and cats cannot be adequately expressed in terms of mg. of drugs per kg. of body wt. Fat animals require larger doses than thin. Curves are shown for predicting dosage.

T. H. Rider

A pharmacognostic study of Japanese drug "Nindo." T. Munesada. *J. Pharm. Soc. Japan* 53, 689–90(1933).—The Japanese drug "Nindo" is the dried stems and leaves of *Lonicera japonica* Thumb. Its pharmacognostic study is described in detail and the difference of this plant from other similar ones is pointed out.

Naoy Uyei

Notes on the water of crystallization of quinine sulfate. G. D. Beal and C. R. Szalkowski. *J. Am. Pharm. Assoc.* 22, 1219–25(1933).—Twenty-eight specimens of quinine sulfate, representing market material, were tested for loss in weight at 100°. A specimen contg. 16.78% H<sub>2</sub>O (R) and an anhyd. specimen (A) were prepd. The market material lost 4.39–12.29%, or calcd. as H<sub>2</sub>O 1.9–5.8 mols. None of the specimens conformed to the U. S. P. which requires 7 or 8 mols. of H<sub>2</sub>O (14.43 or 16.16%). Portions of A and R were exposed in desiccators 14 days to conc. H<sub>2</sub>SO<sub>4</sub>, 3:1 H<sub>2</sub>SO<sub>4</sub>, 2:1 H<sub>2</sub>SO<sub>4</sub>, 1:1 H<sub>2</sub>SO<sub>4</sub>, satd. soln. KC<sub>2</sub>H<sub>3</sub>O<sub>2</sub> (20% humidity), satd. soln. of CaCl<sub>2</sub> (30% humidity), satd. soln. K<sub>2</sub>CO<sub>3</sub> (40% humidity) and satd. soln. of NH<sub>4</sub>Cl (80% humidity). No marked changes took place after the ninth day. The dihydrate (4.60% H<sub>2</sub>O) is the most stable form. The heptahydrate (14.43%), the octahydrate (16.16%), and the anhyd. salt tend to form the dihydrate. In changing from the heptahydrate to the dihydrate the salt loses its long, flaky cryst. form and results in short needles which have almost the appearance of fine powder. The salt also loses in bulk.

L. E. Warren

Essential oil in desert plants. III. Examination of the oil of *Artemisia tridentata* typica. Maxwell Adams and Francis S. Oakberg. *J. Am. Chem. Soc.* 56, 457–9 (1934); cf. C. A. 26, 3876.—The dry leaves of *Artemisia tridentata* typica (black sage) yield about 1% of oil, contg. 5% artemisinal (I), 20% α-pinene, 7% cineole, 40% 1-camphor, 12% unidentified sesquiterpenes and 16% resins. I, a new aldehyde, b<sub>100</sub> 61°, has d<sub>4</sub><sup>20</sup> 0.81, is very volatile, a powerful lachrymator and is probably the aromatic substance responsible for the sage brush odor; at 0° it polymerizes to a faintly yellow transparent solid, decomp. at 200°; the semicarbazone m. 184° and the 3,4-dinitrophenylhydrazones, reddish orange, m. 186°. C. J. W.

The so-called Polish surgical cotton prepared from flax. Kazimierz Monikowski. *Wiadomości Farm.* 60, 629–32 (1933).—Surgical "cotton" prepd. from flax shows the following compn.: H<sub>2</sub>O 4.5%, ash 0.14%, SO<sub>2</sub> traces, Cl 0, Ca traces, reducing substances normal, reaction neutral, sorption of H<sub>2</sub>O good. The use of Polish surgical cotton is advocated.

J. Wiertelak

Chemical studies on lymphatin. S. Trawkowska. *Wiadomości Farm.* 60, 661–2, 675–7(677 in French)(1933).—Lymphatin, the dry ext. of lymphatic glands, is of value in treating diseases of bacterial origin. The powd. prepn. has the following compn.: H<sub>2</sub>O 11.7, ash 4.633 (water-insol. part 2.8, sol. part 1.833), NaCl 0.975, alky. 0.5% (calcd. as Na<sub>2</sub>CO<sub>3</sub>), p<sub>H</sub> of aq. ext. 6.2; metals: Na<sub>2</sub>O 1.23, K<sub>2</sub>O 1.45, CaO 0.058, MgO 0.184, Fe<sub>2</sub>O<sub>3</sub> 0.028%, Mn 3.04 mg. in 100 g. dry substance. Of metals exhibiting a pronounced catalytic action the following were found for the first time: Cu 0.004%, Zn 16.9 mg. per 100 g., Ni 0.0025%, Co traces, As traces, TiO<sub>2</sub> 0.011 mg. per 100 g. Of non-metals the following were detd.: S 0.45, total P 1.043, lipoidal P 0.3026, nucleic P 0.2032, mineral P 0.4696%. Lymphatin has the following const.: fatty acids 5.6, unsaponifiable matter 7.36, cholesterol 1.021%, I no. 57, sapon. no. 230, m. p. of the acids 31.2°; acid no. 25.2, pentoses, hexoses, aldoses

and ketoses, neg., proteins pos., total N 9.8, sol. N 2.45, protein N 7.35, NH<sub>3</sub> 1.8, total protein substances 45.92%. In addn. to the above lymphatin contains a great no. of enzymes the role of which is important in metabolism. Arginase, arbutase, lecithase and glycolase were found in lymphatin for the first time. J. Wiertelak

**Preliminary studies on the oil of *Monarda fistulosa*.** S. Badzyński. *Wiadomości Farm.* 60, 689-94 (693 in French) (1933).—*M. fistulosa* contains 0.6% of an essential oil which readily becomes brown on light. The oil contains 17% of alkali-sol. substances, of which 8-9% are phenol-like compds. of the thymol group, the rest belonging to quinones. J. Wiertelak

**Pharmaceutical material from the "Papyrus Rzhherzog Rainer"** (v. Lippmann) 2. Examn. of anise (Benedek) 12. Nondyeing metalliferous sulfurized phenol derivs. [intermediates for pharmaceutical compds.] (U. S. pat. 1,943,179) 25. Negatively charged "aluminum gel" [for purifying viruses] (U. S. pat. 1,942,790) 18.

**Alkaloids from cacao products.** Jules Bebie, John W. Livingston and Max Luthy (to Monsanto Chemical Co.). U. S. 1,942,160, Jan. 2. Alkaloids are liberated and the cacao product is simultaneously rendered more readily filterable by treating the cacao cake at an elevated temp. with an aq. acid soln. such as dil. HCl while maintained near the b. p., neutralizing the acid, extg. the alkaloids with an aq. medium at a temp. near the b. p. and sepg. suspended matter from the aq. medium. Various modifications are described.

**Recovering alkaloids from cacao products.** Max Luthy (to Monsanto Chemical Co.). U. S. 1,942,177, Jan. 2. Cacao waste products such as press cake or the like are treated to obtain an aq. soln. contg. an alk. earth metal salt of theobromine; this salt is converted into an alkali metal salt as by reaction with alkali metal carbonate, the pptd. metal carbonate is filtered out and the

purified theobromine is liberated from the filtrate by use of an acidifying soln. contg. SO<sub>2</sub>.

**N-Substituted derivatives of the pyridone series.** Karl Miescher and Ernest Urech (to Soc. pour l'ind. chim. à Bâle). U. S. 1,941,312, Dec. 26. New products, for use as therapeutic agents or intermediates are formed by converting compds. contg. the pyridone nucleus, the nuclear N of which is linked with H, or compds. contg. a 2- or 4-hydroxypyridine nucleus, or their substitution products, into derivs. amino-alkylated at the nuclear N. Details are given of the production of *N*-diethylaminoethyl-2-pyridone, anhyd. hydrochloride, m. 148°, and monohydrated m. 74°, *N*-diethylaminoethyl-2-pyridone-3-carboxanilide, b<sub>0.5</sub> 205°, and its hydrochloride, m. 195°, *N*-diethylaminoethylpyridone, monohydrochloride, m. 115°, *N*-diethylaminoethyl-2-quinoline-4-carboxanilide, m. 154°, and hydrochloride, m. 258°, *N*-diethylaminoethyl-2-quinolinecarboxydiethylamide, b<sub>0.5</sub> 220°, and forming a hydrochloride, m. 148° (decompn.), 2-diethylaminoethoxy-3-phenyl-4-quinolinecarboxydiethylamide, hydrochloride, m. 154°, *N*-diethylaminoethyl-4-pyridone, b<sub>0.5</sub> 175°, 2-pyridone-*N*-ethylphthalammide, m. 135.7° and the corresponding phthalimide, m. 205°, the hydrobromide of *N*-aminoethyl-2-pyridone, m. 203°, and the corresponding hydrochloride, m. 183°, *N*-aminopropyl-2-pyridone hydrochloride, m. 181-2°, *N*-diethylaminoethylisoquinoline, b<sub>0.5</sub> 175.8°, and it is stated that there may be similarly formed: *N*-dimethylaminoethyl-2-pyridone-3-carboxanilide, monohydrochloride, m. 218°, *N*-dibutylaminoethyl-2-pyridone-3-carboxanilide, monohydrochloride, m. 181°, *N*-piperidinoethyl-2-pyridone-3-carboxanilide, monohydrochloride, m. 215°, *N*-diethylaminoethyl-2-pyridone-3-carboxyphenetide, monohydrochloride, m. 221°, *N*-diethylaminoethyl-2-pyridone-3-carboxy-*N*-ethylanilide, monohydrochloride, m. 102°, *N*-diethylaminoethyl-2-pyridone-3-carboxydiethyl-ethylenediamide, dihydrochloride, m. 86°, *N*-diethylaminoethyl-2-pyridone-5-carboxanilide, m. p. of the base 100-102°, *N*-diethylaminoethyl-2-quinoline, b<sub>2</sub> 168-70°, *N*-diethylaminoethyl-6-ethoxy-2-quinoline, b<sub>2</sub> 198-200°.

**Sodium *p*-phenylphenate.** Edgar C. Britton (to Dow Chemical Co.). U. S. 1,942,800, Jan. 9. Na *p*-phenylphenate, in the form of white needle-like monohydrate crystals, decomp. about 105°, is formed by reaction of free phenol with an excess of aq. NaOH soln. or by other described methods. It is a germicide and insecticide. Cf. C. A. 27, 4543.

**Quinoline azo compounds.** I. G. Farbenind. A.-G. Brit. 399,818, Oct. 11, 1933. Quinoline-8-azo compds. of the quinine series are manufd. by coupling the diazo compd. of 8-aminoquinoline or of a substitution product thereof with hydrocupreine, or a substitution product thereof. The products have pronounced efficacy against malaria. Among examples 6-methoxy-8-aminoquinoline is diazotized and coupled with hydrocupreine-2HBr to produce 6-methoxyquinoline-8-azohydrocupreine.

**Ovarian hormone.** Edward A. Doisy, Sidney A. Thayer and Clement D. Veler (to The President and Board of Trustees of St. Louis University). Can. 338,190, Dec. 26, 1933. An ovarian hormone is obtained by extn. of the urine of pregnant animals with BuOH, evapg., extg. the residue with C<sub>6</sub>H<sub>6</sub>, evapg., extg. the residue with BuOH and petroleum ether, extg. this soln. with an alk. soln., extg. the alk. soln. with Et<sub>2</sub>O, extg. the Et<sub>2</sub>O soln. with an alk. aq. soln., extg. the alk. aq. soln. with Et<sub>2</sub>O, evapg. the Et<sub>2</sub>O soln., and recrystg. the residual product from org. solvents.

**Ovarian hormones.** Edward A. Doisy (to The President and Board of Trustees of St. Louis University). Can. 338,200 Dec. 26, 1933. Ovarian hormones are obtained by extg. urine of pregnant animals with BuOH, removing the butyl alc., extg. the residue with C<sub>6</sub>H<sub>6</sub>, removing this, dissolving the residue in aq. NaOH, treating the NaOH soln. with Et<sub>2</sub>O, thereby fractionally distributing the hormones between the aq. alk. soln. and the ether soln., removing the ether, dissolving the residue in aq. NaOH soln., fractionally distributing

the hormones therein between ether and aq. NaOH soln., evapg. the ether, recrystg. the residue therefrom to obtain the  $\alpha$  hormone and acidifying one or more of the aq. alk. solns. from the fractional distribution to ppt. the  $\beta$  hormone.

**Testicular extract.** Fred C. Koch and Thomas F. Gallagher (to University of Chicago). U. S. 1,941,900, Jan. 2. For concg. and purifying a testicular hormone, the protein constituents are removed from testicular tissue, the testicular hormone is extd. from the residue at least once with a fat solvent such as  $C_6H_6$  and the fat solvent is removed.

**Wound-treating material.** Karl A. Hofmann (to Asociacion de productores de Yodo de Chile). U. S. 1,942,061, Jan. 2. Silk filaments are prepd. carrying 5-12% of I which is titratable with thiosulfate.

**Surgical bandages.** Bernhard Abele. Brit. 399,986, Oct. 19, 1933. A bandage or plaster is made of soft

paper or like material sprayed with I which has been rendered  $H_2O$ -sol. by combination with casein, magnesia, soda or other metallic salts.

**Use of *o*-cyclohexylphenol in antiseptic and germicidal compositions.** Edgar C. Britton (to Dow Chemical Co.). U. S. 1,942,801, Jan. 9.

**Sterilizing catgut, etc.** Alfred Mayr. Brit. 398,459, Sept. 14, 1933. Surgical sewing material is sterilized by aq. or alc. solns. of compds. of the halogens with each other, e. g.,  $ICl$ ,  $IBr$ ,  $ICl_3$ ,  $BrF_3$ ,  $IF_3$ .

**Dentifrices.** Henkel & Cie. G. m. b. H. Brit. 399,917, Oct. 19, 1933. Corresponds to Fr. 737,220 (C. A. 27, 1454) but gives addnl. information.

**Hair tonics.** Jessie M. Stevenson. Brit. 399,007, Sept. 28, 1933. A prepn. for stimulating hair growth comprises castor oil 8, peach kernel oil 2, verbena oil 4 and surgical spirits (industrial spirit contg. small amts. of castor oil and  $H_2BO_3$ ) 2 parts by vol.

## 18—ACIDS, ALKALIES, SALTS AND SUNDRIES

E. M. SYMMES

**Extraction of boric acid in Tuscany.** Albert Granger. (*Ceram., verrerie, emaille* 1933, 293-5; cf. C. A. 26, 5718.—Boric acid has been extd. since 1818 from certain vapors (*soffioni*) emitted in the region of Tuscany. Modern operations utilize both the content and energy of the vapors. Boric acid,  $NH_3$ ,  $CO_2$  and rare gases such as A and He are sep'd. and recovered. The streams of vapor are used for supplying turbines, the discharged vapor is washed to remove nearly all boric acid and the washed vapor serves to heat the concn. app. Mother liquor from the crystn. contg. small amts. of boric acid is recirculated.

Alice W. Epperson

**Combined production of sulfuric and hydrochloric acids.** G. V. Prikhodko. *Ukrain. Khem. Zhur.* 8, Wiss.-tech. Teil, 66-7 (in German 67) (1933).— $SO_2Cl_2$  was obtained by passing at room temp. an equimol. mixt. of dried Cl and  $SO_2$  mixed with dry air through a tube charged with various catalysts (Ger. pat. 364,519, 419,521; *Z. angew. Chem.* 40, 1253-4 (1927)). Passing  $SO_2Cl_2$  either into  $H_2O$  to 55° B $\acute{e}$  and heating the mixt. at 200-50° until  $HCl$  is expelled, or into 50° B $\acute{e}$ .  $H_2SO_4$  at 250° to satn. produced pure  $H_2SO_4$  (d. 1.84) and  $HCl$  (d. 1.19). The catalysts were not poisoned in the process. C. B.

**Corrosion of lead of various chemical compositions in sulfuric acid plants.** Adolf Schunemann. *Korrosion u. Metallschutz* 9, 325-31 (1933).—Test plates, prep'd. from 14 different grades of Pb and exposed to operating conditions in various parts of a  $H_2SO_4$  plant, were exam'd. for loss of wt. The influence of impurities in the Pb varied in different locations in the plant. While in the Gay-Lussac tower small addns. of Cu, Ni, Cu and Ag, and Bi had temporarily a passivating effect, complete reversal took place later on. For  $H_2SO_4$  plants the purest Pb is recommended, except where mech. vibrations cause destruction of the Pb by recrystn. Under such conditions a small Cu content is recommended. Leopold Pessel

**Oxidation of  $NH_3$  with  $O_2$  in the presence of water vapor.** G. Margolis and A. M. Dubovitzkiĭ. *Trans. Sci. Inst. fertilizers* (Moscow), No. 92, 59-67 (1932).—By substitution of  $H_2O$  vapor for the N from air, and use of  $O_2$  in mixt. with  $NH_3$ , it was possible to produce efficiently NO by the contact method, with Pt gauze as a catalyzer. In the presence of 30 to 68% vapor it was possible to keep down the temp. to 840°. With a concn. of 19-20%  $NH_3$  in the mixt. at a temp. of 780° the yield of NO was 80-93%. Any increase in  $NH_3$  caused an explosion. With a concn. of 22-23%  $NH_3$  in the presence of  $H_2O$  vapor and with 6.5 gm. of  $NH_3$  per hr. for every sq. cm. of Pt. gauze, the yield was 70-77% at 800°. Without  $H_2O$  vapor a concn. of 10-11%  $NH_3$  fed at the rate of 5.5 g. per hr. for every sq. cm. gave a yield of NO equal to 84-85% at 680-700°. By decreasing the load to 2.9 g. per hour, M. and D. found it possible to increase the concn. of  $NH_3$  to 28% and obtain a yield of NO equal to 82-83% at 640°. J. S. Joffe

**Alumina from Poshan bauxite.** Earl O. Wilson and Yu-Ling Kao. *J. Chinese Chem. Soc.* 1, 120-38 (1933).—The finely ground ore, after being calcined with soda ash and lime for 4 hrs. at 1050°, is extd. with hot  $H_2O$ , and the  $SiO_2$  is removed by boiling with CaO; the  $Al_2O_3$  is ppt'd. with  $CO_2$ . The product is satisfactory for metallurgical purposes and contains 98.81%  $Al_2O_3$  and 0.21%  $SiO_2$ . Wm. H. Adolph

**Production of barium chloride from barium sulfide with chlorine.** M. O. Kharmandar'yan and K. I. Brodovich. *Ukrain. Khem. Zhur.* 8, Wiss.-tech. Teil, 110-15 (1933).—The Grano process (U. S. Pat. 1,167,061, C. A. 10, 670), modified by chlorinating dry BaS at 150° for 3 hrs., produced 93-4%  $BaCl_2$ , free S and no  $H_2S$  and  $S_2Cl_2$ . Production of barium chloride from barium sulfate (barite) with chlorine. *Ibid.* 116-18.—A yield of 99.6%  $BaCl_2$  was obtained by chlorinating barite at 600° for 2 hrs. in the presence of the catalyst  $Al_2O_3$  and C (C and  $BaSO_4$  in equal proportion). Production of barium chloride from barium sulfate (barite) with gaseous hydrochloric acid. *Ibid.* 119-24.—Barite treated with gaseous  $HCl$  for 3 hrs. produced 50%  $BaCl_2$  at 600°, 96% at 800° and 96.7% at 1000°.  $FeCl_3$ ,  $NiCl_2$ ,  $CoCl_2$ ,  $Cu_2Cl_2$ ,  $Fe_2O_3$ ,  $MnO_2$  and  $SiO_2$  (gel) acted as anticalysts, reducing the yield of  $BaCl_2$  in proportion to the amts. used. The conversion of  $BaSO_4$  to  $BaCl_2$  with  $HCl$  increased from 30 to 95.06% at 600° in 2 hrs. on addn. of coke C to  $BaSO_4$  in equal proportion.  $BaCl_2$  was leached out with hot  $H_2O$  with a yield of 94.98%, and the recovered C was used over again. Injecting steam into the systems acted adversely.

Chas. Blanc

**Production of sodium ferrite by the Loewig process.** I. M. O. Kharmandar'yan and G. V. Marchenko. *Ukrain. Khem. Zhur.* 8, Wiss.-tech. Teil, 95-103 (in German 103) (1933).—In the production of Na ferrite, the fusion of calcined  $Na_2CO_3$  and iron ore was effected at lower temps. than usual in the Loewig method (1100-200°) by working with finely comminuted materials. Thus finely divided and easily leachable ferrite was obtained at 850° from powd.  $Na_2CO_3$  and iron ore, and at 900° from powd.  $Na_2CO_3$  and coarse ore in proportions of 1  $Na_2CO_3$  to 2 ore.

Chas. Blanc

**Catalytic production of chlorine from hydrochloric acid.** M. O. Kharmandar'yan and G. V. Prikhodko. *Ukrain. Khem. Zhur.* 8, Wiss.-tech. Teil, 68-71 (in German 71) (1933).—Optimum results of 97.5% Cl were obtained by catalytic decompn. of 18-20%  $HCl$  at 370° and at a speed of 30 l. per hr. with a contact mass prep'd. by pptg. a mixt. of nitrates of Cu, Co, Mn and Bi on fireclay and heating at 600° in an elec. oven. The catalyst is poisoned with  $SO_2$  and  $CO$ .

Chas. Blanc

**Progress in the field of hydrogen production, 1932-1933.** Carl Heinrich. *Chem.-Ztg.* 57, 933-6, 950-2 (1933).

E. H.

**The nitrogen industry in 1933.** E. B. Maxted. *Chem.* 1  
Age 29, 598-9(1933). E. H.

**Dry recovery of sulfur from hydrogen sulfide.** M. O. Kharmandar'yan, E. L. Kopelovich and A. E. Buryak. *Ukrain. Khim. Zhur.* 8, Wiss.-tech. Teil, 72-87 (in German 87-8)(1933).—The problem of desulfurizing com. waste gases with recovery of S from  $H_2S$  was investigated. The dry method was selected as more economical, and was developed with satisfactory results in a semi-com. process. The recovery of S by oxidation of  $H_2S$  is possible only at the b. temp. of S ( $300^\circ +$ ), because below  $250^\circ$  S is condensed on the contact mass, and this reduces its activity and necessitates a complicated regeneration process. The gas mixt. must contain not less than 10%  $H_2S$ , because the liberated heat is not sufficient to maintain the contact mass at  $300^\circ$  without the aid of external heat. At higher concns. it is sufficient to heat initially the catalyst up to  $300^\circ$ , and the temp. rises spontaneously up to  $400-500^\circ$  with 16-18%  $H_2S$ . The use of  $SiO_2$  gel as a catalyst, either alone or treated with salts of Mn, Fe, Mn + Fe or Fe + Cu, is possible only with an initial external heating, and though inadequately active, it possesses a greater heat capacity than activated C and is easily prepd. and regenerated.  $SiO_2$  gels impregnated with metal salts are very brittle and are easily disintegrated in the process. Chamotte proved to be a cheaper and a more stable carrier. A highly active catalyst was obtained by treating chamotte with an aq. paste of  $Mn(AcO)_2$ ,  $Fe(AcO)_3$  and a mixt. of the 2 acetates, and igniting the mass at exactly  $400-500^\circ$  with a free access of air. Equally good results were obtained with French bauxite contg. some Fe. The reaction progresses best in the presence of a small vol. (thin layer) of contact mass, and gives pptn. of S on thick layers. The compn. of escaping gas can be regulated by the concn. of  $O_2$  in the  $H_2S$  mixt.: a deficiency of  $O_2$  produces incomplete decompn. of  $H_2S$  and formation of S, while an excess of  $O_2$  gives complete oxidation of  $H_2S$  with some formation of  $SO_2$ . Equiv. mixts. of  $O_2$  and  $H_2S$  lead to incomplete oxidation of  $H_2S$ . A high velocity of gas flow over the contact mass results in a large escape of unreacted  $H_2S$ . Finely dispersed amorphous oxides of Mn and Fe possess high catalytic activity, considerably accelerating the oxidation of  $H_2S$  at a const. rate without the aid of initial external heating. The oxidation of  $H_2S$  is from 75 to 95%, depending on the concn. of  $H_2S$  in the mixt. C. B.

**Activated charcoal and industrial applications.** L. Friderich. *Chimie et industrie* 30, 1038-9(1933).—Polemical with Godel (C. A. 27, 1718). Reply. A. Godel. *Ibid.* 1039-40. Reply. L. Friderich. *Ibid.* 1040.

**Progress in lime industry in 1932.** R. Barta. *Stavro* 1933, 97; *Chem. Obozr.* 8, Abstract sect. 200. J. K.

**Use of starch for precipitation of sludge in the lime method (of causticizing sodium carbonate).** A. V. Petrov. *Ukrain. Khim. Zhur.* 8, Wiss.-tech. Teil, 89-93 (in German 93)(1933).—The use of  $CaCO_3$  in causticizing soda liquors in combination with com. wheat or potato starch produced tolerably good results in plant operation. The addn. of 0.01% starch based on the liquor vol. is sufficient to reduce the end vol. of the ppt. Peeled potatoes can be used with equal results. The speed of pptn. of chalk sludge with starch is 5 times greater than without the starch and twice greater than with limestone. The addn. of starch is effective up to a concn. of 100 g. NaOH per l. of the liquor. Chas. Blanc

**Asbestos. Its production and treatment.** Hans Diegmann. *Caoutchouc and gutta-percha* 30, 16590-1(1933).—A review and discussion. C. C. Davis

**The uses of gypsum.** Albert Moye. *Tonind.-Ztg.* 57, 942-3, 966-8(1933).—A review. Karl Kammermeyer

**Magnesite in the British Empire.** A. W. Comber. *Mining Mag.* 50, 24-7(1934).—Natural  $MgCO_3$  occurs chiefly in the cryst. form (when it may contain a proportion

$FeCO_3$  and be mineralogically classed as breunnerite) amorphous or compact magnesite. The former is he prepn. by high-temp. calcination ( $1700^\circ$ ) of dead-burned magnesite. Austria and Russia The amorphous type carries less im-

purity than the cryst. variety, and is calcined at a lower temp. ( $1450^\circ$ ) to yield caustic or cementitious material. The difference in calcination temp. of  $250^\circ$  has an important bearing on production costs. The system sometimes adopted in the U. S. A. of mixing Fe ore with a cryst. magnesite to reduce its sintering temp. is regarded as not entirely satisfactory. Light basic  $MgCO_3$  is largely imported from Germany for use as an insulator; this can be made from calcined magnesite not of the highest quality, and its manuf. affords a convenient means of utilizing the  $CO_2$  evolved at the kiln. A. W. Furbank

**The plastics industry, 1933.** H. C. Potter. *Chem.* Age 29, 607-8(1933). E. H.

**Solvents and plasticizers.** Thos. H. Durrans. *Chem.* Age 29, 605-6(1933).—A review. E. H.

**Cold adhesives.** F. Kollmann. *Farben-Ztg.* 38, 1795-7(1933).—In Germany, casein adhesives are usually sold in the form of powder mixed with lime ready for mixing with  $H_2O$ , while in the U. S. for example, the ingredients are sold separately. The general properties, uses and manipulation are briefly reviewed. G. G. Sward

**Chemistry to the rescue: a consideration of a new denture base material.** Norman B. Nesbett. *Dental Cosmos* 75, 1085-8(1933).—The advantages and use of vinyl resin in the manuf. of dentures are described. Joseph S. Hepburn

**Specifications for chemicals used in cleaning metals.** Edward B. Sanigar. *Monthly Rev. Am. Electroplaters' Soc.* 20, No. 3, 26-9(Nov. 1933).—The specifications suggested by the Electrodepositors' Tech. Soc. (London) are outlined (cf. C. A. 27, 5487). E. B. S.

**Gas production combined with the regeneration of the waste gas from lime kilns (Mehlig) 21.** App. for synthesis of  $NH_3$  (U. S. pat. 1,942,021) 1.

**Hydrocyanic acid.** Gesellschaft fur Kohlentechnik m. b. H. Brit. 399,718, Oct. 12, 1933. See Fr. 752, 296 (C. A. 28, 862').

**Ammonia.** August Gumbel. Ger. 587,585, Nov. 6, 1933 (Cl. 12k. 7). In utilizing  $NH_3$ , e. g., from coal-distn. gases, to make  $NH_4$  salts, the  $NH_3$  is first treated with Cl under conditions which result in the formation of some  $HCl$  as well as  $NH_4Cl$ . The  $NH_3$  stream may then be carried, with the  $HCl$  and  $NH_4Cl$  into other acids.

**Alkali cyanates.** Nicolaas Rusting (to N. V. Stikstof-binding-industrie "Nederland"). Brit. 399,820, Oct. 9, 1933. See Fr. 731,167 (C. A. 27, 813) and Dutch 29,812 (C. A. 27, 4634).

**Chromates; dichromates.** Bozel-Malétra (Société Industrielle de produits chimiques). Brit. 397,434, Aug. 24, 1933. Addn. to 364,361 (C. A. 27, 1997).—In the process of 364,361 other substances that yield alkali or alk.-earth during the reaction are used in place of or with the alkali or alk.-earth hydroxides, carbonates or bicarbonates. Such substances are alkali or alk.-earth sulfates, chlorides, phosphates, acetates, silicates, aluminates, nitrates, chlorates, per-salts, manganates and permanganates. In 397,435, Aug. 24, 1933, similar substances are used in oxidizing  $Cr_2O_3$ ,  $Cr(OH)_3$  or Cr ores, instead of Cr (alloy), under similar conditions.

**Nitrate production from chlorides.** Bruno Uebler. U. S. 1,942,886, Jan. 9. In producing a nitrate such as  $KNO_3$  from a chloride such as  $KCl$  by reaction with nitrous gases or  $HNO_2$ , nitric oxide is regenerated from the nitrosyl chloride evolved together with Cl by passing this mixt. over  $FeCl_3$  to form an addn. product of  $FeCl_3$  and nitrosyl chloride, heating this addn. product to obtain substantially pure nitrosyl chloride, and passing the latter at ordinary temp. over iron to form nitric oxide and an addn. product of  $FeCl_3$  and nitrosyl chloride (the nitric oxide being re-used in cycle).

**Hyposulfite solution and pure zinc oxide.** I. G. Farbenind. A.-G. (Max Bazlen, Emil Rieger and Fritz Scholtz, inventors). Ger. 587,570, Nov. 4, 1933 (Cl. 12k. 22). An aq. suspension of impure Zn dust (i. e., contg.  $ZnCO_3$ ,  $ZnO$  and foreign materials) is treated with excess of  $SO_2$ :

the  $\text{ZnS}_2\text{O}_4$  soln. is filtered off from the suspended impurities, and the soln. is treated with calcined soda to give a soln. of  $\text{Na}_2\text{S}_2\text{O}_4$  and a ppt. of  $\text{ZnCO}_3$ . Pure  $\text{ZnO}$  is obtained by calcining the latter.

**Removing iron from aluminum salt solutions.** J. R. Geigy A.-G. Brit. 399,772, Oct. 12, 1933. See Ger. 570,376 (C. A. 27, 2540).

**Ammonium molybdate.** Chemische Fabrik Budenheim A.-G. Ger. 587,709, Nov. 7, 1933 (Cl. 12a. 10). Stable solns. of  $(\text{NH}_4)_2\text{MoO}_4$  are obtained by dissolving the substance in dil.  $\text{HNO}_3$  in the presence or absence of  $\text{NH}_4\text{NO}_3$ , boiling for some time and filtering. The boiling may be carried out under pressure at temps. above the normal b. p.

**Ammonium sulfate.** Frederick W. Sperr, Jr. (to The Koppers Co.). Can. 336,146, Oct. 3, 1933. Ammoniacal liquor is treated with  $\text{SO}_2$  to form  $(\text{NH}_4)_2\text{SO}_4$  soln. Finely comminuted oxidizing gas is introduced into the lower portion of a tall narrow column of the  $(\text{NH}_4)_2\text{SO}_4$  soln. to produce  $(\text{NH}_4)_2\text{SO}_4$ . Cf. following abstr.

**Ammonium sulfate.** Robert R. Fulton (to The Koppers Co.). Can. 330,146, Oct. 3, 1933.  $\text{SO}_2$  is introduced into the ammoniacal liquor until the liquor is acid. The oily material is removed and the resulting liquor is treated with air. The  $(\text{NH}_4)_2\text{SO}_4$  in the liquor is converted to  $(\text{NH}_4)_2\text{SO}_4$ .

**Ammonium sulfate.** Frederic M. Pyzel (to The Shell Development Co.). Can. 337,009, Nov. 7, 1933.  $\text{NH}_3$  gas is injected into a stream of acidic soln. of  $(\text{NH}_4)_2\text{SO}_4$  and steam is injected into the stream at the point of injection of the  $\text{NH}_3$  to retard crystn. in the stream. The formation of  $(\text{NH}_4)_2\text{SO}_4$  crystals of uniform size is promoted.

**Ammonium sulfate.** Jan D. Ruys (to The Shell Development Co.). Can. 337,011, Nov. 7, 1933. Acid sludge is neutralized with  $\text{NH}_3$ , and the major part of the oil freed by the neutralization is removed. Finely divided particles of oil remaining in the soln. are agglomerated, and the agglomerated oil is sepd. from the  $(\text{NH}_4)_2\text{SO}_4$  soln., which is thereafter evapd.

**Ammonium sulfate.** Leon R. Westbrook. Can. 337,285, Nov. 21, 1933. The reaction of  $\text{SO}_2$ ,  $\text{NH}_3$ ,  $\text{O}_2$  and  $\text{H}_2\text{O}$  to produce  $(\text{NH}_4)_2\text{SO}_4$  takes place rapidly and substantially completely in the presence of a small amt. of nitrogen oxides ( $\text{NO}_2$  is not included); e. g.,  $(\text{NH}_4)_2\text{SO}_4$  is made by adding a small amt. of an O-transmitting N oxide to a gas phase contg. about 0.5 vol. %  $\text{SO}_2$  and the equiv. amt. of  $\text{NH}_3$  (2 mol.  $\text{NH}_3$ , 1 mol.  $\text{SO}_2$ ), a large excess of O and water vapor, N being the diluent of the gas phase, and maintaining the temp. at 70–125°F.

**Zinc oxide.** Bonner N. McCraven (to New Jersey Zinc Co.). U. S. 1,941,569, Jan. 2. Zinciferous material is reduced to produce Zn vapor from the condensation of which there is maintained a molten bath of Zn metal in full communication by gravity with a second molten bath of Zn metal from which reduction gases are excluded; Zn is volatilized from the second bath and this Zn vapor is oxidized to form  $\text{ZnO}$ . App. is described.

**Zinc oxide.** Metallges. A.-G. (Hans Klencke, inventor). Ger. 587,736, Nov. 7, 1933 (Cl. 40a. 41.01). See Fr. 753,330 (C. A. 28, 1150<sup>6</sup>).

**Decolorizing heavy spar.** Maximilian Schiechel (to American Lurgi Corp.). U. S. 1,941,626, Jan. 2. The heavy spar is heated in admixt. with a relatively small proportion of an oxide or O-contg. salt such as the nitrate or sulfate of K, Na, Al, Mg, Zn or Zr, at a temp. of at least 900° but below the fusion temp.

**Carbon dioxide.** Mark Shoeld (to The Koppers Co.). Can. 337,153, Nov. 14, 1933.  $\text{CO}_2$  is absorbed from gases contg. it by means of alkali carbonate soln. The bicarbonate soln. thus formed is sprayed into a heated chamber into direct contact with steam.  $\text{CO}_2$  is formed and removed from the chamber. The regenerated carbonate soln. is again used for absorption of  $\text{CO}_2$ .

**Hydrogen peroxide.** Kali-Chemie A.-G. (Friedrich Rusberg, Paul Schmid and Ludwig Pellets, inventors). Ger. 587,888, Nov. 9, 1933 (Cl. 12a. 16). App. for the direct prepn. of pure  $\text{H}_2\text{O}_2$  by the fractional distn. of

$\text{H}_2\text{O}_2$  soln. obtained by adding acid to dil.  $\text{BaO}_2$  is described. The mixt. of  $\text{H}_2\text{O}$  and  $\text{H}_2\text{O}_2$  vapor is made into a mist before its entry into the condensing chamber.

**Stabilization of hydrogen peroxide solutions.** Joseph S. Reichert (to The Canadian Industries Ltd.). Can. 337,601, Dec. 5, 1933. A  $\text{H}_2\text{O}_2$  soln. is stabilized by adjusting the acidity to  $p_H$  2–6 and adding an amt. of  $\text{Na}_2\text{SnO}_3$  equiv. to 5–100 mg. of Sn per l. of soln. and 0.01–0.2 g. of  $\text{Na}_4\text{P}_2\text{O}_7$  per l. of soln.

**Anhydrous sulfur dioxide.** Jack E. Elliott. Can. 337,416, Nov. 28, 1933. Liquid anhyd.  $\text{SO}_2$  is manufd. by feeding into a burner substantially pure S, adding air sufficient for vaporization but insufficient for complete oxidation and igniting the S to form S vapor. The vapor is conducted to a combustion chamber and sufficient air added for complete oxidation of the S. The resultant gas is cooled to a low temp., and the  $\text{SO}_2$  is purified by passing all the gases through a water suspension whereby the  $\text{SO}_2$  is dissolved in the water. The resultant aq. soln. is vaporized and the  $\text{SO}_2$  vapor sepd. from the water vapor. The  $\text{SO}_2$  gas is liquefied by compression and then passed to a heat exchanger and the resultant anhyd.  $\text{SO}_2$  is collected as a liquid.

**Hydrogen.** George F. Jaubert. Brit. 399,110, Sept. 28, 1933. See Fr. 42,776 (C. A. 28, 866<sup>1</sup>).

**Elemental sulfur from sulfur dioxide and hydrogen sulfide.** Ludwig Rosenstein (to United Verde Copper Co.). U. S. 1,941,623, Jan. 2. Reaction of  $\text{SO}_2$  with  $\text{H}_2\text{S}$  is effected in the presence of an inorg. gel or adsorbent carbon and of water in the liquid state (suitably at a temp. above 120°).

**Reducing sulfur compounds such as sulfur dioxide to elementary sulfur or hydrogen sulfide.** Charles G. Maier (one-fourth each to Reginald S. Dean and Henry A. Doerner). U. S. 1,941,702, Jan. 2. The compd. to be reduced is heated at an elevated temp. (suitably about 700–900°) with a reducing agent such as a mixt. of H with CO in which the H constitutes over 55% of the mixt.

**Carbon black.** John J. Jakosky and Victor F. Hanson (to The Electrolacks Inc.). Can. 337,132, Nov. 14, 1933. An elec. arc is maintained beneath the surface of a body of oil to cause dissocn. of a portion of the oil and formation of carbon black which is permitted to accumulate in suspension in the oil. A portion of oil remaining undissociated and contg. such carbon black in suspension is withdrawn from the container, the ratio of supply and withdrawal being so regulated as to maintain the concn. of carbon black in suspension in the body of oil within the container and surrounding the elec. arc between 8 and 10%.

**Carbon black.** Gustav A. Frenkel (to The Shell Development Co.). Can. 337,707, Dec. 5, 1933. Natural gas is thermally decomposed in a checker-filled converter and the C produced is collected and admixed with water. The resulting mixt. is subjected to high pressure and sprayed with a stream of hot combustion gases to effect flash evapn. of the water. Air is subsequently added to the resulting humid gas stream, and the carbon black produced is collected.

**Catalysts such as those for sulfuric acid production, etc.** Johannes L. Koetz (to Selden Co.). U. S. 1,941,557, Jan. 2. Raw catalytic material contg. water of hydration, such as a pellet-form V-contg. catalyst, is subjected to the heat given off by a chem. reaction, such as  $\text{SO}_2$  oxidation, that is set up within a moving stream of the material. App. is described.

**Condensation products.** Pfenning-Schumacher-Werke G. m. b. H. Ger. 587,643, Nov. 7, 1933 (Cl. 12a. 7.05). Hardening products are obtained by condensing urea or thiourea with sulfidic compds. and  $\text{CH}_3\text{O}$ . Thus, urea,  $(\text{NH}_4)_2\text{S}$  and  $\text{CH}_3\text{O}$  are condensed in the cold.

**Plastic compositions.** Franz Gassner. Brit. 399,208, Oct. 2, 1933. See Fr. 734,382 (C. A. 27, 1114).

**Plastic compositions.** Eugene V. Hayes-Gratze. Brit. 399,277, Oct. 5, 1933. The residue from a retting or wet-treatment for the extn. of vegetable fibers, e. g., from flax, sisal, cacao beans, etc., is used as a plastic compn. by rolling or pressing to the desired form, with or without

addnl. filling or binding materials. In an example coir waste and pith is dried, ground and mixed to a plastic mass with rubber latex.

**Plastic masses.** Bakelite G. m. b. H. (Fritz Seebach, inventor). Ger. 587,576, Nov. 4, 1933 (Cl. 306. 22). Plastic masses are prepd. by treating a soln. of novolak in fatty oils with a hardening agent. Thus, novolak obtained by condensing cresol and  $\text{CH}_3\text{O}$  in the presence of  $\text{HCl}$  is dissolved in linseed oil.  $(\text{CH}_3)_3\text{N}_4$  is then added at  $130\text{--}50^\circ$  to give a resinous mass.

**Methylene polysulfide plastic.** Joseph C. Patrick. Can. 336,070, Oct. 3, 1933. S-contg. plastics are produced by the reaction of sol. polysulfides on reactive methylene compds., such as methylene dihalides,  $\text{CH}_3\text{O}$ , polymerized  $\text{CH}_3\text{O}$  and  $(\text{CH}_3)_3\text{N}_4$ . Approx. equimol. proportions of the reacting constituents or larger proportion of the methylene compds. are used. The polysulfides are preferably sol. in water and they may be employed in aq. or alc. soln. The products obtained are in general white, yellow or yellowish white, contain more than 65% S, and are readily moldable with a mild application of heat.

**Modifying agents for plastics.** James F. Walsh and Amerigo F. Caprio (to The Celluloid Corporation). Can. 337,319, Nov. 21, 1933. Cellulose acetate and a substantially water-insol. ester of tartaric acid of low volatility are combined by the aid of a solvent. The solvent is then evapd. and the mass formed into the desired shape by heat and pressure. Modifiers include dibutyl dibenzyl, and monobenzyl tartrate. Suitable solvents are acetone, ethyl lactate, ethyl methyl ketone, etc.

**Compound sheets.** Leopold Rado. Brit. 399,304, Oct. 5, 1933. Compd. sheets are formed by drying 2 paper, pasteboard, etc., sheets, coated on one side with metal foil by means of a  $\text{H}_2\text{O}$ -sol. adhesive unaffected by heat, applying to the uncovered sides an adhesive that will soften with heat, e. g., a thermoplastic bitumen compd., and uniting. The compd. may be a mixt. of lignite or soft coal pitch, montan wax, (artificial) asphalt and (or) resin, to which is added turpentine, coal-tar oil, petroleum or linseed oil varnish. In a modification a sheet of pasteboard coated on both sides with the compd. is used to unite the metal-covered sheets.

**Compound sheet material.** Behr-Manning Corp. Brit. 399,856, Oct. 9, 1933. Tough, resilient, flexible sheet material suitable for gaskets, floor coverings, artificial leather, etc., consists of a layer of a mixt. of comminuted cork and fibers and a layer of fibers only or a layer of either material faced on both sides by a layer of the other, the layers being felted together and satd. with a flexible binder. Suitable binders are rubber latex, which may be vulcanized or contain vulcanizing agents, vulcanization accelerators and antioxidants, chlorinated rubber, polymerized isoprene, glyptal, furfural or  $\text{PhOH-CH}_3\text{O}$  resins, etc.

**Dental impression compositions.** I. G. Farbenind. A.-G. Brit. 399,842, Oct. 13, 1933. A plastic mass for dental impressions comprises shellac, copal, stearic acid and a filler, e. g., talc.

**Apparatus and method for molding seamless diaphragms for loud speakers by depositing pulp on porous or perforated formers and drying.** Robert O. Bridger. Brit. 399,165, Sept. 18, 1933.

**Use of fly ash for making molded structural material.** Harry C. Pepper and Paul W. Jones (to Rostone, Inc.). U. S. 1,942,769, Jan. 9. Fly ash produced by burning finely divided bituminous coal is reburned, slaked, mixed with an alk. earth base such as  $\text{Ca(OH)}_2$  and the mixt. is shaped and indurated (suitably by use of steam). U. S. 1,942,770 also relates to mixing fly ash with an alk. earth base and water, shaping and indurating.

**Hard rigid products such as checkers or shuffle boards from vegetable materials of high pentosan content.** Orland R. Sweeney and Charles E. Hartford. U. S. 1,941,817, Jan. 2. Materials such as corncocks, cornstalks, peanut shells, stalks or burrs of cotton are cooked in a liquid such as dil.  $\text{NaOH}$  soln. and comminuted, this

being followed by removal of a portion of the liquid from the mass, and molding into suitable shape.

**Fibrous compositions.** Behr-Manning Corp. Brit. 399,812, Oct. 9, 1933. Sheet material for gaskets and packings, as a backing for artificial leather, etc., consists of comminuted cork and fibers felted in a paper-making machine and satd. with glue or casein which is rendered insol. in  $\text{H}_2\text{O}$  by  $\text{CH}_3\text{O}$ , paraformaldehyde or  $\text{K}_2\text{Cr}_2\text{O}_7$ . Cf. C. A. 27, 1465.

**Rubber-bonded asbestos products.** Dewey & Almy Ltd. Brit. 399,871, Oct. 16, 1933. See U. S. 1,907,617 (C. A. 27, 3571).

**Aqueous dispersions of asbestos and rubber.** Dewey & Almy Ltd. Brit. 399,870, Oct. 16, 1933. An aq. dispersion of latex, the particles of which carry an electropos. charge, is added to an asbestos slurry. The rubber particles remain of colloidal dimensions and attach themselves to the asbestos fibers, which remain dispersed. The charge on the particles may be inverted to electropos. by strong mineral acids, when a protective agent, e. g., hemoglobin is also used, or preferably, by salts with multivalent cations and univalent anions, e. g.,  $\text{AlCl}_3$ ,  $\text{Th(NO}_3)_4$ , when no protective agent is necessary. The material may be used for making asbestos paper, insulating panels, brake linings, etc. Cf. C. A. 27, 3570.

**Adhesive.** Edward F. Christopher (to The Industrial Patents Corp.). Can. 336,140, Oct. 3, 1933. A powd. mixt. of casein, biuret, cyanuric acid and  $\text{CH}_3\text{O}$  forms an adhesive upon the addn. of water.

**Adhesives.** Walter H. Wedger (to Boston Blacking Co. Ltd.). Brit. 399,525, Oct. 9, 1933. Shoe parts are united by use of a cellulose compd. adhesive, e. g., pyroxylin or cellulose acetate cements, the adhesive, which has been applied to the parts and allowed to dry, being softened by a compn. comprising a low-boiling solvent, e. g., mixts. of  $\text{Et}_2\text{O}$ , isopropyl ether or hydrocarbons, e. g., mixed pentanes, with  $\text{Me}_2\text{CO}$  (and  $\text{EtOAc}$ ) or  $\text{EtOH}$ , and a material, e. g., a high-viscosity nitrocellulose or cellulose acetate, which imparts such a character to the compn. that ample time is allowed for assembly of the parts before hardening of the adhesive because of evapn of the solvent, but rapid evapn. of the solvent is permitted after assembly of the parts which are held together under pressure for a much shorter period than usual, e. g., 6 min. at ordinary atm. temps. or less if heat is used. Camphor and (or) resins, e. g., rezyl balsam (I) or santoline resin (II), may be added to the softening compn. I, preferably contg. a (semi-) drying oil, e. g., tung or China wood oil, is made by heating together diethylene glycol, phthalic anhydride and, e. g., China wood oil under a reflux condenser with agitation. II is a product of the condensation of a mixt. of *o*- and *p*-toluenesulfonamide with  $\text{GH}_3\text{O}$ .

**Adhesive and film-forming composition.** Paul C. Lemmerman and Wm. K. Schweitzer (to Grasselli Chemical Co.). U. S. 1,942,299, Jan. 2. A compn. suitable for coating various surfaces comprises a concd. alkali metal silicate soln. contg. less than 2% of a wetting agent such as a substituted naphthalenesulfonic acid, sulfonated oily substance, high mol. wt. carboxylic acid, bile acid, aldehyde, saponin or high-boiling monohydroxy alc. or ester.

**Peanut flour for the manufacture of adhesives.** Irving F. Laucks (to I. F. Laucks Inc.). U. S. 1,942,109, Jan. 2. An oil-free peanut flour is prepd. the protein of which is at least partially coagulated by heat, and this flour is used with an alk. aq. dispersion medium such as one formed with lime and soda to prep. an adhesive of good viscosity, water resistance and strength.

**Synthetic wax preparations from montan wax.** Wilhelm Pungs and Michael Jahrstorfer (to I. G. Farbenind. A.-G.). U. S. 1,942,833, Jan. 9. Products having phys. properties similar to those of carnauba wax or beeswax and which are suitable for use in shoe creams, floor polishing compns., in coating paper, etc., are obtained when crude, deresinified or bleached montan wax, is wholly or partly converted into fatty acids by a treatment with oxidizing agents for example according to U. S. Patent No. 1,777,766 (C. A. 24, 5984) or by steam distn.; the car-

boxylic acids, if desired in the form of their methyl or ethyl esters, are then reduced to alcs. and the latter esterified with one or more non-aromatic monocarboxylic acids contg. up to 25, preferably from 10 to 25 C atoms. As acids for the esterification may be used, *e. g.*, the fatty acids, such as formic, acetic, lactic or butyric acids and especially those of high mol. wt., *e. g.*, vegetal, *i. e.*, vegetable or animal acids, such as stearic acid, palmitic acid, acids from wool fat, linoleic, ricinoleic or resinic acids in the pure or crude state, *e. g.*, colophony, cycloaliphatic naphthenic acids and like non-aromatic mono-carboxylic acids of high mol. wt. as well as mixts. of these acids. Depending on the selection of the acids employed for the esterification, it is possible to prepare wax-like substances having any desired hardness. Various examples, details and modifications of procedure are given.

**Polishing composition.** Grace C. Hipwell. Brit. 399,517, Oct. 6, 1933. A compn. for use on metal, wood, (artificial) leather, etc., is made by adding linseed oil, turpentine and AmOAc to a soln. of shellac in methylated spirit.

**Emulsifying and other agent.** I. G. Farbenind. A.-G. (Karl Brodersen, inventor). Ger. 581,955, Aug. 5, 1933 (Cl. 120. 23.01). An agent for wetting, cleaning, emulsifying, etc., is prepd. by condensing amides of the higher fatty resin and naphthenic acids with aldehydes and aromatic hydrocarbons or their OH, NH<sub>2</sub> or halogen substitution products. The condensates may be sulfonated or have other solv.-inducing groups introduced. In an example, lauryl amide, CH<sub>3</sub>O, KOH, water, PhOH and HCl are stirred together to give a viscous oil suitable for the above uses.

**Softening agents.** I. G. Farbenind. A.-G. Brit. 399,817, Oct. 11, 1933. Softening agents for plastic masses contg. albuminous substances, *e. g.*, albumin, blood, casein, which are free from ash, are prepd. by sulfonating animal or vegetable oils, *e. g.*, castor, neat's foot, to a small extent with H<sub>2</sub>SO<sub>4</sub>, working up the products in the absence of salts of fixed alkalies and adjusting the titer by NH<sub>3</sub> or volatile alkylamines, *e. g.*, MeNH<sub>2</sub>. In an example castor oil is sulfonated and the product, washed with H<sub>2</sub>O, is salted out with (NH<sub>4</sub>)<sub>2</sub>SO<sub>4</sub> and made slightly alk. with NH<sub>3</sub>.

**Wetting agents.** Imperial Chemical Industries Ltd., Fred Scholefield, Walter F. A. Erinen and Wm. Todd. Brit. 399,537, Oct. 2, 1933. A wetting agent comprises a product prepd. according to Brit. 274,611 (C. 1. 22, 23.8) or 311,885 (C. 1. 24, 932), com. pine oil, terpineol or like terpene alc. and H<sub>2</sub>O in the proportion by wt. of  $x : y : z$ , in which  $x + y + z = 100$  and  $x$  and  $y$  are 40-55 and  $z$  9-18.

**Sols for clarifying liquids such as coal wash waters, sewage, etc.** Curtis Q. M. Campbell. U. S. 1,942,507, Jan. 9. A coagulative sol for the concn. of substances in suspension or emulsion in water comprises a combination of an aq. suspension contg. about .5% of starch with expanded but unruptured cells and a dil. soln. of NaOH.

**Negatively charged "aluminum gel."** Pearl H. Brewer and Henry R. Kraybill (to Purdue Research Foundation). U. S. 1,942,790, Jan. 9. For making a negatively charged "aluminum gel," NH<sub>4</sub>OH is added to Al<sub>2</sub>(SO<sub>4</sub>)<sub>3</sub> until the soln. is alk. to litmus, an addnl. amount of Al<sub>2</sub>(SO<sub>4</sub>)<sub>3</sub> substantially equal to the original amt. is added, the white gelatinous ppt. which forms is permitted to settle, supernatant liquid is removed, and the ppt. is repeatedly washed with water, by shaking and then settling, until the NH<sub>4</sub> salts are practically all removed. The product is suitable for use in purifying viruses or other solns. or suspensions.

**Gas-producing compositions.** Imperial Chemical In-

dustries Ltd. and Wilfred R. Cousins. Brit. 399,173, Sept. 25, 1933. A compn., in pelleted form, which evolves gas upon heating, comprises a solid gas-producing substance or mixt., *e. g.*, NH<sub>4</sub>Cl and NH<sub>4</sub>NO<sub>3</sub>, tartaric acid and NaHCO<sub>3</sub> or (NH<sub>4</sub>)<sub>2</sub>CO<sub>3</sub>, with a small proportion of a stabilizer which is an anhyd. substance capable of forming a hydrate (or a hydrate that tends to form a higher hydrate) at temps. of storage of the compn., *e. g.*, anhyd. Na<sub>2</sub>CO<sub>3</sub> or Na<sub>2</sub>SO<sub>4</sub>. The pellets may be used for inflating rubber balls, etc., *e. g.*, at 100° or over.

**Stereotype matrices.** Sydney W. H. Long, Miles Graham, The London Express Newspaper Ltd. and Dunlop Rubber Co. Ltd. Brit. 399,936, Oct. 10, 1933. Deformation of the flexible flongs during casting of printing surfaces is prevented by providing them with a heat-resistant flexible backing composed of a vulcanizable material. The backing consists mainly of rubber, gutta-percha, balata, etc., and can be applied either as a plasticized sheet or an artificial or natural aq. dispersion. In an example a compn. contg. rubber, S, ZnO, Zn diethyldithiocarbamate, barytes and limestone dust is used.

**Nonslipping surface suitable for shoe soles, floor coverings, conveyor belts, etc.** Daniel Repony (to Raybestos-Manhattan, Inc.). U. S. 1,941,912, Jan. 2. A nap is formed upon a base fabric such as terry cloth, the nap is coated with a friction surface material such as a rubber compn. and the threads of the nap are subsequently sepd.

**Heat transfer.** Winthrop S. Lawrence (to Kaumagraph Co.). U. S. 1,941,697, Jan. 2. A paper base is printed with a marking comprising molten fusible material such as a wax and oil mixt. and a pigment such as Cd selenide and a relatively volatile fluid such as "butyl carbitol" which does not substantially volatilize when the compn. is melted and the b. p. of which is above 200°, and the relatively volatile fluid is then allowed to escape from the printed marking which is formed upon the paper base. Cf. C. A. 28, 1486<sup>4</sup>.

**Puncture-proofing composition.** Eugen Hirsch. Can. 330,531, Oct. 24, 1933. A puncture-proofing compn. for pneumatic tubes consists of gum tragacanth 8 lb. dissolved in 14 gallons of water, contg. 16 oz. of short threads of cotton and plasticized with sugar 142 lb., salicylic acid 8 oz., carbolic acid 4 oz., oil of tar 4 oz., alc. 7 gallons, MgCO<sub>3</sub> 45 lb., and Mg silicate 27 lb.

**Projection screens.** Karl Zechmanek and D. Weissmann. Brit. 399,507, Oct. 2, 1933. A sound-permeable projection screen comprises a fine porous textile fabric, *e. g.*, crepe georgette, covered with paint in such a way that some of the pores are closed while others remain open. An oil paint made by suspending finely divided ZnO in boiled linseed oil, nitrocellulose paint made by mixing nitrocellulose lacquer with white pigment or white enamel paint may be used. With some fabrics a preliminary coating of paraffin wax in petroleum is necessary.

**Embalming fluid.** Wm. C. Black (one-half to Chauncey G. Wilson). U. S. 1,942,407, Jan. 9. An embalming fluid suitable for use with jaundiced bodies contains benzoyl peroxide in a fluid solvent distributor such as an aq. soln. of EtOH and formaldehyde.

**Vermin destroyer.** Firma Hermann Nier. Ger. 587,853, Nov. 9, 1933 (Cl. 45. 3.01). A prepn. for destroying vermin on fowls, dogs, etc., consists of naphthalene with a 3% addn. of nicotine.

**Fire extinguishers.** Joseph Caffarel. Brit. 397,391, Aug. 24, 1933.

**Fire extinguisher.** Werner Ursum. Ger. 587,932, Nov. 10, 1933 (Cl. 61b). A filling for fire extinguishers contains non-inflammable org. F compds., such as CCl<sub>2</sub>F<sub>2</sub>, or C<sub>2</sub>H<sub>2</sub>Cl<sub>2</sub>F<sub>2</sub>, as quenching agents.

## 19—GLASS, CLAY PRODUCTS, REFRACTORIES AND ENAMELED METALS

G. R. BARTON, C. H. KERR

Jonah Spode—his times and triumphs. John Thomas. *Trans. Ceram. Soc. (Engl.)* 32, 489-512 (1933).—A biographical sketch. H. F. Kriege

Essentials of glass technology based on American practices. Samuel R. Scholes. *Ceram. Ind.* 22, 102-4 (1934); cf. C. A. 28, 1157<sup>1</sup>. H. Willson

**Progress of the glass industry in 1932.** Oscar Knapp. *Glashütte* 63, 675-6 (1933).—K. briefly reviews the latest investigations dealing with: (1) crystal chemistry of silicates; (2) arrangement of atoms in glass; (3) the state of undercooled liquids and glasses; (4) nature of the glassy state; (5) constitution of glass according to the solvation theory; (6) vols. of tech. glasses; (7) the system K and Na silicates and silica; (8) melting diagrams of the system  $\text{PbO-SiO}_2$ ; (9) reactions between Ca carbonate and  $\text{SiO}_2$ ; (10) rate of disintegration of Ca carbonate; (11) volatilization of soda silica glasses; (12) synthetic Ca silicates. References are given.

M. V. Kondoidy

**New ideas concerning the flow of glass in tanks.** H. Hausner. *Ceram. Ind.* 22, 18-22, 81-6 (1934); cf. C. A. 27, 5913.

Herbert S. Willson

**Effect of zirconium oxide on the resistance of heavy baryta glasses.** W. G. Voinot and A. A. Appen. *Optic. Mech. Ind.* (U. S. S. R.) 12, 8 (1932); *Sprechsaal* 66, 825 (1933).—Heavy baryta glasses have a low resistance to acids; it was attempted to ameliorate resistance by changing the glass compn. without changing the optical properties of glasses. According to Turner ZrO improves the stability of glass. In a glass of the compn.  $\text{SiO}_2$  31.78,  $\text{BaO}$  47.96,  $\text{B}_2\text{O}_3$  12.86,  $\text{Al}_2\text{O}_3$  3.03,  $\text{ZnO}$  2.83,  $\text{As}_2\text{O}_3$  1.54 ( $n_D = 1.6126$ ,  $n_F - n_C = 0.01046$ ), silica was replaced by increasing addn. of  $\text{ZrO}_2$ . Two series of melts were produced, one in grog the other in Pt crucibles. Up to 5%  $\text{ZrO}_2$  was added in the form of Zr mineral. The resistance of glasses obtained was not improved. M. V. Kondoidy

**Melting white arsenic enamel for glass.** M. F. Shur and V. I. Mosheiko. *Glashütte* 63, 524-6, 542-4 (1933).—White glass enamel is used for applying white strips on thermometric capillaries, burets, etc. The enamel must have the same coeff. of expansion as the glass; while the coeff. of elasticity (elasticity modulus), coeff. of Poisson, softening temp. and tensile strength should correspond to those of the glass. The enamel must be easily fusible, and its chem. compn. should be such that with repeated heating the color would not change (color usually changes because of the reduction of Pb or As). White sand, As oxide,  $\text{Pb}_2\text{O}_3$ ,  $\text{KNO}_3$ , boric acid and feldspar or kaolin were used as raw materials.  $\text{SiO}_2$  and PbO are the chief ingredients (they are present as the compd.  $\text{PbSiO}_3$ ). PbO,  $\text{K}_2\text{O}$ ,  $\text{Na}_2\text{O}$  and  $\text{B}_2\text{O}_3$  make the enamel easily fusible.  $\text{B}_2\text{O}_3$  and PbO bestow a special luster; while As oxide makes it opaque. The fusing temp. is 1250-80°. The flame should never be reducing so as not to ppt. metallic Pb or As. Directions for the prepn. of the enamel batch, its fusing and cooling are given. M. V. Kondoidy

**Employing blast-furnace slag in glass manufacture.** Fritz Althof. *Glashütte* 63, 604-6 (1933).—The granulated blast-furnace slag used did not contain alkalis. The batch contg. slag melted easily; hence the soda content of the batch could be lowered considerably (23%). Because of the presence of S (in the form of CaS) and Mn oxide in the slag, graphite and pyrolusite were not used for coloring the glass. It was found that the S coloring is more certain and uniform. Bottles manufactured from batches contg. slag (12%) were found to be very stable. M. V. Kondoidy

**Interpretation of the action of mineralizers.** W. Eitel and W. Weyl. *Chem. Erde* 8, 445-61 (1933).—The action of small amts. of volatile components on the viscosity, crystn. power and inner mol. equil. of glasses is reviewed. A crystn. theory is advanced which takes into account the field action of ions and dipoles and according to which complexes or stable lattice configurations may form. Absorption spectrum measurements on a Na silicate glass colored with NiO were made, and from these the effects on the inner equil. of chilling and of fluoride addn. were studied. P. S. Roller

**Significance of the microscope for judging devitrification.** Hugo Kühn. *Glashütte* 63, 567-71 (1933).—The crystn. phenomena referring to devitrification are due to various causes. The following possibilities are present when batches are melted which do not produce eutectic melts: (1) Undissolved particles remain in the melt.

(2) The glass appears to have streaks and is cloudy. The microscope shows the presence of cristobalite crystals. (3) A part of the melt is clear, while the other is cloudy, forming an inhomogeneous glass. On cooling, such a melt devitrifies. The microscopic study of stones shows the presence of dense crystal needles of prismatic form. They are formed by Ca and silica and are known as wollastonite. Usually, wollastonite crystals appear together with those of cristobalite. In defective alumina glasses, Na aluminate crystals form large colorless prisms. The observations of Tammann, Zsigmondy, Jøbsen-Marwedel and Penner on the formation of crystals are discussed.

M. V. Kondoidy

**Effect of barium oxide on the properties of technical glasses.** F. H. Zschacker, W. Höder and A. Riaz. *Keram. Rundschau* 40, 534-6, 558-61 (1932).—In glasses with 10% RO, substitution of CaO by BaO raises the speed of melting. The clarifying velocity at first increases and then decreases; the glasses are "longer." Pure BaO glass is almost colorless; the workability and the luster are improved by BaO. On substitution of  $\text{Na}_2\text{O}$  by BaO the melting velocity is at first almost unchanged, but larger quantities reduce it; clarification is more difficult and the color darker. BaO glasses poor in  $\text{Na}_2\text{O}$  readily devitrify. Prolonged melting produces a brown color due to sulfide.

B. C. A.

**Chemical glass and optical glass.** P. Gilard. *Rev. universelle mines* 9, 243-8, 268-72 (1933).—See C. A. 27, 4044.

M. Hartenheim

**Testing methods for glass tank blocks.** A. Möser. *Tonind.-Ztg.* 57, 871-2 (1933).—A review of testing methods relating to the vitreous properties. K. K.

**Cooling of the refractory blocks of glass tanks.** O. Bartsch, H. Blank, H. Jersen-Marwedel, W. Koenig and A. Schild. *Fachausschussber. Deut. Glastechn. Ges.* 1932, No. 23, 19-28; *Chemie & Industrie* 30, 1368.—Cooling of the bricks must be considered as a mistake, because it intensifies transverse currents and therefore the erosive action of the glass on the bricks. After the bricks have been in service for some time, it becomes necessary to cool them so as to lengthen their life; in this case cooling should be coned. at the joints; it is necessary to solidify the glass in the cracks, so as to prevent leaks. Refrigeration is effective only if the glass thickens considerably on contact with the brick, which can be effected only with bricks less than 50 mm. thick. Best protection of the joints consists in blowing cold air directly on the glass so as to solidify it.

A. Papineau-Couture

**West Bohemian kaolin and clay deposits.** W. R. Zartner. *Zprávy českoslov. keram. společnosti* 1932, 48-76, *Chem. Obzor* 8, 2(X).

J. Kučera

**Some factors in the weathering of clay shales.** S. R. Hind. *Ceram. Age* 22, 169-70 (1933).

H. S. W.

**Plasticity, shrinkage and other fundamental properties of clay in relation to the form of the clay particles.** Julius Aron. *Trans. Ceram. Soc.* 32, 513-32 (1933).—A translation of the original article appearing in 1873 in *Notizblatt des deutschen Vereins für Fabrication von Ziegeln, Thonwaren, Kalk und Cement* 9, 167. The discussion of tests with numerous German clays is of technical and historical interest.

H. F. Kriege

**Rational analysis of clays.** Albert Granger. *Ceram. vererie, emailerie* 1933, 245-7; cf. C. A. 27, 5914.—Alkalis in clay are believed to result from at least 3 origins: feldspar, mica and alkalis absorbed by argillaceous matter. Rational analysis does not lead to precise results.

Alice W. Epperson

**Practical studies of the relation between burning cracks and clay analysis.** W. Schuen. *Tonind.-Ztg.* 57, 1146-8 (1933).—Burning becomes more difficult as the amt. of chemically bound  $\text{H}_2\text{O}$  increases. Burning cracks, which appear at about 600°, increase as the free  $\text{SiO}_2$  content and the degree of acidity of the acid part increase and the silicate content decreases.

Karl Kammermeyer

**Some notes on the shrinkage of clays during drying.** J. W. Mellor. *Trans. Ceram. Soc.* 32, 455-71 (1933).

H. F. Kriege

**Technical production of tridymite bricks.** H. Salmang

and H. J. Lungen. *Tonind.-Ztg.* 57, 650-1(1933).—Eighteen tests on frits of different compns. show that it is possible to produce tridymite only and have low porosity and high resistance to temp. shock. Flux adds. to the frit ( $\text{Na}_2\text{O}$ ,  $\text{Fe}_2\text{O}_3$ ,  $\text{FeO}$ , etc.) are desirable in small amts.

Karl Kammermeyer

**Heat expansion of silica bricks.** Fritz Fromm. *Arch. Eisenhüttenw.* 7, 381-4(1934).—Expansion of 5 kinds (d. 2.38-2.44) was detd. for temps. up to  $1600^\circ$ . Heat expansion from 0 to  $1600^\circ$  and growth above  $1400^\circ$  increased considerably with the d. The growth is less under pressure according to porosity. All samples assumed after heating to  $1600^\circ$  the same d. of 2.32. The quartz begins to change to tridymite in coke ovens at  $800^\circ$ , at first slowly up to  $1410^\circ$ ; at higher temps. and especially in bricks of more than 2.38 d. the conversion is rapid so that the elongation may lead to warping and damage of tie-rods.

M. Hartenheim

**Heat sources for brick drying.** Georg Zehner. *Tonind.-Ztg.* 57, 792-3(1933).

Karl Kammermeyer

**Building materials for tunnel kilns.** Felix Singer. *Tonind.-Ztg.* 57, 618-19(1933).

Karl Kammermeyer

**Rational firing of rotary kilns.** Carl Kjeldsen. *Tonind.-Ztg.* 57, 1077-8(1933).—A discussion of operating practices.

Karl Kammermeyer

**Protective coatings for kiln repair.** W. Schuen. *Tonind.-Ztg.* 57, 676-7(1933).

Karl Kammermeyer

**The slagging action of fuel-oil ash.** L. R. Faulkner. *Bull. Am. Ceram. Soc.* 13, 45-6(1934).—Unfired  $\text{MgO}$  showed the lowest vol. loss, and recrystd.  $\text{SiC}$  the least effect in a series of tests. No direct relation was seen between  $\text{SiO}_2:\text{Al}_2\text{O}_3$  ratio and slag resistance in the fire-clay types of refractories. Absorption was apparently not directly related to slag resistance.

C. H. Kerr

**Manufacture of stoneware for the chemical industries.** P. P. Budnikov and S. A. Shcheparevich. *Chem.-Ztg.* 57, 903-4(1933).—Clays and feldspar of South Russia were found useful for chem. stoneware. The use of artificially plasticized clay gives a thick body structure with normal shrinkage and a proportionately lower firing temp. Higher acid resistance was secured by the casting process than by plastic formation. Ceramic properties of raw materials and finished products are tabulated.

C. B. Jenni

**Decarbonization, reduction and blister formation in the firing of stoneware.** M. Mields. *Tonind.-Ztg.* 57, 908-9, 933-4(1933).—A discussion of the chem. principles involved.

Karl Kammermeyer

**Practical notes on the manufacture of porcelain.** Marc. Larcheveque. *Ceram. verrerie, emailerie* 1933, 341-5; cf. C. A. 25, 1649.—Formulas are given for emulsion for retouching glazes and machines for removing glaze are described.

Alice W. Epperson

**Physical and chemical phenomena in the manufacture of refractories.** Karel Hincis. *Slavsko* 1933, 128; *Chem. Obzor* 8, Abstr. Sect. 198.—The amt. of kaolinite in Czechoslovakian clays is 23.5-86.5%. If it is assumed that all the  $\text{Al}_2\text{O}_3$  is combined in kaolinite, the remainder would be:  $\text{SO}_3$  55.8-68.2, Fe compds. 1.2-11.5,  $\text{CaO}$  0.5-30.0,  $\text{MgO}$  0.6-8.5%.

Jaroslav Kucera

**A new method for testing refractories.** Georg Ising. *Tonind.-Ztg.* 57, 812-13(1933).—In a special furnace test blocks can be exposed to com. conditions and the appearance of the test surface noted.

Karl Kammermeyer

**Notes on the refractory clays of the Andenne basin.** A. Clausset. *Verre et silicates industriels* 5, 2-6(1934).

Herbert S. Willson

**Graphite in refractory materials.** Erich Buchholtz. *Tonind.-Ztg.* 57, 1207-8(1933).—A general discussion.

Karl Kammermeyer

**Action of carbon monoxide on refractory materials.** I. W. Hugill, H. Ellerton and A. T. Green. *Trans. Ceram. Soc.* 32, 533-42(1933).—Sec C. A. 26, 3083. II. Further experiments on the disintegration of fireclay products by carbon monoxide. *Ibid.* 543-50.—See C. A. 26, 3084.

H. F. Kriege

**Improved method for measuring the "after-contraction" of refractory materials.** A. Eric J. Vickers and J. A.

1 Sugden. *J. Soc. Glass Tech.* 17, 320-3(1933).

H. F. Kriege

**The relations between water permeability and the structure of refractories.** Otto Bartsch. *Tonind.-Ztg.* 57, 1158-9, 1182-3(1933).—The influence of burning temp., preliminary burning and grain distribution of grog, and mfg. methods upon water permeability were investigated.

Karl Kammermeyer

2 **Comparison of the rates of flow of water and of air through refractory materials.** F. H. Clews, E. O. Mills and A. T. Green. *Trans. Ceram. Soc.* 32, 472-8(1933).—Ten refractories with apparent porosities of 17.9-70.2% were compared. The comparative order established by the water penetration method was acceptably close to that found by the more laborious water- or air-permeability methods.

H. F. Kriege

**Discoloration of refractories by "iron."** J. W. Mellor.

3 *Trans. Ceram. Soc.* 32, 403-14(1933).—If iron were the only coloring constituent, greens, blues and black would result from ferrous iron and reds from ferric iron. However, the tendency of  $\text{Fe}_2\text{O}_3$  and  $\text{Al}_2\text{O}_3$  to form solid solns. at temps. below  $700^\circ$  modifies the reds beyond mere diln. to buff. Lime also bleaches  $\text{Fe}_2\text{O}_3$ . The proper combination of  $\text{FeO}$  and  $\text{Fe}_2\text{O}_3$  in the presence of  $\text{Al}_2\text{O}_3$  may yield white as seen occasionally around black cores in refractories.

H. F. Kriege

4 **The palette of modern colloidal colors.** E. Zschimmer. *Ceram. verrerie, emailerie* 1933, 255-9; cf. C. A. 27, 5014.—A review relating to the yellow of  $\text{CdS}$  and ruby of  $\text{Se}$  and  $\text{CdS}$ .

Alice W. Epperson

**Further development of the underglaze color crayon.** Kenneth E. Smith and Aurelia Arbo. *Bull. Am. Ceram. Soc.* 13, 40-1(1934); cf. C. A. 27, 173.

C. H. Kerr

5 **Leadless glazes in the home pottery industry.** L. I. Sivoplyas. *Ukrain. Khim. Zhur.* 8, Wiss.-tech. Teil, 104-8(in German 108; in Russian 109)(1933).—Leadless glazes were developed equal to glazes contg. Pb. The chief constituents are low-melting clays, soda, quartz, chalk, etc.

Chas. Blanc

**Pastes which work well with stanniferous enamels.** V. Lucas. *Rev. matériaux construction trav. publics* 1933, 228-31B.—The compns. of pastes and their casting properties are discussed.

Karl Kammermeyer

6 **Foundry refractories** (Crawley) 9. **Ceramic ink** (Can. pat. 337,714) 26. **Heat of hydration of kaolin** (v. Gronow, Schwiete) 2.

**Chipman, Frank W.:** Romance of Sandwich Glass. Boston: Sandwich Pub. Co. \$5.

**Eden, F. Sydney:** Ancient Stained and Painted Glass. New York: The Macmillan Co. \$2.50.

7 **Litinsky, L.:** Markenbezeichnungen im Feuerfest-Fach und im Ofenbau. Leipzig: The Author. M. 5.

**Urbach, E. Erwin:** Hermann Seger. The Life and Work of a German Scientist. Berlin: Keram. Rundschau. 67 pp. M. 5.

**Apparatus for feeding batch materials to glass-melting furnaces.** Everett O. Hiller (to Hartford-Empire Co.). U. S. 1,941,897, Jan. 2. Structural and mech. features.

**Uniform feeding of mold charges of molten glass.** Wm. J. Miller and Edward A. Lawrence (to Hartford-Empire Co.). U. S. 1,942,035, Jan. 2. Various details of app. and operation are described.

**Photoelectric control device for automatically feeding mold charges of molten glass.** Everett O. Hiller (to Hartford-Empire Co.). U. S. 1,941,896, Jan. 2. Various structural and operative details are described.

9 **Continuous glass manufacture.** Walter O. Amsler (to Simplex Engineering Co.). U. S. 1,941,778, Jan. 2. In making glass in a tank having a melting chamber and a cooling chamber sepd. by a reduced neck through which a full depth flow of glass is permitted, a max. temp. on the glass is maintained in the melting chamber at a point adjacent to the end of the neck. App. is described. U. S. 1,941,779 relates to details of glass-tank construction.

**Apparatus for automatically controlling the weight of glass articles made by the gob-feed automatic machine process.** Kenneth M. Henry and Burton A. Noble (to Hartford-Empire Co.). U. S. 1,941,552, Jan. 2. A photoelec. cell exposed to light rays emitted by the "gobs" serves to control the outflow of glass. Various elec. and mech. details are described.

**Apparatus for maintaining the thickness of drawn glass tubes, rods or sheets.** Jules Arrault (to Soc. anon. des manufactures des glaces et produits chimiques de St. Gobain, Chauny & Cirey). U. S. 1,941,924, Jan. 2. Mech. features.

**Apparatus for manufacture of glass bottles, tumblers, etc.** Willard L. Van Ness (to Corning Glass Works). U. S. 1,943,195, Jan. 9. Mech. features.

**Apparatus for uniform heating and softening of a succession of similar glass articles such as in electric light bulb manufacture.** Adolph W. Machlet. U. S. 1,941,807, Jan. 2. An app. is described in which fuel gas is compressed and cooled to sep. moisture from it, air is similarly treated, the dried gas and dried air are mixed with each other under pressure, and a jet of the burning mixt. is projected against the glass articles being treated.

**Composition for coating electric lamp bulbs to render them opalescent.** Albert F. Lindstrom (to Westinghouse Lamp Co.). U. S. 1,941,990, Jan. 2. Na silicate is used in admixt. with a filler such as kaolin, hydrated chromic oxide and boric acid.

**Silvering glass surfaces.** George F. Colbert and Wm. H. Colbert (to Liberty Mirror Works). U. S. 1,942,686, Jan. 9. For partially silvering a glass surface, a coat of Ag is pptd. over the area, a film of Cu is electrodeposited on the Ag, a pattern resistant to the action of a solvent of these metals is superposed on the coatings and the exposed parts are then subjected to the action of a solvent such as an acid soln. Various details and modifications of procedure are described.

**Optical glass.** Edwin Berger (to Jenaer Glaswerk Schott & Gen.). U. S. 1,943,051, Jan. 9. An optical glass in which  $n_D > 1.77 - 0.0037\gamma$  ( $\gamma$  is the relative dispersion), contains 0.5-20% of  $TiO_2$  which serves to reduce the susceptibility of the glass to tarnishing.

**Transfers.** Leonard Allen and Johnson Matthey & Co. Ltd. Brit. 390,922, Oct. 19, 1933. Transfers for the decoration of glass, porcelain, pottery, enameled ware, etc., are prepd. by printing the design in 1 or more colors on paper coated with a film of plastic material that burns away on firing, e. g., collodion, cellulose acetate, resins, varnishes, etc., and contains a vitreous flux.

**Treating clay for transportation and handling.** Wm. S. Wilson (to Merrimac Chemical Co.). U. S. 1,942,196, Jan. 2. While wet, the clay is formed into short cylindrical shapes which are dried without decrepitation and may subsequently be plasticized with water when desired.

**Bricks, etc.** Alfred Wanklin. Brit. 398,237, Sept. 11, 1933. Addn. to 341,594 (C. A. 26, 2839). The method of 341,594 is modified by obtaining the mixt. of hot burnt and unburnt clay for molding by burning only a part of the clay subjected to the initial heat treatment or by mixing alternate batches of burnt and unburnt clay from the same kiln. The mixt. is led to a grinding mill and is then molded and finally burnt as before.

**Firebrick.** Philip H. Jung (one-half to Thomas N. Kurtz). U. S. 1,942,431, Jan. 9. Raw material of high alumina and low silica content is calcined at a high temp., the calcined product is bonded with a mineral material of colloidal character substantially free from, or low in, silica, such as colloidal fire clay and the final mixt. is molded, dried and burned.

**Apparatus for sanding green bricks, tiles, etc.** J. W. Jackman & Co. Ltd., and Stephen Ernest Garratt. Brit. 399,593, Oct. 12, 1933.

**Apparatus for sifting potters' slip, etc.** Arthur C. Harrison, Frank D. Boulton and Fred Beardmore. Brit. 399,293, Oct. 5, 1933.

**Fused-silica articles.** Alvarado LeR. Ellis and Gunnar A. F. Winckler (to The British Thomson-Houston Co. Ltd.). Brit. 399,749, Oct. 12, 1933. Massive articles of fused  $SiO_2$ , e. g., large astronomical mirrors, are made by forming a base of translucent  $SiO_2$  which contains gas bubbles and fusing onto the base a facing of transparent vitreous  $SiO_2$  free from gas bubbles. The base is deposited on a support of refractory material as described in Brit. 296,059 (C. A. 23, 2263).

**Fused silica articles.** Elihu Thomson (to The British Thomson-Houston Co. Ltd.). Brit. 399,750, Oct. 12, 1933. See U. S. 1,930,327 (C. A. 28, 2779).

**Porous ceramic products.** Frederick E. Kern. U. S. 1,941,804, Jan. 2. For producing porous products such as bricks, relatively low-temp. bituminous coal is subjected to distn. whereby volatiles are removed from it, the devolatilized coal is comminuted and mixed with comminuted clay material, the mixt. is plasticized, shaped and subjected to heat treatment by which the coal is burned out of the material.

**Refractory ceramic material suitable for use in furnace and kiln construction.** Frank H. Riddle (to Champion Spark Plug Co.). U. S. 1,942,879, Jan. 9. Andalusite is used together with finely divided sintered alumina.

**Refractory bricks.** Kenneth M. Simpson (to International Chromium Process Corp.). U. S. 1,943,263, Jan. 9. A major portion of fire-clay is formed into bricks which are covered with a small amt. of the clay mixed with chrome ore, and the bricks are dried and burned.

**Refractory masses.** Arthur Sprenger. Ger. 587,827, Nov. 9, 1933 (Cl. 80b. 8.17). Oxides of Mg, Cr and Al are fused in such proportions that the wt. of the  $MgO$  equals, or is greater than, the sum of the wt. of the  $Cr_2O_3$  and  $Al_2O_3$ , the amt. of  $Cr_2O_3$  being greater than the amt. of  $Al_2O_3$ . Other oxides such as  $SiO_2$ ,  $CaO$ ,  $FeO$ , etc., may also be present. Cf. C. A. 28, 873<sup>1</sup>.

**Refractories.** Alterra A.-G. Brit. 399,126, Sept. 28, 1933. Divided on 394,115 (C. A. 28, 278<sup>4</sup>). Refractory sintered  $MgO$  is produced from materials low in Fe by adding black or blackish brown (artificial)  $MgFeO$  thereto. In an example 4%  $MgFe_2O_4$  prepd. by calcining mesitine spat, or native magnesioferite is added to a magnesite low in  $SiO_2$ , Fe and  $CaO$  and the mixt. sintered  $MgFe_2O_4$  may be added to previously sintered  $MgO$  to improve its refractory properties.

**Emery and sand cloth, etc.** Behn-Manning Corp. Brit. 378,014, July 28, 1932. In mfg. abrasive-coated paper, grinding disks, etc., the grains of abrasive, as they fall onto the adhesive-coated sheet, etc., pass through an elec. field whereby they are sep'd. and also turned so that the sharpest points are outwardly directed on the sheet. App. is described. In 398,907, Sept. 25, 1933, the grains of abrasive are stratified according to size. Cf. C. A. 28, 602<sup>1</sup>.

**Manufacture of open space coated abrasive paper by use of paraffin or other hydrophobic materials.** Frank J. Tone (to Carborundum Co.). U. S. 1,941,962, Jan. 2. Certain portions of fabric such as paper are coated with the paraffin or other hydrophobic material; the whole surface is then coated with an adhesive mixed with abrasive grains and the coating is subsequently brushed or scraped from the initially coated areas. App. is described.

**Tunnel kilns.** Keramische Industrie-Bedarfs-A.-G. Ger. 587,767, Nov. 7, 1933 (Cl. 80c).

## 20—CEMENT AND OTHER BUILDING MATERIALS

J. C. WITT

**Slurry drying in the cement industry.** Zollikofer. *Tonind.-Ztg.* 57, 879 82, 904 6, 929 31, 953 5(1933). -

A discussion of the various methods of mud drying. Karl Kammermeyr

**Methods for the determination of shrinkage in cement-bound bodies.** G. Frenkel. *Tonind.-Zig.* 57, 1096-7, 1122-4 (1933).—The Amser shrinkage app. was used for the measurements, with a modification when used with porous bodies. The operative technic and exptl. equipment which were evolved in making about 20,000 measurements are discussed.

**Calculation of the results of breaking tests of cement samples.** Henry Le Chatelier. *Rev. matériaux construc-tion trav. publics* 1934, 1-3; cf. Feret, C. A. 28, 1497.—A statistical discussion.

**Status of specifications for hydraulic cements in the United States.** P. H. Bates. *Proc. Am. Soc. Testing Materials* 3, Part II, 462-75 (1934).

**Study of the setting of magnesian cement.** Louis Chassevent. *Chimie & Industrie* 30, 1020-6 (1933).—Anhyd. MgO dissolves in MgCl<sub>2</sub> solns., giving supersatd. solns. The max. amt. of MgO which dissolves before the mixt. begins to thicken depends on the chloride content of the soln.; the degree of supersatn. in MgO increases very rapidly as a function of the MgCl<sub>2</sub> concn. when the latter is above 10%; with a 30% MgCl<sub>2</sub> soln. the max. amt. of MgO dissolved before thickening of the soln. is approx. 1000 times the amt. corresponding to equil. The thickening of the paste and the pptn. of the supersatd. solns. sepd. from the solid correspond to a decrease in the MgO concn. of the soln. Mg(OH)<sub>2</sub> dissolves only very slowly in MgCl<sub>2</sub> solns; this explains the slowness of its setting and its lack of hardness. X-ray examn. revealed that the ppt. formed at the end of 24 hrs. by a supersatd. soln. of MgO in 30% MgCl<sub>2</sub> is the stable oxychloride, in disagreement with Lukens (C. A. 26, 3742). The rate of hydration of MgO in dil. MgCl<sub>2</sub> solns. is greater than in water; as a function of MgCl<sub>2</sub> concn. it passes through a max. The compressive strength after 24 hrs. and after 7 days does not vary with the MgCl<sub>2</sub> concn. of the soln. when the latter is less than 10%; it increases very rapidly with the concn. when the latter is above 20%. The solns. which have the highest MgCl<sub>2</sub> concns. and give the greatest supersatn. also result in highest strength at the end of 24 hrs. and 7 days. MgO burnt at 1085° does not begin to set as rapidly as MgO burnt at 900° and at 720°; but there is little difference in the strength after 24 hrs. and after 7 days.

**Portland cement high in magnesia.** Ernst Ludwig Meyer. *Tonind.-Zig.* 58, 6 8, 27-9, 40 2 (1934). The pptn. of const.-vol. sintered cements high in Mg is feasible.

**The composition of portland cements and the characteristics of regular and hydraulic concretes.** E. Perry. *Paint & Varnish Production Mgr.* 10, No. 1, 14, et seq. (1934).—The manuf. of portland cement from a deposit of oyster shells and silt in San Francisco Bay is described. The forces operating to destroy concrete structures are discussed. The differences between regular and hydraulic cements are discussed.

**Controlling the lime content and the physical properties of portland cements by addition of pulverized minerals and ash.** Rich. Grun and Hugo Beckmann. *Tonind.-Zig.* 57, 822 4, 832-4 (1933).—Mixed cements consisting of cement clinker and coal ash from powd.-coal operations, which have only very weak hydraulic properties, are not superior to undiluted cements in regard to strength and are inferior in their resistance to storage in corrosive solns. Powd. mineral addns. (slate), which represent inert material, are also inferior to undiluted cements in regard to strength and salt-water resistance.

**The properties of high-grade portland cements.** Th. Klehe. *Tonind.-Zig.* 57, 1048-50 (1933).—A discussion of the specifications of 7 European countries. Strength and setting data are presented.

**Clays of portland cement. III. Firing of tuff with coal shale.** Yoshiaki Sanada. *J. Soc. Chem. Ind., Japan* 37, Suppl. binding 5 (1934); cf. C. A. 28, 1496.—The tech. analyses of 5 coal shales and their ashes are reported. Firing expts. carried out in a small shaft kiln (40 × 67 cm.) showed that coal shale can be used with good results as fuel for tuff firing.

**from burned tuff and limestone.** *Ibid.* 6-7.—Analyses of limestone, burned and unburned tuff and coal shale ash as raw materials are given. Eight raw mixts. were prepd. from these with addns. of Cu slag, and fired in a small rotary kiln (40 × 55 × 700 cm.). The clinkers were ground with 2.5% of gypsum and the cements tested by the usual methods. Exptl. data on the raw mixes and the cements are presented. Conclusion: Portland cement of best quality can be prepd. from the raw materials which were used.

**"Dolomitizing" of portland cement mortars.** G. Kathrein. *Tonind.-Zig.* 57, 850-60 (1933).—Tests were carried out by storing test pieces of 1:4 mortar in (1) H<sub>2</sub>O-satd. silica sand, (2) same as (1) with 5% MgCO<sub>3</sub> addn. and (3) a suspension of MgCO<sub>3</sub> in H<sub>2</sub>O. Storage was at 16-20° and for 8 months. The compressive strength averaged for 15 samples was for case: (1) 197 kg./sq. cm. (100%), (2) 178 (90%) and (3) 183 (93%). The av. deviation was only 15 kg./sq. cm. The detrimental influence of MgCO<sub>3</sub> is therefore confirmed, even though it is not very clearly recognizable on account of side reactions.

**Calorimeter installation in the engineering materials laboratory of the University of California for studies of heat generation in mass concrete.** S. B. Hiddle, Jr., and J. W. Kelly. *Proc. Am. Soc. Testing Materials* 3, Part II, 571-88 (1934).—See C. A. 27, 3578.

**The testing of protective coatings for concrete.** C. R. Platzmann. *Tonind.-Zig.* 57, 883-4 (1933).—A review.

**Reinforced concrete piling bituminized against deterioration by sea action.** E. Perry. *Paint & Varnish Production Mgr.* 10, No. 2, 14-16 (1934).—Plain or reinforced concrete is subject to deterioration when in contact with sea water. Methods used by the Port of Oakland and the Pacific Piling and Construction Co. in Los Angeles for protecting concrete structures are described. The former consists of painting with refined asphalt. The latter consists of impregnation under 26 in. vacuum at 250°F. with grade D asphalt. A penetration of 1/8 1/2 in. is obtained. The process is expensive but gives durability.

**Refractory concrete.** R. T. Giles. *Metals & Alloys* 5, 28-30 (1934).—The use of high-Al<sub>2</sub>O<sub>3</sub> cement as a binder of refractory materials is discussed.

**Casting Barzas diabases.** A. S. Ginzberg and F. G. Semenov. *Mineral. Surv'e* 8, No. 10, 9-13 (1933). Several samples of diabasic rocks mined in the region of Barzas, Kuznetz basin, produced satisfactory castings in the lab. expts.

**Advances in the field of bituminous binders for road construction.** H. Mallison. *Chem.-Zig.* 58, 93-5 (1934).

**Artificial stone from Martin and cupola furnace slags.** P. I. Bazhenov and V. A. Aleksandrovskii. *Mineral. Surv'e* 8, No. 10, 14-22 (1933).—Lab. expts. with slags from different plants showed that Martin slags, being too rich in CaO and SiO<sub>2</sub>, are not suitable for casting. Cupola furnace slag alone or in equal mixts. with Martin slag produced castings at 1200°, which possess high mech. strength, good resistance to mech. abrasion, but poor dielec. strength and acid resistance.

**Colored surfaces for artificial stones and cement bodies.** Willi Serkin. *Tonind.-Zig.* 57, 1168-71 (1933).—A review.

**Utilization of waste talc-chlorite stone.** N. G. Sergiev. *Mineral. Surv'e* 8, No. 10, 40-8 (1933).—Waste talc-chlorite, a metamorphosed picrite, was pressed into blocks with various cements and subjected to practical tests.

**The drying of wood.** J. M. Helvé. *Rev. ind.* 63, 282-8, 344-9, 404-7, 437-44, 501-8, 561-3 (1933).—A very complete review, including illustrations and descriptions of various types of drying plant, ~~calorim.~~, etc. The drying and aging of wood by treatment with ozone produces very satisfactory results; methods of analysis and control are detailed. Treatments with the vapors of benzene, gas-

line and  $\text{CCl}_4$ , and with  $\text{AcOH}$  (Maurer process) are briefly outlined.

**Weathering of creosote.** H. E. Gillander, C. G. King, E. O. Rhodes and J. N. Roche. *Ind. Eng. Chem.* 26, 175-83 (1934).—A machine is described in which small sapwood blocks evenly impregnated with creosote are exposed to continuous weathering cycles to allow the effects of weathering to be studied either as the results of individual factors or in the aggregate. The course of weathering is followed by removing a certain no. of blocks at stated intervals and detg. (1) their resistance to direct attack by fungi, (2) the percentage loss of oil, (3) toxicity of the extd. oil and (4) the distn. range of the extd. oil. Data are given to show the degree of weathering brought about by the machine and the effect of various cycles. Toxicity-permanence interrelationships are developed, and the probable mechanics of weathering of the oil in treated wood is discussed.

Alfred L. Kammerer

**Hydration of tricalcium aluminate** [setting of portland cement] (Foster) 6. Compound sheet material [for floor coverings] (Brit. pat. 399,856) 18. The sp. heats of  $\text{CaO} \cdot \text{Al}_2\text{O}_3$ ,  $2\text{CaO} \cdot \text{SiO}_2$ ,  $2\text{CaO} \cdot \text{Al}_2\text{O}_3 \cdot \text{SiO}_2$ , etc. (v. Gronow, Schwiete) 2.

**Modern Road Emulsions.** Edited by F. H. Garner, L. G. Gabriel and H. J. Prentice. London: The Carriers' Pub. Co., Ltd. 206 pp. 12s. 6d. Reviewed in *Chem. Trade J.* 94, 32 (1934).

R. scuola d'ingegneria (R. politecnico) Milan. T. XII. La chimica del cemento. Pt. 1. Il cemento portland. By Querino Sestini. Milan: Ulrico Hoepli. L. 28.

**Schriever, Walter:** Beiträge zur Chemie des Calciums unter besonderen Berücksichtigungen des Portlandzementes. Thesis, Brunswick. 1930. 66 pp.

**Cement.** Hubert K. Woods, Harold H. Steinour and Howard R. Starke (to The Riverside Cement Co.). Can. 336,331, Oct. 10, 1933. Portland cement of low heat of hardening comprises finely ground clinker which contains less than 8%  $3\text{CaO} \cdot \text{Al}_2\text{O}_3$ , substantially no  $2\text{CaO} \cdot \text{Fe}_2\text{O}_3$ , at least 10%  $3\text{CaO} \cdot \text{SiO}_2$ , and in which the sum of the percentage of  $3\text{CaO} \cdot \text{SiO}_2$  and twice the percentage of  $3\text{CaO} \cdot \text{Al}_2\text{O}_3$  is less than 35.

**Cement.** Paul Mecke. Ger. 587,634, Nov. 7, 1933 (Cl. 80b. 1.05). See Fr. 754,113 (C. A. 28, 11637).

**Cements.** Siemens & Halske A.-G. Brit. 398,767, Sept. 21, 1933. See Ger. 583,347 (C. A. 28, 2714).

**Rotary kiln suitable for cement manufacture.** Johan S. Fastang (to F. L. Smidth & Co.). U. S. 1,942,140, Jan. 2. Structural details.

**Cement clinker cooling chambers, etc.** Harry S. Lee. U. S. 1,941,560-1, Jan. 2. Structural and mech. details.

**Apparatus for drying material, e. g., cement, previous to burning in a rotary kiln.** Einar Rønne. Brit. 398,548, Sept. 18, 1933.

**Porous compositions.** Deutsche Gold- und Silber-Scheideanstalt vormals Roessler (to Leichtbaustoff-G. m. b. H.). Brit. 398,367, Oct. 5, 1933. Addn. to 363,058 (C. A. 27, 1724). The process of 363,058 is modified by the use, instead of or in addn. to the catalysts, of substances which effect the release of the O by chem. reaction with the O-contg. substances and are themselves changed in the process, e. g.,  $\text{KMnO}_4$ ,  $\text{Ca}(\text{ClO})_2$ , and alkali hypochlorite. In an example a porous cement compn. is made by adding 20 cc. 30%  $\text{H}_2\text{O}_2$  and 20 g.  $\text{KMnO}_4$  in aq. soln. to 2400 g. portland cement. Cf. C. A. 28, 6047.

**Porous concrete compositions, etc.** François Ernest Marechal. Brit. 398,651, Sept. 21, 1933. Porous building materials are made by agitating in a specially constructed mixer the usual lime and magnesia base mixt. with the addn. of colloidal stabilizing materials, e. g., oleic acid, alkali xanthates and preferably also materials that are readily oxidized to form  $\text{CO}_2$  to promote pore formation. Gelatinous substances, e. g.,  $\text{SiO}_2$ , and  $\text{Al}(\text{OH})_3$ , electrolytes, e. g., halogen compds., S compds.,

e. g., sulfates and sulfonates, fillers, e. g., sand and pumice, and org. silicates, e. g., Et silicate, may be added. App. is described.

**Curing concrete.** Ira S. Reynolds. U. S. 1,942,000, Jan. 2. Freshly laid concrete is provided with a film or coating comprising a volatile liquid and a plasticizer such as a soln. comprising naphtha, rosin and pine oil.

**Centrifugal molding apparatus for manufacturing concrete pipes, etc.** Ralph Williams. Brit. 398,983, Sept. 28, 1933.

**Rotary melting furnace, particularly for producing concrete, etc., from earth or waste materials, e. g., town refuse.** Robert H. King, Allen O. Crocker, Bernardino B. van Domselaar, Louis N. Thomas, Kenneth Henderson, Wm. S. Adams and Wm. A. Westley (trading as Constructora de Caminos "Kingite," Crocker, King & Co.). Brit. 398,872, Sept. 21, 1933.

**Road-making materials.** Lazlo d'Antal. Brit. 399,684, Oct. 12, 1933. A road surface is formed with at least 1 layer consisting of a coarse fibrous vegetable material, e. g., one obtained from leaves, stems or roots of water and bog plants, straw, bamboo, sugar cane, etc., woven or interlaced to form a mat and impregnated with a vegetable oil, fat or resin or with latex (derivs.) or a combination of such substances with bituminous substances.

**Paving and coating materials.** Emanuel J. Propper. Brit. 398,672, Sept. 21, 1933. See Fr. 745,253 (C. A. 27, 4371).

**Bituminous compositions.** John Lightfoot. Brit. 399,147, Sept. 15, 1933. Tennis courts, etc., are made by applying a compn. of bitumen, stearin pitch and shredded, ground or granulated rubber, e. g., shredded old tires, to a foundation surface of concrete, etc. The compn. may also contain coal-tar pitch.

**Bituminous compositions.** Robert H. King, Allen O. Crocker, Bernardino B. van Domselaar, Louis N. Thomas, Kenneth Henderson, Wm. S. Adams and Wm. A. Westley (trading as Constructora de Caminos "Kingite," Crocker, King & Co.). Brit. 399,176, Sept. 25, 1933. A compn. for use as a pavement, road surface, etc., consists of bitumen and a lava with a porous honeycomb structure obtained by melting common earth and cooling.

**Bitumen emulsions.** Société chimique. Ger. 587,829, Nov. 9, 1933 (Cl. 80b. 25.06). Emulsions for road surfacing are prepd. by mixing natural asphalt or petroleum pitch with sufficient petroleum heavy oil to render the mixt. fluid at 15°, and stirring with aq. alkali soln. to form an emulsion.

**Asphalted sheet material for building construction** Thomas Robinson (to Lancaster Asphalt, Inc.). U. S. 1,941,491, Jan. 2. A sheet material suitable for roofing, etc., is produced by forming a sheet of non-aq. plastic material capable of hardening, such as asphalt, and unfelted fiber, and building up the sheet by forming and applying to it a dry layer of plastic material and unfelted fiber in different proportions from those of the sheet, and sealing the materials together. App. is described.

**Building slabs.** Fibroplast G. m. b. H. Brit. 399,000, Sept. 28, 1933. The coarser fibrous material sep'd. by centrifugal or jigger sorters from fine wood pulp for the manuf. of paper and card ("refiner stuff") is mixed with  $\text{H}_2\text{O}$ , binders and, if desired, fillers and is felted and dried to produce slabs, hard slabs being obtained by pressing during or after drying. In an example resin (2%) and water glass (2%) in aq. soln. form the binder which, after felting, is pptd. on the fibers by  $\text{Al}_2(\text{SO}_4)_3$ .

**Composite sheets, building slabs, etc.** Eric R. Harrap and Robert H. Turner. Brit. 398,171, Sept. 4, 1933. A slab for partitions or walls comprises a central asbestos (-cement) sheet, which may be in several plies, with coverings on each side of (ply)wood, linoleum, fabric or paper. The central and covering sheets are each coated with adhesive and then united under pressure, the covering sheets then being sprayed with cellulose or other paint, if desired.

**Coating masonry.** Karl Müller and Eugen Hutzenlaub (to Firma Paul Lechler). U. S. 1,943,085, Jan. 9. Masonry is provided with a coating of asphalt contg. fatty

acid pitch and asbestos into which a layer of sand is pressed, which reduces sun ray absorption.

**Composition tiles.** George P. Heppes (to Tile-Tex Co.). U. S. 1,942,060, Jan. 2. A binder such as gilsonite, a filler such as asbestos and a pigment are mixed under the influence of heat to form a coherent mass, which is calendered and cut into unit slabs for the manuf. of compn. tile, the slabs being fed through a cooling zone (of a described app.) in which opposite faces of the slabs are caused progressively to contact cooling surfaces, and this cooling operation is repeated to reduce the temp. of the slabs to a suitable cutting temp.

**Composition roofing material.** Norman P. Harshberger (to Bakelite Building Products Co.). U. S. 1,943,257, Jan. 9. A sheet of felt is treated with a soln. of starch which when dry will form a smooth coating on the fibers of the felt; a bituminous waterproofing material is then applied to the treated felt sheet, which quickly penetrates the fibers of the sheet.

**Hard sheet material suitable for roofing, etc.** Harry E. Holcomb (to Fiberfraks Inc.). U. S. 1,941,985, Jan. 2. Hard sheets are formed with an outer layer of asbestos-cement compn. contg. about 20% of mineral fiber and 80% of cement, and with an inner layer contg. about equal parts of cement and an org. fibrous material such as wood fiber.

**Marking material such as bitumen-saturated felt.** Wm. R. Mershon (to Barrett Co.). U. S. 1,942,763, Jan. 9. Before satg. a felt base or the like with bituminous material, it is provided with markings formed with a suspension of a metallic powder such as Al in a dil. silicate soln. App. is described.

**Waterproofing solution for treating stuccoed walls.** Wm. B. Houston. U. S. 1,942,601, Jan. 9. In prepg. a waterproofing soln., an aq. soln. of a Na stearate soap is heated to about 50°, a hard fat is then added to the soln., and there is finally added a soft soap soln. of cresols in the proportion of about a half fluid oz. to each 2 gals. of the soap-fat soln.

**Wall and other coverings.** Gaston Desagnat. Brit. 399,358, Oct. 5, 1933. The covering comprises plates of rigid material, e. g., glass, cemented to a substratum, e. g., ribbed tricot, by an adhesive that does not penetrate the substratum, the material of which is extensible and compressible in all directions and sufficiently loose in texture to be completely impregnated by a pasty adhesive, e. g., mastic, which fixes the covering to the wall, etc.

**Wallboard.** Evelyn Hurden, Alfred P. Hurden and Stephen E. Beeson. Brit. 398,649, Sept. 21, 1933. Wallboard comprises a sheet of asbestos cement to which is attached a facing of fibrous material, e. g., paper, cardboard, with an intermediate sheet of fibrous material which is corrugated or indented to form cavities. The sheets are preferably united by waterproof glue.

**Composite hard fibrous panels.** Trudway B. Munroe and Elbert C. Lathrop (to Celotex Co.). U. S. 1,942,723, Jan. 9. A base portion is formed of fibrous material such as bagasse, wood or cornstalk fiber heterogeneously arranged, having a moisture content of about 50%, with a surfacing sheet carrying a design secured to the base portion by use of heat and pressure and an adhesive such as a synthetic resin.

**Fibrous compositions for acoustic plaster.** Joseph J. Bamberger. Brit. 398,547, Sept. 18, 1933. The plaster comprises a plaster base and a binding material composed of fibers of *Ceiba pentandra* or like flusses or silk cottons which do not absorb H<sub>2</sub>O and which each contain an air cell. The base may be gypsum, CaO or cement. H<sub>2</sub>O-absorbing material, e. g., cork, shredded asbestos, may be included. Fillers used are pumice, clay, sand, chalk, coke breeze, diatomaceous earth, chopped hair, etc.

**Use of adhesive particles in suspension in air in plywood manufacture.** Theodore W. Dike (to I. F. Laucks, Inc.). Brit. 399,470, Sept. 27, 1933. See U. S. 1,809,957 (C. A. 26, 5393).

**Fireproofing cellulosic materials.** Ernest E. M. Payne. U. S. 1,942,977, Jan. 9. Material such as wood or fiberboard is treated (in either order successively) with a soln. of a sol. acid phosphate of a metal such as Ca which yields an insol. phosphate and with a soln. of a sol. phosphate such as an NH<sub>4</sub> phosphate which ppts. the insol. phosphate in the cells of the material treated. Various other substances such as H<sub>3</sub>BO<sub>3</sub> and Na aluminate or silicate also may be used.

**Treating felted fibrous products with toxic substances such as insecticides and fungicides.** Fergus A. Irvine. U. S. 1,942,706, Jan. 9. An aq. suspension which may contain about 1% fiber (such as that for insulating-board manuf.) and 90% liquid is admixed with a toxic substance such as As<sub>2</sub>O<sub>3</sub>, which is added in dry, finely divided, solid form so that the particles are incorporated individually, and the suspension may then be felted as by a paper-forming operation or the like.

## 21—FUELS, GAS, TAR AND COKE

A. C. FIELDNER AND ALDEN H. EMERY

**Report of the Fuel Research Board.** H. Hartley, et al. *Dept. Sci. Ind. Research, Fuel Research Board for the year ended March 31, 1933*, 123 pp.; cf. C. A. 27, 4055.—**Coal survey.**—Committees are working in 9 coal areas covering 96% of the present production in the British Isles. Results will be charted to give a complete picture of the distribution of the various types of coal. **Cleaning and de-ashing of coal and its preparation for market.**—Expts. with the vacuum flotation process are being continued with both lab.- and full-scale operations. The former has dealt mainly with desliming, with differential size oiling and with the relation between the rank of coals and their flotation properties. A new type of air jig with 1½ ton/hr. capacity also is being used. **Carbonisation of coal.**—Studies on the effect of velocity of heating gases in vertical retorts on the throughput are being continued. A new setting of vertical chamber ovens is now in use in expts. on the effect of blending coals on the coke, tars and gas produced. Expts. with a new setting of narrow vertical brick retorts intended primarily for low temps. indicate the possibility of its being suitable for use over a wide temp. range. **Use of pulverised coal, including "colloidal" fuel.**—The "Grid" burner designed at the Fuel Research Station has given promising results and is being developed. The dispersion of 0.5% of Na stearate in a Persian fuel oil made possible a 40% suspension of coal, 85% of which

had passed a 240-mesh B.S. screen. **Hydrogenation of tar and coal.**—Results of studies show that ease of hydrogenation of tar varies with the temp. at which carbonization takes place. A plant handling two tons of tar per day is in project. **Constitution of coal.**—The Board is cooperating with Bone and Scyler in their researches.

H. L. Olin

**Flotation processes for the purification of coal fines.** Ch. Berthelot. *Chimie & Industrie* 30, 770-86(1933).—A review of tendencies followed during the past few yrs. in the chief European collieries, showing that the technic of flotation permits of transformation of low-grade products into com. coals and the means by which the difficulties inherent to the drying of coal fines have been completely overcome. Little-known industrial data on the cost of purification and drying of coal fines are given.

A. Papineau-Couture.

**Progress in coal carbonization, gas making and by-product recovery.** Horace C. Porter. *Ind. Eng. Chem.* 26, 150-4(1934).—Although the by-product coke industry has expanded rapidly practically the same percentage of total coal production is carbonized as was 30 years ago, 16-16.5%. Because of the growth in the use of natural and refinery gases, future expansion in coal carbonization depends on an increase in the steel trade or on building up the demand for domestic coke and coal gas. Progress

in the industry during the past 25 years is reviewed.

P. J. Wilson, Jr.

The hydrogenation of coal. C. C. Wright and A. W. Gauger. *Ind. Eng. Chem.* 26, 164-9(1934).—A review.

P. J. Wilson, Jr.

The separation of coal into fractions of different ash contents. Jaroslav Dolínski. *Gas i Woda* 13, 307-9 (1933).—Pulverized coal is sepd. into fractions of different ash contents by means of a KCNS soln. of known sp. gr. (1.205). The app. consists of a glass tube 1.4 m. in length and 45 mm. in diam. The lower end is closed by a stopper with an inserted glass stopcock. The pulverized coal is shaken in the tube with the soln. and left for 24 hrs. The coal particles settle according to their sp. gr. and their ash content.

J. Wiertelak

Increase in the ash content of fuel dried separately by five gases before its utilization. E. G. Gershtein. *Trans. Thermo-Techn. Inst. Moscow* 1933, No. 8, 8-15. A calcn. of the effect of heat on the coal.

A. A. B.

The determination and evaluation of ash melting points. Břetislav G. Šimek, František Coufalík and Zdeněk Beránek. *Feuerungslechn.* 22, 1-6(1934).—The microscopic method of Dölch and Pöschmüller (*C. A.* 24, 5909) gives low results because of conduction away from the thermocouple junction, the sample being heated by radiation. When the app. is more adequately heated, it gives correct results. Other methods of ash m.-p. detn. give concordant results, which agree with those obtained by gasifying the original fuel in CO<sub>2</sub> at controlled temps.

Ernest W. Thiele

Refining of brown coal by heating with water vapor under pressure. Břetislav G. Šimek and Apollo Ruzička. *Mitt. Kohlenforschungsinstit. Prag.* 1933, 355-420.—The physicochem. changes of brown coal resulting from drying and from heating with satd. water vapor under pressure are described. The most favorable conditions for the drying of the coal were considered, and a suitable process was described. A description is given of expts. in a 1-cu. m. lab. autoclave and in an industrial plant having a daily capacity of 400 tons of brown coal. The advantages in the use of a dried coal consist not only in a greater heat efficiency but also a saving in transportation.

M. E. H.

The acids in Bohemian montan wax. August Stadler. *Mitt. Kohlenforschungsinstit. Prag.* 1933, 445-81.—The Me esters of the fatty acids from the wax were fractionated by vacuum distn., and two of the fractions were investigated more closely. The two acids isolated from the fractions were pure white substances, crystg. in shiny plates and m. 86.8 and 89.3, resp. Titration of the acids to det. their equiv. wts. gave results of 410 and 438, which would correspond to the formulas C<sub>27</sub>H<sub>54</sub>O<sub>2</sub> and C<sub>28</sub>H<sub>56</sub>O<sub>2</sub>. Attempts at a further sepn. by recrystn. and fractional pptn. were without result.

M. E. H.

The internally heated retort constructed by V. P. Izhevskii. I. M. Rafalovich. *Trans. Thermo-Techn. Inst. Moscow* 1933, No. 7, 39-43.—The retort consists of an inverted cupola-shaped chamber with a vertical partition which does not reach the ceiling of the retort. The fuel, which may be any solid fuel, is passed through the bottom of the retort and moves upwardly, reaches the upper edge of the partition where it is subjected to a partial combustion through the air admitted through the ducts in the partition. The coke then overflows the partition and moves downwardly to be discharged finally at the bottom of the retort. Volatile products are withdrawn through the ceiling and they are subjected to the customary treatment and sepn. A high efficiency, such as high calorific value coke and gases obtainable in this installation, is claimed. Various calcs. are given.

A. A. B.

Controlled cracking in continuous vertical retorts. E. B. Tomlinson. *Gas World* 100, 82-3; *Gas J.* 205, 195-6(1934).—The gases are subjected to further heat treatment in the space above the charge in the retort. In doing this it was necessary to feed small quantities of coal at regular intervals into the retort and to control the coke extn. so as to maintain a fixed free space above the charge. Under the optimum conditions of cracking with the first

coal tried and 14.5% steaming in Woodall-Duckham retorts 84.8 therms of 528 B. t. u. gas were produced per ton with a throughput of 5.2 tons per day. Under normal operation with 12.3% steaming 81.6 therms of 477 B. t. u. gas were produced with a throughput of 6.1 tons per day. A higher bulk d. of coke than normal from that type of retort is obtained. Further work is in progress.

P. J. Wilson, Jr.

The new tables for steam constants. N. A. Kostrov. *Trans. Thermo-Techn. Inst. Moscow* 1933, No. 7, 43-6.—A discussion of Mollier (*C. A.* 22, 1418) and Knoblauch tables.

Simple determination of the losses by free and bound heat in steam boilers. K. Münzer. *Arch. Wärmewirt.* 14, 318(1933).—A slide rule for combustion calcs. is described.

Ernest W. Thiele

Twenty-five years of natural and refinery gases. Geo. A. Burrell. *Ind. Eng. Chem.* 26, 143-50(1934); cf. *C. A.* 27, 4056.—Progress in the industry is reviewed.

P. J. Wilson, Jr.

Recent developments in Germany's gas industry. A. Thau. *Eng. Progress* 14, 230-2(1933).

E. H.

Annual distribution conference of the American Gas Association, Pittsburgh, Pennsylvania, April 3-4, 1933. Report on inspection and tests of specimens removed in 1932. Scott Ewing, et al. *J. Am. Water Works Assoc.* 25, 1618-19(1933).—An abstract of a report dealing with the study of coatings for gas pipe. Coatings varied in thickness from 0.007-0.216 in. (0.18-0.55 mm.) and consisted of various mixts. and combinations of asphalt, coal tar, mineral fillers, and fabric or felt reinforcements. No coating in the test showed enough elec. resistance to rank as a dependable insulator. The condition of a nonmetallic pipe covering is indicated by an electrolytic method that involves deposition of the metallic ions on suitable pattern paper which is immersed in a developing soln. with resultant blue stains recording discontinuities in the coating.

W. H. Boynton

The scientific utilization of gas. Further investigation of burner jets. W. J. G. Davey and A. E. Jones. *Gas World* 100, 84-6(1934).—The discharge coeff. for Amal fixed jets (cf. *C. A.* 27, 399) with channel length 3-5 times the orifice diam. has been detd. as 0.720, whereas American adjustable jets have coeffs. of 0.80-0.85. Corrections for gas discharge from Amal jets to standard conditions are discussed. When Amal jets are installed in preheated burners, jets with a gas discharge of approx. 20% in excess of the required discharge should be used. The Parkinson jet balance for the rapid and accurate calibration of jets against a master jet measures the differential pressure between 2 chambers with a common gas inlet, but from one of which the master jet discharges, and from the other the jet to be calibrated.

P. J. W., Jr.

Protecting gas services from corrosion. K. L. Clark. *Gas World* 100, 87-90(1934).—Corrosion on the inside of services is almost completely prevented by drying the gas, but added security may be obtained with dry gas by painting the inside surface and allowing it to dry before the pipe is laid. Different materials for pipes are discussed. Cu tubing appears to have possibilities by reason of the greater throughput of gas as a result of the smooth surface, and the superior resistance in corrosive soils. Elec. tests on the imperviousness to H<sub>2</sub>O of pipes externally protected by wrapping indicates that double wrapping is better than single, but the test is not decisive in the selection of a pipe covering. Various methods for the external protection of joints are described.

P. J. W., Jr.

Gas production combined with the regeneration of the waste gas from lime kilns. Hans Mehlig. *Tonind.-Zig.* 57, 1120-2, 1148-50(1933).—Lime kiln waste gas can be substituted in part for the steam blown into the gas producer. Equations for the process, which are derived, show that a gas of 900-1100 kg. cal./cu. m. can be produced based upon pure C as fuel. The producer operation can be controlled by the quantity of waste gas blown. The use of the waste gas increases the efficiency of the plant and under certain conditions may make a steam

boiler unnecessary. A numerical example is presented. 1

Kari Kammermeyer  
Production of producer gas from peat. E. Belani. *Wärme* 53, 345(1933); *Chimie & industrie* 30, 807.—Descriptive. Present-day methods of drying peat permit of remunerative production of producer gas from peat, provided 50 kg.  $(\text{NH}_4)_2\text{SO}_4$  and 80 kg. of tar can be obtained per ton of dry peat.

A. Papineau-Couture  
Application of a new gasification process to producers for automotive engines. G. Lauro. 2me Congr. intern. carbone carburant (Milan, Oct., 1932), 149-60; *Chimie & industrie* 30, 1004.—Application of gasification of pulverized coal in small producers for automotive engines presents difficulties on account of the necessity of obtaining a rich gas, sufficiently free from dust, in a small app., while the use of pulverized coal necessitates a fairly large combustion chamber in which the coal dust is kept agitated. Preliminary expts. have shown that a flame blown into the interior of the combustion chamber produces an agitation sufficient to keep the coal particles in motion and thus ensure good contact between the coal and the gases with which it must react.

A. Papineau-Couture  
Chemistry of the Thylox gas-purification process. H. A. Gollmar. *Ind. Eng. Chem.* 26, 130-2(1934).—Na or  $\text{NH}_4$  thioarsenate is the active ingredient used in the Thylox process for removing  $\text{H}_2\text{S}$  from gases. The soln. is regenerated by blowing with air (cf. C. A. 23, 4554). The toxicity of the solns., usually contg. less than 1% equiv.  $\text{As}_2\text{O}_3$ , was studied, but no evidence was found of As poisoning. From his study of the chemistry G. concludes that  $\text{Na}_4\text{As}_2\text{S}_5\text{O}_2 + \text{H}_2\text{S} = \text{Na}_4\text{As}_2\text{S}_6\text{O} + \text{H}_2\text{O}$  represents the principal reaction in the absorber, and  $\text{Na}_4\text{As}_2\text{S}_6\text{O} + \text{O} = \text{Na}_4\text{As}_2\text{S}_5\text{O}_2 + \text{S}$  the principal one of regeneration. Unless the  $\text{pH}$  of the Thylox soln. is maintained at 6.7 or higher, the As tends to revert to its lower valence; and probably a mixt. of  $\text{As}_2\text{S}_3$  and S is pptd.  $\text{Na}_2\text{S}_2\text{O}_3$  slowly forms from a little of the S in suspension. HCN in the gas is converted to NaCNS.  $\text{CO}_2$  has practically no effect because of the low alk. of the soln. ( $\text{pH}$  is 8 or less).

P. J. Wilson, Jr.  
Water-gas generation in coke ovens. S. B. Gorelik. *Coke and Chem.* (U. S. S. R.) 1932, No. 9, 24-8.—A summary of results obtained by admitting steam into the coke ovens as reported by several European gas producers. Admission of steam by means of nozzles and pipes at different points is discussed. Adoption of this practice in the U. S. S. R. gas industry to increase their capacity is urged. No preference is made as to the method of steam admission most suitable for U. S. S. R. gas plants.

James Sorrel  
The large coke plant of the Alma mine in Gelsenkirchen. Otto Krebs. *Feuerungstechnik* 22, 11-12(1934).—A modern by-product plant is described, with some statistics.

Ernest W. Thiele  
A simple laboratory method for the assessment of the combustible nature of coke. H. E. Blayden, W. Noble and H. L. Riley. *Gas J.* 205, 201-5(1934).—The app. by which the crit. air blast necessary to keep fine coke burning (cf. C. A. 28, 291<sup>a</sup>) is detd. has been used to grade cokes. Low-temp. cokes have crit. air blasts in the range 0.015-0.030 cu. ft. per min.; special domestic high temp. oven cokes, 0.042-0.048; gas cokes, 0.045-0.073; and metallurgical cokes, 0.057-0.150. Samples taken from the center of a coke-oven charge were much more reactive than those near the walls. Samples from the pusher end of the charge were decidedly more reactive than an av. sample. Sepn. of the oven charge into reactive and less-reactive fractions is believed to have possibilities.

P. J. Wilson, Jr.  
Free-burning domestic coke from coke ovens. C. H. S. Tupholme. *Ind. Eng. Chem.*, News Ed. 11, No. 23, 342(1933).—A coke oven with a laterally movable wall built by Koppers is used in exptl. coking runs to det. the optimum thickness of coal charge for varying coking temps. For the medium temp. range of 680-720° an oven width of 11.8 in. is most suitable. Coke produced in this middle range is highly reactive and should prove popular for domestic purposes.

H. L. Olin

Utilization of low-temperature carbonization coke in power plants. I. M. Tochilkin. *Trans. Thermo-Tech. Inst. Moscow* 1933, No. 8, 1-7.—The low-temp. coke derived from Zhurinskii and Cheremkhov coals had the following compn.: C 83.9-85.6, H 3.5-3.8, S 0.4-2.1 and O + N 10.2-12.3%. It had a calorific value of 7720-7940 calories. The ash of the Cheremkhov coke contained:  $\text{SiO}_2$  57.9-58,  $\text{Al}_2\text{O}_3$  23.4-24.1,  $\text{Fe}_2\text{O}_3$  7.8-7.9, CaO 3.6-3.7, MgO 2.3-3.2 and  $\text{SO}_2$  2.8-4.7%, and its m. p. was 1080-1310°, while that of Zhurinskii was 1180-1370°. A great variety of data with reference to the behavior of this coke in the boilers is given.

A. A. Bochtlingk  
Coking of coal residue for electrode manufacture. N. A. Nikolskii and M. A. Stepanenko. *Coke and Chem.* (U. S. S. R.) 1932, No. 9, 9-16.—A series of lab. expt., semi-plant and plant tests with prepn. of pitch coke electrodes showed the possibility of producing ash-free coke suitable for use in electrodes at approx. cost of 80-90 rubles (\$40-45) per ton.

James Sorrel  
Circular flow of gases in a coke oven. A. A. Agroskin. *Coke and Chem.* (U. S. S. R.) 1932, No. 9, 16-23.—A review of the important improvements made in the design of coke ovens to insure proper gas circulation and thereby to avoid local overheating, damage to brickwork, excessive loss of heat, etc. The Koppers coke oven is described as an important achievement in respect to rational gas circulation.

Callen, Arthur S., and Ulmann, August, Jr.: Fuel Testing and Power Economics. Scranton, Penna.: Intern. Textbook Co. \$1.60.

Sneeden, J. B. O.: Introduction to Internal Combustion Engineering. New York: Longmans, Green & Co. 263 pp. Reviewed in *Commonwealth Engr.* 21, 121(1933).

Liquid fuel. Duilio Annaratone. Ger. 587,775, Nov. 7, 1933 (Cl. 23b. 4.01). Fuel for motors, etc., is obtained by mixing about 25% of components b. 160-205° with about 60% of components b. 35-98° and about 15% of components with a b. p. between those of the two former types. Thus, a fuel may contain 59% of a mixt. of EtOH, abs. alc. and heptane, 15% of a mixt. of toluene, MeOH and *p*-xylene, and 25% of a mixt. of methylcyclohexanol, decahydronaphthalene and tetrahydronaphthalene.

Diesel fuels. I. G. Farbenind. A-G. Brit. 399,150, Sept. 26, 1933. See Fr. 746,116 (C. A. 27, 4378).

Fuel suitable for firelighters. H. K. Maruschek and W. Friedmann. Brit. 359,905, Nov. 2, 1929. A readily combustible liquid such as "petrol" or heavy benzene is absorbed in material such as charcoal, peat dust, sawdust, coke dust, or infusorial earth, or mixts. of such materials, and a mass of the material is coated with paraffin or a suitable oil and then with a mixt. such as may be formed from waste rubber and crude petroleum or like materials. Numerous other ingredients and auxiliary addns. are also mentioned.

Benzene and homologs from gaseous hydrocarbons. Charles C. Towne (to Texas Co.). U. S. 1,943,240, Jan. 9. Normally gaseous hydrocarbon material contg. a large proportion of paraffinic constituents heavier than  $\text{CH}_4$ , such as gases sepd. in "natural gasoline" production, is subjected to a conversion temp. of about 650-950° while in the presence of a clay type catalyst such as bauxite or fuller's earth.

Motor benzene. Clifford Banta (to The Barrett Co.). Can. 336,438, Oct. 17, 1933. Crude benzene is agitated for about 1/4 hr. with about 0.08 lb. of 66°Bé.  $\text{H}_2\text{SO}_4$  per gal. at a temp. below about 40°. The refined benzene is

sepd. from the resulting acid sludge, neutralized and distd. Gum-forming constituents are thus removed.

**Filtering device, particularly for liquid fuel for internal-combustion engines.** Bryce Ltd. and Arthur A. Sidney. Brit. 399,207, Oct. 2, 1933.

**Apparatus for making explosive gaseous mixtures such as those for internal-combustion engines.** Jack A. de Grey. U. S. 1,942,956, Jan. 9. A gaseous mixt. such as air and low-grade hydrocarbon fuel is passed through tubes in which further mixing takes place and thence to a catalytic chamber which may contain various fuel-cracking catalysts. Various structural and operative details are described.

**Decarbonizing devices for internal-combustion engines.** Edward Bagnall-Bull. Brit. 368,513, Mar. 10, 1932. Air is drawn into the induction pipe through a container that has a renewable cartridge comprising an absorbent material satd. with a decarbonizing substance, *e. g.*,  $(\text{NH}_4)_2\text{CO}_3$ ,  $\text{H}_2\text{O}_2$ . In 397,849, Aug. 29, 1933, the air is drawn through a chamber contg.  $\text{H}_2\text{O}$  or other liquid, *e. g.*,  $\text{CCl}_4$ , an aq. soln. of monochloronaphthalene, and then through a 2nd chamber contg. the decarbonizing substance.

**Catalytic device for determining the character of exhaust gases from internal-combustion engines.** George R. Blodgett (to Moto Meter Gauge & Equipment Corp.). U. S. 1,942,323, Jan. 2. Structural details.

**Centrifugal gas cleaners for internal-combustion engines on submarines, etc., wherein liquid oxygen is added to the exhaust products to make the gaseous charge for the succeeding explosion.** Fritz von Opel. Brit. 398,367, Sept. 14, 1933.

**Method for controlling combustion in regenerative furnaces burning gaseous, liquid or pulverulent fuel.** British "Rema" Manufacturing Co. Ltd. and Peter Howden. Brit. 398,200, Sept. 8, 1933.

**Retort furnaces for distilling or coking fuel.** Otto Hellmann. Brit. 399,053, Sept. 28, 1933.

**Destructive hydrogenation.** Ulysses A. R. Dudley. Brit. 399,487, Sept. 25, 1933. Carbonaceous materials, particularly cycloparaffin oils, are hydrogenated with  $\text{H}$  under pressure, preferably in presence of a catalyst, *e. g.*, Mn bronze, the temp. being maintained below  $20^\circ$  by a cooling agent, *e. g.*, brine. App. is described.

**Retorts for the low-temperature carbonization of coal admixed with crude oil or tar.** Thomas H. Parry, Wm. Johnson and Henry A. S. Gothard. Brit. 398,160, Aug. 29, 1933.

**Retort furnaces for the low-temperature carbonization of coal admixed with crude oil or coal tar.** Thomas H. Parry, William Johnson and Henry A. S. Gothard. Brit. 399,495, Sept. 29, 1933. Divided on 398,160 (preceding abstr.).

**Air-pervious table, etc., for separating coal from impurities, etc.** Richard Peale (to Peale-Davis Co.). U. S. 1,941,490, Jan. 2. Various structural and operative details are described.

**Coal and tar distillation.** Stuart P. Miller (to Barrett Co.). U. S. 1,942,375, Jan. 2. Coal is coked in a portion of the ovens of a coke-oven battery, and pitch is coked in another portion of the ovens to form separately pitch-coke. Hot gases from both such coking operations are combined and cooled to sep. a combined tar contg. constituents from both the coal and the pitch. App. is described.

**Plant for high-pressure steam production.** Alfred Huster (to Fried. Krupp Germaniawerft A.-G.). U. S. 1,942,861, Jan. 9. Structural and operative details.

**Apparatus for superheating steam.** Arthur Williams (to Superheater Co.). U. S. 1,942,676, Jan. 9. Structural details.

**Steam superheaters.** Percival R. Boulton. Brit. 399,937, Oct. 19, 1933.

**Steam desuperheaters.** Deutsche Babcock & Wilcox-Dampfkessel-Werke A.-G. Brit. 399,308, Oct. 5, 1933.

**Coal-gas purification.** Frederick W. Sperr, Jr. (to Koppers Co. of Del.). U. S. 1,942,072, Jan. 2. The gas is preliminarily cooled as it issues from the retorts, purified, then finally cooled, and the cooled gas is scrubbed

to remove naphthalene. After the final cooling but before the naphthalene removal the gas is treated with a hygroscopic liquid comprising hygroscopic brines or NaCNS to dehydrate the gas while at its final distribution temp. and so that any entrained salt soln. from this treatment will be removed in the naphthalene scrubbing step. App. is described.

**Purifying gases.** Christian J. Hansen. Ger. 583,938, Sept. 12, 1933 (Cl. 26d. 9.04). See Fr. 750,531 (C. A. 28, 884').

**Purifying fuel gas.** Caleb Davies, Jr. (to Koppers Co. of Del.). U. S. 1,942,050, Jan. 2. The gas is contacted with an aq. liquid contg. suspended S to remove HCN from the gas, then contacted with an Fe salt soln. which absorbs  $\text{NH}_3$  and  $\text{H}_2\text{S}$  to form an  $\text{NH}_4$  salt in soln. with pptn. of Fe sulfide (such as a soln. contg.  $\text{FeSO}_4$ ); the Fe sulfide formed is removed from the soln., treated with acidic material to liberate  $\text{H}_2\text{S}$ ; the liberated  $\text{H}_2\text{S}$  is converted into free S and the latter is added to an aq. liquid in which it forms a suspension which is utilized for further fuel-gas treatment to remove HCN. App. is described.

**Purifying gas from hydrogen sulfide.** Herbert A. Gollmar (to Koppers Co. of Del.). U. S. 1,937,196, Nov. 28. An alk. absorbent liquid is recirculated through a cycle comprising an absorption stage in which the liquid is brought into contact with the gas for removal of  $\text{H}_2\text{S}$  and a regeneration stage in which  $\text{H}_2\text{S}$  removed from the gas by the liquid is liberated. Liberated  $\text{H}_2\text{S}$  from the regeneration stage is removed and oxidized to form  $\text{SO}_2$ ; the resulting  $\text{SO}_2$ -contg. gases are washed with a soln. of Na thio-sulfate, and the resulting soln. is removed and regenerated by subjecting it to contact with the gas contg.  $\text{H}_2\text{S}$  and it is recirculated for further washing of the  $\text{SO}_2$  gas. App. is described. Cf. C. A. 27, 591, 5519.

**Removing sulfur impurities from hydrocarbon gases and oils.** Clarence W. Garrison (to Koppers Co. of Del.). U. S. 1,942,054, Jan. 2. A gas such as coal gas or oil-refinery gas is subjected to countercurrent contact with alkali carbonate soln. to absorb all the  $\text{H}_2\text{S}$  of which it is capable (thereby preliminarily partially fouling the soln. for the following oil-treatment stage) and oil such as a petroleum distillate is then subjected to contact with at least a substantial portion of the soln., to effect further  $\text{H}_2\text{S}$  absorption, and the soln. is then regenerated for further use. App. is described.

**Desulfurizing gases.** I. G. Farbenind. A.-G. (Hans Bähr, inventor). Ger. 587,797, Nov. 9, 1933 (Cl. 26d. 9.11). The  $\text{H}_2\text{S}$  in gases such as coal-distn. gases is catalytically converted to  $\text{SO}_2$  and this, with the  $\text{NH}_3$  present, or with added  $\text{NH}_3$ , is converted to  $(\text{NH}_4)_2\text{SO}_4$ ,  $\text{NH}_4\text{HSO}_4$ ,  $(\text{NH}_4)_2\text{S}_2\text{O}_8$  or polythionate. Cf. C. A. 28, 294'.

**Cooling and purifying burner gases.** Edwin J. Mullen (to General Chemical Co.). U. S. 1,943,137, Jan. 9. Hot burner gas is passed through a tower in contact with a stream of  $\text{H}_2\text{SO}_4$ , and at intervals the flow of acid is stopped and a stream of water is substituted while the flow of burner gas is continued to wash out impurities from the tower. Various details of app. and operation are described.

**Apparatus for controlling the flow of liquids such as solvents used in gas-purification towers, etc.** Herbert A. Gollmar (to Koppers Co. of Del.). U. S. 1,942,094, Jan. 2. Various structural and operative details are described.

**Apparatus for washing flue gases.** Wm. N. C. Clinch. Brit. 399,575, Oct. 12, 1933.

**Gas-washing solutions.** The Koppers Co. Ger. 587,653, Nov. 7, 1933 (Cl. 26d. 9.30). Gas-washing solns. of an element of the Sn group, *e. g.*, As compounds, have the solid impurities removed, are cooled to remove  $\text{Na}_2\text{S}_2\text{O}_3$  and NaCNS by crystn., and are filtered. The liquid is then regenerated by oxygenation.

**Materials for making gas, etc.** Thomas R. Dixon. Brit. 398,601, Sept. 21, 1933. Carbonaceous materials, *e. g.*, powd. coal, are treated with a bacterial org. acid and (or) with fungi or enzymes prior to fractional distn. for the production of spirits, oils, gases. AcOH or an acid

produced by bacteria of the genus *Lactis* may be used. In an example a mixt. of powd. coal and acid is allowed to stand 7 days at 128–132°F., the acidity is reduced by addn. of alkali, the temp. falling to 80°F. and the mixt. left a further 21 days. The liquor is then decanted from the smokeless coal-dust residue and is again fermented by the addn. of yeast and molasses before being fractionally distd. Tar, wood, peat or vegetation may be similarly treated.

**Air-gas generator.** Aldo Curioni. Brit. 399,655, Oct. 12, 1933.

**Oil-gas generation.** Société des procédés Chilowsky and Constantin Chilowsky. Brit. 398,640, Sept. 21, 1933. Heavy oil is atomized directly into an unobstructed zone by an amt. of preheated air insufficient for supporting complete combustion, so as to obtain a free jet of hot products in which partial combustion takes place, and the products are transferred to a 2nd zone sepd. from the 1st by a heat-radiating body to the center of which heat is imparted by substantially the whole of the products before they leave the 2nd zone. App. is described.

**Water-gas generator.** Charles W. Andrews and Wm. B. Chapman. U. S. 1,941,455, Jan. 2.

**Water-gas generators.** Humphreys & Glasgow Ltd. and Arthur R. Griggs. Brit. 399,119, Sept. 28, 1933.

**Portable plant for the production of inert gas from fuel and air for use, e. g., in purging gas holders.** Arthur D. Harrison. Brit. 399,687, Oct. 12, 1933.

**Apparatus for producing gas from liquid hydrocarbon material by electric heating.** Henri Gamard. U. S. 1,941,678, Jan. 2. Various structural and operative details are described.

**Arrangement for discharging ashes from gas producers.** Geo. H. Bentley and Simon-Carves & Co. Ltd. Brit. 398,251, Sept. 14, 1933.

**Device for automatically controlling the calorific value of a gas by varying the output of the gas-making plant.** British Airca Regulators Ltd. and Thomas Lindsay. Brit. 399,798, Oct. 5, 1933.

**Gas holders.** K. & J. Dempster Ltd. and Wm. A. Hulme. Brit. 399,420, Oct. 5, 1933.

**Distilling tar.** John M. Weiss (to Barrett Co.). U. S. 1,942,195, Jan. 2. In distg. tar with the aid of fuel gases, part of a main stream of fuel gases is diverted and passed through hot tar contained in a still to effect its distn., the resulting gases and vapors are cooled to condense oils from them, and the gases and uncondensed tar vapors thus cooled are returned to the main stream of the fuel gases subsequent to the point in the stream whence the gases were diverted. App. is described.

**Distilling tar.** Stuart P. Miller (to Barrett Co.). U. S. 1,942,371, Jan. 2. In distg. liquid material such as tar by the heat of hot coal-distn. gases, the latter, separately collected from a controlled period of the coal-distn. operation such as selected rich or lean gases, are bubbled at a temp. above the dew point of their contained oil vapors, through the material to be distd. to effect distn. and produce a pitch residue of regulated free C content; the resulting gases and vapors are cooled to condense both distillate oils and oils from the coal distn. gases (which may be coke oven gases). App. is described. Cf. C. A. 27, 2790.

**Distilling tar.** Stuart P. Miller (to Barrett Co.). U. S. 1,942,374, Jan. 2. For distg. tar and recovering high-boiling resinous and greasy constituents, the coal tar is brought into direct contact with hot coal-gasification gases, so that the tar is distd. to a pitch of high m. p., and resinous or greasy constituents are volatilized from the tar; gases and vapors from the distn. are brought into direct contact with a regulated quantity of oil to effect only partial cooling of the gases and vapors by which resinous and greasy constituents are condensed and sepd. from the gases and remaining vapors, and the resulting gases and vapors are subsequently cooled to sep. oils from them. App. is described.

**Distilling tar or pitch and coking coal in a by-product coke oven.** Stuart P. Miller (to Barrett Co.). U. S. 1,942,372, Jan. 2. Coal is charged into an incandescent

coke oven and, before coking of the coal is completed, material such as tar or pitch to be distd. is introduced into the upper portion of the coke oven; the liquid material and coal are heated so as to distil the liquid and coke the distn. residue and simultaneously coke the coal in the oven, and mixed vapors and gases thus formed are withdrawn. App. is described.

**Processing tar.** Edmund O. Rhodes and Floyd D. Hager (to The American Tar Products Co. Inc.). Can. 336,568, Oct. 24, 1933. Tar is sepd. by solvents, such as aliphatic ketones and mixts. of aliphatic ketones and alcs., into a pitch-like insol. product that is relatively rich in benzene-insol. constituents and can be readily coked, and a creosote-like sol. product that is relatively rich in high-boiling constituents and is useful for the same general purposes for which creosote is used. The sol. portion may be treated to obtain pitches having a wide range of m. p. by distg. with or without steam. Cf. C. A. 27, 3590.

**Processing tar and pitch.** Charles S. Reeve (to The Barrett Co.). Can. 336,923, Nov. 7, 1933. The free C content of tars or pitches produced in coal gasification processes is increased by distg. off a portion of the volatile constituents and collecting the distillate. The residue from the distn. operation is heated under a pressure between 15 and 120 lb. per sq. in. at between 700° and 820°F. without substantial distn. A portion of the distillate is mixed with the resulting product.

**Indene recovery from tar oils.** Leopold Kahl. U. S. 1,943,078, Jan. 9. The concn. of indene in tar oils is increased up to about 80% by fractional distn., the fraction with this indene concn. is cooled down to about –25° and the indene which crystallizes out is sepd. by centrifuging.

**Apparatus for separating water, etc., from the tar, tar oil or other sealing liquid of a disk gas-holder.** Maschinenfabrik Augsburg-Nürnberg A.-G. Brit. 398,703, Sept. 21, 1933.

**Apparatus and process for the continuous oxidation of tar to pitch.** Société pour l'exploitation des procédés Ab-der-Halden. Brit. 398,112, Sept. 7, 1933.

**Apparatus for coking bituminous liquids such as pitch, oil residuum or asphalt.** Lewis C. Karrick. U. S. 1,942,650, Jan. 9. Various structural and operative details are described.

**Coking processes.** Carl Still (trading as the Firm Carl Still). Brit. 399,859, Oct. 13, 1933. In producing gas and coke in a chamber oven in which vertical ducts are formed in the charge by the insertion of rods that are frequently withdrawn, the ducts communicate with a collecting pipe by tubes extending downwardly from the oven roof and are used for the introduction of steam, coal gas or other gas into the glowing coke during the later stages of the carbonizing period. App. is described.

**Coking bituminous materials such as tar or pitch.** Edmund O. Rhodes (to American Tar Products Co.). U. S. 1,942,978, Jan. 9. In effecting coking in a by-product oven having side walls with heating flues extending substantially through the entire height of the walls, the side walls of the oven are heated to maintain the coking chamber at coking temp., and the material to be coked is sprayed together with a gaseous medium such as superheated steam, substantially free from uncombined O, into the coking chamber so as to produce a liquid spray, which on passing downwardly through the oven, is substantially freed from foaming constituents that cause excessive foaming, the feed of the material being so regulated as to avoid undue chilling of the walls of the oven; the coking of collected residual matter is continued to cause shrinkage to free coke from the side walls of the oven and to form a coke that is removable *en masse* from the oven by a pushing operation. App. is described. Cf. C. A. 27, 2570, and the following abstr.

**Coking bituminous materials such as tar or pitch.** Edmund O. Rhodes (to American Tar Products Co.). U. S. 1,942,980, Jan. 9. By-product coke-oven chambers with side walls having heating flues extending substantially through their entire height are charged with material in a

free-flowing condition, and the oven, above the level of the material deposited in it, is maintained substantially completely filled with vapors from the material, while at the same time excessive foaming is prevented. The charging is conducted at such a rate that emission of vapors from the oven occurs at a greater rate than that at which vapors are superheated and decompd. (this reducing lampblack formation). Accumulated residual coke is pushed out. App. is described.

**Coked fuel agglomerates.** Earl H. Bunce (to New Jersey Zinc Co.). U. S. 1,941,462, Jan. 2. Agglomerates such as those formed from coke breeze and bituminous coal or the like are passed, while in free contact with one another, by gravity, through an upright coking chamber in which they are heated to a coking temp. by direct contact with hot gas passed transversely through the chamber (the hot gas entering the agglomerates at a temp. of at least 800° and leaving them at a temp. not lower than 550°). App. is described.

**Apparatus for charging a coke oven with liquid carbonizable material such as pitch.** Edmund O. Rhodes, Ernest W. Volkmann and James C. Fitzpatrick (to American Tar Products Co.). U. S. 1,942,979, Jan. 9. Various structural and operative details are described.

**Vertically fired coke ovens.** Joseph Van Ackeren (to The Koppers Co. of Delaware). Brit. 398,610, Sept. 21, 1933.

**Vertically fired coke ovens.** Wm. Hesser Pavitt. Brit. 399,975, Oct. 19, 1933.

**Horizontal regenerators, particularly for coke ovens.** Didier-Werke A.-G. Brit. 399,409, Oct. 5, 1933.

**Elements for use in the construction of reversible heat regenerators, e. g., of coke ovens.** C. Otto & Co. G. m. b. H. Brit. 398,320, Sept. 14, 1933.

**Creosoting compositions.** Stuart P. Miller (to Barrett Co.). U. S. 1,942,373, Jan. 2. A large part of the volatile oils present are distd. off from coal tar by spraying it into hot fresh coal-distn. gases from a coke oven or retort plant at the temp. at which such gases normally enter the collector main of the plant, the spray of tar being regulated so as to enrich greatly the gases and effect partial cleaning to produce a gas-vapor mixt. contg. entrained pitch particles in a ratio of pitch to pitch plus oil vapors of about one-fifth of the usual ratio of these in hot fresh coal-distn. gases; the mixt. is cooled to condense oils, and from the condensed oils and entrained pitch particles there is formed a tarry oil suitable for use as a creosoting compn. App. is described. Cf. C. A. 27, 1490.

## 22- PETROLEUM, LUBRICANTS, ASPHALT AND WOOD PRODUCTS

W. F. FARAGHER

**Raccoon Bend oil field, Austin County, Texas.** I. P. Teas and Charis R. Miller. *Bull. Am. Assoc. Petroleum Geol.* 17, 1459-91(1933). Analyses of oil and oil-field waters are given. The variable gravities of Gutoskey oils are explained as due to (1) variation in source material, (2) variation in amt. of accompanying gas and (3) the character of the assocd. waters. Alden H. Emery

**Vapor pressure and vaporization of petroleum fractions.** Geo. G. Brown and Donald L. Katz. *Natl. Petroleum News* 25, No. 50, 28, 30, 32, 34-5; No. 51, 22-4, 26-9; No. 52, 23-4, 26(1933).—A summary of the latest data. R. W. Kelly

**The isolation of mesitylene, pseudocumene and hemimellitene from an Oklahoma petroleum.** Beveridge J. Mair and Sylvester T. Schickelanz. *Bur. Standards J. Research* 11, 665-80(1933)(Research Paper No. 614).—Mesitylene (I), pseudocumene (II) and hemimellitene (III) were isolated in very pure condition from Mid-Continent petroleum, by extg. with liquid SO<sub>2</sub> the fraction b<sub>118</sub> 118-32°, and fractionally distg. and crystg. the ext.; selective sulfonation and crystn. of the sulfonic acids and their hydrolysis were also employed. I has 2 cryst. modifications. The percentage of each in crude petroleum is: I, 0.02 (probably low), II 0.2, III 0.06. The density at 20°, n<sub>D</sub><sup>20</sup>, b. p. and f. p. are, resp.: I: 0.8653, 1.4967, 164.64°, —44.78° (α-form), —51.74° (β-form); II: 0.8762, 1.5025, 169.18°, —44.09°; III: 0.8951, 1.5116, 176.10°, —25.47°. Curves show the transmission of infra-red light. Twenty-two references. M. P. Benoy

**Jamin effect in oil production.** Randall Wright. *Bull. Am. Assoc. Petroleum Geol.* 17, 1521-6(1933).—The Jamin effect does not retard the flow of petroleum toward a well, although it may retard encroachment of edge water. Hydraulic pressure produced more oil under lab. conditions than air pressure. One asphalt-base and one paraffin-base oil exhibited greater adhesion for sand grains than did H<sub>2</sub>O. Alden H. Emery

**Survey of fuel consumption at refineries in 1932.** G. R. Hopkins. *Bur. Mines, Rept. of Investigations* No. 3222, 9 pp.(1933); cf. C. A. 27, 2287.—Av. fuel required per bbl. of crude oil was 692,000 B. t. u. in 1932, as compared with 672,000 B. t. u. in 1931. Use of refinery gas increased 8% and displaced oil as the primary refinery fuel, since the latter declined 11%. Use of coal, natural gas and petroleum coke declined. Acid sludge increased in importance. Alden H. Emery

**The inversion of emulsions of mineral oils and aqueous**

**solutions.** L. Hemmer. *Ann. combustibles liquides* 8, 1135-45(1933).—The formation of different types of emulsions depends upon the volumetric ratio of the 2 phases and upon the method of operation. The change in phase takes place at a certain value of this ratio, called the point of inversion. Expressed in percentage of the dispersed phase of total vol., the point of inversion varies between 74 and 100%. This variation is a function of interfacial tension. At very low tension it approaches 100, and 75% at high tension. In presence of neutral salts the point of inversion decreases inversely to the salt concn. Above a p<sub>H</sub> of about 11 soda produces about the same effect as NaCl. Karl Kammermeyer

**Solubility and liberation of gas from natural oil-gas solutions.** Ben E. Lindsly. *Bur. Mines Tech. Paper* 554, 65 pp.(1933); cf. C. A. 28, 1514°.—Gas may be liberated from solus. in 2 ways. Soly. curves for flash liberation are approx. a straight-line function of pressure. For differential liberation, which is somewhat similar in principle to hatch distn., soly. graphs have pronounced curvature. In the oil sands, reduction in pressure results in differential liberation; flash liberation takes place in the flow string of a well. The method of liberating gas has a pronounced effect upon the gravity of the oil. When gas was liberated differentially in these expts., the A. P. I. gravity of the oil was 1-4° higher than after flash liberation. Gas loss results in oil shrinkage, —11.3% for Ventura crude oil of 34° A. P. I. gravity to 40.5% for Kettleman Hills, 63° A. P. I. gravity. The rate of shrinkage increases greatly below 100 lb. per sq. in. The first 50% shrinkage was caused by liberation of a gas of low sp. gr. contg. approx. 77% CH<sub>4</sub>, whereas the last 50% was caused by a much smaller vol. of heavier gas contg. only 11% CH<sub>4</sub>. Virtually every sample obtained at the well head was undersatd. Alden H. Emery

**Oxidation-reduction reactions between natural hydrocarbons and oil-filled waters.** O. H. Behre, Jr. and R. K. Summerbell. *Science* 79, 39-40(1934).—Previously unpublished work is reported in abstr. form. Expts. show that sulfate-bearing waters, even in the absence of bacteria, suffer reduction to sulfides in contact with paraffin-base oils at temps. of 30-122°. The work is being repeated in more detail, special attention being paid to variations in (a) temps. and pressures, (b) types of paraffins, (c) types of oxidizing agents and (d) naturally occurring catalysts. Howard A. Smith

**Development of the oil-cracking art.** P. C. Keith and W. B. Montgomery. *Ind. Eng. Chem.* 26, 190-4(1934).—

A brief description of the development and of the present state of various cracking processes. V. A. Kalichevsky. *Vapor-phase cracking*. C. R. Wagner. *Ind. Eng. Chem.* 26, 188-9(1934).—A brief survey of the literature on vapor-phase cracking, supplemented by the exptl. data which show that the cracking temp. and the nature of the charging stock affect the characteristics of the reaction products.

V. A. Kalichevsky. *Fundamental variables in mixed-phase cracking*. Harold Sydnor. *Ind. Eng. Chem.* 26, 184-7(1934); cf. *C. A.* 22, 585.—Temp., pressure, reaction time, and conversion per pass (percentage of gasoline multiplied by percentage of fresh feed in total feed) are the only variables which account for the differences between various cracking processes. Results obtained in cracking a Mid-Continent gas oil show the interdependence of these variables and their effect on the yield and knock rating of gasoline. The tube and tank process is described.

V. A. Kalichevsky. *Resinification of gasoline*. Evert Norlin. *Tek. Tid., Uppf. C, Kemi* 63, 89-94(1933).—A discussion of the reasons for the formation of gum in gasoline produced by the cracking process. Recent methods for the estn. of existing and potential gum are described in detail, together with a discussion of various means of inhibiting the gum formation. The use of antioxidants, the effect of the storing of gasoline on the efficiency of these agents and the relation between the activity of antioxidants and their chem. compn. are discussed.

D. Thuesen. *Determination of carbon in graphited cup grease*. F. Heathcoat. *Analyst* 59, 28-9(1934).—The samples examined were supposed to consist of a lime-soap base and 5% of graphite. The graphite was left behind after boiling 3-4 g. with 30 ml. of glacial AcOH, filtering, washing with hot glacial AcOH and finally with hot water. W. T. H.

Conversion of fatty and waxy substances into petroleum hydrocarbons (Seyer) 8. Overhanging salt on domes of Texas and Louisiana (Judson, Stamey) 8. App. for coking oil residuum or asphalt (U. S. pat. 1,942,050) 21. Destructive hydrogenation (Brit. pat. 399,487) 21. Removing S impurities from hydrocarbon gases and oils (U. S. pat. 1,942,054) 21. Tertiary alkyl-substituted *o*-dihydroxybenzenes [for preventing gum formation in gasoline] (U. S. pat. 1,942,827) 10. Hydrogenation of oil (Can. pat. 336,448) 27.

British Standards for Turbine Oils. (B. S. S. No. 489-1933). London: Brit. Standards Inst.

Richtlinien für Einkauf und Prüfung von Schmiermitteln. 6th ed. Issued by Verein deutscher Eisenhüttenleute und dem deutschen Normenausschuss. Berlin: Beuth-Verlag. 128 pp. M. 6.75.

Distillation and utilization of liquid fuels such as heavy petroleum oils. Eastman A. Burrows (one-half to Thomas D. Campbell). U. S. 1,941,968, Jan. 2. A liquid fuel is continuously introduced into a heating zone to effect its partial distn., lighter components from the distn. are removed; heavier components are passed to burners in a furnace assocd. with a primary heat-utilization system for heating material other than the fuel (such as for heating a kiln) maintained at a temp. above 1090°, and intermediate components resulting from the distn. are passed into heat exchange with the flue gases from the furnace at a temp. of below 920° and back to the heating zone. App. is described.

Fractional distillation of materials such as petroleum oils. Albert G. Peterkin, Jr. (to Atlantic Refining Co.). U. S. 1,942,446, Jan. 9. Various details are described of distg. tower operation in which steam is used.

Apparatus for the destructive hydrogenation of petroleum oils. Wm. B. Plummer (to Standard Oil Co. of Ind.). U. S. 1,942,120, Jan. 2. Various structural and operative details of a catalytic app. are described.

Breaking emulsions of petroleum with water. Charles Fischer, Jr. and Warren T. Reddish (to Kontol Co.).

U. S. 1,941,886, Jan. 2. A demulsifying reagent comprises a mineral oil sulfonic product of the type recovered from the refining of medicinal white oils, etc., with strong or fuming H<sub>2</sub>SO<sub>4</sub> with alc. as a viscosity reducer, reagent disperser and coalescence accelerator.

Apparatus for breaking petroleum emulsions by vibratory and electric treatment. Levering Lawrason (to Petroleum Rectifying Co. of Calif.). U. S. 1,942,480, Jan. 9. Various structural and operative details are described.

Cracking petroleum oil. Percy C. Keith, Jr. (to the Gasoline Products Co. Inc.). Can. 336,130, Oct. 3, 1933. Gasoline is produced from petroleum oils by heating in a confined stream to 875-975°F. under a pressure of upward of 500 lb., and passing the heated oil into an enlarged reaction chamber, wherein cracking and sep'n. of vapors from liquid take place. The liquid is withdrawn from the reaction chamber while the vapors therein are maintained at cracking temp. The sep'd. vapors are passed through a heating coil and subjected to vapor-phase cracking, and the heated vapors are passed into a second enlarged reaction chamber, wherein they are maintained at cracking temp. under a pressure of upward of 500 lb. The products of conversion are withdrawn from the latter reaction chamber so rapidly that the accumulation of liquid therein is prevented. The products of conversion are fractionated to sep. the desired high-antiknock gasoline.

Apparatus for cracking hydrocarbon oils. Petroleum Conversion Corp. Ger. 587,899, Nov. 10, 1933 (Cl. 23b. 1.04).

Cracking oil. Walter J. Perelis (to The Shell Development Co., to The Universal Oil Products Co.). Can. 337,552, Nov. 28, 1933. Oil feed is sep'd. into a lighter and a heavier fraction, and the heavier fraction is cracked under flow and under superatm. pressure in the liquid phase while out of contact with the lighter fraction. The lighter fractions from the cracked liquid-phase efflux are sep'd. and passed together with the lighter fraction of the feed to a distg. zone, where lighter and heavier fractions are sep'd. The lighter fractions from the zone are removed and condensed, and the heavier fractions from said zone are cracked in the vapor phase under flow and under a pressure substantially atm. The lighter fractions of the cracked vapor-phase efflux are sep'd. and condensed, and the light condensate from the liquid- and vapor-phase cracking is separately collected.

Distilling and cracking oils. Frank W. Steere (one-half each to Semet-Solvay Engineering Corp. and Air Reduction Co.). U. S. 1,942,191, Jan. 2. The oil is cyclically circulated to form a continuous stream which is subjected to direct contact with the hot gaseous products of a reaction between O, steam and combustible carbonaceous material such as coal, oil or gas and the resultant gas and vapors are passed through a rectifying column to condense heavy hydrocarbons, and the gas and remaining vapors from the column are passed through a condenser to sep. light liquid hydrocarbons and water from the gases. App. is described.

Single-pass heat-exchange apparatus suitable for use with oil-cracking apparatus. Carl S. Reed (to Lummus Co.). U. S. 1,942,878, Jan. 9. Structural details.

Hydrocarbon oil conversion. Hans Engel and Josef Jannek (to I. G. Farbenind. A.-G.). U. S. 1,941,884, Jan. 2. For obtaining products of lower b. p., an oil such as a middle oil or tar or gas oil is subjected to the action of a free halogen such as Cl at a temp. between 0° and 150° (suitably about 100° when using Cl) and the resulting products are then further subjected at a temp. of 100-500° to the action of Al activated by treating it with a soln. of a salt of a less electropos. metal such as HgCl<sub>2</sub>. App. is described.

Conversion of hydrocarbon oils. Robert E. Wilson (to the Standard Oil Co.). Can. 336,184, Oct. 3, 1933. Higher-boiling hydrocarbon oil is heated to about 900° F. under a pressure of about 750 lb. per sq. in., the heated oil is passed to a zone of substantially lower pressure of at least 100 lb. per sq. in. wherein the desired low-boiling

- products together with a portion of the products heavier than the desired products are vaporized and the unvaporized products are maintained at not less than 750°F. The vapors and unvaporized products are separately withdrawn and the unvaporized products are passed to another zone of still lower pressure wherein substantially all of the remaining heavier constituents thereof desirable as cracking stock are vaporized. The vapors and unvaporized portions of the second low-pressure zone are separately withdrawn, the vapors are condensed and the condensate is passed to the oil undergoing cracking. The vapors from the first low-pressure zone are fractionated and the heavier constituents condensed as reflux condensate, which is passed to the oil undergoing cracking. The fractionated vapors are partially condensed and the uncondensed constituents are passed through the unvaporized product in the second low-pressure zone before the latter is withdrawn therefrom. The desired low-boiling oils are recovered.
- Conversion of hydrocarbon oils.** Richard F. Trow (to the Texaco Development Corp.). Can. 336,188, Oct. 3, 1933. A charge of oil, such as an unclean gas oil or a topped crude oil, is brought into contact with hot cracked vapors, by which the more volatile portion of the charge oil is vaporized and the heavier less refractory portion is cracked and partially vaporized, while a portion of the vapors is condensed and deposited along with a remaining unvaporized portion of the charge oils. The combined vapor is scrubbed in the distn. zone and is then dephlegmated to produce a final motor-fuel vapor and a clean gas-oil condensate, which is heated to a temp. well above the usual cracking temp. for such a stock. The residual cooler portion from the distn. zone is combined with the heated products from the heater and the mixt. digested in enlarged zones. The resultant hot vapors are delivered to the distn. zone to distil the charge oil and a residuum, being deposited in the digestion zone, is autogenously distd. to produce an ultimate residue and a vaporous portion which is preferably condensed and delivered to the device for dephlegmating cracked vapor. A motor fuel of high antiknock qualities is recovered.
- Distillation of hydrocarbon oils.** Max G. Paulus (to The Standard Oil Co.). Can. 338,052, Dec. 19, 1933. Hydrocarbon oils are subjected to superatm. pressure and cracking temp. Vapors and unvaporized heavy residual portions comprising pressure tar are separately withdrawn. The hot tarry residues are passed to a chamber at lower pressure, whereby the volatile constituents are flashed into vapors, producing reduced-pressure tar. The vapors and tar are separately withdrawn from the chamber. The tar is agitated, while in the chamber at reduced pressure, to prevent deposition of coke.
- Removing hydrogen sulfide from hydrocarbon oils.** Charles J. Smith (to Koppers Co. of Del.). U. S. 1,942,071, Jan. 2. In purifying a hydrocarbon oil from  $H_2S$  by means of an alk. carbonate soln. recirculated through a cycle comprising an absorption stage in which the oil is treated with the soln. and an actification stage in which the fouled soln. is treated for the removal of  $H_2S$ , the actification stage is so conducted that not more than about half its absorbed  $H_2S$  content is removed. App. is described.
- Refining benzenoid hydrocarbon oils.** Alfons Kemper (to Koppers Co. of Del.). U. S. 1,942,002, Jan. 2. A flow of oil such as benzene is continuously commingled with a flow of 60-65° Bé.  $H_2SO_4$  and this mixt. are agitated and then mixed with water in greater quantity than that of the acid, the dild. mixt. is further agitated, and the flow of mixed oil and acid soln. is then sepd. into different streams of oil and dil. acid soln. App. is described.
- Refining hydrocarbons.** John D. Fields. Can. 337,756, Dec. 12, 1933. A mixt. of petroleum 80, vegetable matter 10 and iron ore 10 parts is heated to 400°F. at normal pressure to drive off distillates. The remaining mixt. is heated to 580°F. under a pressure of approx. 100 lb., and then to 650°F., which temp. is maintained to convert the high-boiling fractions to low-boiling fractions and to drive off the volatile matter until a dry residue is left. The vaporous distillates are condensed and resinous compds. are extd. from the condensates. When a residuum of ferric coke of hard character is desired the iron ore is added, but when a soft dry coke is desired the iron ore is omitted. Suitable vegetable matter is sawdust, kelp, beet pulp, sugar cane and the like.
- Refining liquid hydrocarbons.** Edeleanu G. m. b. H. Ger. 587,900, Nov. 10, 1933 (Cl. 23b. 1.05). App. for refining liquid hydrocarbons by treatment with liquid  $SO_2$  is described. Cf. C. A. 27, 2027.
- Refining oils.** Sigbert Seelig. Ger. 587,984, Nov. 11, 1933 (Cl. 23b. 1.05). Distn. or "cracked" products of mineral, shale or lignite tar oils are refined by treatment with alkali plumbite soln. to which  $Fe_2O_3$ ,  $Fe(OH)_2$ , basic Fe oxide or an Fe salt has been added.
- Refined distillate.** Edward B. Peck (to The International Hydrogenation Patents Co., Ltd.). Can. 338,347, Jan. 2, 1934. Heavier hydrocarbon oil is cracked at above 800° F. An oil boiling above 400° F. and having an aniline point below 100° F. is segregated and passed with H under pressure in excess of 20 atm. through a catalytic reaction zone above 900° F. The product is withdrawn and cooled; it comprises low-boiling hydrocarbon suitable for high-grade motor fuel.
- Treating oil pressure distillates.** Lyle Caldwell and Raymond T. Howes (to Calif. First National Bank of Long Beach). U. S. 1,941,970, Jan. 2. A pressure distillate which has been treated with an inorg. acid such as  $H_2SO_4$  is neutralized and then vaporized with steam; the mixed vapors are passed in contact with material contg. MgO to react and form water-sol. salts; the vapors are condensed, and the condensate is treated with Na plumbite. App. is described.
- Working up crude oils.** Edeleanu G. m. b. H. Ger. 587,774, Nov. 7, 1933 (Cl. 23b. 1.05). Crude oil is heated to 400° to distil off the light oil. The residue is then refined by treatment with liquid  $SO_2$  and further fractionated.
- Viscous oils.** N. V. de Bataafsche Petroleum Maatschappij. Brit. 399,646, Oct. 12, 1933. See Fr. 742,935 (C. A. 27, 3812).
- Hydrogenating and distilling oil shale.** Ralph H. McKee. U. S. 1,941,809, Jan. 2. Oil shale ground to a fineness of at least 20-mesh is preheated to about 300°, then suspended in a rapidly moving stream of steam of about equal wt. and the mixt. is passed through a highly heated metallic tube under a pressure of at least 1000 lb. pressure per sq. in. but not more than 2500 lb. per sq. in. A temp. of about 900° is maintained in the first half of the tube and temps. of 250-450° are maintained through the second half of the tube and the movement of the mixt. through the tube is controlled so that the oil shale is only subjected to the heat for a relatively short time such as a few sec. to produce vapors without deleterious effects upon them. The vapors are withdrawn and products are condensed from them. App. is described.
- Separating wax and oil.** Seymour W. Ferris (to Atlantic Refining Co.). U. S. 1,941,601, Jan. 2. An oil-wax mixt. is extd. with  $PhNO_2$ , and the wax is then sepd. from the oil which remains in the undissolved portion of the mixt. after the extrn.
- Dewaxing mineral oils.** Roy N. Giles (to Standard Oil Co. of Ind.). U. S. 1,943,236, Jan. 9. A wax-bearing oil is heated with liquefied butane or the like to effect complete soln. of the wax and oil; the soln. is then refrigerated to cause crystn. of the wax and the latter is sepd. Numerous details of procedure and app. are described. Cf. C. A. 27, 5960.
- Cracked motor fuel.** Alphonso O. Jaeger (to Selden Co.). U. S. 1,941,689, Jan. 2. Succinimide (suitably in a proportion of about 2-6 lb. per 100 bbl.) is used as a gum-formation inhibitor in cracked hydrocarbon distillates contg. unsatd. compds. in high proportion. Phthalimide, ethyl- or phenyl-phthalimide, naphthalimide, etc., also may be used. Cf. C. A. 27, 3805.
- Concentration of sludge acid.** Laurence V. Phillips (to The Texaco Development Corp.). Can. 336,652, Oct. 24, 1933. The sludge produced by treatment of hydrocarbon oils with  $H_2SO_4$  is extd. with water to produce an acid of 25-30° Bé. contg. 1.0-1.5% carbonaceous ma-

terial. This acid is heated for 6-15 hrs. to a temp. at which substantial pptn. of the carbonaceous materials occurs but at a temp. insufficient to effect substantial vaporization or cause material reduction of the acid to  $\text{SO}_2$  by the carbonaceous material. Air is then passed upward through the acid to conc. the pptd. carbonaceous material on the surface. The ppt. is sepd. and the purified weak acid is concd. to at least 60°Bé.

**Retarding gum formation in gasoline, etc.** Eugene Ayres (to Gulf Refining Co.). Brit. 399,733, Oct. 12, 1933. Divided on and addn. to Brit. 394,511 (C. A. 28, 1814). The products of 394,511 are added to motor fuel, e. g., 0.0005-0.01% *peri*-monoöxynaphthalene to cracked gasoline.

**Lubricating oil.** Harry T. Bennett and Le Roy G. Story (to Mid-Continent Petroleum Corp.). U. S. 1,942,636, Jan. 9. A low-pour-point lubricant for engines comprises a lubricating oil having a viscosity of 100 to 1000 sec. at 38°, together with 5-15% of a low-boiling hydrocarbon oil and not more than 10% of Al stearate. Cf. C. A. 27, 2800.

**Grease.** Gus Kaufman (to The Texaco Development Corp.). Can. 336,653, Oct. 24, 1933. Hydrocarbon or mineral lubricating oil and fatty oil ingredients are mixed in suitable proportions and heated with stirring to 400 (600°)F. The digested mixt. is saponified by the addn. of NaOH, lime or the like, either with or without prior cooling.

**Grease.** Gus Kaufman (to The Texaco Development Corp.). Can. 336,655, Oct. 24, 1933. A mixt. of mineral

and fatty oil is digested for a predetd. time at 400-700°F. to increase the viscosity and hardness. Alk. materials such as NaOH or CaO are added to the digested mixt. to react with its saponifiable constituents. Volatile fractions which may include glycerol, fatty acids and hydrocarbon fractions evolved in vapor form are subjected to controlled dephlegmation for the removal of the valuable constituents to form a reflux condensate which may be returned to the mixt. undergoing treatment.

**Asphalt from blown petroleum residues.** Claude P. McNeil (to Standard Oil Co. of Ind.). U. S. 1,942,656, Jan. 9. Air is continuously mixed with the residue from petroleum distn. and the mixt. is passed continuously through a reaction zone in which heat is liberated by the exothermic reaction of the air with the hot residue. At least part of the liberated heat is absorbed by heat exchange with petroleum passing to the reaction zone. App. is described. Cf. C. A. 27, 1163.

**Apparatus for emulsifying bituminous materials, etc.** Kenneth E. McConaughay (to Pre Cote Corp.). U. S. 1,941,808, Jan. 2. Structural and mech. features.

**Products such as methanol, etc., from vegetable materials by digestion and dry distillation.** Erik L. Rinnan. U. S. 1,941,760, Jan. 2. Raw vegetable material such as wood chips or straw is digested in an aq.  $\text{Ba}(\text{OH})_2$  soln. at an elevated temp. under pressure to effect decomposition and formation of compds. with the  $\text{Ba}(\text{OH})_2$ ;  $\text{BaO}$  is added to the resulting soln. to effect reaction with the water of the soln. and generation of heat, thus driving off water from the soln., and the residue is subjected to dry distn.

## 23—CELLULOSE AND PAPER

CARLETON E. CURRAN

**The iodine number of cellulose.** Brissaud. *Mém. poudres* 25, 222-43 (1932-33); cf. Bergmann and Machermer, C. A. 24, 2877.—By treatment of cotton linters and wood pulp with I in alk. soln., acidulation and titration with hyposulfite, it was found that the I no. varies according to whether the I or caustic is added first, that there is no relation between I no., Cu no. and percentage of  $\alpha$ -cellulose and that bleaching in acid soln. increases the Cu no. with slight increase of the I no., while in alk. soln. the Cu no. is slightly increased and the I no. considerably decreased.

**The copper number of cellulose.** Brissaud. *Mém. poudres* 25, 244-86 (1932-33).—Modifying the usual method by using Erlenmeyer flasks almost completely full, in order to avoid oxidation, filtering on a porous plate, passing the filtrate through a filter paper and washing until 0.2 cc. permanganate was not reduced in 2 min. showed that 3-hr. tests were satisfactory and that longer tests resulted in the deposition of silica upon the fibers. The alk. Cu soln. dissolves slightly polymerized products present and reduces them to glucose, which in turn may be decompd. with loss of reducing power, and reduces cupric to cuprous salts. The Cu no., the resultant of these reactions, measures the reducing groups present, not preexistent but formed during the course of the reaction, as well as their speed of soln., this being proportional to the degree of polymerization and amt. of surface exposed. For similar celluloses the results are proportional to the  $\alpha$ -cellulose present and the results are superior in consistency and reproducibility to the I and Ag nos. Results are not comparable for materials which differ in sp. surface and degree of polymerization such as cotton linters, regenerated cellulose and wood cellulose.

**The reaction of cellulose in acetylation with zinc chloride as catalyst.** C. Trogus and K. Hess. *Angew. Chem.* 47, 30-32 (1934).—The acetylation of the fibers in presence of  $\text{ZnCl}_2$  is a micellar heterogeneous process which results in triacetylcellulose only, as shown by x-ray examus. The authors conclude that the direct formation of weaker acetylated cellulose acetates will only succeed with a fundamental change in the exptl. conditions, such that the

diffusion velocity of the reagent into the crystallite interior is increased greatly, and that the esterification velocity is simultaneously decreased to such an extent that the difference in the reaction const. of the hydroxyl groups becomes effective. Such attempts are in progress. Twelve references.

**Dielectric loss of acetylcellulose and influence of solvents.** D. A. Fedorov and V. N. Malishev. *J. Tech. Phys.* (U. S. S. R.) 3, 749-55 (1933).—The dielec. loss of fully dried acetylcellulose film is independent of, or very slightly dependent upon, field intensity. Addn. of 15% plasticizer causes no variation. Loss of moistened film is considerably greater, being directly detd. by the moisture content. Clean moistened films show higher loss with no apparent parallelism to moisture content. The loss is independent of, or very slightly dependent upon, temp. up to 90° or 100°. For higher temps. the loss increases with various degrees depending upon field strength, and at 120° with high field strength is detd. on the one hand by plasticizing of film, and on the other hand by impurities present, solvents and plasticizers. E. H.

**Swelling capacity and solubility of benzylcellulose in organic liquids.** Ichiro Sakurada and Ichiro Kido. *J. Soc. Chem. Ind. Japan* 36, Suppl. binding 656-9 (1933).—In testing the reaction of 36 liquids upon dibenzylcellulose it was found that the dipole moment, mol. vol. and degree of assocn. of the liquids exert a decided influence. Nonpolar liquids cannot dissolve benzylcellulose completely but are usually good swelling agents. Aliphatic hydrocarbons are poor swelling agents, benzene dissolves the cellulose mostly and tetralin completely. Halogenated hydrocarbons and benzene derivs. usually are good solvents. All aliphatic satd. alcs. are swelling agents only. AcOH is only a partial solvent but  $\text{EtCO}_2\text{H}$  dissolves the cellulose completely. Lactic acid is a poor swelling agent. Esters are nonsolvents except for  $\text{HCO}_2\text{Et}$ ,  $\text{AcOMe}$  and  $\text{AcOEt}$ . Ketones are similar to acids and esters in their action.

**Hygiene in the manufacture of rayon.** Gabriel Bertrand. *Bull. acad. méd.* 109, 221-3 (1933). A. E. M. Composition of some Philippine soft woods. V. Augustus P. West, F. M. Yeuko, Luz Baena and H. M.

Curran. *Philippine J. Sci.* 52, 209-16(1933); cf. C. A. 27, 1733.—Analyses of the following woods were made: anablong (*Trema orientalis*); fire tree (*Delonix regia*); palong-manok (*Alangium chinense*); balsa (*Ochroma lagopus*); ilang-ilang (*Canarium odoratum*); alim (*Melanolepis multiglandulosa*); baguimbang (*Aleurites trisperma*); lumbang (*Aleurites moluccana*), which has the lowest lignin and the highest cellulose and  $\alpha$ -cellulose content; malapapaya (*Polyscias nodosa*); rain tree (*Samanea saman*), which has the lowest ash; basikong (*Ficus conora*), which is highest in lignin; tibig (*Ficus nota*), which has the lowest cellulose and highest ash content; binunga (*Macaranga tanarius*) and gubas (*Endospermum peltatum*). The methods used were those of the U. S. Forest Products Lab. Louis E. Wise

Present status of determining the strength of chemical wood pulps. Société Spiro. *Chimie & industrie Special No.*, 1101-6(June, 1933).—A description of the present standard Swedish, American and German methods for the prepn. of test sheets for the strength-testing of chem. wood pulp. A. Papineau-Couture

Chemical properties of screen fractions of black gum and slash pine groundwood pulps. E. R. Schafer and Matti Santaholma. *Paper Trade J.* 97, No. 10, 46-7 (1933).—The lignin content and the soly. in 1% NaOH varied from fraction to fraction, being higher in the finer fractions than in the coarser. Neither the chem. constituents of the various fractions nor of the whole pulp appear to have any bearing on the paper-making properties of the pulp. A. Papineau-Couture

Effect of different-sized fibers on the physical properties of groundwood pulp. E. R. Schafer and Matti Santaholma. *Paper Trade J.* 97, No. 19, 40-5(1933).—A study of the strength and suspension properties of groundwoods in relation to the dimensions of the fibers, carried out by recombining the screen fractions in various proportions, showed that the av. fiber length is related in a general way to nearly all the usual strength and suspension properties, thus permitting of the employment of screen analysis as an aid in evaluating pulp quality. A. Papineau-Couture

The cooking of wood pulp (with water). Arne Knudsen. *Papir J.* 21, 229-31(1933).—Forty-g. portions of wood pulp suspended in 2.5 l. of  $H_2O$  were autoclaved 15, 30, 45 and 60 min. at pressures from 1 to 6 atm. The temp. of cooking had a marked effect on the phys. properties; little further change occurred after cooking 15 min. Schopper-Riegler wetness decreased about 15% upon cooking at 100° and remained const. until 143° (4 atm.) was reached, above which it fell off rapidly. Absorption measured in mm. capillary rise in 5 min. increased steadily with temp. Breaking length dropped 12.8% upon cooking at 100° and remained const. until 143° was attained, above which it increased rapidly. Yield decreased from 98% at 100° to 92.6% at 155° (6 atm.). Titration with  $KMnO_4$  indicated that the hydrolysis of polysaccharides by water increases with temp. and time. Clinton L. Brooke

The cooking process. VI. Cooking wood with sodium sulfide. S. I. Aronovsky and R. A. Gortner. *Ind. Eng. Chem.* 26, 61-5(1934).— $Na_2S$  is a strong pulping agent which inhibits the destructive action of  $H_2O$  on the  $\alpha$ -cellulose at high temps. VII. Cooking wood with sodium hydroxide and trisodium phosphate. *Ibid.* 220-6.—NaOH hinders the hydrolytic action of  $H_2O$  on  $\alpha$ -cellulose and is a strong pulping agent.  $Na_3PO_4$  yields results similar to those obtained with  $Na_2CO_3$ . P. S. B.

Chemistry of alkaline wood-pulp process. IV. Is there a critical pulping temperature for the sulfate process? J. Stanley Martin, M. W. Bray and C. E. Curran. *Paper Trade J.* 97, No. 20, 38-42(1933); cf. C. A. 25, 5763.—Twenty-two sulfate digestions were made in which all conditions were kept const. excepting temp. (varied from 160° to 180°) and time. An increase in cooking time for any of the temps. employed resulted in a decrease in yield and strength values, with the exception of the resistance to tear for the pulps made at 160°. Pulps cooked for the same length of time at various temps.

showed the higher yields for the lower temps. In the semi-com. digestions increasing the cooking time at 180° and at 170° caused a small decrease in yield and in strength properties; at 160° there was a small (unexplained) increase in pulp yield with increase in cooking time. Increasing cooking time resulted in easier bleaching for pulps in the 160° series; but little change was observed in the bleach requirements for the 170° and 180° digestions. Pulps cooked at 180° showed higher tear and folding resistance and seemed to hydrate easier than those made at the lower temps. The magnitude of the variations observed was small in all instances. Conclusion.—Within the range of 160-180° there is no particular optimum or crit. temp. which is noticeably beneficial or detrimental to the resulting pulps. A. Papineau-Couture

Hydration and beating of cellulose pulps. W. Boyd Campbell. *Ind. Eng. Chem.* 26, 218-19(1934).—Although the effect of beating termed "hydration" is not the result of a solid soln. of water in the cellulose or of the formation of a cryst. hydrate, hydration in the sense of adsorbed water mols. exists but its degree is unchanged by beating. Water causes a soln. of intercrystallite attractions and beating aids this swelling action to increase the external surface, with resulting fibrillation, the essential action of beating. After fibrillation there results the "internal tension effect" of the water, which, during its removal in paper making, forces the cellulose surfaces in sufficient proximity for the crystg. forces to form bonds between them which hold after the water is evapd. F. A. Simmonds

Methods of hydrating pulp for strength testing. Howard W. Morgan. *Paper Trade J.* 97, No. 24, 35-8(1933).—A review of the present status of the use of the expl. beater and porcelain pebble mill for prepg. pulp samples for sheet making and subsequent testing, giving particular attention to a consideration of the variables inherent to the pebble mill method and an outline of the work to be done to establish this method as a tentative pulping testing standard of the Tech. Assoc. of the Pulp & Paper Ind. A. Papineau-Couture

Observations relative to the physical and chemical changes taking place in the cooking of new white rags. Edwin R. Laughlin. *Paper Trade J.* 97, No. 17, 39-52 (1933).—A pressure in excess of 150 lb. is not feasible in com. rag cooking because of the excessive phys. and chem. degradation. Pressures of 100-150 lb. are not excessively degrading when the cook is of short duration (up to 3 hrs.) and at a concn. of up to 3.5% NaOH or 10% lime on the wt. of the rags. The effect of time of treatment on the stability of the cellulose as measured by the viscosity and tearing resistance is small compared to that of pressure and chem. concn. Cooking losses are small for concns. up to 3% NaOH or pressures up to 100 lb., but increase rapidly above these values. The presence of  $MgO$  is favorable to increased phys. strength and viscosity and to lower cooking losses; the cooking residues resulting from lime- $Na_2CO_3$  cooks are not rendered more difficultly removable in the washing operation by the presence of  $MgO$  in the cooking liquor. The presence of  $HCO_2H$ ,  $AcOH$  and small amts. of lactic acid in the waste liquors from rag cooks indicates that the cellulosic degradation process is a mild form of that undergone by cellulose in high concns. of alkali at high pressures and by sugar materials in the presence of strong alkali. At low concns. of alkali and low pressures, non- $\alpha$ -cellulose material is attacked to yield sol. Cr-reducing products faster than  $\alpha$ -cellulose is degraded to non- $\alpha$ -cellulose material insol. in the cooking liquor; at high pressures and high alkali concns., the reverse is true. A. Papineau-Couture

Analysis of alkaline black liquors of varying sulfidity by ammonia distillation method. M. A. Heath, M. W. Bray and C. E. Curran. *Paper Trade J.* 97, No. 20, 33-7 (1933); cf. C. A. 27, 2806.—The previously described method was modified by: (1) elimination of oxidation with  $H_2O_2$ ; (2) use of standard acid and standard I in the first receiver; (3) absorbing the  $CO_2$  in an ascarite bulb instead of in standard alkali; (4) correction for the presence of org. salts by detg. the corresponding amt. of

non-volatile acids remaining in the distg. flask, with methyl red indicator. A comparison was made of the modified method with the standard method used at the U. S. Forest Products Lab., on 2 series of bomb-scale digestions with Douglas fir, in which the  $\text{Na}_2\text{S}:\text{NaOH}$  ratio was varied from 0 to 100%. Results by the standard method for free alkali are low and show regularity; those for  $\text{Na}_2\text{S}$  are high and irregular. The black liquors change in compn. on standing, the NaOH content generally increasing at the expense of the  $\text{Na}_2\text{S}$ . The total consumption of chemicals in sulfate digestions is only slightly affected by the proportion of  $\text{Na}_2\text{S}$  to NaOH when the free alkali is maintained const. This holds throughout in the 30% free alkali series, and up to 60%  $\text{Na}_2\text{S}$  in the 20% free alkali series; with 80–100%  $\text{Na}_2\text{S}$  at 20% free alkali, based on the wt. of wood, the consumption of chemicals is definitely higher, even though the pulping action is less. Digestions by the soda process at alkalinities of 20 and 30% consume less chemical than do the sulfate digestions at the same alkalinities. A. P.-C.

**Murray-Waern system of sulfate and soda waste heat recovery.** C. L. Durkee. *Paper Trade J.* 97, No. 24, 20, 22(1933).—Descriptive. A. Papineau-Couture

**United States patents on paper making. Third quarter, 1933.** Clarence J. West. *Paper Trade J.* 97, No. 22, 35-7(1933); cf. C. A. 27, 4923.—A list in numerical sequence of patents relating to pulp- and paper-making issued at Washington during July, Aug. and Sept., 1933. A. Papineau-Couture

**Ultra-violet rays in the examination of papers.** Gino Testi. *Chim. ind. agr. biol.* 9, 470-1(1933).—Raw kraft cellulose gives brown or red fluorescence; bleached, gray or bluish; raw cotton pulp, grayish; bleached, pink-gray; Manilla pulp (both raw and bleached), reddish gray; raw soda cellulose from conifers, brown; bleached, yellowish gray, raw eucalyptus pulp, deep violet; bleached, gray; raw flax pulp, violet-gray; bleached, clear gray. G. A. Bravo

**The place of pulp color measurements in paper making—present and future.** Lester C. Lewis. *Paper Trade J.* 97, No. 23, 35-9(1933).—Improvements effected during the past few yrs. in methods of measuring reflectance make it possible to substitute this detn. for the more complex and less certain "color" measurement used heretofore. Its field of usefulness in the pulp and paper industry is discussed. A. Papineau-Couture

**Keeping dirt out of paper.** E. K. Becker. *Paper Trade J.* 97, No. 23, 39-41(1933). A. P.-C.

**The most economical way to prepare stock for the paper machine.** M. C. Osborne. *Paper Trade J.* 97, No. 19, 19-20(1933).—A brief discussion. A. P.-C.

**The electron tube in the paper industry.** Amos J. Gernain. *Paper Trade J.* 97, No. 23, 33-4(1933).—A description of the principal types of electron tubes and their applications in the paper industry. A. P.-C.

**Determination of gelatin in paper.** V. Gruenman. *Papier* 36, 729-37, 821-7(1933).—A review of methods for the detection and detn. of gelatin in paper. A. Papineau-Couture

**The establishment of paper specifications.** C. C. Heritage. *Paper Trade J.* 97, No. 19, 24-6, 29(1933).—An explanation of the essential steps in the establishment and use of paper specifications. A. Papineau-Couture

**New method for determining the moisture content of paper as it leaves the paper-machine driers.** Rene Leonhardt. *Mon. papeterie belge* 13, 675-7(1933).—The "siccometer," constructed by Siemens & Halske, detn. the  $\text{H}_2\text{O}$  content by measuring the dielec. const. of the sheet which passes continuously through a specially designed condenser cell, consisting essentially of a single plate over which the sheet of paper is passed. A. P.-C.

**Comparison of natural aging of paper with accelerated aging by heating.** Royal H. Rasch and B. W. Scribner. *Bur. Standards J. Research* 11, No. 6, 727-32(1933) (Research Paper No. 620).—Addnl. evidence favorable to accelerated aging tests is presented. Thirty-three samples are placed in about the same order of stability by accelerated aging as by normal aging. P. S. B.

**Haug refiner versus attrition and Jordan type refiners.** Anton J. Haug. *Paper Trade J.* 97, No. 22, 33-4(1933).—A brief description of the new Haug refiner, and discussion of its merits. A. Papineau-Couture

**Serviceability and processing effects of oval cast iron and circular steel rods in a rod mill.** C. E. Hrubesky, P. S. Billington and P. K. Baird. *Paper Trade J.* 97, No. 16, 34-8(1933).—Hydration (as measured by the flow rate method) and the rate of development and maxima of bursting, tearing and folding strengths are greater with the circular than with the oval rods at 8% pulp consistence, and the power requirement for processing a given pulp to the desired point would therefore be considerably lower with circular rods. At 4% consistence, the same conclusions can be drawn, except with the tearing strength, where the rate of development and the max. value are lower with the circular rods. A. P.-C.

**Factors governing absorption of dyestuffs by paper fibers.** Frederick A. Soderberg. *Paper Trade J.* 97, No. 21, 39-45(1933).—The av. loss of color in the dyeing of waterleaf paper is 25%; this can be overcome by adding the color to the machine chest by means of a meter and controlling the rate of flow and consistency of the stock. Except for pigment dyestuffs, coloring of sized paper is best carried out at a  $\text{pH}$  of 4.5-5.5; a lower  $\text{pH}$  produces a deadened shade, while above 5.5 the colors are not entirely absorbed. In calender coloring natural sizing in the stock and added sizing necessitate the use of penetration assists; acid colors and some of the more sol. basic dyes are satisfactory for this work; when using basic colors, it is practical to include a small quantity of AcOH to hold the dyestuff in soln. Fillers (clay and talc only were investigated) absorb approx. the same quantity of color as the paper fiber; this may be taken advantage of to prevent granite effects which frequently occur with basic dyes. Fastness to light of certain dyes is improved by using  $\text{CuSO}_4 \cdot 5\text{H}_2\text{O}$ , which is best used lb. for lb. following the color and before adding size and alum. The only obvious effect of glue tub-sizing upon dyestuffs is to enhance the apparent color strength due to increased light refraction. In combination with rubber latex, the best results are obtained with direct dyes. When Zn hyposulfite is used for bleaching ground-wood, it should be added to the stock 15-20 min. before addn. of the color. On the whole, addn. of size and alum as mordants is beneficial to the absorption of color; with basic colors it is best to add size first, allowing time thoroughly to mix with the fiber, then color and finally alum. Development of color in the beater to its max. strength varies according to the chem. structure of the dyestuff; as the paper fiber passes a certain point in heating time it develops a translucent appearance which accentuates the color value, and at the same time the shade becomes proportionately duller; the colors are generally fully developed after 90 min. beating. When necessary to use excessive quantities of acid colors, it is advisable to add either  $\text{AlCl}_3$  or  $\text{BaCl}_2$  (preferably the latter) to increase retention. Pptn. of dyestuffs and retardation of fixation by Ca compds. in the water can be prevented by lowering the  $\text{pH}$  before addn. of the dye. Troubles due to Cl residues in the pulp are eliminated by washing the stock thoroughly, carrying it in a trough over as long a distance as possible, and allowing it to circulate in the beater at least 1 hr. before adding color. In order to assist penetration of dyes into paper that is not sized uniformly, alc. and soap chips can be advantageously used with basic colors, and sulfonated oils (of the double-sulfonated type) with acid colors. An app. is described which is suitable for specialty coloring with acid dyes on a board machine (but did not give good results with basic dyes). A. Papineau-Couture

**Colloidal control in starch sizing.** B. W. Rowland. *Paper Trade J.* 97, No. 21, 37-8 (1933).—Cooked starch can be effectively pptd. on pulp fibers in the beater by adding successively cooked starch and alum and then slowly neutralizing with an alkali such as  $\text{NH}_4\text{OH}$ . Similar results can be obtained by reversing the order of addn. of alkali and alum. It does no harm to pass the neutral point into low alk., and likewise it does not reverse the action to pass from neutral or alk. back to acid again. Severe mech. agitation after pptn. of the starch must be avoided. The amt. of alum required for this process is much greater than that employed for setting the rosin, and the quantity of alkali is much greater than usually carried by rosin size. For best results the ratio of alum to starch should be held within certain limits because the pptg. action brings down an adsorption complex of  $\text{Al}_2\text{O}_3$  and starch, and  $\text{Al}_2\text{O}_3$  beyond the pptn. requirements will lower the adhesive strength of the mass. The bursting strength is considerably higher than is obtained by the use of the same amt. of starch in the usual way.

**Reproductions of photomicrographs of paper cross-sections.** Walter E. Rogers. *Paper Ind.* 15, 450-1 (1933).—A series of 11 photomicrographs of various grades of paper.

**Relation of paper properties to printing quality.** C. G. Weber. *Paper Ind.* 15, 452-3 (1933).—A description of the work carried out at the U. S. Bur. of Standards.

**Defects of printing papers.** Harel Vnuk. *Chimie & industrie Special No.*, 1094-1100 (June, 1933).—A discussion of the principal defects of paper as they affect its utilization in the graphic arts, their causes, detection and prevention.

**Treating cellulose.** British Celanese Ltd., John E. Jones and Stanley C. Bate. Brit. 399,508, Oct. 5, 1933. Cellulosic materials are treated with at least 40% of  $\text{SO}_2$  at ordinary temp. for a substantial period of time, *e. g.*, 1 hr., or at increased temps. Inert diluents, *e. g.*,  $\text{C}_6\text{H}_6$ , PhMe, or constituents of a subsequent esterification mixt. may be present, *e. g.*,  $\text{Ac}_2\text{O}$ , or a catalyst, *e. g.*,  $\text{H}_2\text{SO}_4$ . Among examples wood pulp, treated by the process of Brit. 249,173 (*C. A.* 21, 1010), is heated 1-2 hrs. at 50-60° with glacial AcOH and  $\text{SO}_2$  (50% of the wt. of the cellulose). After cooling, AcOH,  $\text{Ac}_2\text{O}$  and Cl are introduced to effect acetylation.

**Cellulose solutions.** Emil Scheller (to Deutsche Gold- und Silber-Scheideanstalt vorm. Roessler). U. S. 1,942,346, Jan. 2. For prep. of a soln. of relatively high viscosity, cellulose material such as cotton is treated (as by boiling with water *in vacuo*) to remove substantially all the

uncombined O present in the material, substantially all free O is removed from the interior of the reaction vessel in which the desired soln. is to be prep., a solvent such as  $\text{Cu}_2\text{O}$  and  $\text{NH}_3$  is added to the cellulose, and residual free O is further removed from the cellulose and solvent mixt. so that the entire operation is conducted in substantially complete absence of free O. Pyrogallol and  $\text{Cu}_2\text{Cl}_2$  may be used in O removal. Cf. *C. A.* 27, 412.

**Cellulose solutions.** Charles Gracnacher (to Soc. pour l'ind. chim. à Bâle). U. S. 1,943,176, Jan. 9. Solns. suitable for manuf. of threads, films, etc., are produced by dissolving cellulose in a liquefied quaternary  $\text{NH}_4$  salt obtained by addn. of a hydrohalide ester of an alc. contg. not more than 8 C atoms such as benzyl chloride to a tertiary amine of the pyridine series such as pyridine itself. Numerous examples with details are given. Cf. *C. A.* 27, 5535.

**Molding cellulose derivatives.** Arthur Eichengrün (to Celanese Corp. of America). U. S. 1,942,000, Jan. 2. A cellulose deriv. such as cellulose acetate is subjected to swelling in an excess of swelling agent such as methylene chloride, the excess of swelling agent not absorbed is removed, a plasticizer such as triacetin and alc. is added and the material is molded under heat and pressure.

**Cellulose esters.** Henry Dreyfus. Brit. 399,509, Oct. 5, 1933; Fr. 752,725, Sept. 29, 1933. Cellulose is esterified in the presence of a hydrohalide acid and a hydrohalide of a N-contg. base, particularly with HCl and  $\text{NH}_4\text{Cl}$  or the hydrochloride of an org. base. Org. bases used may be  $\text{MeNH}_2$ ,  $\text{EtNH}_2$ ,  $\text{PrNH}_2$ , ethanalamine or the corresponding dialkylamines,  $\text{PhNH}_2$ , benzylamine, cyclohexylamine or, less advantageously, tertiary bases, *e. g.*,  $\text{Me}_3\text{N}$  or pyridine.

**Cellulose esters.** Kodak A.-G. Ger. 582,068, Aug. 8, 1933 (Cl. 120. 6). Addn. to 577,704 (*C. A.* 28, 894<sup>h</sup>). See Brit. 360,417 (*C. A.* 27, 1167) and 360,058 (*C. A.* 27, 600).

**Purification of cellulose esters.** Jacques Scheidegger (to Camille Dreyfus). Can. 338,069, Dec. 19, 1933. Cellulose acetate is dissolved in a mixt. of benzene and EtOH at elevated temp. and then cooled to below 50° until a substantial portion of the cellulose acetate ppts. or crystallizes. At least some of the impurities or ingredients that lower the clarity, heat test or viscosity characteristics are removed. Suitable solvent mixts. are benzene and EtOH or benzene and MeOH. The mixt. may contain 70-40 parts of benzene and 30-60 parts by vol. of MeOH or 60-35 parts of benzene and 40-65 parts of EtOH, resp. The heat resistance of the cellulose acetate is increased.

**Mixed nitro-aliphatic esters of cellulose.** David R. Wiggam and John S. Tinsley (to Hercules Powder Co.). U. S. 1,943,231, Jan. 9. An ester such as a cellulose nitroacetobutyrate is produced by esterifying cellulose (which may be in the form of cotton, etc.) with a mixt. of an aliphatic acid anhydride such as  $\text{Ac}_2\text{O}$ , an aliphatic acid, such as butyric acid, of different mol. wt. than the acid represented in the anhydride, an inorg. acid catalyst such as  $\text{H}_2\text{SO}_4$  and a nitrate of a weak base such as  $\text{NH}_4\text{NO}_3$ .

**Cellulose ester and ether compositions.** Henry Dreyfus. Brit. 399,191, Sept. 19, 1933. Liquid and solid compns., filaments, films, etc., of improved waterproof properties, comprise (1) cellulose ethers, ether-esters or esters in which the org. ester groups are derived from lower fatty acids and (2) relatively small proportions, *e. g.*, 5-15%, of cellulose derivs. contg. radicals of higher fatty acids as sole substituent groups. In modification films or sheets having a basis of regenerated cellulose or cellulose derivs. of group (1) are coated with compns. comprising cellulose derivs. of group (2). In the production of films from the mixts. a common solvent or mixt. of solvents should be used. High-boiling solvents, plasticizers, resins, fire retardants, fillers, etc., may be added. Among examples (1) a mixt. of cellulose acetate (85-90 parts), cellulose stearate (10-15 parts), tritoyl phosphate and diethyl phthalate is dissolved in a mixt. of  $\text{Me}_2\text{CO}$  and  $\text{C}_6\text{H}_6$  and the soln. cast onto a film wheel, band, etc., and

(2) a cellulose acetate foil is passed through a 5-10% soln. of cellulose stearate in  $\text{Me}_2\text{CO}-\text{C}_6\text{H}_6$ , which may also contain dibutyl phthalate.

**Cellulose ether compositions.** Arlie W. Schorger (to C. F. Burgess Laboratories, Inc.). U. S. 1,941,276, Dec. 26. Solns. or liquid dispersions with caustic alkali are formed of cellulose ethers such as hydroxyalkyl ethers contg. Et or Pr and contg. one alkyl radical to 3 or 4 units of cellulose. These compns. are suitable for use in the manuf. of films or filaments, etc., by pptn. or coagulation. Various examples with details of procedure are given. U. S. 1,941,277 relates to a process in which a reaction product such as that formed from alkali cellulose and ethylene oxide or the like is rendered more sol. in dil. caustic alkali soln. by at least partial freezing of a caustic alkali soln. of 2-10% strength with which the material is mixed. Numerous examples and details are given. U. S. 1,941,278 relates to the production of hydroxyalkyl ethers of carbohydrates such as ethyl- to aryl-cellulose, etc., e. g., cellulose hydroxypropyl ethers contg. one Pr radical to 3 or 4 cellulose units or corresponding starch derivs., by reaction of propylene oxide or the like on an alkali carbohydrate. Various examples are given, with details of procedure, including the production of a hydroxyethyl cellulose ether benzoate. The products may be used for the manuf. of films, filaments, etc.

**Use of an acetylated tribromoaniline as a fire resister with cellulose acetate or other esters or ethers.** Arthur J. Daly (to Celanese Corp. of America). U. S. 1,941,664, Jan. 2.

**Use of dibutyl malate as a plasticizer for cellulose acetate and similar esters.** Henry B. Smith (to Eastman Kodak Co.). U. S. 1,942,843, Jan. 9.

**Use of dialkyl esters such as the diethyl and dipropyl esters of  $\alpha,\alpha'$ -dibromosuccinic acid as plasticizers for cellulose acetate and the like.** Henry B. Smith (to Eastman Kodak Co.). U. S. 1,942,844, Jan. 9.

**Use of a dihydroxybenzophenone as a plasticizer with cellulose acetate compositions for films, lacquers, etc., or other purposes.** Wm. H. Moss (to Celanese Corp. of America). U. S. 1,941,710, Jan. 2.

**Plastic materials.** Hans T. Clarke and Carl J. Malm (to Kodak Ltd.). Brit. 399,814, Oct. 11, 1933. An aryl phosphate, e. g., triphenyl, tritolyl, monotolyl diphenyl or trinaphthyl phosphate, is used as a plasticizer for higher cellulose esters, e. g., stearate, laurate, oleate, palmitate or for cellulose phenylacetate or crotonate. The material may include also other cellulose esters, cellulose ethers, fats, waxes, oils, gums, resins, etc. A soln. for making films contains cellulose stearate 100,  $\text{C}_6\text{H}_5\text{I}_3$  300-500 and triphenyl phosphate (I) 10-50 parts. A soln. for coating or for making filaments contains cellulose oleate 100,  $\text{Me}_2\text{CO}$  300-500 and I 10-50 parts. The compn. may be used in lacquers or varnishes or in a molding powder.

**Films or sheets.** Henry Dreyfus. Fr. 754,108, Nov. 2, 1933. Thin films or sheets made from cellulose derivs. have their mech. resistance increased by a longitudinal and transversal drawing while still in the soft or plastic state.

**Impregnated cellulosic products.** Leo Kollek and Wilhelm Engels (to I. G. Farbenind. A.-G.). U. S. 1,942,146, Jan. 2. A smoothly finished article is formed of a cellulosic material such as wood or paper impregnated with a viscid polymerization product of an alkylene oxide such as ethylene oxide.

**Apparatus for forming films, tubes or the like from viscose solutions by extrusion into a precipitating bath.** Julius Voss (to Visking Corp.). U. S. 1,942,990, Jan. 9. Structural and operative details.

**Nozzle for rayon production by the stretch-spinning process.** Waldemar zur Löwen (to American Bemberg Corp.). U. S. 1,942,632, Jan. 9.

**Device for regulating the feed of spinning-liquid to the spinning-nozzles of rayon spinning-machines.** Fred Nimelt. Brit. 399,920, Oct. 18, 1933.

**Rayon.** British Celanese Ltd., Robert P. Roberts

and Edgar B. Johnson. Brit. 399,795, Oct. 4, 1933. Solns. of cellulose acetate, etc., are extruded into a current of evaporative medium and, in the vicinity of the spinning orifices, there is introduced a current of addnl. evaporative medium from the external atm., the latter current being induced by heat. App. is described. Cf. C. A. 27, 4080.

**Rayon.** Henry Dreyfus. Fr. 752,726, Sept. 29, 1933. Rayon is made by dry-spinning solns. of cellulose derivs. of high viscosity, the fluidity of the material being increased or maintained during the 1st stages of the spinning. The fluidity may be maintained by limiting the amt. of evapg. agent or reducing its temp. in the neighborhood of the spinning nozzles. Improved results are obtained by incorporating in the spinning soln. a solvent of lower volatility than that of the principal solvent, or by using solvents of lower volatility than usual. A higher temp. of the soln. previous to spinning may be used. Thus, a 23% soln. of cellulose acetate in equal parts of acetone and dioxane is spun at 65-70°, the temp. of the evapg. agent being 60-5° at the spinning nozzles. Other examples are given.

**Delustered rayon.** James W. Humphrey and John W. Pedlow (to The Viscose Co.). Can. 337,194, Nov. 14, 1933. Viscose is prepd. in the normal way and into the soln. to be spun is incorporated, in amts. as percentage of the finished yarn from 0.2 to 10% of chlorinated biphenyl and from 0.5 to 15% of oil. A delustered yarn is produced.

**Delustered rayon.** Frank H. Griffin (to The Viscose Co.). Can. 337,195, Nov. 14, 1933. To a soln. to be spun are added 0.1 to 5.0%  $\text{TiO}_2$  and 0.5 to 15% chlorinated biphenyl. A delustered yarn is produced.

**Thread of cellulosic material.** Wm. Whitehead and Camille Dreyfus (to Camille Dreyfus). Can. 337,033, Nov. 7, 1933. Thread or yarn of improved appearance and textile properties is formed by adding a finely divided titanic acid and an oil to a soln. of cellulose acetate and then spinning the soln. Preferably  $\text{Ti}_2\text{O}_3$  is used and the amt. of titanic acid added is 0.1-10% of the wt. of the cellulose compd. present in the finished yarn. The oils used include diethylene glycol, heavy white mineral oil, olive oil and castor oil.

**Artificial threads, etc.** Henry Dreyfus. Brit. 399,171, Sept. 29, 1933. Filaments, threads, yarns, etc., are obtained from compns. contg. 2 or more filament-forming substances of substantially the same chem. nature but of widely differing viscosity characteristics. Said substances must have the same groups within their mols.; they may be mixts. of 2 cellulose acetates, formates, propionates, butyrates, nitrates, nitroacetates or xanthates or 2 Me, Et or benzyl celluloses or 2 modifications of cellulose dissolved in cuprammonium soln. or 2 polymerized vinyl acetates or other polyvinyl esters or ethers or 2 condensation products of the same chem. nature.

**Artificial filaments.** British Celanese Ltd. and Wm. I. Taylor. Brit. 399,822, Oct. 12, 1933. In dry-spinning artificial filaments the means of supply, e. g., pipe, for the spinning soln. passes through a zone of evaporative atm. that is hotter than that into which the filaments are extruded and the cool current into which the filaments are initially extruded is substantially prevented from entering the vicinity of the supply means. App. is described.

**Artificial straws, etc.** British Celanese Ltd. and Wm. I. Taylor. Brit. 399,811, Oct. 9, 1933. Filaments of flattened cross-section are produced by associating a plurality of individual artificial filaments, e. g., of cellulose acetate, etc., or of condensation products of cellulose and glycols or other polyhydric alcs., in the form of a flattened thread and applying a (restricted) solvent or softening agent thereto by means of a surface adapted to maintain the filaments in the desired form so as to cause them to coalesce, pressure being unnecessary. App. is described.

**Extrusion apparatus for the production of artificial filaments by the evaporative method.** Henry Dreyfus, Edward Kinsella, Joshua Bower and Wm. I. Taylor (to Celanese Corp. of America). U. S. 1,942,540, Jan. 9. Various structural and operative details are described.

**Apparatus for preparing or spinning yarns or threads from artificial fibers such as those made from cellulose acetate.** Wm. A. Dickie and Frank C. Hale (to Celanese Corp. of America). U. S. 1,941,880, Jan. 2. Various details are described of an app. having a guide member and calender rolls with surfaces of cellulose acetate.

**Cellulose digester and liquor-circulating system.** Fritz Krüger (to Zellstoffabrik Waldhof). U. S. 1,943,221, Jan. 9. Structural and operative details.

**Sulfite pulp digester with a liquor-pumping system.** Andreas Christensen (to Fibre Making Processes, Inc.). U. S. 1,942,685, Jan. 9. Structural and operative details.

**Sulfite pulp.** Otto Kreissler (to American Lurgi Corp.). U. S. 1,942,760, Jan. 9. Before cooking begins, the digester used is charged with an amt. of liquor which is smaller than the usual amt. by the amt. that would otherwise have to be removed by relieving and blowing-off, without reducing the amt. of wood charged into the digester, and the wood above the level of the liquor is irrigated with cooking liquor (by a described circulating app.) and cooking is otherwise effected in usual manner.

**Paper pulp.** Clinton K. Textor (to The Northwest Paper Co.). Can. 336,325, Oct. 10, 1933. Wood chips are treated at an elevated temp., with a liquor contg.  $\text{Na}_2\text{SO}_3$  as its principal reagent and also contg. a carbonate of Na; the residual liquor is sepd. and concd. and the product is carbonized or melted. The Na compds. thus formed are dissolved in  $\text{H}_2\text{O}$  and the soln. is treated to form a liquor contg.  $\text{Na}_2\text{SO}_3$  as its principal reagent and also contg. a carbonate of Na. Some  $\text{CO}_2$  is preserved in the soln. in a free or loosely combined form. The wood is treated with the resulting liquor.

**Paper pulp.** Clinton K. Textor (to The Northwest Paper Co.). Can. 336,326, Oct. 10, 1933. Wood chips are digested with a liquor of an alky. not less than  $\text{pH}$  7.5, which contains 30 to 40 lb. of  $\text{Na}_2\text{SO}_3$  and 1.3 to 2.6 lb. of  $\text{Na}_2\text{CO}_3$  per 100 lb. of oven-dried wood. From  $\frac{1}{4}$  to  $\frac{3}{4}$  cu. ft. of liquor is used per cu. ft. of wood chips in the digester, at a temp.  $175^\circ$  to  $188^\circ$ , for 3-7 hrs. The base of a soda-contg. waste black liquor from the digestion of the wood is recovered by adding to the liquor a material contg.  $\text{NaOH}$ , evapg. the liquor to a sirupy concd. form, and incinerating, whereby the Na content is converted substantially all into  $\text{Na}_2\text{CO}_3$ . The carbonate is leached from the ash and the leach liquor treated with a predetd. amt. of  $\text{SO}_2$  to form  $\text{Na}_2\text{SO}_3$  from a portion of the  $\text{Na}_2\text{CO}_3$  and to convert the remainder into  $\text{NaHCO}_3$ .

**Apparatus for screening paper pulp, etc.** Orrie J. Mills and Wm. G. Webb. U. S. 1,942,303, Jan. 2. Structural and mech. details.

**Paper-pulp beaters.** Robert J. Marx and Anton D. J. Kuhn. Brit. 399,073, Sept. 28, 1933.

**Fourdrinier paper-making machines.** Walter Voith, Hermann Voith and Hanns Voith (trading as J. M. Voith). Brit. 399,739, Oct. 12, 1933.

**Cleaning felts of paper-making machines.** Robert J. Marx. Brit. 399,113, Sept. 28, 1933.

**Paper.** John Traquair and Francis G. Rawling (to Mead Corp.). U. S. 1,942,622, Jan. 9. In the manuf. of pulp, dewatered fibrous material and a continuously maintained gaseous chlorinating agent are moved relatively to each other through a treating chamber (of a described app.) and the excess of the gaseous chlorinating agent is continuously washed from the treated material

prior to its discharge from the treating chamber. Cf. C. A. 27, 597.

**Paper.** James J. O'Connor and Donald F. Morris (to The Mead Corp.). Can. 338,029, Dec. 19, 1933. A body filler comprising a finely divided, slowly settling, nonfurnaced and uncarbonated lime sludge ppt. obtained in the recovery of pulp-cooking liquor by causticization with high-Ca lime is mixed with a fibrous furnish and the admixed material is used in the manuf. of paper.

**Paper.** Weberei Kbnat A.-G. and Textilwerke Horn A.-G. Brit. 399,077, Oct. 12, 1933. See Swiss 157,962 (C. A. 27, 4674).

**Preparing rags for paper making.** John L. Cooney. U. S. 1,942,855, Jan. 9. Various details of app. and operation are described.

**Coating paper by use of rolls.** Charles A. Dickhaut and Charles C. Willis. U. S. 1,942,383, Jan. 2. Various details of app. and operation are described.

**Sizing paper.** George J. Manson (to Manson Chemical Co.). U. S. 1,942,438, Jan. 9. A wax such as paraffin or a vegetable wax, an org. dispersing agent such as glue or casein and an org. stabilizing agent such as formaldehyde are used together.

**Parchmentized paper or pulp.** Robert B. MacMullin and Wesley K. McCready (to The Mathieson Alkali Works). Brit. 399,725, Oct. 12, 1933. Fibrous cellulose is parchmentized or gelatinized by subjecting to the action of a Na,  $\text{NH}_4$  or K salt, e. g.,  $\text{NaI}$ ,  $\text{KNO}_3$ , dissolved in liquid  $\text{NH}_3$ , in concn. and for a time limited to avoid complete dispersion of the cellulose. In an example paper (pulp) is parchmentized in a liquid  $\text{NH}_3$  soln. of  $\text{NH}_4\text{CNS}$ ,  $\text{NH}_4\text{Cl}$ ,  $\text{NH}_4\text{NO}_3$  or  $\text{NaNO}_3$  at  $-34^\circ$  to  $30^\circ$ . The gelatinized products may be used as moldable cellulose plastics or to produce leather-like paper products. Swollen products may be ground to give material suitable for filter paper or sanitary pads.

**Dyeing paper, etc.** Soc. pour l'ind. chim. à Bâle Fr. 42,623, Aug. 23, 1933. Addn. to 693,172 (C. A. 25, 1674). Water-sol. salts of basic compds. contg. a basic N atom and an aliphatic radical having at least 10 C atoms, other than those of Fr. 693,172, are used to form insol. compds. with sol. dyes in dyeing paper or pulp. Suitable compds. include the  $\text{HCl}$  salt of diethylethylamine, dimethyloctadecylamine and pentadecyldihydroimidazole, the sulfomethylate of octadecyltrimethylammonium, ester of stearic acid and dimethyl (or diethyl)aminoethanol, palmitic ester of *m*-hydroxyphenyltrimethylammonium chloride, etc.

**Apparatus for making paper bottles, where the bottles, after leaving the shaping and other devices, are dried and carried into a heated impregnating bath.** Carl Ristow. Brit. 399,671, Oct. 12, 1933.

**Capsules.** Arthur G. Enock. Brit. 399,722, Oct. 12, 1933. Capsules of the material cellophane are secured on bottles by applying heat and moisture.

**Hard vegetable-fiber products such as fiberboard of high wet and dry strength.** Robert M. Boehm (to Masonite Corp.). U. S. 1,941,536, Jan. 2. A moist mass of vegetable fiber having a sufficiently large non-cellulose content to bond the fibers together is subjected to consolidating pressure and heat until dry. The product, together with a drying oil in a quantity less than half that necessary to saturate the mass after consolidation, is subjected to highly heated air for a sufficient time greatly to increase the modulus of rupture of the material.

## 24—EXPLOSIVES AND EXPLOSIONS

CHARLES R. MUNROE AND C. O. STORM

**Modern manufacture of lead azide.** Alfred Stettbacher. *Tech.-Ind. Schweiz. Chem.-Ztg.* 1933, 198 200 (1933). Polémique with von Herz (C. A. 27, 4083). B. 11.

**Contiguous commercial manufacture of nitropenterythritol and the future of this explosive.** P. R. de Wilde. *Chimie & industrie* 30, 1034 7 (1933); cf. Desvergues, C. A. 27, 4675. Tetranitropenterythritol can

be considered as a typically synthetic explosive, as it can be manufd. by elec. power from coal (or charcoal),  $\text{H}_2\text{O}$ , air, limestone and (in the continuous nitration process)  $\text{H}_2\text{SO}_4$ , which theoretically can be completely recovered. The procedure followed in a Swiss factory for the continuous nitration of penterythritol (Meissner process, Pat. 702,417, C. A. 25, 4154) and continuous neutraliza-

tion, stabilization and recrystn. of the tetranitrate is described. The possibility and probability of the extensive development of the use of this explosive for military purposes are briefly discussed. A. Papineau-Couture

**Thrimetric determination of the degree of stability of nitrocellulose.** T. Tomonari. *Angew. Chem.* 47, 47-8 (1934).—The method is based upon the observation that unstable nitrocellulose gives up the acid substance which causes instability, only slowly to water, but rapidly to water contg. MeOH or to pure MeOH. The acid no. (cc. of 0.01 N NaOH required to neutralize the acid extd. by boiling 1.0000 g. nitrocellulose 15 min. in 50 cc. MeOH) was correlated with explosion temps., and it was found that acid nos. of 5 or less give a stable nitrocellulose. In the stabilization process by a water boil for many hrs. new acid substances are formed. These side reactions did not occur with stabilization in MeOH. Exptl. data and references are given. K. K.

**Hygroscopicity of nitrocellulose.** Demougin. *Mém. poudres* 25, 287-301 (1932-33).—Hygroscopicity measurements on nitrocellulose of 13.43% N(CP<sub>1</sub>), 11.62% N(CP<sub>2</sub>), 10.49% N(CP<sub>3</sub>), trinitrocellulose prepared with a HNO<sub>3</sub>-AcOH mixt., linters and hydrocellulose in both beaten and unbeaten condition, in humidifiers over H<sub>2</sub>SO<sub>4</sub>-water mixts. showed that equil. is more rapidly attained the lower the vapor pressure. Will's hypothesis that hygroscopic water is fixed on the nonesterified OH groups, making hygroscopicity plus N content equal to 14.6, was found to be untrue for cellulose and trinitrocellulose and true only at low pressures for the others. With approach to satn. there is added to a chem. fixation of water, a phys. absorption and capillary condensation which depends on the amt. of surface and its porosity. These factors vary with the same sample when unbeaten, beaten or gelatinized. Phys. condition is very important at high satn. pressures. A. J. Phillips

**Preparation and properties of the nitric acid ester of starch.** I. J. Hackel and T. Urbanski. *Z. ges. Schiess- Sprengstoffw.* 28, 306-10, 350-4, 378-82 (1933); 29, 14-16 (1934).—See C. A. 27, 2302. II. *Ibid.* 29, 10-17 (1934).—See C. A. 27, 3334. C. G. Storm

**Construction of buildings for the manufacture of poudre B.** Rausch. *Mém. poudres* 25, 205-21 (1932-33).—Mechanical construction. A. J. Phillips

**Inflammability of gaseous mixtures from solvent recovery.** E. Burlot and R. Schwob. *Mém. poudres* 25, 336-420 (1932-33).—A study of the limits of inflammability of gaseous mixts. of alc., ether, O, N and CO<sub>2</sub> with recorded pressure curves, condition of a paper diaphragm closing the explosion chamber and auditory, visual, mech. and olfactory effects. Conclusions: Normal operating conditions are well under the limits of inflammability and the chief danger is in the enrichment of mixts. with O by air leakage. The inflammability limit is affected by the hygroscopic condition of the entering air. A. J. P.

**Conditions favorable to shaft-kiln explosions.** Otto Schott. *Tonind.-Zig.* 57, 979-82 (1933).—A crit. discussion of the causes of a shaft-kiln explosion. K. K.

**Gas explosions in sewers.** V. W. Willits. *Munic. Sanit.* 3, 484-5 (1932); *U. S. Pub. Health Eng. Abstracts* 13, S, 63 (Sept. 23, 1933).—Explosions in sewers are due to either petroleum, oil or gasoline wastes or leaks, or to fuel gas. Explosions may occur in dry conduits as well as in sewers. The presence of sewer gas is readily detected by a wire-gauze-enclosed alc. flame, or Wolf lamp, in which the flame (1) dies down and goes out in a noncombustible gas, and (2) flares up and blows out in combustible gas. A H-filled aneroid barometer-like box instrument, set with its flexible diaphragm on a gasket over an open hole in the lid, indicates by a needle the d. relative to the atm. For showing the presence and combustibility of gas, a combustible gas indicator is used the action of which depends on the change in resistance of a small metal filament in the presence of the combustible gas. C. R. Fellers

**Thermal analysis of picrates.** I. Dehydration, m. ps. and initial and pre-explosive temps. (Tucholski) 2. Projectiles (Brit. pat. 398,045) 9.

**Explosives.** Henry Wm. Clapham and Imperial Chemical Industries Ltd. Brit. 399,553, Oct. 9, 1933. Peat of a bulk d. not exceeding 0.22 g. per cc. under 25 lb. per sq. in. pressure is used as a carbonaceous ingredient in blasting explosives. It may be slightly charred before use. In an example the explosive contains a fully nitrated mixt. of 4 parts glycerol and 1 part ethylene glycol 14, NH<sub>4</sub>NO<sub>3</sub> 44.5, NaCl 11, NaNO<sub>3</sub> 13, peat contg. 5% moisture 17, resin 0.25 and (NH<sub>4</sub>)<sub>2</sub>HPO<sub>4</sub> 0.25%.

**Use of red crystalline basic lead styphnate in ammunition priming mixtures.** Willi Brün (to Remington Arms Co.). U. S. 1,942,274, Jan. 2. This compd. may be used with Pb nitrate, glass, etc.

**"Igniting stick" suitable for repeated use.** Ferdinand Ringer. U. S. 1,941,621, Jan. 2. An igniting stick ignitable by friction is formed of materials such as KClO<sub>4</sub> 35, Ca plumbate 3.7, S 0.9, benzoyl peroxide 3.7, powd. glass 14.2, (CH<sub>3</sub>)<sub>2</sub>N<sub>4</sub> 42.5 parts with glue and CH<sub>2</sub>O as a binder.

**Igniting composition for matches.** Sven H. Ledin. U. S. 1,942,806, Jan. 9. See Brit. 355,901 (C. A. 27, 1177).

**Composition for slow matches.** Aubrey A. Young (to The Atlas Powder Co.). Can. 337,978, Dec. 19, 1933. A match compn. contains an initiating compd. together with a deflagrating compn. consisting of tetryl, NH<sub>4</sub> picrate, trinitrotoluene, tetranitroaniline, hexanitrodiphenylamine, picric acid, or trinitroresorcinol, and a chromate or dichromate. The proportions vary from 90% nitroaromatic compd. and 10% oxidizer to 25% nitroaromatic compd. and 75% oxidizer. Cf. C. A. 28, 646<sup>6</sup>.

**Device for preventing the propagation of flame or explosion in pipe lines conveying explosive gases.** Panstwowa Wytworuina Prochu (formerly known as Panstwowa Wytworuina Prochu i Materjalow Kruszacych). Brit. 391,025, Apr. 20, 1933.

## 25—DYES AND TEXTILE CHEMISTRY

L. A. OLNEY

**Recent technical developments in dyeing.** A. J. Hall. *Chem. Age* 29, 609-10 (1933). E. H.

**Light sensitivity of aryl- $\beta$ -naphthylamine azo dyes.** F. Krollpfeiffer, C. Mühlhausen and G. Wolf. *Ann.* 508, 39-51 (1933).—This study was undertaken to det. the chem. reactions involved in the bleaching of azo dyes. *p*-(2-Phenylamino-1-naphthyl)azobenzenesulfonic acid (I) (5 g.) in a diln. of 1:1000, on standing 3 days in the sunlight gives 0.45 g. naphthophenazine, m. 141-2°, and 2.17 g. of the *betaine* (II), pale yellow needles, identical with the oxidation product of I with AmNO<sub>2</sub>. Illumination of phenylazophenyl- $\beta$ -naphthylamine (III) on the fiber and addn. of picric acid to the ext. of the fibers give 2,3-diphenyl- $\alpha\beta$ -naphtho-1,2,3-triazolium picrate, m. 243-

4°, also obtained by oxidation with AmNO<sub>2</sub>; the *nitrate* (IV) decomps. 305°; the 2-*p*-chlorophenyl analog, pale brown, decomps. 278-9°; the *betaine* of 2-(*p*-phenyl-sulfonic acid)-3-phenyl- $\alpha\beta$ -naphtho-1,2,3-triazolium hydroxide (II) m. 360° (decompn.); this also results by oxidation with K<sub>2</sub>Cr<sub>2</sub>O<sub>7</sub> or H<sub>2</sub>O<sub>2</sub>; the 3-*p*-tolyl analog of IV decomps. 270°; the 3-*p*-chlorophenyl analog, pale brown, decomps. 237-8°. Coupling of (*p*-XN<sub>2</sub>C<sub>6</sub>H<sub>4</sub>)<sub>2</sub> with 2 mols.  $\beta$ -C<sub>10</sub>H<sub>7</sub>NHPh gives a green dye, m. 281-2°, which is oxidized to *biphenyl*-3,3'-bis(3-phenyl- $\alpha\beta$ -naphtho-1,2,3-triazolium *nitrate*), brown-yellow, decomps. 245°; excess (NH<sub>4</sub>)<sub>2</sub>S gives the disazo compd.; the *picrate*, golden yellow, m. 320-1° (decompn.); the *nitrate* of the 2,2'-dichlorobiphenyl analog, pale-brown, decomps. 250-60°.

III and  $\text{BzCl}$  in  $\text{C}_6\text{H}_5\text{N}$  give the *N*-Bs deriv. (V), citron-yellow, m. 173–4° (decompn.), of phenylazoxyphenyl- $\beta$ -naphthylamine, red, m. 132–3°. Heating V in  $\text{AcOH-HCl}$  at 150° gives 2,3-diphenyl- $\alpha$ - $\beta$ -naphtho-1,2,3-triazolium chloride and  $\text{BzOH}$ . The above nitrates on fibers regenerate the azo dyes in slightly alk. hyposulfite bath.

C. J. West

**New uses for indigosols [in printing].** A. Wolff. *Melliand. Textilber.* 14, 312(1933).—Indigosols, unlike the vat dyes from which they are prepd., are not discharged by a mixt. of  $\text{Na}_2\text{S}_2\text{O}_4$  and Leucotrope W (I), so that fast multicolored effects are obtained by printing on cotton fabric having a vat ground shade (produced with easily dischargeable vat or indigosol dyes) a discharge paste contg. an indigosol, Hydrosulphite NF conc. and I, steaming, and then developing the indigosol by treatment with  $\text{Na}_2\text{Cr}_2\text{O}_7 + \text{H}_2\text{SO}_4$  at 70°.

B. C. A.

**Technological study of hard cordage fibers: sisal and Manila.** F. Heim de Balsac, J. Dantzer and O. Roerich. *Trav. serv. études product. colon.* 1933, 1–16; *Chimie & industrie* 30, 1417.—See C. A. 27, 4679.

A. P.-C.

**Flax.** J. Dantzer and O. Roerich. *Rev. textile* Dec., 1932, Jan.–Feb.–March, 1933, 1–37.—A study of the relation between the abs. strength and the wet strength of flax. The yarn was examd. microscopically from the standpoint of the retting process and pectic matter content. The wet strength of the yarn obtained from a given two depends firstly on the fineness after carding and secondly on the foreign matter content, which consists more of degradation products of the cortical tissues than of waxes and pectin. It is the latter that gives the slipping qualities required in dry spinning. For wet spinning, in which stretching takes place between the elementary fibers, it is advisable to try to remove as much as possible of the pectin binder in the inside of the fiber bundles. Chem. retting, which tends to cottonization and which liberates fibers that are too short, should be avoided in many cases. Pushing degumming too far yields a yarn that is dull and fuzzy after stretching. Luster is due to the parallelism of the slightly twisted fibers held together by the natural gums.

A. Papineau-Couture

**New method for detecting cotton which has been deteriorated by chemical agents.** J. Markert. *Text. Forsch.* 15, 1–11(1933); *Chimie & industrie* 30, 1163.—An old observation of Willows and Alexander on the swelling of cellulose in an alk. liquor can be used to detect and evaluate the degradation of cotton by chem. agents. When cotton fibers which have been cut perpendicularly to their length are treated with 19 Bé.  $\text{NaOH}$ ; it can be seen under the microscope that the ends of undeteriorated fibers swell into a mushroom-like formation. Comparative observations were made with cotton that had been deteriorated with more or less concd.  $\text{H}_2\text{SO}_4$  solns. (hydrocelluloses) or oxidizing solns. contg. 1–3 g. available Cl per l. (oxycelluloses). There can be distinguished 3 types of fibers: (a) well-formed terminal swellings, (b) moderate swelling, (c) no distinct swelling. By means of the percentages of (a), (b) and (c), the amt. of chem. deterioration can be expressed numerically. This can be done with either raw, mercerized, bleached or dyed cotton. Mech. strength tests showed that there is a certain parallelism with the value used to express chem. degradation as indicated above.

A. Papineau-Couture

**Pigments in natural silk.** G. Barbera. *Ann. chim. applicata* 23, 501–8(1933).—The pigments in Italian and Japanese silk are extd. with  $\text{Me}_2\text{CO}$  and  $\text{EtOH}$ , resp., and are shown to consist of carotenoids, in the case of the yellow pigments, and of flavones, for the green (Japanese) pigments, by comparing the reactions of these exts. to reagents such as  $\text{SbCl}_5$  in  $\text{CHCl}_3$  (Carr-Price reagent),  $\text{FeCl}_3$ ,  $\text{H}_2\text{SO}_4$ ,  $\text{CH}_3\text{CHO} + \text{a drop of } \text{H}_2\text{SO}_4$  (Bucher reaction for stearins),  $\text{CCl}_3\text{CO}_2\text{H}$ , and  $\text{CS}_2$ , for the carotenoids; and  $\text{FeCl}_3$ ,  $\text{H}_2\text{SO}_4$ ,  $\text{K}_2\text{CO}_3$ , Fehling soln. and basic Pb acetate, for the flavones. The above reactions were carried out on the exts. above, as well as on exts. known to contain carotenoids and flavones.

A. W. Contieri

**The properties of liquid silk.** Dante Ongaro. *Giorn. chim. ind. applicata* 15, 506–9(1933).—Liquid (non-

coagulated) silk is an irreversible colloid. It is coagulated by the gentlest mechanical rubbing, and on passing through a capillary. It is pptd. by dil., and coagulated by concd. acids. High concns. of electrolytes are needed to bring about coagulation.  $\text{NaOH}$  (0.001 *N*) retards coagulation markedly, a 3% soln. of silk coagulating in 7 days, a 2% soln. in 10 days and a 1% soln. in 15 days. A 1% soln. of the whole silk, fibroin alone and gelatin have the same gold no., 0.02–0.03. The soln. of fibroin shows Brownian movement;  $[\alpha]_D^{25} -39.0^\circ$ . The coagulum is inactive when formed spontaneously, but active when formed by mechanical means.  $\text{NH}_4\text{OH}$  has no action;  $\text{EtOH}$  causes coagulation; tannin causes pptn., while a soln. of  $\text{EtOH-Et}_2\text{O}$  ppts. the silk while extg. all pigments.

A. W. Contieri

**Reactivity of the sulfur linkage in wool.** J. B. Speakman. *Nature* 132, 930(1933); cf. C. A. 25, 1388; H. J. Woods, *Nature* 132, 709(1933).—From the contraction of wool fibers in solns. of  $\text{Na}_2\text{S}$  and  $\text{Ag}_2\text{SO}_4$ , it is apparent that the phenomenon of supercontraction is assocd. with the breakdown of disulfide linkages in wool, so that when strained fibers are exposed to steam, the first reaction is  $\text{RSSR} + \text{H}_2\text{O} \rightleftharpoons \text{RSH} + \text{RSOH}$ . That this reaction is possible is supported by the fact that wool heated with  $\text{H}_2\text{O}$  in the presence of Hg vapor is rapidly contaminated with  $\text{HgS}$  at a temp. as low as 55°. The second step, the rebuilding of new linkages, probably takes place as follows:  $\text{RSOH} + \text{RNH}_2 = \text{RSNHR} + \text{H}_2\text{O}$ . This view is supported by the fact that when fibers are treated with satd.  $\text{Ag}_2\text{SO}_4$  for 17 hrs. in the cold, to convert the disulfide group to  $\text{RSO}_3\text{H}$ , their ability to assume a permanent set is considerably reduced. The reactivity of the S linkage in wool is also shown as follows: prolonged treatment with baryta water removes the S from wool, but an addn. compd. is apparently formed first. Its formation is responsible for the inability of fibers treated with satd.  $\text{Ba(OH)}_2$  for 1.5 hrs. in the cold to contract when boiled 1 hr. with 5%  $\text{NaHSO}_3$  soln. In addn. such fibers have no power of assuming a permanent set.

Louise Kelley

**Treatment of [viscose] rayon crepe fabrics with caustic alkalis.** L. Kollmann. *Melliand. Textilber.* 14, 134–5 (1933).—The shrinkage, handle and appearance of viscose rayon fabric may be modified by treatment, before or after creping in a hot soap bath, with dil. aq.  $\text{NaOH}$ . Full details are given of the behavior of a viscose weft crepe fabric when creped with the assistance of aq.  $\text{NaOH}$  of d. 1.06 and 1.16; the resulting handle is softer and dyeing more even with the dil.  $\text{NaOH}$ , and treatment with the more concd.  $\text{NaOH}$  is not recommended, but the overall shrinkage of the fabric is 30% greater when the creping process includes an alkali treatment (before or after the hot soap bath) than without it. Viscose filaments of 7 denier swell in diam. 28, 36, 45, 76, 118 and 67% when immersed in solns. contg. 0, 5, 20, 60, 115 and 330 g. of  $\text{NaOH}$  per liter, resp. Viscose rayon loses 13% in tensile strength after treatment with  $\text{NaOH}$  (d. 1.16), but is unaffected in strength by  $\text{NaOH}$  (d. 1.06). A viscose filament swelled 69% when immersed in  $\text{NaOH}$  (d. 1.05), but regained its original dimensions when washed and dried. The crepe appearance of fabrics treated with dil. aq.  $\text{NaOH}$  is less coarse than when this treatment is omitted.

H. C. A.

**Preservation of filtering cloth.** M. O. Kharmandar'yan and L. I. Sivoplyas. *Ukrain. Khim. Zhur.* 8, Wiss.-tech. Teil, 125–6(in German 126)(1933).—Good results were obtained in the preservation of filtering cloth in factory operation by cooking the cloth with aq.  $\text{Na}_2\text{CO}_3$  and then impregnating it with an  $\text{NH}_3$  soln. of  $\text{CuSO}_4$ .

C. B.

**Pupa oil emulsion. II. Physical properties of pupa oil emulsion.** Hideo Kaneko and Kenichi Yamamoto. *Bull. Sericult. Silk-Ind. Japan* 6, No. 2, 3–4(1933); cf. C. A. 25, 4712; 28, 331<sup>1</sup>.—Casein, dextrin, Na oleate, gum arabic A and sericin B are good agents for emulsifying pupa oil in  $\text{H}_2\text{O}$ . Many agents have max. emulsifying power between 0.04 and 0.1 g. per 100 cc. In an emulsion contg. 0.93% pupa oil the globules ranged from 1 $\mu$  to 5 $\mu$  in diam. Pupa oil emulsions are very stable.

**Dyes.** I. G. Farbenind. A.-G. Brit. 399,790, Oct. 9, 1933. Acylaminoanthraquinones are prepd. by acylating aminoanthraquinones, or their substitution products, with carboxylic acids of quinoline or naphthoquinoline contg. the COOH group(s) in an isocyclic ring or by condensing haloanthraquinones with the amides of said acids. Among such dyes described are those from (1) 1-amino-5-benzoylaminoanthraquinone (I) and quinoline-5-carboxylic acid (dyes greenish yellow), (2) quinoline-5,8-dicarboxylic acid and 1-aminoanthraquinone (yellow) and (3) 1-naphthoquinoline-3-carboxylic acid and I (yellow).

**Dyes.** I. G. Farbenind. A.-G. Fr. 42,589, Aug. 23, 1933. Addn. to 717,017 (C. A. 26, 2870). The reduction of Fr. 717,017 is effected by the action of anhyd. alkali metal sulfides or polysulfides in the presence of a tertiary base, such as pyridine which may be replaced in part by a diluent such as PhCl. It is advantageous to add a small amt. of a strong primary or secondary base such as piperidine.

**Dyes.** I. G. Farbenind. A.-G. (Fritz Lange and Hans Krzikalla, inventors). Ger. 584,645, Sept. 22, 1933 (Cl. 22a. 2). Addn. to 474,997 (C. A. 23, 3105). The method of 474,997, for producing complex Cr compds. of *o*-hydroxyazo dyes is varied by using Cr<sub>2</sub>(SO<sub>4</sub>)<sub>3</sub> instead of (HCO<sub>2</sub>)<sub>2</sub>Cr. Thus, an aq. soln. of the dye from diazotized 4-chloro-2-amino-1-methoxybenzene and 2-hydroxynaphthalene-6,8-disulfonic acid is treated with an aq. soln. of H<sub>2</sub>SO<sub>4</sub> and Cr<sub>2</sub>O<sub>3</sub> to give a dye which imparts fast violet shades to wool. Another example is given. Cf. C. A. 28, 649<sup>1</sup>.

**Dyes.** I. G. Farbenind. A.-G. (Georg Rösch, Josef Haller and Fritz Helwert, inventors). Ger. 584,718, Sept. 23, 1933 (Cl. 22b. 3.06). Dyes are produced by treating the 9,10-disulfuric acid ester of leuco- $\beta$ -sulfaminoanthraquinone or its salts with oxidizing agents, especially PbO<sub>2</sub> or ferricyanides, in aq. neutral or alk. soln. The product may be subjected to the action of dil. mineral acids or acid oxidizing agents in the substance or on the fiber. In an example, a soln. of the K salt of the 2-sulfamic acid of anthrahydroquinone-9,10-disulfuric acid ester is treated with an aq. soln. of K<sub>2</sub>CO<sub>3</sub> and K<sub>2</sub>FeC<sub>6</sub>N<sub>6</sub> to give the K salt of the tetrasulfuric acid ester the leuco compd. of 1,2,2',1'-anthraquinonazine. Treatment of this with dil. H<sub>2</sub>SO<sub>4</sub> and CuSO<sub>4</sub> gives *N*-dihydro-1,2,2',1'-anthraquinonazine. Other examples are given.

**Dyes.** Chemische Fabrik vorm. Sandoz. Ger. 581,161, July 25, 1933 (Cl. 22b. 3.15). Addn. to 578,995 (C. A. 28, 781<sup>9</sup>). Dyes sol. in water are prepd. by introducing one or more SO<sub>2</sub>H groups into substituted arylaminoanthrapyridones. Examples are given.

**Dyes.** Soc. pour l'ind. chim. à Bâle. Ger. 584,577, Sept. 21, 1933 (Cl. 22b. 2.07). Dyes of the anthraquinone series are prepd. by treating unsulfonated vat dyes contg. exchangeable substituents, with alc. solns. of alkali alcoholates at temps. above 100°, in optional presence of catalysts. The products may be alkylated or halogenated.

Thus, nitrodibenzanthrone is heated with KOH and benzyl alc. to give a dye. Other examples are given.

**Dyes (gallocyanine series).** I. G. Farbenind. A.-G. Fr. 754,276, Nov. 3, 1933. New dyes are obtained by condensing gallic acid or one of its derivs., such as gallamide, an arylamide of gallic acid or pyrogallallic acid, with nitroso compds. of a secondary or tertiary aromatic amine of the formula aryl-*N*(R)-alk-SO<sub>2</sub>H (alk. is an alkylene group of at least 2 C atoms, R is H, alkyl or substituted alkyl). The dyes may be sulfonated or reduced to the leuco compds. or condensed with mono- or di-amines or their sulfonic acids or with aldehydes, phenols, naphthols or naphthosulfonic acids. Several examples are given.

**Azo dyes.** Friedrich Felix (to Soc. pour l'ind. chim. à Bâle). U. S. 1,943,170, Jan. 9. Azo dyes which dye various colors are formed by coupling a diazo compd. of the general formula 4,2-X(YO<sub>2</sub>S)C<sub>6</sub>H<sub>4</sub>N:NOH, in which X stands for NO<sub>2</sub> or an NH-acyl group and Y for a nucleus of the benzene series, with an alkyl- $\beta$ -naphthylamine or other suitable coupling component of the naphthalene series which, due to the presence of an NH-R group in the 2-position (R being H, alkyl, aralkyl or aryl), couple in the 1-position.

**Azo dyes.** I. G. Farbenind. A.-G. Brit. 399,916, Oct. 19, 1933. Azo dyes are made by coupling in an acid soln. a diazo compd. of *o*-aminodiphenyl sulfone, or of a nuclear halo-, alkyl- or alkoxy-substitution product thereof, with 2-amino-8-naphthol-6-sulfonic acid. They dye wool from an acid bath red shades.

**Azo dyes.** I. G. Farbenind. A.-G. Fr. 749,348, July 22, 1933. Azo dyes, insol. in water, are made by coupling diazo compds. with aminoarylaminanthraquinones of acylacetic acid, of arylenebisacetic acid or of 2,3-hydroxynaphthoic acid. Several examples are given.

**Azo dyes.** Soc. pour l'ind. chim. à Bâle. Fr. 754,054, Oct. 31, 1933. Arylides of 2,3-hydroxynaphthoic acids are coupled with diazotized aryl or aralkyl ethers of *o*-aminophenols contg. at least one alkyl or alkoxy group in the *o*-aminophenol radical, e. g., 4-methoxy-2-amino-1,1'-diphenyl ether or 4-methoxy-2-amino-5-acetylamino-1,1'-diphenyl ether. A large no. of examples is given.

**Azo dyes containing a nitroso group.** Leopold Laska, Arthur Zitscher, Wilhelm Christ and Adolf Petzold (to General Aniline Works). U. S. 1,942,865, Jan. 9. Numerous examples are given of the production of azo dyes contg. a nitroso group and corresponding probably to the general formula: 1,2,3-[ $\beta$ -PhN(NO)C<sub>6</sub>H<sub>4</sub>N:N](HO)(R-NHCO)C<sub>10</sub>H<sub>7</sub>, in which the naphthalene nucleus may contain a halogen and the two benzene nuclei halo, alkyl, hydroxyalkyl or hydroxyaryl groups, and R stands for a radical of the benzene or naphthalene series, which dyes are when dry red-like claret to garnet colored powders, sol. in concd. H<sub>2</sub>SO<sub>4</sub> with a reddish violet to violet color, forming color lakes when mixed with the usual substrata and yielding claret to garnet-like reddish to violet dyeings of a good fastness to chlorine and washing when produced on the fiber. Among the initial components which may be used are: nitrosodiazocompds. of 4-aminodiphenylamine itself and of its substitution products, such as 4-amino-2'-(3' and 4')-methyl, 4-amino-2'-(and 4')-methoxy, 4-amino-2'-(and 4')-ethoxy, 4-amino-2'-(3' and 4')-phenoxy, 4-amino-2'-(3' and 4')-chloro, 4-amino-3-methyl-4'-methoxy, 4-amino-3'-methyl-6'-methoxy, 4-amino-2'-methyl-4'-chloro, 4-amino-2'-methyl-5'-chloro, 4-amino-3'-methyl-6'-chloro, 4-amino-4'-methyl-3'-chloro, 4-amino-2'-methoxy-4'-chloro, 4-amino-3',4'-dichloro derivs. and 4-aminophenyl- $\beta$ -naphthylamine. As azo components there may be used, for instance, the 2,3-hydroxynaphthoyl derivs. of aniline, of toluidines, of aminoethylbenzenes, of the alkyl, aralkyl and aryl ethers of aminophenols, of aminophenyl ketones, sulfones and sulfamines, of the halogen-substitution products of the aforesaid compds., of naphthylamines and their derivs., of arylenediamines, diaminodiarlys and their derivs., diamines, in which two aryl radicals are united by a further complex, further such arylamides of 2,3-hydroxynaphthoic acid contg. further substituents with the exception of sulfonic or carboxy group in the hydroxynaphthoyl radical such as arylamides

of 6-bromo-2,3-hydroxynaphthoic acid. Cf. C. A. 27, 1183.

**Azo dyes; intermediates.** Soc. pour l'ind. chim. à Bâle. Brit. 399,097, Sept. 28, 1933. *N,N'*-Diacyl-1,4-diamino-8-hydroxynaphthalene-6-sulfonic acids are prepd. by treating the corresponding diamino compd. with an acylating agent. In an example 1-amino-5-hydroxynaphthalene-7-sulfonic acid is acetylated and diazotized with  $\text{PhNH}_2$  run in. The resulting monoazo dye is reduced by  $\text{SnCl}_2$  to give 1,4-diamino-8-hydroxynaphthalene-6-sulfonic acid. This is acetylated by  $\text{Ac}_2\text{O}$  and 3- and 4-nitrobenzoyl chlorides. In the latter 2 cases reduction of the  $\text{NO}_2$  group to  $\text{NH}_2$  by  $\text{Fe}$  and  $\text{AcOH}$  is also exemplified. Azo dyes are formed in substance or on the fiber by treating the *N,N'*-diacyl compds. with a diazo compd. In the case of aliphatic acyl compds. coupling with simple diazo compds. gives acid dyes; using aromatic acyl compds., the resultant dyes have affinity for vegetable fibers, e. g., cotton, or rayon from regenerated cellulose, e. g., viscose, and such dyes may be further developed on the fiber. The dinitro compds. obtained by using nitroarylacyl compds. may be coupled directly or first reduced and then coupled. Among examples (1) see Swiss 182,465 (C. A. 28, 6509), (2) the dye 1-amino-5-acetoxynaphthalene-7-sulfonic acid  $\leftarrow$  2-naphthylamine-5-sulfonic acid is diazotized and coupled with 3',3''- or 4',4''-diaminodibenzoyl-1,4-diamino-8-hydroxynaphthalene-6-sulfonic acid; on saponification the Ac group blue direct-dyeing dyes are obtained which can be further developed on the fiber, and (3) cotton impregnated with 3',3''- or 4',4''-dinitrodibenzoyl-1,4-diamino-8-hydroxynaphthalene-6-sulfonic acid is developed with diazotized *m*-nitro-*p*-toluidine to give a lilac shade. Cf. C. A. 28, 6554.

**Diazoazo dyes.** I. G. Farbenind. A.-G. Brit. 399,753, Oct. 12, 1933. Solid stable diazoazo salts are made by adding to an aq. soln. of diazotized *o*- or *p*-aminoazotoluene sufficient  $\text{H}_2\text{SO}_4$  to form the acid diazonium sulfate, sepg. the solid diazoazo salt and mixing, if necessary, with a diluent or dyeing assistant. Examples are given.

**Vat dyes.** Soc. pour l'ind. chim. à Bâle. Brit. 399,241, Oct. 5, 1933. Addn. to 381,920 (C. A. 27, 4407). See Fr. 42,574 (C. A. 28, 11974).

**Vat dyes.** I. G. Farbenind. A.-G. Brit. 399,491, Oct. 4, 1933. See Ger. 582,169 (C. A. 27, 5195).

**Vat dyes (anthraquinoneacridone series).** I. G. Farbenind. A.-G. Brit. 399,182, Sept. 29, 1933. 4-Acylamino-*Bs*-2,3,5-trichloroanthraquinone-2,1(*N*)-benzacrindones are prepd. by acylating the corresponding 4-amino derivs., preferably in an org. diluent. The products give fast even dyeings on mixed fabrics of viscose rayon and cotton. Examples describe acylation with  $\text{BzOH}$  (dye blue), *p*-chlorobenzoic (reddish blue), anthraquinone-2-carboxylic (grey-blue), oxalic (blue), terephthalic, isophthalic, biphenylcarboxylic, naphthoic, naphthalene-1,5-dicarboxylic and anthraquinone-benzacrindone-*Bs*-carboxylic acids, etc.

**Vat dyes.** I. G. Farbenind. A.-G. Fr. 753,511, Oct. 18, 1933. Sulfuric esters of leuco derivs. of vat dyes are prepd. by treating a reduction product of a vat dye, stable to air and practically insol. in dil. aq. alkalis, by an agent liberating  $\text{SO}_2$ , in the presence of an org. base, e. g.,  $\text{ClSO}_3\text{H}$  in the presence of pyridine or  $\text{PhNMe}_2$ .

**Vat dyes (anthraquinone series).** I. G. Farbenind. A.-G. Brit. 399,724, Oct. 12, 1933. See Fr. 753,185 (C. A. 28, 9064).

**Vat dyes of the anthraquinone series.** Otto Bayer (to General Aniline Works). U. S. 1,938,993, Dec. 12, 1933. Dyes (examples of which dye yellowish green shades) are prepd. by causing one mol. proportion of a *m*- or *p*-diphenylbenzenedicarboxylic acid or a substitution product thereof, or, more advantageously, of a functional deriv. of these compds. (the halides, for example) to react on two mol. proportions of  $\alpha$ -aminoanthraquinone or substituted  $\alpha$ -aminoanthraquinones, for example, those substituted in the nucleus by halogen ( $\text{Cl}$ ,  $\text{Br}$ , etc.), aryloxy groups (benzoylamino, *m*-methoxybenzoylamino, chlorobenzoylamino, naphthoylamino groups, etc.) or alkoxy groups (methoxy, ethoxy, etc.). The reaction

is advantageously performed while heating the reaction components in the presence of a high-boiling org. solvent inert to the starting materials, such as  $\text{PhCl}$ , *o*- $\text{C}_6\text{H}_4\text{Cl}_2$ ,  $\text{PhNO}_2$ , etc.

**Anthraquinone dyes.** Imperial Chemical Industries Ltd. Ger. 581,793, Aug. 10, 1933 (Cl. 22b.3.08). See Brit. 387,793 (C. A. 27, 2811).

**Dyes containing sulfur.** I. G. Farbenind. A.-G. Brit. 399,583, Oct. 12, 1933. See Fr. 745,091 (C. A. 27, 4412).

**Dye preparations.** Soc. pour l'ind. chim. à Bâle. Brit. 399,208, Oct. 5, 1933. See Swiss 155,461 (C. A. 27, 1194). In 399,274, Oct. 5, 1933, addn. to 399,268, the org. acid amides are mixed with dyes that are insol. in  $\text{H}_2\text{O}$  and alc. to dil. them. Among examples indanthrone-3,3'-dicarboxylic acid is mixed with *p*-toluenesulfonamide. The preps. of both patents are useful for coloring nitrocellulose lacquers, varnishes and resins.

**Anthraquinone derivatives.** I. G. Farbenind. A.-G. Brit. 399,095, Sept. 28, 1933. 1-Aminoanthraquinone-sulfonamides, substituted in the 4-position by an amino group having identical or different *H*, aliphatic, alicyclic, aromatic or aliphatic-aromatic radicals and in which the sulfonic amide group may be similarly substituted, are obtained by treating 1-amino-4-haloanthraquinone-sulfonamides with the required primary or secondary amine or  $\text{NH}_3$  and the products may be sulfonated. Among examples (1) 1-amino-4-bromoanthraquinone-2-sulfonhexylamide is treated with  $\text{PhNH}_2$  or 1-amino-4-methoxybenzene to give dark blue products, and (2) 1-amino-4-anilinoanthraquinone-2-sulfonanilide and 1-amino-4-cyclohexylaminoanthraquinone-2-sulfonmethylamide, obtained, resp., from the 2-sulfonyl chlorides via the 2-sulfonamides and  $\text{PhNH}_2$  or cyclohexylamine, are sulfonated to give blue wool dyes still contg. a sulfonamide group.

**Halogen derivatives of isobenzopyrenequinones.** Max A. Kunz and Karl Koeberle (to General Aniline Works). U. S. 1,942,761, Jan. 9, 1933. New halogenated 4,5,8,9-dibenzopyrene-3,10-quinones probably corresponding to the formula:

in which the  $\gamma$ - and  $\gamma'$ -positions are unsubstituted by halogen and at least one of the  $\alpha$ -,  $\beta$ -, and  $\alpha'$ -,  $\beta'$ -positions is substituted by halogen, dyeing vegetable fibers essentially more reddish shades than the unhalogenated initial material and with a less bluish tinge than the isomeric 4,5,8,9-dibenzopyrene-3,10-quinones halogenated in chlorosulfonic acid, are obtainable by halogenating 4,5,8,9-dibenzopyrene-3,10-quinones in org. solvents. Several examples with details of procedure are given.

**Hydroxynaphthylbenzoic acid.** Alfred Rieche. Ger. 584,859, Sept. 26, 1933. The compd. 2-(2-hydroxy-1-naphthyl)benzoic acid is prepd. by treating 1,8-phthaloxyl-2-naphthol with alkali hydroxides in alc. soln. The lactone m. 220°. The substance is used as a dye intermediate.

**Nondyeing metalliferous sulfurized phenol derivatives.** Valentin Kartaschoff and Oskar Knecht (to Chemische Fabrik vorm. Sandoz). U. S. 1,943,179, Jan. 9, 1933. Products which have mordanting, tanning, reserving and insecticidal properties and which may be used as intermediates for manuf. of dyes and pharmaceutical compds. can be prepd. by heating phenols with S in presence of metals of the  $\text{H}_2\text{S}$  and  $(\text{NH}_4)_2\text{S}$  groups and their salts and of suitable addn. compds. that act as accelerators for the sulfurizing operation. Such addn. compds. are, for instance, the salts of org. carboxylic acids, like acetates, formates, lactates; salts of weak inorg. acids, like nitrites, hyposulfites, thiosulfates, thionates, sulfohydrates; or compds. like aniline, iodine, etc. Small additions are suitable. As salts of the metals of the  $\text{H}_2\text{S}$  and  $(\text{NH}_4)_2\text{S}$  group it is preferable to use salts of weak inorg. acids like sulfites,

nitrites or salts of org. carboxylic and sulfonic acids such as formates, lactates, benzoates, *p*-toluenesulfonates, etc. Oxides and hydroxides may also advantageously be used, where the use of sulfates and chlorides is inconvenient as the reaction proceeds only slowly and higher temps. must be used. Preparation of Mo, Cr, Sn and Al compds. is described in detail. Cf. C. A. 28, 177<sup>a</sup>.

**Dyes and intermediates.** I. G. Farbenind. A.-G. Fr. 754,987, Nov. 17, 1933. Primary condensation products which may be used for the prepn. of dyes, *e. g.*, oxazine or S dyes, are prepd. by condensing 1,4-quinones with monoamino derivs. of pyrene, fluoranthene, chrysene, or their substitution products, in the presence or not of org. or inorg. oxidants, metal chlorides or acylating agents and sulfonating the products obtained. The dyes correspond probably with the formula—

where X is H, alkyl or halogen, R represents a bivalent radical of the pyrene and other series, and SO<sub>2</sub>H signifies that the dye may be sulfonated. In examples, 4(or 11)-aminofluoranthene is condensed with chloranil, toluquinone or  $\alpha$ -naphthoquinone, 3(or 4)-aminopyrene is condensed with chloranil, benzoquinone and  $\alpha$ -naphthoquinone; aminochrysene is condensed with chloranil.

**Intermediates and dyes.** Soc. pour l'ind. chim. à Bâle. Fr. 750,922, Aug. 22, 1933. Stilbene derivs. which contain in each C<sub>6</sub>H<sub>4</sub> ring substituents capable of giving the anthranilic acid grouping are reduced to the corresponding NH<sub>2</sub> compds., the NH<sub>2</sub> and COOH groups being ortho with respect to one another. The derivs. may also contain other substituents. An example is given of the prepn. of the 4,4'-diamino-3,3'-dicarboxy deriv. and of a large no. of dyes obtained by tetrazotizing it and coupling with components such as 1-amino-8-naphthol-4-sulfonic acid, and of dyes obtained by treating these dyes with metallizing agents. The 4,4'-dinitro-3,3'-dicarboxy deriv. m. above 280°, is obtained by oxidation of 6-nitro-3-methylbenzoic acid with NaOCl in alk. soln.

**Intermediates and dyes.** Soc. pour l'ind. chim. à Bâle. Fr. 751,324, Aug. 31, 1933. Azo dyes are prepd. by coupling diazo compds. with *N,N*-diacyl derivs. of 1,4- or 1,5-diamino-8-hydroxynaphthalene. The acyl compds. are prepd. by treating 1,4(or 1,5)-diamino-8-hydroxynaphthalene or their sulfonic acids with acylating agents. Examples are given of the prepn. of diacetyl-1,4-diamino-, 3',3''(or 4',4'')-diaminodibenzoyl-1,4-diamino-, and 3',3''(or 4',4'')-dinitrodibenzoyl-1,4-diamino-8-hydroxynaphthalene-6-sulfonic acid and 1,5-dibenzoyldiamino-8-hydroxynaphthalene and dyes prepd. therefrom.

**Dyeing.** I. G. Farbenind. A.-G. Fr. 42,476, July 31, 1933. Addn. to 727,605 (C. A. 26, 5765). See Ger. 578,648 (C. A. 28, 910<sup>a</sup>).

**Dyeing fibers.** John L. Hankey. Ger. 587,584, Nov. 6, 1933 (Cl. 8m. 11.01). Vegetable and silk fibers are mordanted by treatment with a mixed soln. of K<sub>2</sub>Cr<sub>2</sub>O<sub>7</sub> and hyposulfite and steaming.

**Dyeing cellulose esters.** Charles S. Bedford. Brit. 399,533, Sept. 29, 1933. Cellulose esters are dyed or printed with insol. or difficultly sol. dyes in the form of aq. colloidal dispersions obtained with the aid of sulfonated CH<sub>3</sub>O-cresol condensation products, used as free sulfonic acids or as alkali salts.

**Dyeing cellulose esters and ethers.** British Celanese Ltd., George H. Ellis and Henry C. Olpin. Brit. 399,559, Oct. 9, 1933. The production of oxidation colors on materials made of or contg. cellulose esters or ethers is resisted locally by applying a compn. contg. an oxidizable compd. of an inorg. acid, said compd. having mild reducing properties, *e. g.*, sulfites, thiosulfates, stannous and ferrous

salts, and a dye resistant to the oxidizable compd. and having affinity for, or capable of being fixed on, the materials. In an example a cellulose acetate fabric is printed with an aq. paste contg. a dye, *e. g.*, 2,4-dinitro-4'-aminodiphenylamine, 1,4-diamino-2-methoxyanthraquinone, *p*-hydroxybenzenazo-1-phenyl-3-methyl-5-pyrazolone or Duran blue G, methylated spirit, gum arabic, AcONa, ZnO and Na<sub>2</sub>S<sub>2</sub>O<sub>3</sub> or SnCl<sub>2</sub> and the printed fabric is padded with an aq. liquor contg. PhNH<sub>2</sub>·HCl, AcOH, methylated spirit, tragacanth thickening, NaClO<sub>2</sub>, and CuCl<sub>2</sub> and is dried, aged, chromed and washed to obtain a colored pattern on a black ground.

**Dyeing cotton goods with sulfur black.** Herbert A. Lubs and Herbert W. Walker (to E. I. du Pont de Nemours & Co.). U.S. 1,941,901, Jan. 2. Cotton goods are dyed with a S black produced by thionating a nitrophenol, and from 0.5 to 15% of the Na salt of 1-amino-4-ethoxyphenyl-2-thioglycolic acid is used for a stabilizer and to inhibit tendering.

**Dyeing wool.** Soc. pour l'ind. chim. à Bâle. Brit. 399,228, Sept. 25, 1933. Divided on and addn. to 398,878 (C. A. 28, 1548<sup>a</sup>). Azo dyes are made on wool by grounding with an unsulfonated arylide of 2,3-hydroxynaphthoic acid and developing with a diazotized *p*-aminodiphenylamine or an unsulfonated deriv. thereof, the grounding being conducted in a short bath under the following conditions: (a) the arylide in the bath is not more than 5% of the wt. of the wool, (b) the alkali hydroxide must be 1.5–2.5 times the quantity of arylide and (c) the grounding bath must be exhausted. In an example the dye 4'-ethoxy-4-aminodiphenylamine  $\rightarrow$   $\alpha$ -naphthylamide of 2,3-hydroxynaphthoic acid is produced on wool. Cf. C. A. 27, 4689.

**Printing silk with chrome dyes.** Jean-Jacques Roulet (to Durand & Huguenin S. A.). U. S. 1,942,774, Jan. 9. See Brit. 387,207 (C. A. 27, 4689).

**Obtaining full prints on material of cellulose organic substitution derivatives such as cellulose acetate or the like.** George H. Ellis and Ralph J. Mann (to Celanese Corp. of America). U. S. 1,943,008, Jan. 9. Printing is effected with aq. preps. contg. in undispersed form relatively water-insol. unreduced anthraquinone vat dyes or similar dyes having affinity for the goods, and fixing the coloring compds. by steaming.

**Apparatus (with a liquor-circulating propeller) for yarn dyeing and similar operations.** Harold Gough (to British Cotton & Wool Dyers' Association Ltd.). U. S. 1,943,175, Jan. 9. Structural and operative details.

**Retting materials such as flax.** Jules A. M. Faut (to "Les Fibres Textiles"). U. S. 1,941,793, Jan. 2. About 2% of the wt. of the flax of saponified linseed oil is used as an auxiliary retting bath ingredient to facilitate retting. Cf. C. A. 27, 2826.

**Treating coir fiber to give it a smooth glossy surface.** Ivan Tudor and Owen Tudor-Hart. U. S. 1,941,451, Jan. 2. After treatment with alkali and drying, a mass of the fiber is subjected to a rubbing action.

**Treating cellulose fibers, etc.** Aage C. Thaysen. Brit. 399,952, Oct. 19, 1933. Cellulose, either raw or in the form of threads, fabrics, fishing-nets, etc., is uniformly acetylated so that the increase in wt. thereof is not more than 18% by an acetylating mixt. contg. up to 0.25% HClO<sub>4</sub>, or a salt thereof, 5–10% Ac<sub>2</sub>O and a diluent org. liquid, not more than 1.5 parts Ac<sub>2</sub>O to each part of cellulose being present. The cellulose is thus rendered immune to deterioration by destructive organisms without substantial interference with the normal textile properties.

**Sizing artificial fibers of cellulose esters and ethers.** Carroll F. Chandler (to Du Pont Rayon Co.). U. S. 1,943,000, Jan. 9. The weaving properties of artificial fibers such as those formed of cellulose acetate are improved by combined treatment with a swelling agent such as NH<sub>4</sub>CNS and a sizing material such as gum arabic. Various examples are given.

**Sizing textiles.** I. G. Farbenind. A.-G. Brit. 399,905, Oct. 19, 1933. Addn. to 345,207 (C. A. 26, 320). Textile fabrics, *e. g.*, rayon, are sized with a mixt. of polyvinyl alcs. or their H<sub>2</sub>O-sol. derivs., the viscosity in aq.

solu. of 1 component thereof differing from that of another. Borax,  $\text{Na}_2\text{CO}_3$ , glucose, sucrose, polyglycerol, urea-glycerol condensation products, triethanolamine and  $\text{H}_2\text{O}$ -sol. carbohydrate derivs., e. g., dextrin, Me cellulose, dimethoxytriethoxyhexane (made by catalytic reduction of Me cellulose), may be added to the size. Cf. C. A. 28, 6567.

**Treating textiles, etc.** Luis Neuman. Ger. 587,974, Nov. 11, 1933 (Cl. 8 $\frac{1}{2}$ . 1). Dry pectin material is mixed with the finishing, etc., preps. for textiles, leather, paper, etc.

**Treating yarns.** Owen Tudor-Hart. Brit. 399,800, Oct. 11, 1933. Coir yarn, the fibers of which have been boiled in alkali before or after spinning, is subjected to a rubbing process before or after weaving to impart flexibility, glossiness and greater affinity for dyes.

**Processing yarn.** Frederick J. Williams and Herbert E. Martin (to Camille Dreyfus). Can. 338,070, Dec. 19, 1933. Yarns contg. org. derivs. of cellulose are conditioned by incorporating or applying a fluid contg.  $(\text{CH}_3\text{OH})_2$ , castor oil and BuOH. The yarn has increased flexibility.

**Delustering fabrics.** Charles R. Weiss and Winton R. Bennett. U. S. 1,942,523, Jan. 9. "Shine" is removed from fabrics such as worn garments by use of an alc. soln. contg.  $\text{NH}_4\text{OAc}$ .

**Delustering rayon.** Frederick D. Lewis. Brit. 399,512, Oct. 6, 1933. Artificial threads, etc., of reduced luster are obtained by adding to the spinning soln., e. g., viscose or cuprammonium soln., a halogenated (hydro- or alkyl-) naphthalene, which may be admixed with highly refractive perfumery products, e. g., alkyl and aryl naphthyl ethers, and diluents, e. g.,  $\beta, \beta'$ -dichloroalkyl ethers. Among examples yarn is spun from viscose contg. a dispersion of a soln. of (1) hexachloronaphthalene in  $\alpha$ -monochloronaphthalene, and (2) pentachloronaphthalene in  $\beta, \beta'$ -dichlorodimethyl ether.

**Rayon.** Glanzstoff-Courtaulds G. m. b. H. Fr. 753,951, Oct. 28, 1933. See Brit. 397,253 (C. A. 28, 913<sup>a</sup>).

**Increasing the ironing point of rayon.** Camille Dreyfus and Herbert Platt (to Camille Dreyfus). Can. 337,207, Nov. 14, 1933. The safe ironing point of a textile material contg. filaments of cellulose is raised by treating the material with a soln. contg.  $\text{SnCl}_4$  5% and  $\text{NaCl}$  30% at about 85° for about 2 hrs. and then with a soln. of silicate at elevated temp. Other weighting salts of Zn, Al, Bi, W or Sb may be used, but  $\text{SnCl}_4$  is preferred.

<sup>1</sup>  $\text{KCl}$ ,  $\text{CaCl}_2$  or similarly acting materials which are neither swelling agents nor weighting agents for cellulose acetate material may be used.

**Apparatus for washing, bleaching, desulfurizing or other wet treatments of spooled rayon.** Conrad Herrmann (to American Glanzstoff Corp.). U. S. 1,943,072, Jan. 9. Structural and operative details.

**Crepe threads.** British Celanese Ltd., Wm. A. Dickie and Wm. I. Taylor. Brit. 399,534, Oct. 2, 1933. Highly twisted crepe threads comprise both sapond. and unsapond. cellulose ester filaments.

**Washing wool.** Louis Delfosse. Brit. 399,634, Oct. 12, 1933. See Fr. 741,830 (C. A. 27, 3623).

**Degreasing wool, etc.** Arnold Golwig. Brit. 399,338, Oct. 5, 1933. Animal fibers are degreased by treatment below 0° with org. solvents for fat, e. g., ethylene trichloride, to which may be added 10% of ethane tetrachloride or  $\text{CCl}_4$ . The treatment may be in stages, different solvents and (or) temps. being used at each stage.

**Cleaning wool.** John F. Paterson. Brit. 399,509, Oct. 12, 1933. Raw or manufd. wool is cleaned by dusting with finely divided dry raw gypsum, revolving in 1 or more drums in a machine and discharging onto an endless continuously moving conveyor by which it is taken into a conduit where it is treated by suction before delivery from the machine. App. is described.

<sup>4</sup> **Wool-cleaning process.** Fitzer California Co. Brit. 398,083, Sept. 21, 1933. See U. S. 1,844,154 (C. A. 27, 2587).

**Cleaning felts.** Rudolf F. L. Wille. Brit. 398,695, Sept. 21, 1933. See Fr. 747,708 (C. A. 27, 5207).

**Bleaching vegetable materials with hypochlorites.** Soc. pour l'ind. chim. à Bâle. Brit. 399,319 and 399,320, Oct. 5, 1933. See Fr. 743,925 and 743,926 (C. A. 27, 4102).

<sup>5</sup> **Incandescent mantles.** Deutsche Gasglühlicht-Auer-G. m. b. H. Brit. 399,354, Oct. 5, 1933. Braided hose, consisting of rayon, ramie, and other fibers and with diagonal reinforcing ribs only, is used in the manuf. of the mantles. Cf. C. A. 28, 650<sup>a</sup>.

**Mothproofing agent.** Jules Sibille. Brit. 399,938, Oct. 19, 1933. An agent for preserving textiles, furs, etc., from moths, etc., comprises a  $\text{H}_2\text{O}$ -insol. vegetable alkaloid compd. produced by reaction of crystd. quassin and quinine in the presence of  $\text{HBr}$  and  $\text{H}_2\text{O}_2$ . Oleic or similar fatty acid may be used in place of  $\text{HBr}$ . Cf. C. A. 26, 2027.

## 26—PAINTS, VARNISHES AND RESINS

A. H. SADIN

**Studies in light-proof blue paints.** H. Rasquin. *Farben-Ztg.* 39, 60(1934).—Ultramarine blue excelled in light-proofness indanthrene blue, Pure blue and Fanal blue L. Bex when these pigments were used to tint  $\text{ZnO}$ , white lead carbonate, and lithopone in both glue-vehicle and oil-vehicle paints. G. G. Sward

**Painting "Elektron."** Fr. Kolke. *Farben-Ztg.* 38, 1756(1933).—A bakelite primer containing 30%  $\text{TiO}_2$ , baked on, was the best of several for the Mg alloys, A2M and AM503. Chromatizing pretreatment also favorably affected the durability of the paints. G. G. Sward

**The use of rubber in paints.** H. P. Stevens and Noel Heaton. *J. Oil & Colour Chem. Assoc.* 17, 8-26(1934); cf. C. A. 28, 1570<sup>a</sup>.—The amt. of raw rubber introduced into paints has been limited by the high viscosity of rubber sols. It was found that low-viscosity rubber sols could be prepd. by introduction of small amts. of metallic soaps, linoleates being the most satisfactory. Co, Mn, Cu, Pb, Zn and Fe were the most effective in the order named. The most important effects of the rubber sols on paints were excellent wetting of pigments, good storage properties and good flow of the wet films with the elimination of brush marks. These properties make the use of low-viscosity rubber especially valuable

in flat wall paints and outside house paints. It is not of much value in enamels. No apparent change in durability was noted. G. G. Sward

**Some paint and varnish problems of the rubber industry.** H. J. Stern. *Oil & Colour Trades J.* 85, 322-6(1934). The possible presence of free S and antioxidants in rubber requires consideration in the formulation of coatings for rubber goods. Properties required of coatings for various rubber articles are discussed. G. G. Sward

**The function of paint as a metal preservative.** I. A. Jordan, et al. *J. Oil & Colour Chem. Assoc.* 16, 398-421(1933).—A discussion. G. G. Sward

**Microbicidal paint.** Troussaint. *Bull. acad. med.* 109, 448-52(1933).—The addn. of *o*-hydroxyquinoline sulfate to the paint imparts to the surface the power to destroy most types of germs within 24 hrs. A. E. M.

**Critical oil content of stand oil paints.** H. Wolff. *Farben-Chem.* 4, 445-7(1933); cf. C. A. 23, 5333; 27, 5555.—Regardless of the type of pigment, the crit. viscosity of stand oil paints equals  $3.35\sqrt{V_0}$ , where  $V_0$  is the viscosity of the stand oil. As previously shown, the crit. viscosity of raw linseed oil paints equals  $3.35\sqrt{1/n}$ , where  $n$  is the exponent in the viscosity equation. Hence it is concluded that the  $n$  of the oil det. the crit.  $n$  of

stand oil paints, but the characteristics of both oil and pigment det. the crit. oil content of raw linseed oil paints.

G. G. Sward

**Relationship between color and structure of organic pigments.** Edward J. Zimmer. *Paint, Oil & Chem. Rev.* 96, No. 2, 7-9(1934).—Theories of the relation between color and chem. structure are illustrated by structural formulas of typical dyes and color lakes.

G. G. Sward

**Titanium dioxide, lithopone and leaded zinc.** H. H. Morris. *Official Digest Federation Paint Varnish Production Clubs* No. 131, 356-64(Jan., 1934).—The general properties of Ti pigments for paper, oil paints and enamels are described. A study was made of the possibility of replacing mixts. of extended Ti pigment with  $TiO_2$  and barytes or asbestine, and leaded zinc for ZnO in outside paints formulated on a basis of 45:35:20 titanox-B basic carbonate white lead:ZnO. The results indicated superiority of  $TiO_2$ -asbestine mixts. over titanox-B and also superiority of leaded zinc over pure ZnO pigments.

G. G. Sward

**Lead sulfate in chrome-yellow manufacture.** George Zerr. *Farbe u. Lack* 1934, 4.—The use of by-product  $PbSO_4$  as a source of Pb in the manuf. of chrome yellow is discussed.

G. G. Sward

**Treatment of oils for nonpenetrating paints.** Wilhelm Krumbhaar. *Official Digest Federation Paint Varnish Production Clubs* No. 131, 352-6; *Paint & Varnish Production Mgr.* 10, No. 2, 5-6, 8(1934).—Nonpenetrating properties of paint vehicles are due to the formation of a gel structure as soon as the volatile matter has evapd. They may be obtained by the incorporation of metallic soaps, in which case the effect is often only temporary because of the flocculating action of some pigments. The specific effects of various metals are described. The use of heavy-bodied oils to obtain nonpenetration is limited by their soly. and compatibility with pigments. The production of nonpenetrating oils by sulfurizing processes is difficult to control.

G. G. S.

**Tung oil: chemical studies and specifications.** L. A. Jordan. *J. Soc. Chem. Ind.* 53, 111T(1934).—A lecture covering the detn. of complete and partial satn., gelation by heat and polymerization. The heat test is reviewed and a new method of test which has been in use for some time described. The complete compn. of 11 Empire tung oils is given.

P. S. Roller

**The tung oil phenomenon and the drying of oils by ionized oxygen.** H. Albrecht. *Farben-Ztg.* 39, 15 16(1934).—Using a limed rosin-tung oil varnish, A. was unable to confirm Rossmann's observations (cf. C. A. 27, 5557). The wrinkling of tung oil films is ascribed to the presence of N oxides whose formation in turn may be due to active gases, e. g.,  $O_3$  or other oxidizing gases.

G. G. Sward

**The swelling of cellulose acetate films.** D. Kruger. *Farbe u. Lack* 1934, 3, 15-16, 29-30.—The absorption of  $H_2O$  and various organic liquids by cellulose acetate is reviewed. Twenty-nine references.

G. G. Sward

**Evaporation rates and distillation range [of solvents].** L. Ivanovszky. *Farben-Chem.* 3, 335-6(1932); cf. C. A. 26, 3411.—The distn. range,  $d$ ,  $\eta$ ,  $\gamma$  and comparative rates of evapn. of 21 common nitrocellulose solvents and thinners are tabulated. The filter-paper method does not give the rate of evapn. when the liquid is present in a lacquer; the figures obtained are variously affected by the  $\eta$  and  $\gamma$  of the liquid, the presence of admixed liquids or nitrocellulose and the porosity of the paper. A self-recording app. is recommended.

B. C. A.

**Research on rosin products.** Louis Light. *Paint & Varnish Production Mgr.* 10, No. 2, 24-7(1934).—A review of patents (chiefly German) on esterification, chlorination and other means of modifying rosin for use in varnish and lacquer.

G. G. Sward

**Chemical progress in the synthetic resins industry.** H. L. Bender. *Chimie & industrie* 30, 525-32(1933).—A brief review, with bibliography of 23 references.

A. Papineau-Couture

**Electrometric titration of artificial resins.** S. Gluckmann and N. Riasantzev. *Chimie & industrie* 30, 1290-6(1933).—The method of Bishop, Kittredge and Hildebrand (C. A. 16, 885) was applied (with some modifications) to the electrometric titration of solns. of artificial resins in 95% EtOH, BuOH and in mixts. of these with 20%  $C_6H_6$ . From the titration curves it can be concluded that the resins contain  $CO_2H$  groups and OH groups that react with the alkali, the greater or less quantity of which is characterized by the buffer power expressed by the slope of the curve. The results of electrometric titrations of iditol show that it contains OH groups that react with alkali; in esterified iditol, esterification weakens the buffer power. The sol. portion of ammoniacal bakelite, at all stages of its heat treatment, gives equal curves, indicating identity of the solid, alc.-insol. phase, which also reacts with alkali to a certain extent, leads to the supposition that there is a gradual passing from stage B to stage C, while the passing from stage A to stage B takes place in steps. By means of electrometric titration, abietic acid can be detd. in albertols. The carboxylic values, calcd. from these curves, are lower than the acidity obtained by titration in presence of phenolphthalein which comprises total acidity, viz., carboxylic, which is neutralized by alkali and hydroxylic (phenolic) which is partly neutralized by coned. alkali. The upper portion of the curves gives an idea of the amt. of unesterified phenolic groups. Electrometric titration curves give much more information regarding the properties of albertols than acidimetric titrations in presence of indicators.

A. P.-C.

**Plioform—a new molding resin.** H. R. Thies and A. M. Clifford. *Ind. Eng. Chem.* 26, 123-9(1934).—Various chem. reactions of the rubber hydrocarbon are reviewed. Rubber is converted into Plioform resins by certain adaptations of the reaction between rubber and the chlorotin acids. These resins are tough, odorless and tasteless, resistant to alkalis, most acids and moisture, and are thermoplastic. They are sol. in solvents of the gasoline or benzene type and insol. in solvents of the acetone type. Milled Plioform gives solns. of high concn. and low viscosity. The resins can be produced in a large variety of transparent, translucent, pearlescent and opaque colors. Details of the molding process are discussed.

W. A. La Lande, Jr.

**New sol. pigment B. G. 125 (Bary, Graffe) 30.** Methylene ether esters [solvents and plasticizers] (Walker) 10. Viscometer [for paints, lacquers, etc.] (U. S. pat. 1,942,920) 4. Plastic materials [for use in lacquers or varnishes] (Brit. pat. 399,814) 23. Dye preps. [for coloring nitrocellulose lacquers, varnishes and resins] (Brit. pat. 399,268) 25.

**Chatterjee, A. C.:** Bibliography of Lac. Calcutta: Indian Lac Cess Committee. 129 pp. Rs. 2/8.

**Miskella, Wm. J.:** Practical Automotive Lacquering. Oak Park, Ill.: Finishing Research Labs., Inc. 194 pp. \$3.50.

**Schüller, H. Josef:** Beiträge zur Kenntnis der Kunstharze. (Bakelite, Cyclohexanoncondensate.) Thesis, Bern. 1931. 44 pp.

**Paints and special pigments.** Wendell G. Randolph (to Egyptian Lacquer Mfg. Co.). U. S. 1,942,491, Jan. 9. In prepg. a liquid coating compn. free from tendency to stratify, at least two sep. finely ground differently colored pigments are mixed in the presence of a small amt. of a "cellulose-type lacquer" such as one contg. cellulose nitrate sufficient to bind the particles of the sep. pigments together; the mixt. is dried and ground without substantial sepn. of the differently colored pigments and the product is dispersed in a liquid paint vehicle in which the dried residue of the lacquer used is insol.

**Pigments and paints.** Titanium Pigment Co., Inc. Brit. 399,183, Sept. 29, 1933. See Fr. 734,601 (C. A. 27, 1218).

**Pigments.** Imperial Chemical Industries Ltd., Joseph Edward Clapham and Anthony James Hailwood. Brit. 399,497, Oct. 2, 1933. Inorg. and org. pigments are improved as regards coloring power and miscibility with  $H_2O$ , drying oils, etc., by grinding, wet or dry, with a small proportion of (the Na salt of) a sulfuric ester of an alc. having 10-20 C atoms, e. g., stearyl or dodecyl sulfate, oleyl, stearyl or cetyl Na sulfate.

**Writing ink.** Konstantin Skumburdis. Ger. 587,796, Nov. 7, 1933 (Cl. 22g. 1). Saponin or exts. contg. saponin are added to writing inks.

**Ceramic ink.** Lawrence McLaughlin (to The Western Electric Co. Inc.). Can. 337,714, Dec. 5, 1933. A ceramic ink comprises  $CoO$ ,  $3$ , borax  $1$  part, lead oxide and a sufficient amt. of linseed oil varnish to cause the ink to have the consistency of printer's ink. The compn. of the ink may be widely varied in accordance with the color desired and the nature of the surface to which it is to be applied. Thus vitreous enamel fluxes other than borax may be used, such as glass or lead borate, and any of the following substances, as well as mixts. thereof, are suitable as pigments, manganese oxide, Ni, Fe, Cu, Cr and selenium red.

**Drying oil from castor oil.** Johannes Scheiber. U. S. 1,942,778, Jan. 9. By the treatment of castor oil by vacuum distn. and chem. dehydration and further heating with glycerol, a reaction product is obtained suitable for use in varnishes and paints and which comprises an ester of glycerol with octadecadienic-9,11-acid  $1$ .

**Varnish composition and shellac substitute.** Joseph B. Dietz and Edmund F. Oeffinger (to E. I. du Pont de Nemours & Co.). U. S. 1,942,413, Jan. 9. A mixt. such as Batu gum 18-20, rosin 10-20, lime 1-2 and China-wood oil 20-40 parts which has been heated to over  $200^\circ$  is dissolved in a varnish thinner such as naphtha and benzene.

**Cellulose ester lacquers.** Leo Roon (to Roxalin Flexible Lacquer Co.). U. S. 1,942,902, Jan. 9. Uniformly dispersed finely divided solid particles of carnauba wax are suspended in a lacquer (such as one contg. nitrocellulose) the ingredients of which do not dissolve the wax at ordinary atm. temp., so that the wax serves as an opacifying agent.

**Use of primers and lacquers on surfaces such as wood, brick, stone or concrete.** Wm. H. Moss (to Celanese Corp. of America). U. S. 1,941,709, Jan. 2. Before coating a surface with a cellulose deriv. lacquer such as one contg. cellulose acetate and a synthetic resin the surface is treated with a primer in which the major non-volatile constituent is a non-resinous substance capable of inducing plasticity in the cellulose deriv.

**Coating compositions.** Accumulatoren-Fabrik A.-G. Brit. 399,344, Oct. 5, 1933. A viscous compn. that can be shaped, brushed or sprayed consists of an aq. rubber dispersion,  $NH_3$ , water glass and Zn or Pb salts of 1 or more weak acids, e. g., carbonates or borates. Vulcanizing agents and fillers may be added. In an example S 200,  $ZnCO_3$  10 g., water glass (sp. gr. 1.25) 50 and  $NH_4OH$  (25%) 15 cc. are added to 1 l. latex (60%).

**Coating composition.** Horace H. Hopkins and John Richardson, Jr. (to The Canadian Industries Ltd.). Can. 336,932, Nov. 7, 1933. A coating compn. is manufd. by dissolving in a thinner, an oil-modified glyceryl phthalate resin in the ratio of about 90.3 to 107.2 parts by wt. of thinner to 1 part by wt. of resin and thereby obtain a soln. having a viscosity from about 10 to 20 poises. Drier is incorporated into the soln., which is diluted to a sp. gr. of about 90. Flaked Al is incorporated into the soln. in the ratio of 1.5-2.5 lb. of Al flake to 1 gallon of soln. Cf. C. A. 27, 3836.

**Rust-resisting coating composition.** Herbert O. Albrecht (to The Canadian Industries Ltd.). Can. 336,447, Oct. 17, 1933. Rust-resisting coating compn. is manufd. by mixing  $H_3PO_4$  and BuOH with a coating compn. of the paint or varnish type.

**Coating compositions containing cellulose derivatives and synthetic resins.** Wm. H. Moss and Blanche B. White (to Celanese Corp. of America). U. S. 1,941,708,

Jan. 2. A coating compn. or lacquer comprises an org. cellulose deriv. such as cellulose acetate together with a phenol-furfural resin which bleaches on exposure to light, a phenol-aldehyde resin which darkens on exposure to light and a common solvent (the different synthetic resins being in proportions to give a compn. which as an entirety does not change color on exposure to light). Cf. C. A. 27, 3350; 28, 893.

**Use of chlorinated biphenyl with nitrocellulose in coating compositions.** Russell L. Jenkins (to Swann Research, Inc.). U. S. 1,942,926, Jan. 9. Chlorinated biphenyl is used with nitrocellulose and resins, etc. Various examples are given.

**Resinous coating composition.** John W. Iliff and Harry R. Young (to E. I. du Pont de Nemours & Co.). U. S. 1,942,757, Jan. 9. A solvent such as hydrocarbon material having a b.-p. range of not more than about  $30^\circ$  and lying between  $150^\circ$  and  $250^\circ$  is used with an oxidizable polyhydric alc.-"polybasic" acid resin insol when oxidized in the solvent, together with an oxidation inhibitor for the resin such as cresol, guaiacol, eugenol, catechol or *p*- or *o*-hydroxybiphenyl. Numerous examples are given.

**Resinous coating composition suitable for use on flexible floor-covering materials.** Wilmer F. Whitecarver and Horace H. Hopkins (to E. I. du Pont de Nemours & Co.). U. S. 1,942,736, Jan. 9. A varnish is prepd. by adding a volatile solvent to the product obtained by cooking a drying oil with an oil-sol. resin and a bodied drying oil is blended with this varnish. The resin used may be a condensation product of glycerol and phthalic anhydride.

**Aqueous finishings.** I. G. Farbenind. A.-G. Brit. 399,816, Oct. 11, 1933.  $NH_3$  or mixed  $NH_3$ , alkali metal salts of acid or substantive dyes, with or without the addn. of urea, are added to aq. finishings, e. g., aq. solns. of casein, shellac, tragacanth, carrageen, methylcellulose or like colloidal sol. substances, or body colors, e. g., the said finishings together with a pigment such as  $Fe_2O_3$  or alk. earth metal salts of dyes contg.  $HSO_3$  groups or the like. In an example the dye obtained by coupling tetrazotized diaminostilbenedisulfonic acid with PhOH and alkylating is dissolved in  $H_2O$  and acidified with HCl, the dye which seps. is kneaded with  $NH_4OH$ , urea added if desired, and dissolved in  $H_2O$  and mixed with an aq. soln. of casein.

**Coating metals.** Gerhard H. Averbek. Ger. 587,982, Nov. 16, 1933 (Cl. 22g. 7.02). In rendering metals non-corrosive by coating with org. cellulose ester solns., a water-absorbing agent such as cement or calcined  $CaSO_4$  is added to the soln.

**Plastic compositions, films, lacquers, etc.** Alphonse O. Jaeger (to Selden Co.). U. S. 1,941,474, Jan. 2. Phthalide substances such as phthalide itself or its various hydrogenated products such as tetra- or hexa-hydrophthalide or their alkyl, alkylidene, alicyclyl and aryl derivs. are used as plasticizers and softeners with various condensation products such as those formed from glycerol and phthalic anhydride,  $C_6H_5OH$  and  $CH_2O$ ,  $C_6H_5OH$  and furfural, urea and  $CH_2O$ , from the polymerization of styrene, itaconic acid or the like or with resinous compns. such as those contg. shellac. Various examples with details are given.

**Molded decorative material.** Lester O. Marsteller (to Westinghouse Elec. & Mfg. Co.). U. S. 1,943,131, Jan. 9. A base of plastic compn. such as one contg. a synthetic resin is molded with a colorant such as one comprising anodic Al; it exhibits metallic luster with depth and relative permanence.

**Molded articles containing phenolic resins.** Clarence A. Nash (to Bakelite Corp.). U. S. 1,942,874, Jan. 9. Articles such as water-meter disks and valves are molded from a compn. comprising a phenolic resinoid and a filler of finely divided mica and asbestos fiber.

**Molded artificial resin articles.** Allgemeine Elektrizitäts-Ges. (to International General Electric Co., Inc.). Brit. 399,738, Oct. 12, 1933. The articles, particularly for elec. insulating purposes, comprise a

foundation of artificial resin and filling material and a surface layer consisting (partially) of an artificial resin molding compn. contg. amine-aldehyde resin, the surface being formed during the molding process.

**Treating molten resin to effect its solidification and granulation.** Stuart P. Miller (to Barrett Co.). U. S. 1,942,764, Jan. 9. Various details of app. and operation are described, the molten resin being spread on a belt for cooling.

**Resins.** I. G. Farbenind. A.-G. Brit. 399,232, Oct. 5, 1933. Resins are manufd. by polymerizing mixts. of mono- or polyolefin benzenes or naphthalenes or homologs thereof, e. g., styrene,  $\alpha$ -alkylstyrenes, e. g.,  $\alpha$ -methylstyrene, divinylbenzene (I), vinylnaphthalenes, e. g.,  $\alpha$ -vinylnaphthalene (II) or vinylmethylmethylbenzenes, with unsatd. ketones contg. an olefin linkage in conjugation with the keto group, e. g., vinyl methyl ketone, methylene ethyl methyl diketone (III), benzalacetone. Polymerization accelerants, etc., may be present. Among examples (1) III and styrene are emulsified in  $H_2O$  with the aid of the hydrochloride of diethylaminoethoxyethyl-anilide and the emulsion is shaken 2 days at 60° and (2) a mixt. of vinyl methyl ketone and styrene is polymerized for 8 days at 80°. I is made by treating  $C_6H_6$  with  $C_2H_4$  and dehydrogenating the  $C_6H_4Et_2$  formed with the use of a catalyst, e. g.,  $ZnO$ ,  $Al_2O_3$ . II is made by treating  $\alpha$ -naphthylmagnesium bromide with AcH and dehydrating the naphthylethanol formed with, e. g.,  $KHSO_4$ . III is made by reaction of methyl ethyl ketone with  $CH_2O$  in dil. NaOH and dehydrating with, e. g.,  $K_2CO_3$ .

**Resins from oils containing polymerizable constituents.** Edwin L. Cline (to Barrett Co.). U. S. 1,942,201, Jan. 2. An oil such as crude coal-tar naphtha is heated with PbO and then distd. and treated with a polymerizing agent such as  $H_2SO_4$  to obtain light colored varnish resins.

**Condensation products from resins.** I. G. Farbenind. A.-G. Brit. 399,206, Oct. 2, 1933. Natural resins or the corresponding resin acids or the esters thereof are treated with volatile inorg. halides to give new products.

<sup>1</sup> Inert solvents may be used. The product may be esterified by alcs., e. g., glycerol. Among examples (1) a soln. of colophony in  $CCl_4$  is treated with  $BF_3$  in a current of N, (2) the product of (1) is esterified with glycerol in a current of N, (3) a mixt. of PhMe and the glycerol ester of colophony is treated with  $AlCl_3$  and (4) a soln. of colophony in  $C_6H_6$  is treated with  $SnCl_4$  or  $TiCl_4$ . In Brit. 399,211, Oct. 2, 1933, natural resins, anhydrides or esters thereof are made to react with phenols or substitution products or functional derivs. thereof, e. g., ethers or esters thereof, in the presence of volatile inorg. halides. The products may be further esterified or etherified by means of ethylene oxide or alkyl or aralkyl halides, e. g.,  $BuCl$ , benzyl chloride,  $\alpha$ -chloromethylisopropylmethylbenzene (I) in the presence of alkali, or an alc., e. g., glycerol, acids, e. g.,  $Ac_2O$ , or acid chlorides, e. g.,  $AcCl$ ,  $BzCl$ . Among 26 examples (1) a soln. of American colophony in  $CCl_4$  is treated with a soln. of  $BF_3$  in crude cresol or PhOH, (2) gaseous HCl is passed into a mixt. of the glycerol ester of colophony,  $CCl_4$  and PhOH and (3) the product of (1) is treated with I in the presence of aq. NaOH.

<sup>2</sup> **Distilling column and rectifier operation for distilling resins and resinous materials.** Erik Öman and Sven H. Ledin. U. S. 1,942,767, Jan. 9. In the operation of a column constituted by a still and a superposed communicating rectifier each comprising a plurality of communicating chambers, the resinous material to be distd., in the liquid state, is introduced into the uppermost chamber of the still and a vapor such as superheated steam is introduced into the lowermost chamber of the still; the still is heated to different temps. increasing by stages downwardly through the still, while in the rectifier a temp. is maintained at its bottom substantially identical with the temp. of the top of the still and the temp. decreases by stages upwardly through the rectifier. App. and details of temp. control are described.

<sup>3</sup> **Synthetic resins.** Bakelite Corp. Ger. 582,665, Aug. 19, 1933 (Cl. 12o. 26.02). See Brit. 275,604 (C. A. 22, 2882).

## 27—FATS, FATTY OILS, WAXES AND SOAPS

E. SCHRRUBEL

**A test of deteriorated fats by means of the reaction of Stamm.** István Korpáczy. *Kísérletügyi Közlemények* 36, 211-15 (1933).—Dissolve 1 cc. liquefied fat in 1 cc. of a soln. contg. 0.5 g. diphenylcarbazine in 100 cc. acetylene tetrachloride, immerse for exactly 3 min. in boiling water in a test tube, cool and compare with an aq. Bordeaux S soln. Fats showing higher color nos. with this reaction than 5 should be considered deteriorated and unfit for consumption.

**Hungarian castor-oil plant.** Miklós Janicsék. *Mezőgazdasági Kutatások* 6, 316-19 (1933).—Castor beans grown in Hungary had oil contents of 43.75-57.00%. The acid no. varied from 0.59 for freshly pressed seeds to 4.32 for seeds that had been stored in a bottle for 60 days.

**Rye oil. II. Properties as affected by choice of menstruum.** Albert W. Stout, H. A. Schuette and R. G. Fischer. *J. Am. Chem. Soc.* 56, 210-11 (1934); cf. C. A. 26, 4972. The yield of oil that can be recovered by extraction from rye embryo, the degree of pigmentation of the oil, its phys. and chem. consts. and the contents of unsaponifiable matter and P depend on the solvent. The yields for the various solvents increased in the order: petr. ether <  $Et_2O$  <  $CCl_4$  <  $C_6H_6$  <  $CS_2$  <  $C_6H_6$  <  $CHCl_3$  <  $Me_2CO$ . The following minima and maxima were noted:  $d_{20}^{25}$  0.9220 and 0.9482,  $n_D^{20}$  1.4732 and 1.4789, I no. 133.8 and 139.5, percentage of unsaponifiable matter 8.09 and 10.00, percentage of P (tentatively recorded as lecithin equiv.) 1.03 and 7.26.

**Sapukaja nut.** F. W. Freise. *Tropenpflanzer* 36, 199-202 (1933); *Chimie & industrie* 30, 901-2. —Sapukaja nut has a pericarp contg. a toxic compd. and must be

removed. The compn. of the nuts is: protein 16.1, fat 63.6, N-free ext. and crude fiber 8.2,  $H_2O$  8.2, ash 3.85%. The light yellow, almond-odor cold-pressed oil has the following characteristics: d. 0.920, sapon. no. 198, I no. 75.9. Modern plants produce 45-48% yields of first-pressing and 11-13% of second-pressing oil, the former being suitable for edible purposes and the latter for fine soaps.

**Vegetable lecithin of the soy bean.** F. Rothé and F. Nielloux. *J. pharm. chim.* 18, 443-5 (1933).—As lecithin is insol. in acetone, sol. in  $CHCl_3$  or  $Et_2O$ , this permits its quant. sepn. from the fats of com. crude lecithin, and its detn., e. g., in cacao butter. Purified vegetable lecithin contains total P 2.76%; total N 1.37%; ratio P:N 2.015. For egg lecithin, Lebeau and Courtot (C. A. 23, 3307) give P 3.84%, N 1.86%, P:N 2.07.

**Heat economy in the soap industry.** H. Gäbler. *Arch. Warmewirt.* 15, 47-9 (1934). —A general discussion of heat and power requirements.

**Lanolin in toilet soaps.** G. Knigge. *Deut. Parfümerie-Ztg.* 19, 133-4 (1933); *Chimie & industrie* 30, 900. —A study of the methods of detn. of lanolin in toilet soaps. Tests carried out on mixts. of ordinary soaps or Ca soaps, coconut fat and lanolin showed that detn. of the latter, particularly in the presence of unsaponif. fats, by extn. of the Ca soaps by  $EtOAc$  does not give accurate results, the latter being always low. In order to obtain accurate results, the detn. should be based on the difference between the sapon. nos. of lanolin in alc. and in petr. ether solns.

A. Papineau-Couture

Tertiary alkyl-substituted *o*-hydroxybenzenes [anti-oxidants for fats, waxes, soaps, etc.] (U. S. pat. 1,942,827) 10.

Küter, Hans: Blei(4)-Salze von Fettsäuren, Darstellung und Anwendung in der Fettanalyse. Eine neue Methode zur Darstellung von Rhoden-Verbindungen. Thesis, Jena. 1931. 44 pp.

Stabilizing fats and oils. Roy C. Newton and Donald P. Grettie (to Swift & Co.). Brit. 399,639, Oct. 12, 1933. See Fr. 741,417 (C. A. 27, 2833). (Restricted to guaiacum resin.)

Stabilization of oil and fat. Wm. D. Richardson, Donald P. Grettie and Roy C. Newton (to Swift and Co.). Can. 337,546, Nov. 28, 1933. A small amt. of a condensation product of pyrogallol and acetone, which is substantially insol. in water but sol. in the oil or fat, is incorporated into oils or fats for use in food products to stabilize them. Cf. C. A. 27, 1535.

Processing fish oil. Wm. S. Bodaly ( $1/2$  interest to Agnes Bodaly). Can. 337,392, Nov. 21, 1933.  $\text{NaHCO}_3$  3-5 and powd. alum 1-3 oz. are dissolved in hot water. One imperial gallon of oil such as pilchard oil is heated to  $212^\circ\text{F}$ . and the soln. of  $\text{NaHCO}_3$  and alum is added. The mixt. is stirred 15 min. and the temp. maintained until the water content is substantially evapd. When the oil has cooled it is ready for use. The pptd. stearin may be left in with the oil or sepd. as desired but its inclusion does not impair paint produced with the oil then treated.

Hydrogenation of oil. Julius F. T. Berliner (to The Canadian Industries Ltd.). Can. 336,448, Oct. 17, 1933. Various vegetable and animal oils as well as mineral oils contg. unsatd. compds. are hydrogenated by the use of cracked  $\text{NH}_3$  in the presence of a suitable catalyst. E. g., 100 parts of cottonseed oil contg. 2 parts by wt. of a Ni catalyst is charged into a pressure autoclave, heated

to approx.  $115^\circ$  and cracked  $\text{NH}_3$  is passed into the autoclave until a pressure in the neighborhood of 100 lb. per sq. in. is reached.

Toilet soap powder. Wm. H. Alton (to R. T. Vanderbilt Co.). U. S. 1,943,253, Jan. 9. Finely divided high-grade soap is mixed with about 3 times its quantity of finely divided pyrophyllite (both materials being of about 100-mesh fineness).

Wetting, cleansing and dispersing agents from 7,18 stearic glycol, etc. Fritz Guenther and Karl Saftmayer (to I. G. Farbenind. A.-G.). U. S. 1,942,812, Jan. 9. One mol. proportion of water is split off from the 7,18-stearic glycol, obtained by the reduction of ricinoleic acid or its esters, the resulting unsatd. alc. being then converted into water-sol. products by treatment with a strong "polybasic" inorg. acid such as a sulfonating agent or  $\text{H}_3\text{PO}_4$ . Various examples with details of procedure are given.

Wetting and other agents. Soc. pour l'ind. chim. à Bâle. Fr. 754,626, Nov. 10, 1933. Wetting, emulsifying, dispersing and other agents are prepd. by transforming cyclic amidines, substituted in the  $\mu$ -position by an aliphatic or hydroaromatic radical of at least 3 C atoms (derived from *o*- or *peri*-diamines of the  $\text{C}_6\text{H}_4$  or  $\text{C}_{10}\text{H}_6$  series) into compds. sol. in water by alkylation, arylation, or aralkylation up to exhaustion or by sulfonation or by a combination of these 2 processes. Examples are given of products obtained by sulfonating  $\mu$ -heptadecyl-,  $\mu$ -hendecyl-,  $\mu$ -naphthenyl-,  $\mu$ -heptadecyl-*N*-phenyl- and  $\mu$ -heptadecyl-(and hendecyl)-*N*-benzylbenzimidazole,  $\mu$ -heptadecyl-1,2-naphthimidazole (by condensing 1,2-naphthalenediamine with stearic acid),  $\mu$ -heptadecyl-(by heating 1,8-naphthalenediamine with stearic acid) and  $\mu$ -undecylpyrimidine. The prepn. of quaternary  $\text{NH}_4$

salts of the general formula  $\text{C}_n\text{H}_n \text{N}(\text{CH}_2\text{Ph}) \text{CR}'\text{NCl}$ . ( $\text{C}_{12}\text{H}_{12}$ , where  $\text{R}'$  is a heptadecyl or pentadecyl radical, is also described.

## 28—SUGAR, STARCH AND GUMS

J. K. DALE

Making muscovado sugar in Jolo. Robert L. Pendleton. *Sugar News* 14, 599-601(1933).—Illustrated description of primitive methods. L. Cusachs

The effect of the working temperature on the polarization of Java raw sugars. K. Douwes Dekker. *Arch. Suikerind.* 41, III; *Mededeel. Proefsta. Java-Suikerind.* 1101-17(1933).—Eleven white sugars and 79 raw sugars were dissolved and polarized at room temp. (approx.  $28^\circ$ ) and also at  $20^\circ$ , and the polarizations of one raw sugar were repeated 25 times under the same conditions. For the white sugars the differences varied from 0.21 to 0.52, av. 0.29; for the raw sugars from 0.12 to 0.46, av. 0.263; for the replicate detns. on one sugar from 0.17 to 0.43, av. 0.258. For pure sucrose the av. differences would have been 0.31, 0.288 and 0.318, resp. The variations found are partly due to differences in the nature of the non-sucrose constituents of the sugars, but errors of observation also play an important part. For molasses the polarization at room temp. was usually higher instead of lower than that at  $20^\circ$ . The results show the advantage of working at  $20^\circ$ ; in doubtful cases sugar samples should be sent to a lab. equipped that way. F. W. Zerban

The necessity of clarification for the determination of reducing sugars in superior head sugar, head sugar and new assortment raw sugar. K. Douwes Dekker and P. J. Klokke. *Arch. Suikerind.* 41, III; *Mededeel. Proefsta. Java-Suikerind.* 1089-99(1933).—In comparisons between no clarification, and clarification with neutral  $\text{Pb}(\text{OAc})_2$ , followed by deleading with  $\text{Na}_2\text{HPO}_4$  and K oxalate, the 1st method gave for 56 samples of superior head sugar results varying from 0.008 higher to 0.011 lower, av. 0.0012 lower than the 2nd. For 48 head sugars the same figures were +0.026, -0.012 and -0.0009, for 51 raw sugars +0.038, -0.015 and +0.0068, resp. In the future the

official method of the Java sugar industry will omit clarification for reducing sugar detn. in these 3 types of sugar and in refined sugar. F. W. Zerban

A study of sugar-distribution methods. Cecilio Alencastre. *Sugár News* 14, 546-9(1933). L. Cusachs

Study of sugar-cane variety P. O. J. 2878. J. O. Carrero. Puerto Rico Agr. Expt. Sta., *Rept.* 1932, 8 11 (1933); cf. C. A. 27, 620.—The inorg. P content of a sugar cane variety is very important in subsequent juice defecation. P. O. J. 2878 is a very heavy P feeder, but lab. examn. of juices of this variety showed variations in inorg.  $\text{P}_2\text{O}_5$  content of 6-62 mg. in 100 cc., with an av. of about 30.5 mg. In 1932, the inorg. P content of this cane was only 50-75% as great as in 1931, and defecation complaints were numerous. The methods for the detn. of inorg. and total P in sugar cane are discussed.

C. R. Fellers

Statistical treatment of ripening data (on sugar cane). Th. J. D. Erlee. *Arch. Suikerind.* 41, 753-61(1933).—A critique of Hommes' article (C. A. 27, 2835).

F. W. Zerban

Occurrence of aconitic acid in cane-sugar products. H. C. Prinsen-Geerligs. *Arch. Suikerind.* 41, 720 1 (1933).—A deposit obtained by centrifuging a 1st molasses in a Cuban factory was found to consist of Ca aconitate, with small quantities of  $\text{CaCO}_3$ ,  $\text{MgCO}_3$ ,  $\text{Fe}_2\text{O}_3$  and  $\text{SiO}_2$ . Cf. Nelson, C. A. 23, 4933.

F. W. Zerban

Sugar beets in the U. S. S. R. from the data of the sugar factories. P. G. Morozov. *Trans. Central Inst. Sugar-Ind.* (U. S. S. R.) No. 4, 3-64(1930).—A review with complete data.

V. E. Baikow

Quality of sugar beets in the U. S. S. R. P. Shemyakin. *Trans. Central Inst. Sugar-Ind.* (U. S. S. R.) No. 4, 65-105(1930).—The max. difference in sugar content

among the factories was 1.97%, purity 3.4 and tech. quality 1.89%. The geographical situation of factories had no direct relation to the richness of the beets. The max. difference of losses was 0.2% on the wt. of beets.

V. E. Baikow

The methods of investigation of silo rotting at a factory storing beets. V. P. Murav'ev. *Trans. Central Inst. Sugar-Ind.* (U. S. S. R.) No. 5, 24-31(1930).—M. outlines the reasons for rotting in silos and gives methods for identification of the microorganisms.

V. E. Baikow

The clarification and characteristics of the last mill juice. R. H. King and Ernesto Villareal. *Sugar News* 14, 533-45(1933).—A gradual elimination of gums takes place above  $p_H$  8.5. Liming to  $p_H$  10.0 more completely removes the suspended matter, non-sugars and gums; the vol. of mud is less and more compact. Because of the high alk. heating to 90° is recommended. The clear juice can be used to temper the mixed juices, or the last mill juice and factory settlings are limed to  $p_H$  10, filtered, and the filtrate is used to temper the factory mill juices. Citations and analytical results are included.

L. Cusachs

Comparative experiments on purification of diffusion juices by the ordinary, V. N. I. S. and Teatini methods. A. M. Pshenichnui and B. P. Shumkov. *Nauk. Zapiski Tsukrovoi Prom.* 32, 59-68(1933).—Juices treated with a small amt. of CaO by the Teatini and V. N. I. S. methods are of the same purity as juices treated by 2% CaO at the 1st and with 0.25% CaO at the 2nd defecation. Ca salts give the same results in all 3 cases. Max. color was decreased by the V. N. I. S. method. Filtration of juices treated by the Teatini and V. N. I. S. methods is good; filtered juices are sparkling and have a slightly greenish coloration which indicates the absence of colloids. The treatment of low-purity diffusion juices (76-80) by these methods also gave very good results. Of great importance in the coagulation of colloids is the maintenance of optimum conditions. From lab. expts. it can be stated that the max. coagulation of colloids under acid conditions is at  $p_H$  4.7-4.9 and in alk. solns. at  $p_H$  11.5-12.0.

V. E. Baikow

Conductometric control of vacuum pan boiling in the refinery. S. Stare. *Intern. Sugar J.* 36, 19-23(1934).—See C. A. 28, 674<sup>2</sup>.

W. L. Owen

Further notes on boiling after-product sugars. Using electrical conductivity control. W. F. Ak-wijn. *Intern. Sugar J.* 35, 465-8(1933); cf. C. A. 27, 6003. A discussion of the comparative merits of high-vacuum and low-vacuum pans with a description of a device for drawing in sirup. Charts are given of elec. cond. during masecuite boiling.

W. L. Owen

Scale formation in evaporators. Its prevention by corrective processes. H. Claassen. *Intern. Sugar J.* 36, 17-18; *Centr. Zuckerrind.* 41(1933).—Scale formation in evaporators differs from that in boilers in that org. salts of Ca and Mg are present. Boiler scale can be prevented by (1) displacement of sulfate and oxalate ions by carbonate and phosphate ions; (2) kinetic reactions on the use of protective colloids; (3) addn. of coarsely dispersed substances; (4) proper operation; (5) elec. means. In the prevention of scale in evaporators (1) and (4) give the best promise of success.

W. L. Owen

Factory results. F. Hommes. *Arch. Suikerind.* 41, 741-52(1933); cf. C. A. 27, 5567. The causes of error in the wt. of mixed juice and imbibition water have been further studied. The juice content may be low because of drying out of the cane after cutting; slight errors may be made unconsciously in calibrating scales and tanks, and in applying foam and other corrections; undetd. losses are often ascribed to errors in the juice wt., and the latter is corrected accordingly; the wt. of the juice may be altered deliberately. Sometimes the reported purity of the mixed juice is suspiciously low; this may be due to souring, but may also be fraudulent, for the purpose of making a better showing. The "concealed" losses may be detected by multiplying the proportional purity ratio (C. A. 27, 2835) with the juice content. A comparison by this method of the results obtained in Java

in 1930 and in 1931 shows that not much progress has been made. It is significant that for some factories the product of juice content and Winter rendiment is const., while in others it fluctuates widely. The undetd. losses are probably mostly mech., and occur principally in the filter station, especially during the night shift. They could be overcome by stricter supervision. It is proposed to use for the over-all control of the factory the formula:  $\text{sugar \% cane} = \text{available sugar in 1st mill juice} \times \text{juice \% cane} \times \text{Brix extn.} \times \text{proportional purity ratio} \times \text{winter rendiment}$ . Detailed directions are given for assembling the necessary data and for supervision of the control.

F. W. Zerban

Electrical power consumption of the sugar factories Goenoengsarie and Soedhono (Java). J. J. W. den Haan. *Arch. Suikerind.* 41, 111; *Mededeel. Proefsta. Java-Suikerind.* 985-1030(1933).

F. W. Zerban

Analyses of Italian molasses of the 1931 campaign. M. Catenacci and Leonetti-Luparini. *Ind. saccar. Ital.* 26, 555-61(1933).—The final molasses from De Vecchis plants is low in purity and high in reducing sugars and color; that from Steffen plants is low in albuminoid N. Analytical tabulations and references are given.

L. C.

Quantitative estimation of sulfurous acid in molasses. G. Staiger. *Brenner's Ztg.* 50, 13-14(1933); cf. *Ibid.* 47, 131(1930).—S. concludes that the simple test with starch KI paper is suitable to replace the volumetric or gravimetric method within certain limits of accuracy. The time of discoloration of the I test is observed and thus the amt. of  $SO_2$  estd. Results comparing the various methods are tabulated.

S. Józsa

Quantitative estimation of sulfurous acid in molasses. B. Drews. *Brenner's Ztg.* 50, 142(1933).—The gravimetric (official) and the volumetric methods are compared. The volumetric method is quicker and dependable. Rothenfusser's method (C. A. 24, 1056) is not sufficiently accurate to be recommended.

S. Józsa

Combating the high yield of final molasses. I. B. Mintz, A. D. Girda, N. I. Zaduikhailo and F. M. Gontar. *Nauk. Zapiski Tsukrovoi Prom.* 32, 77-83(1933).—A high yield of final molasses was caused mainly by the presence in the beets of a large amt. of sol. org. non-sugars, chiefly nitrogenous. Decreasing of the final molasses yield must start with the breeding of the beets. All field and plant operations must be controlled. Treatment of greens with 3% CaO (on the wt. of greens) and carbonation decreases the yield of final molasses by 10-20%.

V. E. Baikow

Prediction of ash percentage in final molasses from conductivity measurements at 35°. J. G. Davies. *Intern. Sugar J.* 35, 472-5(1933).—Formulas designed to predict the chem. ash in final molasses by means of cond. measurements at 20° cannot be used in the tropics owing to the inconvenience of cooling to that temp. The method of Zerban and Sattler gives reliable results when the measurements are carried out at 35°. The higher temp. for measurements introduces an increased error due to the increase in cond., making the variation in the compn. of the ash more apparent. While prediction formulas derived from data obtained from samples from any one country do not yield accurate results even in all cases within that country, a specific prediction formula for any one factory gives results as accurate as the chem. ash analysis in 80% of the cases.

W. L. O.

Benzoylation of starch. A. F. Damansky. *Compt. rend. soc. biol.* 114, 1051-3(1933); cf. C. A. 27, 5572. Three g. of extremely dry starch was added to 100 cc. pyridine and 8 cc.  $BzCl$  and the mixt. slowly heated to 75° during the course of 72 hrs. Amylose prep'd. by Samec's method gave a quant. yield of tribenzoate,  $[\alpha]_D^{25} = 80.1^\circ$ , sol. in pyridine,  $CHCl_3$  or  $Me_2CO$ , insol. in  $Et_2O$ ,  $EtOH$  or water. Amylopectin gave a quant. yield of dibenzoate, insol. in org. solvents. Potato starch formed principally dibenzoate, with a little tribenzoate.

Kukharevskii, I. A.: Vade-Mecum du cultivateur. Paris: Betterave & les Industries agricoles. 66 pp. F. 30. Reviewed in *Facts about Sugar* 29, 61(1934).

Carbonating sugar juices. Arthur W. Bull and Elmer R. Ramsey (to Dorr Co.). U. S. 1,941,461, Jan. 2. Lime juice and gas are continuously mixed (in a described app.) to carbonate the juice; the degree of alk. is detd from a sample exposed to the atm. and the resulting detn serves as a basis for proportioning the ingredients of the mixt.

Dextrinizing starch. Arthur D. Fuller (to National Adhesives Corp.). U. S. 1,942,544, Jan. 9. Starch is made to react with Cl<sub>2</sub>, the pH is adjusted for the particular product desired (suitably to 7.3 for the production of British gum or 2.0 for the production of thin boiling starch) and the material is then dextrinized. Cf. C. A. 28, 1214<sup>4</sup>.

## 29—LEATHER AND GLUE

ALLEN ROGERS

The use of fluorides in preserving hides. D. Jordan Lloyd. *Collegium* 1933, 698-700.—Edible gelatin prepd. from hides cured with 99% NaCl and 1% NaF did not contain enough F to be harmful to health even though its effect is cumulative. I. D. Clarke

The most important instruments for measuring pH in the leather industry. A. Salmony-Karsten. *Lederlecher Rundschau* 25, 97-100(1933). Com. app. is described. I. D. Clarke

Checking the method for determination of sulfuric acid in leather. I. Kh. Bakhtiyarov. *Ovladanie Tekhniki: Koshevennoe Proizvodstvo* 1931, No. 1, 33-4.—For free H<sub>2</sub>SO<sub>4</sub> added to hide powder, the Balland-Maljean method gives accurate results. For powder treated with sulfates but not free H<sub>2</sub>SO<sub>4</sub> the Balland-Maljean method shows the presence of a considerable amt. of free H<sub>2</sub>SO<sub>4</sub>. The Procter-Sirl method has the same disadvantages, although the data are slightly lower. In both cases of treatment with free H<sub>2</sub>SO<sub>4</sub>, H<sub>2</sub>SO<sub>4</sub> was found in the filtrate. This acid should be ascribed to the SO<sub>3</sub> from the sulfates. The amt. of Na<sub>2</sub>SO<sub>4</sub> is detd. correctly by the Schroder method. A powder which was treated with Na<sub>2</sub>SO<sub>4</sub> or NaHSO<sub>3</sub> (which contained some SO<sub>2</sub>) gives an excessive amt. of sulfates by the Schroder method. In these cases H<sub>2</sub>SO<sub>4</sub> was not found. The Schroder method gives satisfactory results in case of small quantities of H<sub>2</sub>SO<sub>4</sub> and a simultaneous presence or absence of salts. The Procter-Sirl and Balland-Maljean methods cannot be used for leather tanned with sulfited or sulfite cellulose exts. Atkin-Thomson's "acid number," contrary to the Balland-Maljean and the Procter-Sirl methods, gives lower values with an increase of the acid content. The "acid number" is based on the measurement of the pH of the leather by the Atkin-Thomson method and it gives a good scientific base for the evaluation of the harmful effects exercised by the acid on the leather tissue. A. A. B.

Fat-liquoring process. VII. Train oil spue on vegetable-tanned leather. F. Stather, H. Sluyter and R. Lauffmann. *Collegium* 1933, 617-28; cf. C. A. 27, 5574.—Light, high humidity and low temp. favor spue formation. Mineral salts increase spue moderately. Spue forms more rapidly as either the amt. of grease or sol. solids in the leather increases. The properties of the oil have an unknown influence on spue formation; the I no. is not a reliable guide. VIII. Alteration of liquor fats in chrome leather. F. Stather and R. Lauffmann. *Ibid.* 723-6.—The fat-liquor fats and soaps change considerably during fat-liquoring and after they are in the leather; fatty acids and oxyfatty acids are formed, and the I no. is lowered. Fat extd. from the leather cannot be used to predict the nature of the fat-liquor fat. I. D. Clarke

The use of woolen fabric interwoven with other fibers for identifying tannins by the quartz lamp. Leopold Pollak. *Collegium* 1933, 628-30. Wool interwoven with silk and mercerized cotton in the warp and rayon and ordinary cotton in the weft is used like Mulhouse ribbons (cf. C. A. 26, 4728). I. D. Clarke

Würtenberger, Richard: Über elektrometrische Messungen im Gerberei-Laboratorium, insbesondere unter Benutzung eines Röhrengalvanometers als Messinstrument. Thesis, Darmstadt. 1931. 66 pp.

Drying and cleaning hides. Paul Hertzsch. Brit. 399,327, Oct. 5, 1933. Addn. to 340,940 (C. A. 27, 2335). In the process of 340,940 the cleansing agents are allowed to pass out freely with the stream of air to a separator from which they are returned to the drying chamber. App. is described.

Tanning hides. Richard Pasternack and Gordon O. Cragwall (to Charles Pfizer & Co.). U. S. 1,941,485, Jan. 2. For tanning hides, skins or skins, a soln. contg. an Al compd. such as AlCl<sub>3</sub> or Al<sub>2</sub>(SO<sub>4</sub>)<sub>3</sub>, together with gluconic acid (or Al gluconate) is used.

Tanning leather. Chemische Werke vorm. H. & E. Albert (Karl Uhl and Hans Menzler, inventors). Ger. 587,724, Nov. 7, 1933 (Cl. 28d. 3). A prepri. for Cl tanning is obtained by bringing org. material such as leaves into soln. by gradual addn. of mineral acid and chromates or bichromates, and heating.

Condensation products (light-colored tanning agents) Alphons O. Jaeger and Heinrich W. Witzel (to Selden Co.) U. S. 1,941,475, Jan. 2. At least one carbohydrate, such as cellulose is condensed with phthalic anhydride, and at least one impure aromatic hydrocarbon such as a crude anthracene or naphthalene residue with H<sub>2</sub>SO<sub>4</sub> and a dispersion of the resulting sol. condensation product is subjected to the action of a bleaching agent such as NaOCl or Cl to lighten its color without destroying its tanning properties.

Agglutinant suitable for use with leather, etc. Wally Stelkens and Richard Müller (to C. F. Boehringer & Soehne G. m. b. H.). U. S. 1,941,958, Jan. 2. Acetyl cellulose, collodion wool and ethyl acetanilide are used together with various solvents, etc.

Electroosmotic fractionation of solutions of glue or gelatin in a four-cell electroosmotic apparatus. Alexander Jenny (to Siemens Elektro-Osmose, G. m. b. H.). U. S. 1,942,478, Jan. 9. Various details of app. and operation are described.

## 30—RUBBER AND ALLIED SUBSTANCES

C. C. DAVIS

Recent progress in the rubber industry. Georges Thesmar. *Bull. soc. ind. Mulhouse* 99, 559-87(1933).—An address. I. H. Odell

New horizons in the manufacture of rubber. Paul Buère. *J. pharm. chim.* 18, 376-8(1933); cf. *C. A.* 24, 3397; Graffe, *C. A.* 27, 4127; Thiollot, *C. A.* 27, 6015, 6017.—Permanency of rubber goods upon storage is made possible by the judicious use of accelerators in vulcanization and of antioxidants; also by treatment of finished goods with paraffin oil. S. Waldbott

Advances in rubber manufacture since the end of the World War. F. Kirchhoff. *Chem.-Ztg.* 57, 977-80(1933.) E. H.

Review of developments and progress in the chemistry and technology of latex and of rubber from 1927 to July, 1932. St. Reiner. *Caoutchouc and gutta-percha* 31, 16846 8(1934); cf. *C. A.* 28, 1569<sup>1</sup>. Numerous articles and patents on electrophoresis are cited. C. C. D.

Industrial uses of rubber latex. A summary of uses to which rubber latex is being put in many manufacturing processes. D. F. Twiss. *Rubber Age* (N. Y.) 34, 115-17(1933), 172-4, 176(1934); cf. *C. A.* 27, 3636.—A review and discussion. C. C. Davis

The technic of latex dipping processes. H. Barron and G. L. Barron. *India Rubber J.* 86, 767-9, 793, 801 (1933).—A review and discussion of the problems involved in handling latex and of the technic of dipping processes. C. C. Davis

Latex and protective colloids. II. Barron. *India Rubber J.* 86, 743-4(1933).—A review of present developments in the stabilization of latex. C. C. Davis

Colloid chemistry of rubber. II, III and IV. Action of metals on colloidal solutions of rubber. (1), (2) and (3). Keiichi Shimada. *J. Soc. Rubber Ind. Japan* 6, 604-27(1933); cf. *C. A.* 26, 2617.—The viscosity-time relation of rubber sols as affected by oleic acid was studied. Oleic acid caused disaggregation of the rubber, and this effect was similar to the action of the Group-2 vulcanization accelerators in S.'s classification (cf. *C. A.* 27, 629-30). The changes of viscosity during 5 hrs. after the prepn. of sols of Al, Co, Ni, Cr, Ag, Zn, Fe, Cu, Pb, Mn or Mg oleate in  $C_6H_6$  were studied; only Co and Mn oleates showed an increase in viscosity with an increase of time. This effect is attributed to the polymerization of metallic soaps brought about by oxidation in the presence of air. The viscosity-time relation of rubber sols in  $C_6H_6$  as affected by Al, Co, Ni, Cr, Ag, Zn, Fe, Cu, Pb, Mn or Mg oleate was then studied; only Cu, Fe, Mn and Co oleates showed a continued lowering of the viscosity, while the other metallic oleates, as in the case of oleic acid, caused a lowering of viscosity at first, after which the latter remained nearly const. In the former case the rubber was depolymerized and in the latter case it underwent disaggregation. The viscosity-time relation of rubber sols with Cu or Fe oleate can be expressed well by S.'s formula,  $\eta_{10} - \eta_1 = k \log t$ , where  $\eta$  is the viscosity at the time of addn. of the metal soap  $t_0$  and  $t$  hrs. later. The depolymerization of rubber as estd. by the change of viscosity in purified H after the addn. of Cu and Mn soaps indicated that the process was the same as in the presence of air. The mechanism of the change of properties of rubber by the addn. of Cu, Fe, Mn or Co oleate is discussed. K. Kitsuta

pn in the rubber industry. M. Dérivé. *Caoutchouc and gutta-percha* 30, 16575-7(1933).—A review and discussion. C. C. Davis

Chlorinated rubber. An account of research work recently carried out on this controversial subject, in behalf of the Rubber Grower's Association. C. A. Rudfarn. *Rubber Age* (N. Y.) 34, 113-14(1933).—A review and discussion. C. C. Davis

The safe use of carbon tetrachloride in the rubber industry. Leon J. D. Healy. *Rubber Age* (N. Y.) 34, 119 21(1933).—A discussion of the long-standing contro-

versial subject of the toxicity of  $CCl_4$ . The experience of H. indicates that under certain conditions  $CCl_4$  is decidedly hazardous. C. C. Davis

Aging processes of rubber. I. The effect of irradiation by ultra-violet light on the surface tension of rubber solutions. B. Dogadkin and G. Panchenkov. *Kolloid-Z.* 65, 350-5(1933); cf. *C. A.* 26, 2079.—Sols. of rubber of 0-2% concn., prepd. from carefully purified rubber, were irradiated in  $N_2$ ,  $CO_2$  and air. The interfacial tension against water did not change in  $N_2$  but in air and  $CO_2$  it was lowered, and reached a const. value in 120 min. Water extd. a substance of significant cond. The results confirm the previous work in that they indicate the changes to be a result of oxidation. Arthur Fleischer

A water-immersed air oven for accelerated aging tests on rubber. A. G. Milligan and J. E. Shaw. *J. Sci. Instruments* 11, 10-14(1934).—The oven, designed primarily for aging rubber but adaptable to other investigations, consists of a cylindrical brass container with a well-insulated, internally fitting lid, and immersed in an electrically heated and thermostatically controlled water bath. A slow current of air is supplied to the container by a rise of water in a cistern with an automatic siphon. The temp. of all parts of the inside of the oven can be maintained uniform and const. within  $\pm 0.1^\circ$ . C. C. D.

Antioxigens. F. Jacobs. *Caoutchouc and gutta-percha* 30, 16578 80(1933); cf. *C. A.* 28, 1569<sup>1</sup>.—The chem. name and formula, com. name and characteristics of various other substances are tabulated. C. C. Davis

Products of porous rubber. St. Reiner. *Caoutchouc and gutta-percha* 30, 16585-6(1933); *Rubber Age* (London) 14, 292-4(1934); cf. *C. A.* 28, 367<sup>1</sup>.—Cellular rubber, latex sponge, microporous rubber, porous hard rubber and hard foam rubber are discussed. C. C. Davis

A new soluble pigment B. G. 125. P. Bary and L. Graffe. *Rev. gén. caoutchouc* 10, No. 96, 3(1933).—The identity of the product is not revealed, but in rubber it behaves like an "active"  $ZnO$ , and is even more sol. in unvulcanized rubber than the latter. It thickens and stabilizes latex, and on evapn. the films are more nearly transparent than ones contg. the same proportion of  $ZnO$ . C. C. Davis

Incorporation of glue in rubber mixtures. C. G. Rous-selot. *Caoutchouc and gutta-percha* 30, 16616-19(1933); 31, 16644-6(1934).—The paper describes expts. on the incorporation of glue into rubber and its effects on the rate of vulcanization, aging and phys. properties of the vulcanizates. Finely ground glue should be swelled with 15% of water to a gel which is readily dispersed. Coarse glue can be incorporated directly in a master batch. Glue has little or no accelerating action and is not detrimental to aging (judged by Geer oven tests). The higher the proportion of glue in vulcanizates immersed in benzine, gasoline, mineral oil and  $C_6H_6$ , the less was the swelling, and the mixts. regained their original dimensions and quality after evapn. on standing. C. C. Davis

Electric wires insulated with oil-resistant rubber. Minoru Osumi. *J. Soc. Rubber Ind. Japan* 6, 627-31 (1933).—A Cu wire with Sn coating was coated with a layer of ordinary rubber and an outer layer of a mixt. of rubber 40, S 7, Mg carbonate 40. The wire showed no more increase in vol. after soaking 200 hrs. in neutral mineral oil or 60 hrs. in gasoline; in the latter case, there was a slight decrease in vol. after this time, which may have been the result of a partial soln. of the rubber. The wire showed therefore excellent resistance to oil, though it softened slightly, not, however, so that it cracked when bent. K. Kitsuta

Use of rubber in paints (Stevens, Heaton) 26. Paint and varnish problems of the rubber industry (Stern) 26. Plioform: molding resin [from rubber] (Thies, Clifford) 26. Gas-producing compns. [for inflating, rubber balls, etc.] (Brit. pat. 399,173) 18. Puncture-proofing compn.

[for pneumatic tubes] (Can. pat. 336,531) 18. Rubber-bonded asbestos products (Brit. pat. 399,871) 18. Aq. dispersions of asbestos and rubber (Brit. pat. 399,870) 18.

Zinc Oxide in Rubber. New York: New Jersey Zinc Co. 32 pp.

**Latex.** Aage Nyrop and Koefoed, Hauberg, Marstrand & Helweg, Aktieselskabet Titan. Brit. 399,370, Oct. 5, 1933. Latex is coned. by distributing it in finely divided form in a layer of coned. latex, which exts. rubber particles and increases in bulk, while liquid, poor in rubber, passes through and forms a lower layer.

**Compounding rubber.** Robert J. King and Elizabeth C. King (to The Robert J. King Co. Inc.). Can. 337,524, Nov. 28, 1933. A liquid thermoplasticizing compn. for use in the compounding of rubber is made by adding to a liquid hydrocarbon solvent of rubber a large amt. of a sulfonated petroleum oil together with com. secondary hexyl alc., and subsequently diluting the mixt. with a large amt. of hydrocarbon oil.

**Masticating rubber.** The Robert J. King Co., Inc. Brit. 398,702, Sept. 21, 1933. The time required for mastication is reduced by adding to the raw rubber 4-8% of a rubber solvent with a small quantity of solvent activator dissolved therein. The solvent is preferably one non-volatile at the mastication temp., *e. g.*, 300° burning oil, and the activator is a higher alc., *e. g.*, hexyl, or (and) a sulfonated hydrocarbon or fatty oil, *e. g.*, the sulfonated products obtained in purifying medicinal white oil, sulfonated castor oil.

**Apparatus and method for mixing and other treatments of rubber by passage through rolls.** Dunlop Rubber Co. Ltd. and Ernest E. Quinton. Brit. 399,850, Oct. 16, 1933.

**Rubber compositions.** Wm. F. Zimmerli and Waldo L. Semon (to B. F. Goodrich Co.). U. S. 1,942,853, Jan. 9. A softener such as a mineral oil is incorporated into one-third to twice its quantity of rubber, the softener being applied to the surface of substantially unmasticated crude rubber and its absorption by the rubber permitted.

**Rubber compositions.** Harry Morser. Brit. 399,329, Oct. 5, 1933. Kbonite with a small proportion, *e. g.*, 0.5-1%, of powd. metal, *e. g.*, Al, incorporated therein before vulcanization is used for making hard flexible sheets having an embossed pattern on 1 or both faces, to serve as hackings under paper in typewriting or handwriting as a safeguard against fraudulent alterations.

**Cellular rubber.** Dunlop Rubber Co. Ltd., Francis J. Payne, Evelyn W. Madge and Walter G. Gotham. Brit. 399,940, Oct. 19, 1933. Sponge rubber particles having a uniform size of less than 0.5 in. are obtained by subjecting the material to a rapid succession of shearing impacts, *e. g.*, in a disintegrator of the revolving-arm type. The particles may be bonded by an aq. dispersion of raw or vulcanized rubber, synthetic rubber, balata, gutta-percha, etc., and molded in known manner. They may also be sprayed onto a surface coated with adhesive for the production of heat- and sound-insulating panels, etc.

**Preservation of rubber.** Waldo L. Semon (to The B. F. Goodrich Co.). Can. 337,506, Nov. 28, 1933. The deterioration of rubber is retarded by treating the rubber with a substance selected from the class consisting of meso-disubstituted acridans and derivs. thereof having only hydrocarbon groups, hydroxy groups or amino groups substituted on the aromatic rings.

**Ornamenting rubber.** Charles W. Leguillon (to The B. F. Goodrich Co.). Brit. 399,051, Sept. 28, 1933. See Fr. 748,940 (C. A. 28, 374°).

**Rubber goods.** Vernon J. Sprunger (to The Anode Rubber Co. Ltd.). Brit. 399,213, Oct. 2, 1933. See U. S. 1,864,621 (C. A. 26, 4500°).

**Making rubber objects from dispersions by electrophoretic deposition in an alternating current.** Dunlop Rubber Co. Ltd. and The Anode Rubber Co. Ltd. Ger. 587,700, Nov. 7, 1933 (Cl. 39b. 1).

**Synthetic rubber.** I. G. Farbenind. A.-G. (Walter Rock and Eduard Tschunkur, inventors). Ger. 580,540, July 12, 1933 (Cl. 39b. 5). Addn. to 578,965 (C. A. 28,

930°). The method of 578,965 for improving the quality of polymerized butadiene hydrocarbon rubber by addn. of soot prior to vulcanization is modified by replacing the soot by other filling materials of a fineness of under 0.3, examples mention colloidal SiO<sub>2</sub>, ZnO, MgCO<sub>3</sub>, and kaolin. These may be used alone, mixed, or mixed with soot.

**Rubber vulcanization accelerators.** Ewald Zaucker, Max Bögemann and Ludwig Orthner (to I. G. Farbenind. A.-G.). U. S. 1,942,790, Jan. 9. Accelerators having good crit. temps. consist of org. compds. contg. the grouping  $xyC-S-N<$ , where *x* and *y* mean vicinal

carbon atoms of an aromatic nucleus, or *x* means N and *y* S, O or the NH group, such as the reaction products from *p*-nitrophenylsulfur chloride and dibutylamine, piperidine *s*-diphenylguanidine and *o*-tolylbiguanide; *o*-nitrophenylsulfur chloride (I) + diethanolamine; I or *p*-nitrophenylsulfur chloride (II) + methylbenzylamine; I or II + EtNHMe thiocresol + *N*-chloropiperidine (III), 2-mercapto-4-phenyl-1,3,4-thiodiazole-5-thione + III, 2-mercaptobenzothiazole (IV) + III, IV + *N*-chloromorpholine, IV + *N*-chlorodimethylamine (V), IV + *N*-chlorodibutylamine (VI), 2-mercaptothiazoline + III, 2-mercaptoimidazoline + V, 2-mercapto-4-phenyl-1,3,4-thiodiazoline + VI, 2-mercaptobenzoxazole + III, 2-mercaptobenzimidazole + III, 6-nitro-2-mercaptobenzothiazole + III, 6-dimethylamino-2-mercaptobenzothiazole + III, mercaptobenzothiazole + V, or 2-mercapto-4-phenyl-5-methyl-1,3,4-thiodiazoline + III.

**Vulcanization accelerator.** Max H. Zimmermann (to The Firestone Tire and Rubber Co. of Canada Ltd.). Can. 336,611, Oct. 24, 1933. Mercaptobenzothiazole and excess of a CH<sub>2</sub>O soln. are boiled together. There is formed an oily product which upon cooling solidifies into a cryst. mass; this is a mixt. of mercaptobenzothiazole and its reaction product with CH<sub>2</sub>O. The CH<sub>2</sub>O-water soln. of the reaction product, upon cooling, yields a pure cryst. reaction product of mercaptobenzothiazole and CH<sub>2</sub>O. If the reaction takes place in alc. soln. recrystn. is not necessary.

**Vulcanization accelerator.** Lorin B. Sebrell and Albert M. Clifford (to The Goodyear Tire and Rubber Co.). Can. 338,019, Dec. 19, 1933. A basic N compd. such as NH<sub>3</sub>, an amine or a Schiff base, added to a rubber mix either together with the desired dithiazyl sulfide or separately, enhances the accelerator power of the dithiazyl sulfide without detracting from its ability to accelerate vulcanization without scorching the stock.

**Vulcanizing apparatus for sponge rubber.** George H. Wheatley. U. S. 1,943,101, Jan. 9. Mech. details of an app. with heating plates between which conveyor belt passes.

**Presser belts for vulcanizing machines.** Gustav Roese. Brit. 398,429, Sept. 14, 1933.

**Vulcanizing rubber.** I. G. Farbenind. A.-G. (Walter Huhn, inventor). Ger. 587,663, Nov. 7, 1933 (Cl. 39b. 8). Addn. to 585,696 (C. A. 28, 1575°). The application of thiuram sulfides to accelerate the vulcanization of rubber as described in 585,696 is extended to use with other accelerators, except those of an aldehyde-diamine character.

**Vulcanizing rubber.** I. G. Farbenind. A.-G. (Ewald Zaucker, Ludwig Orthner and Max Bögemann, inventors). Ger. 587,608, Nov. 6, 1933 (Cl. 39b. 8). A vulcanization accelerator is obtained by substituting the H of the SH group of an accelerator by the N of a secondary amine. Thus, the new accelerators contain the grouping  $\equiv C-S-N\equiv$ . Such an accelerator is obtained by treating mercaptobenzothiazole with piperidine.

**Vulcanizing rubber, gutta-percha, balata, etc.** Leslie G. Jenness (to St. Mungo Mfg. Co. of America). U. S. 1,941,691, Jan. 2. A vulcanizing agent such as S is incorporated with the material and the mixt. is then subjected to the action of an accelerating soln. which may contain an accelerator and gasoline and which also contains a diluent such as acetone capable of retarding the action of the soln. upon the material being treated. Golf-ball manuf. is described.

# CHEMICAL ABSTRACTS

Vol. 28

APRIL 10, 1934

No. 7

## 1—APPARATUS AND PLANT EQUIPMENT

W. L. BADGER

The repair of chemical manufacturing plant by scientific welding. C. W. Brett. *Chemistry & Industry* 1934, 123-5.

Filtration of plating solutions. Louis Weisberg and Willard F. Greenwald. *Metal Ind.* (N. Y.) 32, 15-19 (1934).—A discussion of filters, pumps and materials of construction.

Extraction apparatus. Kurt Peters. *Chem. Fabrik* 1934, 21-5.—App. developed especially for the extn. of coal is described and compared with app. of similar construction, with 25 cuts and many references. J. H. M.

A new photoelectric colorimeter. H. B. Lange. *Chem. Fabrik* 1934, 45-7.—Improvements in construction and operation of the app. referred to in C. A. 27, 451, are described.

An improved equilibrium distillation still and equilibrium distillation tests. Masakichi Mizuta. *J. Soc. Chem. Ind., Japan* 37, Suppl. binding 11(1934).—By adjusting the elec. current in the heating coil of the upper portion of the still partial condensation was eliminated. Nineteen binary mixts. of pure benzene and toluene were tested, and the expl. data agreed completely with those calculated from vapor pressure data. K. Kammermeyer

A simple safety device for high-vacuum apparatus. Josef Obrist. *Z. tech. Physik* 14, 543-6(1933).—An app. is described which will sound an alarm if the heating current on a vacuum pump is cut off and which shuts off the pump if the cooling H<sub>2</sub>O stops.

An indicating hot-wire vacuum meter. H. Murmann. *Z. tech. Physik* 14, 538-40(1933).—A direct-reading vacuum meter, operated by the thermal expansion of a hot wire, is described. It is useful in the range 10<sup>-1</sup> to 10<sup>-4</sup> mm.

Low-temperature measurement with hydrogen thermometer. Sin-ichi Aoyama and Eizo Kanda. *J. Chem. Soc. Japan* 55, 15-22(1934).—A const.-vol. H thermometer using Jena glass has been constructed. The accuracy of the thermometer was found to be  $\pm 0.036^\circ$  at 0, and  $\pm 0.025^\circ$  at  $-200^\circ$ . By means of this thermometer the following values, b. p. of N— $195.79^\circ$ , b. p. of O— $182.98^\circ$  and the sublimation point of solid CO<sub>2</sub>;  $78.51^\circ$ , were obtained.

Modification of the Stoughton constant-temperature humidity chamber. J. R. G. Sutherland. *Quebec Soc. Protection Plants, 23rd & 24th Ann. Rept. 1930-1932*, 87-96(1932); cf. Stoughton, *Ann. Appl. Biol.* 17, 90(1930); C. A. 25, 5598.—The chamber consists of a wooden frame covered with 2 layers of glass spaced 2 in. apart. Humidified air is supplied by passing a stream of air from a pos. blower over a C bulb on which water is dripping at a const. rate. The humidity is controlled by a hair-hygrometer connected in series with the solenoid of a relay in the humidifier-bulb circuit. The chamber can be operated for long periods with max. variations in temp. and humidity seldom reaching 2°F. and 2%, resp.

An inexpensive and economical warm room. G. Grinling. *Analyst* 59, 103-4(1934).—For drying at 78-88°F., a wooden chamber of about 30 cu. ft. is described which is heated with two 250-watt elec. lamps and provided with a temp. regulator.

A nickel vessel for storing standard caustic alkali solutions. Edwin C. Richellato. *Analyst* 59, 104(1934).—Tenth-normal NaOH kept in a Ni bottle remains clear and with unchanged concn.

A valve for regulating the velocity of gas streams. K. Hauschild. *Chem. Fabrik* 1934, 27.

The characteristics of the sodium lamp as influenced by vapor pressure. Gorton R. Pouda and Andrew H. Young. *J. Optical Soc. Am.* 24, 314(1934).

Vapor pressure of solid nitrogen and of solid oxygen. Sin-ichi Aoyama and Eizo Kanda. *J. Chem. Soc. Japan* 55, 23-9(1934).—A thermostat operating on liquid H in the temp. range  $-200$ – $-250^\circ$  was constructed. The vapor pressure of solid N and of solid O has been measured near  $-242^\circ$  by means of the thermostat. Thermodynamic consideration was given to the vapor pressure of N and of O at lower temp.

Operating pointers for users of suspended centrifugals. Wm. T. Powers. *Chem. & Met. Eng.* 41, 84-7(1934).

Some new principles in the design of x-ray apparatus. A. Bouwers. *Radiology* 22, 163-73(1934).—New improvements embodied in Philips x-ray app. are described as follows: reduction of exposure time for x-ray tubes with stationary anode by a new method of loading, which consists simply in automatically lowering a very heavy load, which is initially applied until max. temp. of the anode surface is reached; rotating anode tube with anode cooling; a new high-voltage rectifier; a new x-ray unit of very small dimensions, the entire transformer and enclosed tube weighing only 12 lb.; a new cascade high-voltage generator; and self protected tubes for 400 kv. and more.

A new x-ray goniometer. E. Schiebold. *Z. Krist.* 86, 370-83(1933).—A description of a rotation x-ray goniometer, similar to, but antedating that described by Sauter (C. A. 27, 3643). A characteristic feature is the rotation of the film, either when flat and perpendicular to the x-ray beam, or when on the surface of a cylinder, simultaneous with the rotation of the crystal. The math. relationships are described.

A thermoelectric metal-crystal analyzer. M. F. Hasler. *Physics* 5, 9-14(1934); cf. C. A. 25, 3890; 28, 999.—Detailed description is given of a new app. for detn. and photographic recording of the thermoelec. e. m. f. at room temp. for each increment of length (e. g., 2 mm.) of a metal bar.

Experience with a dry "Union" heating-value recorder. A. Rohr. *Schweis. Ver. Gas- Wasserfach., Monats-Bull.* 13, 301-3(1933).—A short description of the "Union" type recording calorimeter. The gas burning in a no. of quartz nozzles heats up a mechanically balanced suspended circular thermometer, the filling of which can expand on one side. The thermometer thereby rotates and with it an indicator needle. Several compensation devices are used. Its first cost and maintenance are materially less than those of wet calorimeters.

Electric water heater with thermoregulating thermometer for use with refractometer. Franco Lorenzola. *Ann. chim. applicata* 23, 528-9(1933).—An elec. heater with thermoregulator has been designed to heat water in connection with a Zeiss refractometer used for tests on butter. The temp. may be controlled in the range 20-70°.

Low-temperature thermostats. Kurt Peters. *Chem. Fabrik* 1934, 47-9.—The app. is cooled by liquid air and holds any temp. from 0° to  $-185^\circ$  within 0.1-0.5° indefinitely. Cuts and 11 references are given.

- Apparatus and process for forming fine glass needles or pipes.** Pierre H. Du de Roubroune. Brit. 400,109, Oct. 19, 1933. See abstract from *Compt. rend.* (C. A. 27, 863).
- Distilling or rectifying column with a plate-like or annular base.** Carl Eisenach. Ger. 588,941, Dec. 1, 1933 (Cl. 12a. 5).
- Thermally actuated valves for maintaining a constant temperature, e. g., in a gas oven.** Thomas Barnsley. Brit. 400,607, Nov. 2, 1933.
- Temperature- or pressure-control device suitable for use with heating fluids, etc.** Arthur J. Mansure (to Bristol Co.). U. S. 1,943,831, Jan. 16. Structural and mech. details.
- Apparatus for securing zero capacity-temperature coefficient.** Wm. M. Bailey (to General Elec. Co.). U. S. 1,943,713, Jan. 16. A mica capacitor is made with sections having mica and air as a dielectric and other sections having mica and a wax as a dielectric. U. S. 1,943,714-15 also relates to various features of condenser or capacitor construction.
- Rectifying columns.** Gesellschaft für Linde's Eismaschinen A.-G. Brit. 400,798, Nov. 2, 1933.
- Filters.** Louis P. Dolignon. Fr. 755,825, Nov. 30, 1933. Construction of frame.
- Continuous filters.** S. Giertz-Hedström and D. R. E. Werner. Swed. 79,148, Dec. 12, 1933. Hydrostatic and mech. features.
- Rotary-drum filter.** I. G. Farbenind. A.-G. (Siegfried Kiesskalt, inventor). Ger. 590,307, Dec. 30, 1933 (Cl. 12d. 15.03).
- Rotary-drum filtration apparatus.** Charles W. Moore and Carlton W. Cruimb (to Oliver United Filters, Inc.). U. S. 1,943,618, Jan. 16. Various structural and operative details.
- Device on rotary filter for removing the filtered material.** D. R. E. Werner and S. Giertz-Hedstrom. Swed. 77,127, May 2, 1933.
- Drum filter press.** D. W. Berlin. Swed. 77,324, May 23, 1933.
- Air filter.** Verner Dahlman (to Independent Air Filter Co.). U. S. 1,944,407, Jan. 23.
- Air filter for an engine-driven compressor unit.** Fredrick W. Wilson and Tilghman's Patent Sand Blast Co. Ltd. Brit. 401,045, Nov. 9, 1933.
- Filter suitable for oil.** George R. Ericson (to Carter Carburetor Corp.). U. S. 1,944,550, Jan. 23.
- Filter for quick-settling mineral sludges.** Cesag Central-Europäische Schwimm-Aufbereitungs-A.-G. Ger. 588,818, Nov. 27, 1933 (Cl. 1a. 15).
- Centrifugal separator.** Aktiebolaget Separator (H. O. Lindgren, inventor). Swed. 79,266, Dec. 28, 1933.
- Centrifugal separator with automatic intermittent discharge of the separated mud.** Aktiebolaget Separator (E. A. Forsberg, inventor). Swed. 76,977, April 11, 1933.
- Centrifugal separator from which sludge is intermittently discharged through peripheral openings.** Aage Nyrop. Brit. 400,809, Nov. 2, 1933.
- Centrifugal apparatus for purifying gases or vapors.** Franz Heinl. Ger. 590,364, Dec. 30, 1933 (Cl. 12a. 2.01).
- Centrifuge with driving motor mounted upon the frame.** Aktiebolaget Separator (H. O. Lindgren, inventor). Swed. 76,208 and 76,209, Jan. 3, 1933.
- Apparatus for separating solid substances of different specific gravities.** Fried. Krupp Grusonwerk A.-G. Brit. 400,094, Oct. 19, 1933.
- Sifting apparatus.** Samuel D. Robins (to Robins Conveying Belt Co.). Brit. 400,006, Oct. 19, 1933.
- Viscometers.** Glasplakatefabrik Union G. m. b. H. Brit. 400,840, Nov. 2, 1933.
- Piston apparatus for discharging receptacles containing a viscous substance.** Ottomar Voelk. Brit. 401,003, Nov. 6, 1933.
- Apparatus for maintaining a constant concentration or viscosity in a flowing medium.** R. Carlstedt. Swed. 77,661, June 27, 1933. An automatic app. for regulating the addn. of diln. liquid.
- Apparatus for controlling the viscosity of liquids such as wire enamel compositions.** Zoltan J. Kegl and Henry M. Larsen (to Western Elec. Co.). U. S. 1,944,243, Jan. 23. An app. is described in which the height of a column of liquid in a container is varied in accord with the viscosity of the liquid, viscosity-modifying liquids being added in accord with the height of the liquid to produce a liquid of const. desired viscosity.
- Apparatus for the purification of fumes and gases.** Ateliers J. Hanrez. (Soc. anon.). Belg. 396,800, July 31, 1933. Mech. features.
- Gas washers.** Freyn Engineering Co. Brit. 400,360, Oct. 26, 1933.
- Apparatus for continuous gas analysis.** Aktiebolaget Carba (J. G. Tandberg, inventor). Swed. 76,555, Feb. 21, 1933. A vacuum corresponding to the content of a constituent of a gas is obtained in a chamber having a porous closure as a consequence of the diffusion of the constituent through the porous closure and subsequent absorption or diffusion through another porous device. Cf. C. A. 27, 4138.
- Gas pump for gas-analysis apparatus.** Aktiebolaget Carba (J. G. Tandberg, inventor). Swed. 78,721, Oct. 24, 1933.
- Apparatus for detecting the presence of combustible gases such as marsh gas in the atmosphere.** Henry T. Ringrose. U. S. reissue 19,048, Jan. 16. A reissue of original pat. No. 1,645,404 (C. A. 22, 3).
- Apparatus for detecting carbon monoxide in the air.** G. Ljunggren. Swed. 78,160, Aug. 22, 1933. A gas-tight storage box for reagent paper provided with a small testing table with an illuminating device.
- Apparatus for the absorption of carbon dioxide from air or other gas mixture.** P. G. T. Petersen. Swed. 77,624, June 27, 1933.
- Apparatus for indicating the amount of absorbed gas or gases in a liquid.** T. Kalle. Swed. 76,238, Jan. 10, 1933. The liquid is passed through a conduit where it is made to suck in a gas or gas mixt. by means of an injector device, after which it is let out through a friction tube in which it acts upon an indicating device, the effect varying with the velocity of the liquid, which in turn is a function of the amt. of absorbed and unabsorbed gas.
- Apparatus for estimating moisture in the atmosphere.** Alfred Schwartz. Ger. 588,012, Dec. 1, 1933 (Cl. 42. 19.03).
- Adsorbent suitable for removing moisture from air, etc.** Ernest B. Miller (to Chester F. Hockley as receiver for Silica Gel Corp.). U. S. 1,943,617, Jan. 16. U. S. 1,943,616 relates to details of an adsorption refrigerating app.
- Apparatus for humidifying air.** The Textile Illuminating & Engineering Co. Ltd. and Richard Sutchffe. Brit. 400,749, Nov. 2, 1933.
- Device and method for controlling the flow of liquid in air-conditioning or humidifying apparatus.** Rosser & Russell Ltd. and Ernest J. Naylor. Brit. 400,199, Oct. 2, 1933.
- Rotary meter for measuring fluids.** Compagnie française des conduites d'eau and Henry F. Petot. Brit. 400,547, Oct. 26, 1933.
- Rotary liquid meter, provided with means for delivering a predetermined quantity of fluid.** Paul G. Chace and John A. Kienle. Brit. 400,444, Oct. 26, 1933.
- Water-flow calorimeters.** The Gas Light & Coke Co. and Frederick E. Mills. Brit. 400,291, Oct. 26, 1933.
- High-pressure reducing valve suitable for use with water.** Wm. H. Gleeson. U. S. 1,944,424, Jan. 23. Structural and mech. features.
- Apparatus for supplying measured quantities of liquid.** Dieudonne Theophile Tritsch. Brit. 400,615, Oct. 23, 1933.
- Apparatus for delivering measured quantities of liquids from bottles, casks, etc.** Edward T. Slattery. Brit. 400,763, Nov. 2, 1933.
- Apparatus for proportioning the feed of liquid reagents, as in treating liquids in pipe lines.** Edward A. Bailey (to Standard Oil Co. of Kansas). U. S. 1,943,362, Jan. 16. Various structural and operative details are described.

**Level-indicating apparatus.** Telefonaktiebolaget L. M. Ericsson (J. E. Hanson, inventor). Swed. 78,614, Oct. 10, 1933. Elec. features.

**Apparatus for recording the level of an electrically conducting liquid in a tube, e. g., mercury in a thermometer, or recording the difference in levels of the liquid in two tubes.** Wm. Masterton. Brit. 401,100, Nov. 9, 1933.

**Apparatus for emulsifying, atomizing or spraying liquids.** Geo. Harrington. Brit. 401,077, Nov. 9, 1933.

**Apparatus for making and spraying solutions, e. g., disinfectants.** Ernest H. Hill. Brit. 400,242, Oct. 16, 1933.

**Apparatus for drying, cooling or otherwise treating liquids, e. g., liquid fats or fat emulsions.** Hans Kock, Rudolf Knollenberg and Brich Thiel (trading as Schröder & Co.). Brit. 400,849, Nov. 2, 1933.

**Apparatus for emulsifying liquids.** Albert R. Bannister. Fr. 755,666, Nov. 28, 1933.

**Fluid delivery pump for use with a bottle, etc.** The County Chemical Co. Ltd. and Wilfrid Hill. Brit. 400,417, Oct. 26, 1933.

**Apparatus for carbonating liquids.** John E. Treanor. U. S. 1,943,903, Jan. 16. Structural and mech. details.

**Apparatus for carbonating liquids in receptacles such as bottles.** Frank J. Biane and Samuel B. Rowe. U. S. 1,943,753, Jan. 16. Structural and mech. features.

**Apparatus for clarifying liquids.** Aktiebolaget Svenska Maskinverken (F. I. F. Göttner, inventor). Swed. 78,189, Aug. 29, 1933.

**Rotary apparatus for sedimentation of liquid suspensions.** F. Östman. Swed. 78,931, Nov. 14, 1933. The app. is particularly intended for the analysis of blood, urine and similar liquids.

**Timing mechanism for controlling the operation of a valve or similar device such as a sampling device for liquids or granular materials.** Blomfield Engineering Co. Ltd. and Henry Thomas Durant. Brit. 400,084, Oct. 19, 1933.

**Apparatus for mixing solids with liquids in flow in proportionate quantities.** Bell Brothers (Manchester 1927) Ltd. and Charles G. Benson. Brit. 400,917, Oct. 19, 1933.

**Apparatus (with a cylindrical container and circulating pump) for disseminating solids in liquids.** Edwin Cowles (to Cowles Engineering Corp.). U. S. 1,944,836, Jan. 23. An app. is described, suitable for making solns. or suspensions.

**Feeding devices for granular or powdered material such as coal dust or facing or backing sand.** Alfred Baillet & Cie. Brit. 400,617, Oct. 23, 1933, and 400,664, Oct. 30, 1933. Divided on 400,617.

**Continuous apparatus for introducing or withdrawing solids into or from pressure vessels.** I. G. Farbenind. A.-G. (Gerhard Ritter, inventor). Ger. 590,309, Jan. 3, 1934 (Cl. 12g. 2.02).

**Apparatus for granulating crystallized salts, particularly fertilizers.** Preparation industrielle des combustibles. Fr. 755,743, Nov. 29, 1933.

**Crystallization apparatus.** Aktieselskapet Krystal. Norw. 52,690, June 26, 1933. A hot soln. is supersatd. by vacuum evapn., and the supersatd. soln. is passed through a suspension of growing crystals. App. described.

**Evaporating apparatus.** A. Treplin & Co. Nachf. Konin-Ges. Ger. 588,821, Nov. 30, 1933 (Cl. 12a. 2).

**Evaporation apparatus.** Industriemiska Aktiebolaget (H. E. A. Göth, inventor). Swed. 76,860, April 1, 1933.

**Drying apparatus with several drying chambers and a heat-recovery device.** Aktiebolaget Svenska Fläktfabriken (J. G. Olsson and P. I. E. Stenfois, inventors). Swed. 76,354, Jan. 24, 1933.

**Hot-gas drier for moist materials, especially of a vegetable origin.** I. G. Farbenind. A.-G. (Walter Strathmeyer, inventor). Ger. 588,688, Nov. 23, 1933 (Cl. 82a. 1.02).

**Pan for evaporating brine.** Eduard Bodenstein. Ger. 590,470, Jan. 8, 1934 (Cl. 12f. 1).

**Externally heated enameled vessel for evaporation and**

**like processes.** Deutsche Gold- und Silber-Scheideanstalt vorm. Roessler (Karl Bromig, inventor). Ger. 590,172, Dec. 27, 1933 (Cl. 12a. 1). Constructional features are described.

**Furnace regenerator operation.** Samuel A. Porter (to H. L. Dixon Co.). U. S. 1,944,074, Jan. 16. In assocn. with a furnace such as may be used for melting glass, a rotatable regenerator is used through which air is supplied to the furnace, and heated gases are withdrawn from the furnace through the regenerator in a const. direction and in opposition to the direction of regenerator rotation. App. is described.

**Regenerative flame furnace.** Eugen Seifried. Ger. 585,188, Jan. 8, 1934 (Cl. 24c. 6).

**Muffle furnace heated by gas.** The Gas Light & Coke Co. Fr. 755,595, Nov. 27, 1933.

**Method of mounting burners for a rotary or semi-rotary melting-furnace.** Wm. F. Wiltshire. Brit. 400,956, Oct. 30, 1933.

**Multiple-track tunnel kilns.** Gibbons Brothers Ltd. and Wm. E. Gibbons. Brit. 400,496, Oct. 26, 1933.

**Apparatus for spraying sludge into rotary-drum furnaces.** Friedrich Uhde. Ger. 588,557, Nov. 23, 1933 (Cl. 80c. 16.10).

**Apparatus for tilting furnaces or other apparatus.** George E. Taylor and Leslie E. Thompson (to Ajax Electrothermic Corp. and Ajax Elec. Furnace Corp.). U. S. 1,943,494, Jan. 16. Mech. details.

**Laboratory gas burner.** Edwin H. Fisher (to Fisher Scientific Co.). U. S. 1,943,859, Jan. 16.

**Apparatus for continuous heat-treating.** J. M. Pehrson and A. H. Pehrson. Swed. 79,265, Dec. 28, 1933. Mech. features of a rotary or oscillatory drum or furnace for continuous heat-treating of materials by means of air or other gases.

**Heat-exchanging apparatus.** C. F. Rosenblad. Swed. 77,682, July 4, 1933.

**Heat-exchange tubes.** Imperial Chemical Industries Ltd. Fr. 756,084, Dec. 4, 1933. Alloys contg. Al 2-8, Ni 1-3% and Cu the rest are used for the tubes.

**Tubular heat-exchanger.** Manufacture générale métallurgique. Ger. 590,313, Dec. 30, 1933 (Cl. 17f. 5.23).

**Incandescent-cathode x-ray tubes.** Compagnie française pour l'exploitation des procédés Thomson-Houston. Fr. 756,143, Dec. 5, 1933. Means for mounting and centering the tubes is described.

**Röntgen-ray tubes.** C. H. F. Müller A.-G. Brit. 400,036, Oct. 19, 1933.

**Anodes for Röntgen-ray tubes.** O. H. F. Müller A.-G. Brit. 400,022, Oct. 19, 1933.

**Braun tube.** Radioaktiengesellschaft D. S. Loewe and Kurt Schlesinger. Fr. 755,579, Nov. 27, 1933. Disposition of cathode is described. Fr. 755,580. Means is given for concentrating the cathode rays.

**Electron tube.** Allmänna Svenska Elektriska A.-B. (U. Lamm, inventor). Swed. 79,210 and 79,211, Dec. 19, 1933.

**Kerr cells.** Theodore W. Case. Brit. 401,059, Nov. 9, 1933. See U. S. 1,872,675 (C. A. 26, 5794).

**Photoelectric tubes.** Theodor H. Nakken (to Nakken Patents Corp.). U. S. 1,943,984, Jan. 16. To check the tendency to wander of sensitive photoelec. metals, successive coatings are superposed, such as Mg, K, Rb and Cs in successive superposed films. Various other details also are described.

**Thermionic cathodes.** Radioaktiengesellschaft D. S. Loewe and Bruno Wienecke. Brit. 400,351, Oct. 26, 1933. A pot-like shaped cathode for cathode-ray tubes has a part of its outer surface covered with emissive material arranged in a recess in the body and is indirectly heated.

**Thermionic cathodes.** Jenaer Glaswerk Schott & Gen. Brit. 400,981, Nov. 2, 1933. Addn. to 380,025 (C. A. 27, 4966). Structural features.

**Indirectly heated thermionic cathodes.** Allgemeine Elektrizitäts-Gesellschaft (to International General Electric Co., Inc.). Brit. 400,068, Oct. 19, 1933. Structural features.

- Thermionic valves.** Clarence W. Hansell (to Marconi's Wireless Telegraph Co. Ltd.). Brit. 400,819, Oct. 26, 1933. An ultra-short wave oscillator comprises a discharge device having an anode and cathode, the electrodes being so arranged and dimensioned that the time of flight of an electron to the anode is substantially 0.5 (or an odd multiple thereof) the period of oscillation of the anode and any extension thereof, considered as an electrically oscillating body.
- Thermionic valves.** Ferranti Ltd., Robert W. Sutton and Thomas C. Black. Brit. 400,648, Oct. 27, 1933.
- Thermionic valves.** Standard Telephones & Cables Ltd., Wilfrid E. Benham and Frank D. Goodchild. Brit. 400,999, Nov. 6, 1933.
- Double-receiving thermionic valves with two electrode systems.** Telefunken Gesellschaft für drahtlose Telegraphie m. b. H. Brit. 400,897, Nov. 2, 1933.
- Discharge apparatus.** Carl Lindström A.-G. Brit. 400,410, Oct. 26, 1933. Amplifying valves, e. g., triodes, pentodes, are filled with gas, e. g., He at 1-5 mm., and operated so that a Crooke's dark space extends between the cathode and the control grid, but not beyond the latter, while the other portions of the discharge, e. g., the neg. glow, fill, and suppress space-discharges in, the space between the control grid and anode. Mg or Ba may be used as a getter.
- Discharge tubes.** The British Thomson-Houston Co. Ltd. and The General Electric Co. Ltd. Brit. 400,806, Nov. 2, 1933. The starting of a discharge tube having a metallic vapor filling and a self-heated cathode, such as described in Brit. 356,234 (C. A. 23, 3150) and 364,578 (C. A. 27, 2348), is facilitated by an interrupted ignition coating which is, by contraction of the electrode chambers, brought to about 2 mm. from the electrode. The coating consists of Ag which forms a reflector and covers  $\frac{1}{2}$ - $\frac{1}{4}$  of the tube surface, or of a conductive network which encloses the tube, the gap being defined by a metallic coating.
- Discharge tubes having an incandescent cathode.** C. H. F. Müller A.-G. Fr. 756,237, Dec. 6, 1933.
- Discharge tubes with rotary anode.** C. H. F. Müller A.-G. Fr. 756,159, Dec. 6, 1933.
- Electric discharge apparatus.** Compagnie française pour l'exploitation des procédés Thomson-Houston. Fr. 755,702, and 755,703, Nov. 29, 1933.
- Electric discharge device.** Charles Spaeth. U. S. 1,943,845, Jan. 16. In a device such as a Ne-He lamp, an electrode structure comprises a chamber with an outlet opening into which a tube projects which is sealed to the chamber at the edge of the opening, alkali metal being placed in the chamber and a leading-in wire of W being sealed through the walls of the device with a piece of Ni welded to the end of the wire and supported in such position as to be in contact with the alkali metal bath when the alkali metal is liquefied by heating.
- Electrical discharge device containing mercury.** Charles Spaeth (to Ne-Arga Corp.). U. S. 1,943,847, Jan. 16. A device such as a lamp comprises an envelope which may be formed of glass and which contains a gas filling such as Ne and an anode and cathode, a reservoir of Hg being connected with the envelope near the anode and an auxiliary electrode being immersed in the Hg (various other structural and operative details being described). U. S. 1,943,848 relates to various details of a lamp contg. a rare gas such as Ne and in which Hg and alkali metal also are used.
- Alternating-current electrical discharge device.** Charles Spaeth (to Ne-Arga Corp.). U. S. 1,943,846, Jan. 16. A device suitable for use at high c. d. without destructive sputtering comprises a gas-filled envelope contg. a pair of W electrodes and an assoc. alkali metal electrode, arranged for application of a potential between the W electrodes sufficient to heat them to incandescence and to cause a current to flow between the alkali electrode and the W electrodes.
- Electric discharge device anodes.** Allgemeine Elektrizitäts-Gesellschaft (to International General Electric Co., Inc.). Brit. 400,768, Nov. 2, 1933. In the construction of a tubular anode which consists of an outer cylinder of material that has a high thermal cond., e. g., Cu, and an inner tube of material of high m. p., e. g., W, Ta, Mo, Zr, Ti, in intimate contact therewith, the formation of the tube takes place within the cylinder. The high-melting material may be cast, preferably *in vacuo*, or applied as a paste which is then sintered.
- Electric discharge tubes.** N. V. Philips' Gloeilampenfabrieken. Fr. 755,834, Nov. 28, 1933. The wires and crosspieces of the grid are coated, at least at the points of fixation, with a material much more easily fused than the material of the wires and crosspieces.
- Electric discharge tubes.** N. V. Philips' Gloeilampenfabrieken. Fr. 756,198, Dec. 6, 1933.
- Electric discharge tube with a gaseous filling and electrodes so spaced that the discharge has the characteristic of an arc discharge without a positive column.** N. V. Philips' Gloeilampenfabrieken. Brit. 400,764, Nov. 2, 1933.
- Method of sealing leading-in wires into vitreous vessels, e. g., the envelopes of electric discharge devices.** The General Electric Co. Ltd., Robert L. Breadner and Christopher G. Eden. Brit. 400,334, Oct. 26, 1933.
- Luminous discharge tubes.** Patent-Treuhand-Gesellschaft für elektrische Glühlampen m. b. H. (to The General Electric Co. Ltd.). Brit. 400,458, Oct. 26, 1933.
- Gas- or vapor-filled, luminous, positive-column discharge tubes.** N. V. Philips' Gloeilampenfabrieken. Brit. 400,368, Oct. 26, 1933.
- Wire fabric for use as catalytic material.** G. Siebert G. m. b. H. and Heinrich Houben. Ger. 590,468, Jan. 4, 1934 (Cl. 12g. 4.02). Constructional features are described.
- Apparatus for producing sparks for spectrum analysis.** W. C. Heraeus G. m. b. H. Brit. 400,607, Oct. 18, 1933.
- Closure devices, particularly for the gas receptacles of distillation furnaces.** C. Otto & Co. G. m. b. H. Brit. 400,146, Oct. 19, 1933.
- Timing mechanism for controlling the treating period in mixing and other machines.** Ransomes & Rapier Ltd. and Charles E. Brett. Brit. 400,775, Nov. 2, 1933.
- Mixing, kneading and other machines.** F. Aeschbacher A.-G. Brit. 400,149, Oct. 19, 1933.
- Mixing, emulsifying or disintegrating apparatus.** Hermann Hildebrandt. Ger. 590,222, Jan. 4, 1934 (Cl. 50b. 18.20).
- Machine for subjecting materials to a mixing, kneading, shredding or disintegrating process.** Eugen Eppeler and Baker Perkins Ltd. Brit. 400,966, Nov. 3, 1933.
- Hardness tester.** Paul Craemer. Brit. 400,842, Nov. 2, 1933.
- Grinding apparatus.** Soc. anon. d'Ougrée Marillay. Brit. 400,441, Oct. 26, 1933. Addn. to 366,001 (C. A. 27 1553).
- Apparatus (with a testing roller) for testing the hardness of grinding disks.** Herbert Lindner. U. S. 1,944,355, Jan. 23. Structural and mech. details.
- Vibrating-jaw stone crushers.** Fried. Krupp Grusonwerk A.-G. Brit. 400,826, Nov. 2, 1933.
- Ball-and-ring pulverizing mills.** Babcock & Wilcox Ltd. Brit. 401,115, Nov. 9, 1933.
- Apparatus for trapping suspended particles such as dust or cinders from gas currents.** George C. Cook. U. S. 1,943,297, Jan. 16. Structural and operative details.
- Improvement of bag dust removers.** J. Joachim Raven. Belg. 396,984, July 31, 1933. Mech. features.
- Drawing-off arrangement for barrels, drums, etc., for viscous oils, etc.** George F. Beaumont and Cyril G. Beaumont. Brit. 400,936, Oct. 27, 1933.
- Acetylene generator.** Léon Chastan-Bagnis. Fr. 756,736, Nov. 29, 1933.
- Thermostat switch with gas-filled container.** Aktiebolaget Birka Regulator (A. O. Appelberg, inventor). Swed. 77,927, Aug. 1, 1933. The thermostat switch is enclosed in a gas-tight container filled with a dil. gas of low at. wt., e. g., H<sub>2</sub>, with a pressure below the value at which flashing will take place under occurring conditions, the lower limit of the gas pressure being fixed by the condition that the heat cond. of the gas shall be not less than  $\frac{1}{2}$  of its heat cond. at atm. pressure.

## 2-GENERAL AND PHYSICAL CHEMISTRY

FREDERICK L. BROWNE

Wilhelm Bachmann. H. Braune. *Z. Elektrochem.* 40, 57-9(1934).—Obituary with portrait. G. G.

Benjamin Sullivan and the beginnings of chemistry at Yale. Philip E. Browning. *J. Chem. Education* 11, 170-4 (1934). E. H.

Chemistry and chemical arts in ancient Egypt. I. L. E. Warren. *J. Chem. Education* 11, 146-53(1934). E. H.

The regulatory chemist of the present and future. James W. Kellogg. *J. Assoc. Official Agr. Chem.* 17, 29-36(1934).—An address. A. Papineau-Couture

Undergraduate organic laboratory chemistry. IIB. Diversification, relative importance and comparative cost of laboratory experiments. E. F. Degering, R. F. McCleary and A. R. Padgett. *J. Chem. Education* 11, 180-4(1934); cf. *C. A.* 28, 939<sup>7</sup>. IIC. Diversification, relative importance and comparative cost of the course. E. H.

b. F. Degering. *Ibid.* 184-5. E. H.

The oxidation of 3-aminophthalhydrazide ("luminol") as a lecture demonstration of chemiluminescence. Ernest H. Huntress, Lester N. Stanley and Almon S. Parker. *J. Chem. Education* 11, 142-5(1934); cf. *C. A.* 28, 1084<sup>6</sup>. E. H.

The preparation of sputtered metal films. E. O. Hulburt. *Rev. Sci. Instruments* 5, 85-8(1934). E. H.

Arsenic in sea water. Norris W. Rakestraw and Frank B. Luts. *Biol. Bull.* 65, 397-401(1933).—Detn. of total As by the Gutzeit method showed 6-28 mg. per cu. m. of sea water, the mean being about 15 mg. Although the As content increases at 10-60 m. below the surface, there is no general increase with depth; hence the distribution is quite unlike that of P. Most of the As is in forms other than arsenate. K. V. Thimann

The buffer capacity of sea water. Philip H. Mitchell and Norris W. Rakestraw. *Biol. Bull.* 65, 437-51 (1933).—By detg. the change in  $p_H$  of  $CO_2$ -free sea water on adding a known quantity of acid, a correction chart is worked out for use with the Thompson and Bonnar method (*C. A.* 25, 5863) of detg. buffer capacity. This correction covers the true noncarbonate buffering and also the effects of chloride on the indicator, etc. While there was found in general an increase in buffer capacity with depth, this was sometimes absent. The ratio of buffer capacity to total chloride, the "specific buffer capacity," increased from Cape Cod southward toward the Caribbean and was somewhat higher in the Pacific than in the Atlantic. Its average was about 0.119. K. V. Thimann

Graphical computation of logarithmic mean temperature difference. A. J. V. Underwood. *Ind. Chemist* 9, 167-70 (1933).—Charts and the mathematics on which they are constructed are given. B. C. A.

Azeotropy and the preparation of pure compounds. I. Rabowicz-Zubkowski. *Roczniki Chem.* 12, 567-75 (1932).—Theoretical. B. C. A.

Cellophane roll films for slide lanterns. Rots Bonar, Floyd Bonar and Earl C. H. Davies. *J. Chem. Education* 10, 92-4(1933).—A Cellophane roll film can be quickly made from thin com. wrapping Cellophane by the use of carbon-paper typing or by pen drawing. A method of fixing the C-paper writing on Cellophane is described. W. H. B.

Correction nomograph for pressure changes supplementary to humidity charts of gases. Sir5al Hatta. *J. Sec. Chem. Ind., Japan* 37, Suppl. binding 38-43(1934); cf. *C. A.* 27, 4602.—The construction of a Z-nomograph for pressure corrections is described. Nomographic charts for a low-temp. and a high-temp. range are presented giving satd. molal humidity as functions of temp. and pressure. Karl Kammermeyer

The concentration of gallium by means of adsorption on hydrated aluminum and iron oxides. Eugene Wainer. *J. Am. Chem. Soc.* 56, 348-50(1934).—Quant. removal of Ga can be accomplished by copptn. of gelatinous  $Ga(OH)_3$  with  $Fe(OH)_3$  or  $Al(OH)_3$ . The method is suitable for the extn. of low-grade ores. In complete neutralization the ratio  $Al_2O_3/Ga_2O_3$  should be at least 20:1 and  $Fe_2O_3/Ga_2O_3$  at least 10:1. H. F. J.

The periodic system of the chemical compounds of type  $A_mB_n$ . H. G. Grimm. *Angew. Chem.* 47, 53-8 (1934).—A periodic system of the chem. compds. of type  $A_mB_n$  is derived from the periodic system of the atoms. This system shows that the electron nos. of both elements have an effect upon the kind and mode of combination. Substances that belong to the same class, because of their type of bond, always have a corresponding place in this system. The compds. are classified into the following groups: (1) salts (ionic binding, at. binding), (2) at. mols. (at. binding), (3) diamond-like compds. (at. binding or free atoms), (4) metals including elements, compds. mixed crystals, eutectics, etc. (free atoms), (5) noble gases (free atoms), (6) substances with 2 kinds of bond characterized by layer lattices and (7) semi-metals. A very extensive diagram is presented with the 92 elements along the coordinate axes giving the classification of the compd. in its resp. field. Another similar diagram gives a subdivision into fields showing the no. of electrons in the nearest inner electron shell. Twenty references. Karl Kammermeyer

A new chemical theory—its origins, content and consequences. Albert Gosselin. *Bull. soc. chim.* 53, 923-45 (1933); cf. *C. A.* 27, 4451.—A modification of Werner's theory is applied to org. compds., in which C has a coordination no. of 6. The mols. are made up of a central atom or kernel with atoms, atom groups or mols. joined to it by electro-, steric or "mixed" valences. Janet E. Austin

The dynamics of liquid crystals. P. J. Bouna. *Arch. neerland. sci.* IIIA, 219-84(1933).—The dielec. loss of liquid crystals of  $p$ -azoxyanisole was measured by means of a resonance-coupled circuit. The curve of loss vs. frequency shows a max. The max. frequencies increased from  $7 \times 10^4$  to  $2 \times 10^6$  Hertz with increase in temp. from  $118^\circ$  to  $124^\circ$ . An increase in max. frequency with temp. was found also for the solid state except that a sharp max. appeared at the m. p.,  $116^\circ$ . To det. the speed with which the swarms of liquid crystals change their orientation, measurements were made of the permeability in a changing magnetic field, of the cond. in changing magnetic and elec. fields, and of the dielec. loss in a const. magnetic field. P. S. Roller

Variation with temperature of the magnetic birefringence and the dispersion of phenyl ethyl succinate. René Lucas, Marcel Schwob and Antoine Goldet. *Compt. rend.* 196, 72-4(1934); cf. *C. A.* 27, 5225.—Data on the Kerr effect in Ph Et succinate are given in the temp. range  $-6$  to  $107.5^\circ$ . To explain the dispersion of the magnetic birefringence at least 3 forms of the substance must be assumed, of which one has neg. birefringence. A. B. F. Duncan

The dielectric polarization of hydrochloric acid in solution. II. Benzene, ethyl bromide and ethylene dichloride as solvents. Fred Fairbrother. *J. Chem. Soc.* 1933, 1541-8; cf. *C. A.* 28, 13<sup>9</sup>.—Previous expts. (cf. *C. A.* 26, 2356) on the dielec. polarization of HCl in soln. were extended to include EtBr and  $C_2H_4Cl_2$  as solvents, and with improved technic a further series of measurements in  $C_2H_6$  was made. Results for solns. in EtBr and

$C_2H_5Cl$ , lead to values of elec. moment almost identical with Zahn's value (C. A. 19, 426) for gaseous  $HCl$ : in  $EtBr$   $1.02 \times 10^{-18}$  and in  $C_2H_5Cl$ ,  $0.97 \times 10^{-18}$  compared with  $1.03 \times 10^{-18}$  e. s. u. M. McMahon

**Molecular polarizations of nitrobenzene in various solvents at 25°.** H. O. Jenkins. *Nature* 133, 106(1934).—Dielec. consts.,  $d_s$ , and  $n_s$  of dil. solns. of  $PhNO_2$  were detd. in some solvents at 25°. The dielec. const. of the solvent, the total polarization of  $PhNO_2$  at infinite diln., the sum of atom and orientation polarization, electron polarization and the apparent elec. moment are given for solns. of  $PhNO_2$  in  $n$ -hexane, cyclohexane, decalin,  $CCl_4$ ,  $C_6H_6$ ,  $CS_2$ , and  $CHCl_3$ . The total polarization of  $PhNO_2$  is proportional to the dielec. const. of the solvent.

Gerald M. Petty

**The dielectric properties of chlorinated biphenyls.** A. H. White and S. O. Morgan. *J. Franklin Inst.* 216, 635-44(1933).—The dielec. const. and loss factor for 4 com. mixts. of chlorinated biphenyls are plotted as functions of temp. for various frequencies in the region of anomalous dispersion. The temp. at which the material should be used for low loss and high dielec. const. depends on the frequency and is just above the range at which anomalous dispersion begins. Louis Goldman

**Variations in the specific heat of gases with pressure.** E. Burlot. *Mem. poudres* 25, 314-35(1932-33).—A math. discussion of the errors and necessary corrections for calcs. that involve high temps. and high pressures simultaneously, as in explosive reactions. A. J. P.

**Effect of pressure on the spontaneous inflammation of hydrocarbons.** M. Neumann and V. Estrovich. *Nature* 133, 105-6(1934).—Inflammation of the mixt.  $C_2H_{12} + 8O_2$  is shown graphically from 5 to 112 cm. pressure, and 200° to 880°. There is a kink in the curve at 55-65 cm. At higher pressures, ignition is probably due to the oxidation of an aldehyde or other intermediate oxygenated product; at lower pressures, conditions favor a decompn. into  $H_2$ ,  $CO$ ,  $CH_4$ , etc.; these require much higher temps. for inflammation. Gerald M. Petty

**The states of aggregation.** K. F. Herzfeld and Maria Goepfert-Mayer. *J. Chem. Physics* 2, 38-45(1934).—Methods of investigating possible states of aggregation are discussed and a simplified one-dimensional model is introduced. It was possible to find the exact equation of state, but in this case a single (gaseous) state exists. No progress could be made in the understanding of the liquid state. Allen S. Smith

**The conductivity of insulating liquids or poor conductors in thin layers. Variations with temperature.** Thérèse Meyer. *Compt. rend.* 198, 160-3(1934).—The sp. conductivities of 18 org. liquids were detd. at ordinary temp. The values ranged from  $8 \times 10^{-11}$  mho for paraffin oil to  $2 \times 10^{-4}$  mho for  $C_2H_5OH$ . Further, the variation of the resistivity of 5 of the substances (aniline, chlorobenzene, glycerol, glycol and paraffin oil) with temp. (−100° to +60°) was studied. The results obtained are briefly discussed. Reuben Roseman

**Liquids of high refractive index.** B. W. Anderson and C. J. Payne. *Nature* 133, 66-7(1934).—The range of the total-reflectometer type of refractometer can be extended to the limit of the  $n$  of the glass by use of: (1) a 22% soln. of tetraiodoethylene in methylene iodide with sulfur,  $n_D = 1.81$ ; (2) phenyldiiodoarsine,  $n_D = 1.843$ ; (3) Se monobromide mixed with methylene iodide contg. S,  $n_D > 1.90$ . Victor Hicks

**An application of a new method, due to Professor Albert Griffiths, of determining a small change in the density of a liquid.** P. C. Vincent. *Proc. Phys. Soc. (London)* 45, 833-5(1933).—Very small changes in the d. of  $H_2O$  due to the dissolving of glass were detected.

H. F. Johnstone

**Measurements of the surface tension of carbon tetrachloride at low temperatures.** T. Alty and G. F. Clark. *Can. J. Research* 10, 129-33(1934).—The variation of the surface tension of  $CCl_4$  with temp. was detd. with considerable accuracy between +12° and −10°.

J. W. Shipley

**The molecular structure of ice and liquid water.** E.

L. Kinsey and O. L. Sponner. *Proc. Phys. Soc. (London)* 45, 768-79(1933); cf. C. A. 27, 4998.—On the basis of x-ray data a new lattice is proposed that accounts for the existence of a polymer and many of the abnormal properties of ice and water. The structure contains the units  $H^+$  and  $H_2-O$ , the latter built so that 3 H ions lie at the corners of an equilateral triangle in the plane midway between them, and perpendicular to the line of centers of the 2 O ions. It consists of neutral chains of  $H_2-O$ , extending parallel to the  $c$ -axis. Polarization effects account for the instability of dihydrol under pressure, and other properties. At the m. p., besides disocn. into monohydrol, clusters of variable size of the 2 types of mol. are the mobile units. The angle between the  $c$ -axis and the line joining an O with the H in the  $H_2-O$  unit is approx. 30°. The effect of the lattice on this angle is small, but the effect on the polarization of the O is large, and is such as to increase it nearly 3-fold over its value for isolated dihydrol (cf. C. A. 22, 895; 24, 765).

H. F. Johnstone

**The crystalline structure of thallium fluosilicate.** M. Tabet. *Gazz. chim. ital.* 63, 679-80(1933).—Pure  $Tl_2(SiF_6)$  was prepd. by addn. of  $Tl_2(CO_3)$  to  $HgSiF_6$ , without continuing to neutralization (to avoid decompn. of the  $SiF_6$  ion), and pptn. with  $EtOH$ . It is anhyd., and does not lose wt. at 100° (in agreement with Werthner (*J. prakt. Chem.* 92, 131(1864)) and contrary to Kuhlmann (*Compt. rend.* 58, 1037), and Nickles (*J. pharm. Chem.* 41, 32(1865)). Röntgenographic examn. (powd. method) showed that it has the same structure as  $K_2PtCl_6$ , with  $a = 8.60$  and a theoretical d. of 5.72. C. C. D.

**The structure of the hypophosphite group as determined from the crystal lattice of ammonium hypophosphite.** W. H. Zachariayen and R. C. L. Mooney. *J. Chem. Physics* 2, 34-7(1934).—The crystal structure of  $NH_4H_2PO_2$  was examd. to det. the size and shape of the  $H_2PO_2$  group. This group has the shape of a distorted tetrahedron in which 2 corners are occupied by O atoms and the other 2 by H atoms. The  $H_2PO_2$  radical may be visualized as consisting of ions  $(H_2P^+O_2^{2-})^-$  with interat. distances of 1.51 Å. for P-O and 1.5 Å. for P-H with angles between the bonds of 120° and 92°, resp.

Allen S. Smith

**Crystal structure of tenorite (cupric oxide).** G. Tunell, E. Povnjak and C. J. Ksanda. *J. Wash. Acad. Sci.* 23, 195-8(1933).—The unit monoclinic cell has  $a_0$  4.66,  $b_0$  3.40,  $c_0$  5.09 Å., all  $\pm 0.02$  Å.;  $\beta$  99°30'  $\pm$  30'. B. C. A.

**The fine structure of the isomeric hydrocarbons quaterphenyl and triphenylbenzene.** Eduard Hertel and Georg H. Römer. *Z. physik. Chem.* B23, 228-34(1933).—Quaterphenyl is monoclinic;  $J_a = 8.14$ ,  $J_b = 5.64$ ,  $J_c = 18.4$  Å.;  $\beta = 97^\circ$ ; the space group is  $C_{2h}^{2h}$ . Two mols. of symmetry  $C_2$  form the elementary cell. sym-Triphenylbenzene forms rhombic bipyramids;  $J_a = 11.2$ ,  $J_b = 19.8$ ,  $J_c = 7.6$  Å.; the space group is  $V_h^{16}$  and there are 4 mols. of symmetry  $C_2$  in the unit cell.

G. M. Murphy

**Crystal structure of 1,3,5-triphenylbenzene.** Kathleen Lonsdale. *Nature* 133, 67(1934).—Piezoelec. measurements show that the structure proposed by Hertel and Römer (preceding abstract) is not correct in that the crystal class is orthorhombic pyramidal instead of orthorhombic bipyramidal, and that (100) is the mol. plane of symmetry instead of (010).

Victor Hicks

**Crystal structure of carotenoids.** G. Mackinney. *J. Am. Chem. Soc.* 56, 488(1934).—Interplanar spacings are given for carotene, xanthophyll, lutein and lycopene; no spacings longer than 7.53 Å. were observed, though the range explored would have recorded up to 15 Å. Absence of significant variation in pattern makes it improbable that carotene takes up  $EtOH$  of crystn. Lutein and leaf xanthophyll do not differ significantly. Certain similar spacings suggest many common structural features in these mols.

C. J. West

**The density and the viscosity of titanium tetrachloride.** Tatsuro Sagawa. *Science Repts. Tôhoku Imp. Univ. First Ser.*, 22, 959-71(1933).—The d. of  $TiCl_4$  was detd

over the temp. range  $-18.10^{\circ}$  to  $109.60^{\circ}$ . The sp. vol.  $\times V_1 = V_2(1 + 9.6457 \times 10^{-4} + 6.026 \times 10^{-7}t + 5.94 \times 10^{-9}t^2)$ , where  $V_1 = 0.56773$ . The coeff. of viscosity is  $0.007921$  c. g. s. units at  $20^{\circ}$  and  $0.007458$  at  $25^{\circ}$ .

P. T. Newsome

The adsorption of carbon tetrachloride on carbon and the activation of carbon. Walter Lemcke and Ulrich Hofmann. *Angew. Chem.* 47, 37-43(1934).—An automatic app. is described for making vapor adsorption isotherms. The adsorption of  $\text{CCl}_4$  by pure C preps., such as activated charcoals, C from reduced  $\text{CO}$ , lampblack and graphites was examd. The capillary condensation of  $\text{CCl}_4$  upon C takes place only near the satn. pressure. The considerable condensation at small pressures, contrary to Kubelka, is not to be explained by capillary condensation, but rather by the Langmuir-Volmer conception, in which the surface forces of the C bind the vapors in a two-dimensional adsorption layer. The adsorptive power of the individual carbons before and after activation parallels that of dissolved substances like methylene blue and phenol. The increased adsorptive power of activated carbons after activation is caused by increased accessible crystal surface. The decrease in adsorptive power of finely ground Ceylon graphite after activation was attributed to smoothing of the surface by the exposed individual crystals and more rapid consumption of the small crystals. The hysteresis of the isotherms for some activated carbons which was observed in the region of intermediate pressures is connected with the vol. increase during adsorption and explained as a dilation of the grain pores of the carbon. Thirty-two references.

Karl Kaunermeyer

Adsorption of hydrogen sulfide by activated alumina. C. H. Hayley. *Can. J. Research* 10, 19-23(1934).—Adsorption of  $\text{H}_2\text{S}$  on a com. sample of "activated  $\text{Al}_2\text{O}_3$ " was measured by the dynamic and the static methods. The adsorption is affected by prior heating of the  $\text{Al}_2\text{O}_3$  to various temps., being a max. when the temp. of prior heating is  $550^{\circ}$ .

J. W. Shipley

Effect of time on alcohol and ether sorption by silica gels. László Putnok and Vilmos Neráth. *Matematik. Természettud. Értesítő* 49, 575-91(1933); cf. *C. A.* 27, 3618. —The velocity of sorption steadily decreases for both  $\text{Et}_2\text{O}$  and  $\text{EtOH}$ . The heat of sorption diminishes the sorption velocity. Gels can be evaluated according to (a) sorption capacity and (b) sorption velocity. The gels examd. were (1) Horig, (2) one made from  $\text{SiCl}_4$ , (3 and 4) 2-3-mm. and 0.5-2-mm. gels, of Deutsche Kolloides, and (5 and 6) S. "A" and S. "E" gels of F. Hermann. (4) showed large sorption velocity and (1) had a low max. sorption capacity. The others showed no great differences.

S. S. de Finály

So-called negative adsorption and vapor-pressure isotherms of permutites and clays. Paul Szigeti. *Kolloid-Beihfte* 38, 99-176(1933).—Neg. adsorption (water-binding) and vapor-pressure isotherms of permutites and clays satd. with H, Li, Na,  $\text{NH}_4$ , K, Mg, Ca, Sr and Ba ions were detd. The isotherms were interpreted in terms of internal structure differences of the substances. Neg. adsorption occurred both from electrolyte and nonelectrolyte solns. At the same vapor tension, the water content of the permutites is always greater than that of the clays.

Frank Urban

Crystal adsorption by substrates. G. I. Finch, A. G. Quarrell and J. S. Roebuck. *Nature* 133, 28(1934).—Twelve successive layers of Zn were condensed on polished Cu. In 11 of these the cryst. electron-diffraction pattern that was evident on first deposition disappeared on standing. Similar layers deposited on cryst. or etched surfaces were permanent. This is considered as expl. proof of the existence of the *Bailly layer*. Gregg M. Evans

Kinetics of reaction and adsorption in the system silver-oxygen. Arthur F. Benton and Leonard C. Drake. *J. Am. Chem. Soc.* 56, 255-63(1934).—The rate of reaction of  $\text{O}_2$  and finely divided Ag to form  $\text{Ag}_2\text{O}$  at temps. of  $160^{\circ}$  and above is equal, in cc. per hr. per mm. pressure, to  $7.2 \times 10^6 - 22,000/RT$ ; the rate of decompn. of the oxide is  $1.9 \times 10^7 - 22,000/RT$ . Both rates are independent

of the extent of oxidation of samples contg. 0.3-10% O. The difference between the energies of activation of oxide formation and decompn. corresponds to the known heat of formation of  $\text{Ag}_2\text{O}$ . Phys. adsorption of  $\text{O}_2$  by Ag occurs at  $-183^{\circ}$ . Activated adsorption occurs in the range  $0-200^{\circ}$ . The limiting satn. value of this latter type of adsorption was approx. const. between  $150^{\circ}$  and  $200^{\circ}$ . The energies of activation for the activated adsorption and desorption processes were found to be 12.7 and 28.4 kg.-cal., resp. No trend in these energies of activation as a function of the amt. of O adsorbed was detectable.

P. H. Emmett

Effect of sorbed water on the physical properties of asbestos and other fibers, with special reference to resilience. L. M. Pidgeon and A. Van Winsen. *Can. J. Research* 10, 1-18(1934); cf. *C. A.* 19, 759; 27, 5230. —Relative humidity exerts a definite effect on the phys. properties of asbestos. An app. was devised in which a mass of fiber could be compressed in such a way that the vol., pressure and relative humidity of the sample were known at any time. The effect of sorbed water on asbestos is to increase the apparent d. and to decrease compressibility and resilience. The major controlling factor is facilitation of slipping of fibers over one another by sorption of water. Since no fiber unit can be obtained with asbestos, the fiber bundle must be considered and the stiffness of such a bundle depends on the ease of slipping of its components and hence on relative humidity. This fact is of prime importance in the testing of asbestos where humidity exerts a direct effect on the screen test. Cotton and wool fibers were examd., and a definite effect of humidity was demonstrated.

J. W. Shipley

The physicochemical phenomenon of the wetting resistance of peat to water. M. V. Chapek. *Kolloid-Z.* 66, 91-5(1934).—Dry peat is not wetted by  $\text{H}_2\text{O}$  but is readily wetted by org. liquids. The heat of wetting in alc.- $\text{H}_2\text{O}$  solns. increases with  $\text{H}_2\text{O}$  content up to  $8\text{H}_2\text{O}$ :  $2\text{EtOH}$ , where it is no longer wetted. The heat of wetting in  $\text{C}_6\text{H}_6$  is small; the results indicate a hydrophilic surface. Extn. with  $\text{C}_6\text{H}_6$ - $\text{EtOH}$  before drying does not change the resistance; hence wax or resin content is not the significant factor (cf. Ramann, *C. A.* 6, 1197, 1337). After evacuation, dried peat is wetted by  $\text{H}_2\text{O}$  and the heat of wetting is 13.7 cal. per g. The wetting resistance is therefore due to a strongly adsorbed air film (cf. Ehrenberg and Schultze, *C. A.* 9, 1142). The film is firmly adsorbed, since the wetting resistance is not changed even after adsorption of  $\text{H}_2\text{O}$  vapor to 32.67%. Peat is termed an "aerophilic" powder. Arthur Fleischer

The problem of wetting and porosity. Adsorption and complete heats of wetting on powders of various grain sizes. Boris V. Il'in and A. Kiselev. *Kolloid-Z.* 66, 28-40(1934).—Expts. were made with a wood charcoal, steam-activated at  $900^{\circ}$ , 2% ash, dried at  $175^{\circ}$ , and carefully screened. Results are given for the fractions, 0.68 mm. (I), and 0.15 mm. (VII) av. particle size. Adsorption of  $\text{I}_2$  and of propionic, valeric and heptylic acids was detd. at  $30^{\circ}$  up to 36 millimol. per l. The time to reach adsorption equil. decreases with grain size. With coarse grains, Traube's rule is reversed at high concns. For the 2 fractions, the ratios of the amts. adsorbed are const. over the whole range and are: VII/I, propionic 1.071,  $\text{I}_2$  1.048, valeric 1.098 and heptylic acid 1.108. The heats of wetting at  $14-17^{\circ}$  in  $\text{H}_2\text{O}$ , isoamyl alc.,  $\text{C}_2\text{H}_5\text{OH}$ , propionic acid, nitrobenzene and heptylic acid were followed accurately over a time period in an adiabatic calorimeter, the heats of wetting increasing in the order named. The time for complete wetting increases with the mol. vol. of the adsorbate and decreases with increased heat of wetting. The ratios of heats of wetting, VII/I, are for propionic acid 1.061 and heptylic 1.110. In considering these results with the adsorption measurements, the heat of wetting per millimol. adsorbed is const. and hence, the activity of the surface is independent of grain size.

Arthur Fleischer

Physical chemistry of wetting phenomena and flotation processes. IX. P. Rebinder, Marie Lipetz, Marie Rimakaya and A. Taubman. *Kolloid-Z.* 65, 268-83

(1933); cf. C. A. 23, 5404; 25, 630; 26, 638; Talmud, C. A. 23, 5383; 24, 4672; 26, 5519.—The degree of wetting or selective wetting,  $B$ , is defined as cosine  $\theta$ , where  $\theta$  is the contact angle. It is easily measured when 2 liquids of max. polarity differences, such as  $H_2O$  and  $C_6H_6$ , are used. To measure  $\theta$ , a drop of liquid is carefully placed on or below a polished mineral surface immersed in the other liquid. The angle is detd. by projection on a screen or from a photograph. The value of  $B$  depends on the order of immersion,  $B_{11}$  representing a drop of nonpolar liquid at a surface wetted by a polar, and  $B_{12}$  the reverse. The difference,  $B_{11} - B_{12}$  is  $h$ , the static wetting hysteresis, which is reproducible and independent of time. For values of  $B$  between 0 and +1, the surface is hydrophilic; for values between 0 and -1, hydrophobic. Various minerals are arranged in a table. The most hydrophobic surface is shown by pure paraffin. Diamond is hydrophilic in contrast to graphite; hard surfaces usually are hydrophilic. On calcination at 1000°, talc increases in hardness and becomes hydrophilic. Easily oxidized surfaces, such as sulfide, are hydrophobic when cleaved under benzene, but hydrophilic when cleaved under water, because of an oxide-film formation. The value of  $B$  depends on the concn. of surface-active compd. in the liquid. In general,  $B$  decreases with increase in concn., tending to reach a max. at max. adsorption and showing an inversion point, e. g., from initially hydrophilic to hydrophobic. Detn. of inversion concns. permits a quant. comparison of the flotation activity of various reagents.  $B$  changes may also be applied to the study of surface reactions caused by (1) electrolytes as in depressing or activating and (2) oriented adsorption. At mineral-water-air surfaces only undissoc. mols. are effective while the ions are the effective agents at the surface mineral-water-benzene. X. The dependence of wettability on the adsorption of flotation reagents. (Wetting isotherms at the interface mineral-water-air.) P. Rehinder, Marie Lipetz and Marie Rimakaya. *Ibid.* 66, 40-50 (1934).—To measure wetting,  $B$ , the polished mineral surface is dipped in an aq. or  $C_6H_6$  soln. for 5 mm., dried with clean filter paper, and then a drop of liquid carefully brought to the surface. The value of  $B_{11}$  changes with the concn. of surface-active reagent and inversion points, change from hydrophilic to hydrophobic surface, are found at concns., 0.01-0.0001%, used in flotation practice. On paraffin isoamyl xanthate is nearly as active as amyl alc., indicating a purely physicochem. orientation. On malachite, the oriented xanthate layer is chemically fixed, causing a greater activity of the xanthate over the alc. The same occurs with soaps on alk. earth or oxidized minerals. Where chem. fixation occurs at a surface  $B_{11}$  changes in the manner indicated, while  $B_{12}$  decreases very slightly in contrast to the behavior at the interface, mineral- $H_2O$ - $C_6H_6$ . From theoretical considerations of wetting forces the necessary condition for flotation is that  $\theta > 0$ . Too fine grinding of particles hinders flotation by a particle hydration. Sulfidized malachite surfaces are made hydrophobic by xanthate adsorption but not by fatty acid adsorption. "Overcoiling" or decreased flotation due to excess reagent is caused by the formation of a second adsorption film with a reverse orientation, making the surface hydrophobic. Arthur Fleischer

The effect of foreign substances on the wettability of chemicals by water. L. J. Weber and A. C. Chatterji. *Kolloid-Beihfte* 38, 412-38 (1933).—The wetting of anthracene by solns. of formic to undecylic acids; naphthalene by solns. of MeOH to hexadecyl alc.; phenanthrene by solns. of Me to Am acetate was detd. The Traube homologous-series rule is valid up to a certain higher member of the series. Various polar and nonpolar substances were added to naphthalene + water. They were oleic acid,  $C_6H_6$ , PhMe, xylene, benzyl alc.,  $PhNO_2$ ,  $PhNH_2$ ,  $m$ -toluidene, 1,3,4-xyldine,  $PhOH$ ,  $o$ -,  $m$ -,  $p$ -cresol, benzonitrile, Me salicylate, resorcinol,  $Me_2O$ ,  $MeEtCO$ , paraffin, pentane,  $CS_2$ ,  $CHCl_3$ ,  $CCl_4$ . The polar substances favored wetting. The addn. of polar and nonpolar substances to melted naphthalene (oleic acid, benzoic acid,  $p$ -nitrobenzoic acid, nitrobenzene, saline,  $p$ -nitroaniline, octyl alc., hexadecyl alc., paraffin) showed that

polar substances increase wetting. Melted naphthalene, anthracene and phenanthrene are not as easily wetted as before. Since impurities increase wetting, if they are polar, the purity of a compd. can be tested in this way. Frank Urban

Surface solutions. Two-dimensional liquids and unimolecular layers. André Marcellin. *Kolloid-Beihfte* 38, 177-336 (1933).—A review. Frank Urban

Structure of surface films. XVIII. Effect of alkalinity in the underlying solution on films of fatty acids. N. K. Adam and J. G. F. Miller. *Proc. Roy. Soc. (London)* A142, 401-15 (1933); cf. C. A. 27, 3652.—Unimol. surface films of 12-22-C fatty acids were studied in detail over the complete range of acidity between strong alkali and dil acid, especially on the alk. side. Electrolytic dissociation progressively increasing from neutral to alk. solns. causes a very marked decrease in lateral adhesion both in condensed and in expanded films. Minor sp. effects of buffer salts on this adhesion are also found. Collapse occurs, in ultramicroscopic aggregates, on the more alk. soln., but this is prevented if strong concns. (2  $N$ ) of salt are present. Bimol. films are not formed. Concns. of salt sufficient to retard collapse on alk. solns. tend to increase the size of the end groups, probably by adsorption of cations. The change in packing of the condensed films from close-packed chains (alk. solns.) to close-packed heads, usually occurs within a small  $pH$  range, the exact value of which depends somewhat on the buffers present. XIX. Effect of alkaline solutions on films with various end groups. *Ibid.* 416-22.—Unimol. films of diacidic acids  $HOOC(CH_2)_nCOOH$  ( $n = 32; 24; 20$ ); octadecylalonic acid  $C_{18}H_{35}O_4$ ;  $CH_3(COOH)_2$ , alkylphenols,  $C_nH_{2n+1}C_6H_4OH$  ( $n = 18; 16; 12$ ); stearylresorcinol,  $C_{17}H_{35}CO_2C_6H_3(OH)_2$  (1:3:4); Me palmitate; and various nitriles show a marked decrease in lateral adhesion, when the alkyl of the soln. is changed so as to ionize the end groups. Substances with nonionizable end groups do not show this effect. Strong soda solns. tend to increase the size of the carboxyl or phenolic groups at the end of the mol. Films of Me palmitate are fairly rapidly hydrolyzed on 2  $N$  NaOH. XX. Surface potential measurements on nitriles. N. K. Adam and J. B. Harding. *Ibid.* A143, 104-11 (1933).—Surface potential measurements of unimol. films of nitriles (contg. 14-22 total C atoms, including the C in the end CN group) indicate a max. value of  $\mu$ , calcd. from the simple Helmholtz equation, only about 1/7 of the dipole moment of the nitrile group as obtained by other methods. The effective dielec. const. of the surrounding of the film mol. is probably of the order of 7. The transition between condensed and expanded films is heterogeneous with the nitriles. Frank Urban

The action of diminished pressure in the formation of liquid drops on the surface of the same liquid. L. D. Mahajan. *Kolloid-Z.* 66, 22-3 (1934); cf. C. A. 25, 14, 26, 896, 3164; 28, 392<sup>14</sup>.—At barometric pressure of 433 mm. and with  $H_2O$  at 0°, primary drops failed to form and secondary drops formed only with great difficulty. Under like conditions at 556 mm. both kinds formed. The expts. confirm the earlier work. Arthur Fleischer

Electrokinetics. XIII. The relation between streaming potential and applied pressure. Henry B. Bull. *Kolloid-Z.* 66, 20-2 (1934); cf. C. A. 26, 2832.—The streaming potential of NaCl solns., 0.00001  $N$ , in  $H_2O$ ,  $H_2O$ - $C_2H_5OH$  and  $H_2O$ -isopropyl alc. were detd. by methods outlined by Ettisich and Zwanig (cf. C. A. 24, 3150; 26, 3714) except for the substitution of Pyrex for Jena glass capillaries. Plotting the streaming potential vs. pressure gave straight lines that pass through the origin. This confirms the Smoluchowsky-Helmholtz equation and contradicts E. and Z.'s results showing a change of electrokinetic potential with pressure. Arthur Fleischer

Determining the concentration gradient in the ultra-centrifuge cell. Ole Lamm. *Nature* 132, 890-1 (1933).—A new refraction method gives a direct measurement of the concn. gradient. Helen S. Hopfield

The preparation of disperse systems by explosion of vapors of a compound into a cold dispersion agent. I

P. P. von Weizsäcker and Naoyasu Sato. *Kolloid-Z.* 66, 1-11(1934).—A tube of material to be dispersed is sealed from the dispersing agent by a seal which loosens when a high pressure develops in the tube. Three conditions are set forth: (1) when all of the compd. in the tube is vaporized prior to explosion, (2) when part is vapor and part liquid and (3) when the tube is filled with liquids so that practically no vapor is present. Condition 1 is similar in principle to the method used in condensing vapors to obtain colloid solns. but provides a great instantaneous supersatn. The latter cases are accompanied by geyser action and sol formation is partly by mech. dispersion. Stable dil. sols of S, Se and Hg were prepd. In no case were gas bubbles observed. The stability is due to the formation of water-sol. compds. In the former  $H_2S$  and  $H_2Se$  were evident. With Hg, the stabilizing sol. factor is probably derived from a small quantity of org. matter from the seal used. In all cases the stable sols were those showing an increase in color on standing.

Arthur Fleischer

The suspension effect. G. Wiegner, H. Pallmann, A. Musierowicz and J. Albareda. *Polish Agr. Forestal Ann.* 28, 323-56(363-6 in German)(1932); cf. *C. A.* 24, 5200.—Explanation of the suspension effect must be based upon the following exptl. results: Addn. of the dispersed phase to a satd. dispersion medium causes a rise in the H-ion activity. The cause of this rise is the dispersed particle. The effect can be detd. by means of a quinhydrone, a H or a glass electrode, and is, therefore, a normal phenomenon of medium or highly dispersed systems. The activity of the satd. dispersion medium is const. and independent of the abs. amt. of the suspended phase. Extn. of the solid phase with fresh solvent does not free the particle from the acidified agent. Hence the suspension effect is caused by H ions adsorbed by the dispersed phase. The latter, consisting of monones or primary particles (micelles), is composed and characterized by 3 components: (1) the ultramicrone, (2) the compact inner layer, and (3) the loosely attached outer layer of ions. The ultramicrone is the carrier of the chem. properties. This center attracts ions of the same elec. charge by secondary valences, these ions forming the inner layer and transferring their charge to the ultramicrone. The inner layer attracts from the medium ions of an opposite elec. charge, forming the outer layer, which is partly mobile and exhibits a partial reactivity. In aq. media H and OH ions take part in the formation of both layers. In case the micelle is electroneg. the H ions present in the outer layer are able to give electromotive and inversomotive effects.

The aging of arsenic sulfide sols under the influence of light. Stability changes of sols with respect to electrolytes. V. Krestinskaya. *Kolloid-Z.* 66, 58-62(1934); cf. *C. A.* 22, 1884; 28, 950<sup>u</sup>.—Three  $As_2S_3$  sols with empirical compns. (1)  $4As_2S_3.9As_2O_3$ , (2)  $5As_2S_3.18As_2O_3$ , (3)  $2As_2S_3.7H_2S$ , and concns. 0.9545, 0.205 and 2.03 g. per l., resp., were exposed to light for 6-13 days. The coagulation concns. by Ba, H, K and Na chlorides were detd. before and after exposure, in the latter case after filtering off the pptd. S. All sols increased in stability to Ba; 1 and 2 showed increased stability to Na and K, while 3 decreased in stability; 1 and 3 decreased in stability to HCl while 2 showed a slight increase. The coagulation concns. of Ba and K chlorides increased with sol concn.; for HCl it remained const. Increase in  $H_2AsO_4$  in the intermicellar liquid acted like diln. because insol.  $Bas(AsO_4)_3$  was formed. The behavior was further complicated by the formation of S sol, which increased the sensitivity to coagulation.

Arthur Fleischer

The thermodynamic equilibrium in the crystal state. D. Balarev. *Kolloid-Z.* 66, 51-7(1934); cf. *C. A.* 20, 2107; 21, 2610; 25, 2614, 4165; 27, 1793, 2372.— $PbI_2$  crystal platelets, grown by slow diffusion of  $Pb(NO_3)_2$  and KI solns., were of 4 colors by incident light, green, blue, rose and violet, and by transmitted light, the resp.

complementary colors. The colors indicate a stepwise growth, each change representing about 300 m $\mu$ . Evapn. of mother liquor in the presence of platelets produced a fog of submicrons which on complete evapn. left a green film on the crystals. The change in particle size of ground pptd.  $BaSO_4$ ,  $BaF_2$ ,  $SrSO_4$ ,  $PbI_2$ , and natural barytes and fluorspar suspended in  $H_2O$ , on standing and on stirring, gave complex curves with max. and min. Particle growth is not simply a mol. soln. process. The results confirm the mosaic theory of real crystals. A. F.

Study of the stability of metallic organo-sols. Wolfgang Ostwald, J. F. Ehlers and H. Erbring. *Kolloid-Beihfte* 38, 387-83(1933).—The method of oscillatory dispersion of Ag in org. dispersion media was further developed for the purpose of obtaining quantitatively reproducible results. The inversion time, i. e., the time in sec. during which oscillatory dispersion may take place before coagulation occurs, is the most reproducible measure of sol formation and stability. It is more characteristic than inversion concn. The inversion time and concn., also the dispersion velocity, were detd. as functions of temp. and voltage. The dispersion media were mixts. of polar and non-polar liquids ( $Et_2O$ ,  $PhNO_2$ ,  $MeOH$ ,  $EtOH$ ,  $PrOH$ ,  $BuOH$  and  $Me_2CO$ , in  $C_6H_6$ ), and mixts. of 2 polar liquids ( $PhNO_2$ ,  $H_2O$ ,  $MeOH$ ,  $EtOH$ ,  $PrOH$ , iso-AmOH and *n*-hexyl alc. in  $Et_2O$ ). Three to four types of curves were obtained (inversion time  $U$  — compn. of mixt.). In the simplest case,  $Et_2O-C_6H_6$ ,  $U = k\sqrt{c}/\epsilon$ , or  $U = k_1\sqrt{c} \mu^2/\epsilon$ , where  $c$  is the percentage compn. of mixt.,  $\epsilon$ , dielec. const.,  $\mu$  dipole moment,  $k$  and  $k_1$  are constns. The case  $PhNO_2-C_6H_6$  may be represented by the function  $U = k\sqrt{cP^2}$ , where  $P^2$  is the orientation polarization. An attempt was made to connect the stability relations theoretically with the dielec. properties of the dispersion medium.

Frank Urban

Density of particles of a "copper" hydrosol. H. H. Paine and H. W. Shearnsmith. *S. African J. Sci.* 30, 127-31(1933).—Samples of colloidal Cu were prepd. by passing an arc discharge between Cu electrodes under cond. water. The water used in the tests had a cond. of about  $0.5 \times 10^{-8}$  ohm $^{-1}$  cm. $^{-1}$ . The sp. gravities of the 4 colloidal solns. were detd. by measuring the loss of wt. of a glass bulb in the solns. and in cond.  $H_2O$ . The detns. were correct within 1 part in 100,000. The colloidal particles could be Cu,  $Cu_2O$ ,  $CuO$  or  $Cu(OH)_2$ . If they are assumed to be Cu, the soln. contained 0.396 g. Cu per l. (by titration with  $HNO_3$ ). The sp. gravity of the soln. was calcd. to be 1.000352. For  $Cu_2O$ , the calcd. sp. gravity of the soln. was 1.000370, for  $CuO$  1.000418 and for  $Cu(OH)_2$  1.000428. The observed value was 1.000420, lying between those for  $CuO$  and  $Cu(OH)_2$ ; the colloidal particles are assumed to be  $CuO$  or  $Cu(OH)_2$ . Since the soln. is brown and does not change upon boiling, the soln. is considered one of  $CuO$  particles. Three other similarly prepd. solns. confirmed this conclusion. H. B. M.

Ionic interchange in sulfur sols. II. Effect of acids. Thomas R. Bolam and Joseph J. Muir. *J. Chem. Soc.* 1933, 1022-8.—Supplementing the investigation of ionic interchange in well-dialyzed S sols (Bolam and Bowden. *C. A.* 27, 649), undialyzed sols of the same kind, contg. a greater amt. of acid were studied. Total coagulation occurred before the whole of the H ion was liberated, and it was established that the actual cation interchange was incomplete. The degree of replacement at the coagulating point decreased with increase in acid concn., but its value proved independent of the nature of the cation of the coagulating salt, in confirmation of previous work. Increase in acid concn. not only decreased the amt. of H ion liberated at the coagulating point, but also increased the concn. of salt necessary to secure this amt. of replacement. The former of these effects appears to be connected with the coagulating action of the acid; the latter, with its so-called "antagonistic" action. Jerome Alexander

Aging of young aluminum hydroxide gels. R. Fricke and K. Meyring. *Z. energ. allgem. Chem.* 214, 269-74(1933).—The aging of freshly pptd.  $Al(OH)_3$  under dil. NaOH was followed by measuring the  $p_H$  of the super-

nant NaOH soln. The aging takes place in two distinct steps during the 1st of which x-ray examn. reveals formation of  $\text{Al}_2\text{O}_3 \cdot \text{H}_2\text{O}$  in the ppt. and during the 2nd  $\text{Al}_2\text{O}_3 \cdot 3\text{H}_2\text{O}$ . The soly. product of  $\text{H}_2\text{AlO}_3$  decreases during aging by nearly  $1\frac{1}{2}$  powers of 10. F. L. Browne

Coagulation of colloids. VI. Viscosity variations during coagulation. Shridhar Sarvottam Joshi and T. Madhab Menon. *J. Indian Chem. Soc.* 10, 599-609(1933); cf. C. A. 28, 9521.—Viscosity changes during slow coagulation of  $\text{As}_2\text{S}_3$  sols by KCl, KBr, KI, KF,  $\text{AlCl}_3$ ,  $\text{ThCl}_4$  and  $\text{Th}(\text{NO}_3)_4$  were detd. Frank Urban

Membrane equilibria. Aug. Boutaric. *Rev. gen. sci.* 44, 633-7(1933).—A review. Frank Urban

Formation of chromatic gels. Mike A. Miller. *J. Chem. Education* 11, 32(1934).—By the addn. of  $\text{CHCl}_3$  to a chromatic emulsion a rigid gel is produced immediately, without the process of creaming. Frank Urban

Swelling peculiarities of gelatin film and the application of the conclusions to the swelling of emulsion colloids. J. Bollhagen. *Kolloid-Z.* 66, 75-83(1934).—Gelatin film squares, 40 mm. on a side, were cut from sheets poured from 10-20% gelatin soln. prepd. by heating at  $55^\circ$  for 4 hrs. All squares were slightly curved; it was not possible to prep. absolutely plane surfaces. Change of curvature on wetting was noted (a) when the square was placed on the surface of  $\text{H}_2\text{O}$  for a period, (b) when one side was breathed upon, and (c) when one side was coated with petrolatum and the square placed in  $\text{H}_2\text{O}$ . Under a, 4 cases are noted: (1) for squares 0.05 mm. thick, the film first curves concave to the dry side, Type I curvature, and then changes to II, concave to the wet side, only to a slight degree; (2) 0.13-0.17 mm., I is very strong, and cylindrical surfaces are formed, II is very small; (3) 0.17-0.43 mm., a small I changing to II but not showing an intermediate plane phase. The time for the change depends on thickness; (4) 1 mm., a spherical curvature develops without any sign of axes. The axis of II is perpendicular to the axis of I. By method b for thicknesses 0.1-0.5 mm., curvature I is produced, changing rapidly to II. By method c for 0.13-0.17 mm., curvature I changes to II, which then changes back to a I. Gelation changes were followed by a polarization microscope. An air-dry foil consists of numerous deformed particles originally spherical. On swelling, 2 stages occur: (1) an increase in 1 dimension and decrease in another in individual particles and (2) change in size of swelling particles. Arthur Fleischer

The measurement of abnormal viscosities by means of the falling-ball method. Fumio Hirata and Kiichiro Kubo. *J. Soc. Chem. Ind., Japan* 37, Suppl. binding 11-14(1934).—The viscosity of a very viscous soln. of rubber in xylene and the empirical formula for the ratio of the diam. of ball to the velocity of fall were detd. The abnormal viscosity of very viscous colloidal solns. can be detd. by using balls of the same d. but different diams. The app. is described and exptl. data are presented.

Karl Kammermeyer  
The effect of electric charge on the viscosity of hydrophilic colloids. Ichiro Sakurada and Tadashi Nakashima. *Kolloid-Z.* 66, 62-7(1934); cf. C. A. 23, 4340; 26, 6121; 27, 5230.—Sp. vol.,  $\phi$ , and the shape factor const.,  $a$ , are derived by combining the generalized Einstein and Fikentscher-Mark equations. The combined relation  $c/\eta_{sp} = (100/a\phi) - (c/a)$ , in which  $c$  is concn.,  $\eta_{sp} = \eta_r - 1$ , and  $\eta_r$  the relative viscosity, is a straight line from which values of  $a$  and  $\phi$  are readily calcd. Addn. of NaCl to solns. of the Na salt of celluloseglycolic acid causes  $a$  to drop rapidly until it reaches 2.5, while  $\phi$  remains practically unchanged. The value 2.5 is characteristic of spherical and uncharged particles. In solns. less than 0.17 N in NaCl the increase in  $a$  must be due to particle charge. The change of charge by NaOH is less than by neutral salts. With change in temp., the behavior is complicated and difficult to understand. Starch solns. contain spherical particles with hardly any charge. Gelatin solns show no relation between  $a$ ,  $\phi$  and temp. and their particles may be nonspherical or highly charged.

Arthur Fleischer

The elastic properties of collodion when flowing. A. Pakshver and M. Bunin. *Kolloid-Z.* 66, 68-75(1934).—The rate of fall of steel balls,  $\frac{1}{8}$  to  $\frac{1}{16}$  in. diam. through 6-20% nitrocellulose solns. in  $\text{Et}_2\text{O}$  and  $\text{EtOH}$ , was detd. The min. size of ball at which no fall occurs measures roughly the elastic properties while the slope of the line, rate vs. size, measures the viscosity. The elastic limit, which depends on the load and rate of application, must be passed before the balls sink. With increase in temp. over the range  $15-33.5^\circ$ , viscosity decreases while the elastic limit remains const. With increase in concn., viscosity increases while the elastic limit changes. If the full tube is vigorously shaken, viscosity decreases, indicating a thixotropic effect. On standing the original value is resumed. Quartz sand was added to show flow paths in short tubes under pressure. In 20% soln. flow along the axis of the tube resembles solid flow while at the walls there is liquid flow. In long tubes, the rate-pressure lines are weakly curved. Collodion is not an ideal plastic substance. There is no adequate theory for substances with variable viscosity, elastic limit and elastic modulus.

Arthur Fleischer

Stratification phenomena in pigment-containing celluloid films. Erwin Michnickel. *Kolloid-Z.* 66, 84 (1934).—To prep. homogeneous plates for x-ray analysis,  $\text{Me}_2\text{CO}$  solns. of celluloid to which graphite or metal powder is added are poured on an unglazed clay surface coated with paraffin through which an air current is passed during drying. Good plates can also be obtained by incorporating a small quantity of rosin and pouring on glass. Absence of stratification is detd. by microscopic examn of a vertical section and by elec. cond. measurements of the upper and lower surfaces. The drying time of plates depends not on diln. but on the proportions of celluloid and metallic filler. Air inclusions have no effect.

Arthur Fleischer

Determination of electric charge and isoelectric point of fibers. A. V. Dumanski and O. A. Dumanski. *Kolloid-Z.* 66, 24-8(1934).—If a fiber is suspended in a cuvette contg. distd.  $\text{H}_2\text{O}$  and 2 Pt electrodes to which a const. e. m. f. of about 100 v. is applied, the fiber bends toward one of the electrodes. On reversing the current, the fiber movement is reversed. This movement depends only on the charge of the electrode. For more exact expts. non-polarizable electrodes are used and are placed in half-cells with a salt soln. of the same metal, with a KCl-agar siphon. In  $\text{H}_2\text{O}$  with  $p_H$  4, charges noted were ostrich feather +, human hair +, rayon +, glass —, collodion —, gelatin —, algae + and cotton —. Addn. of HCl or Th soln. changes the charge on glass between  $p_H$  2 and 3. The behavior of gelatin is anomalous and should be + in acid soln. The reversal of direction is due to easy penetration by water causing an electroosmotic effect. "This method is not to be confused with Humphry's (cf. C. A. 21, 1740, 2086). The method is called "cataphoresis of fastened fibers." Arthur Fleischer

Lyophilic colloids. XIX. Effect of several neutral salts and nonelectrolytes on isoelectric gelatin sol. I. W. J. Holleman, H. G. Bungenberg de Jong and R. S. Tjaden Modderman. *Kolloid-Beihfte* 38, 439-43(1933) KI, KCl,  $\text{KNO}_3$ ,  $\text{K}_2\text{SO}_4$ ,  $\text{K}_3\text{Fe}(\text{CN})_6$ ,  $\text{K}_4\text{Fe}(\text{CN})_6$ ,  $\text{Na}_2\text{SO}_4$ , NaI, NaCl, KF, KBr,  $\text{EtOH}$ ,  $\text{PrOH}$  and urethan raise the viscosity of isoelec. gelatin solns. Theoretical discussion. Frank Urban

Fixation of iodine by casein. I. S. Yaichnikov. *J. Gen. Chem.* (U. S. S. R.) 3, 1-4(1933).—The action of I vapor on casein was studied by storing 0.4348 g. casein (obtained by drying 0.4524 g. casein to a const. wt. in a vacuum desiccator) and cryst. I (in sep. containers) in a desiccator for 1660 days. Casein became gradually colored from light yellow to coffee-brown. In all, 180 weighings of casein were made at intervals of 1-125 days with 13 refillings of I. The increase in wt. of casein was relatively greater at the beginning of each addn. of I than at the later stages. At some intervals there was a small loss of wt., which was compensated by the continued increase in wt. of casein to 0.9284 g. iodocasein with 53.17% I or 113.52% I based on casein. From the

failure of the compd. to attain equil. it may be inferred that I is fixed in iodocasein mainly by adsorption, probably with a little I more firmly combined. C. B.

The solubility equation of hydrated salts. J. Perreux. *Compt. rend.* 198, 172-4(1934).—The soly. equation of a hydrate,  $S \cdot xH_2O$ , derived from van der Waals' equation (*Rec. trav. chim.* 1, 125(1889)), is  $[503C/(1-sC)] \cdot (q_c/T^2) - (\delta \log p/\delta C) \cdot (\delta C/\delta T) = 0$ , where  $T$  is the abs. temp.,  $C$  the mol. concn. of the satd. salt soln. (expressed as mols. of salt/mol. of total  $H_2O$ ),  $p$  the vapor pressure of this soln., and  $q_c$  the limiting heat of soln. of the hydrate. This equation and 2 corollaries (relating to *transition* and *cryohydric points*) were experimentally verified for several salts of Mn and Na. Reuben Roseman

The solubilities of certain amino acids in water, the densities of their solutions at twenty-five degrees and the calculated heats of solution and partial molal volumes. John B. Dalton and Carl L. A. Schmidt. *J. Biol. Chem.* 103, 549-78(1933).—The solubilities of the following pure amino acids at various temps. between 0° and 70° were detd.: *D*- and *L*-alanine, *L*- and *D*-aspartic acid, *D*- and *L*-glutamic acid, *L*- and *D*-leucine, diiodo *L*-tyrosine, glycine, *D*-isoleucine, *D*-norleucine, *D*-phenylalanine, *L*-tyrosine and *D*-valine. Solubilities calcd. for the 5° intervals between 0° and 75° and at 100° are tabulated. The equations expressing soly. as a function of temp. are given, and from these the heats of soln. (in the case of those marked \*, corrected for the activity of the amino acid) are, in the same order; 1830\*, 2200\*, 5580\*, 6500\*, 6050\*, 5710\*, 830\*, 2070\*, 7830, 3370\*, 1790, 2540, 2770, 5960 and 1590\* cal., resp. Ds. of aq. solns. at 25° are tabulated. Application of the criteria of Meyerhoffer to the data indicates that *D*-alanine, *D*-leucine and probably also *D*-aspartic acid are racemic compds., while *D*-glutamic acid is a racemic mixt. Seventy-six references. K. V. Thimann

The solubility of the amino acids in water. Max S. Dunn, Frank J. Ross and Lee S. Read. *J. Biol. Chem.* 103, 579-95(1933); cf. preceding abstr.—The solubilities in water of the following pure amino acids at 0°, 25°, 50° and 75° are given: glycine, *D*-alanine, *D*- and *D*-glutamic acid, *D*-valine, *D*-isoleucine, *D*-phenylalanine, *D*-norleucine, *D*-leucine, *L*- and *D*-aspartic acid, and *L*-tyrosine. From the figures are calcd. the heats of soln. for successive 25° intervals and the solubilities at 100°, which, in the same order, are: 75.2, 43.2, 5.34, 19.9, 20.0, 9.04, 6.53, 4.70, 4.83, 4.88, 9.94, 0.492 g. per 100 g. water, resp. On the whole the results in this and the preceding abstr. agree well. When the log of the mole fraction is plotted against  $1/T$ , straight lines are given by glycine, alanine and glutamic and aspartic acids, which are therefore probably less assocd. in soln. than the other amino acids tested. K. V. Thimann

A study of two strong electrolytes with reference to the theory of complete ionization. John B. Robertson. *S. African J. Sci.* 30, 187-95(1933).—If strong electrolytes are completely disscd. in aq. soln. then, when a soln. of such an electrolyte is shaken with an org. solvent in which the electrolyte is sol. but undissocd., there is no common mol. species in the two phases. Consequently the partition law does not apply and all the electrolyte migrates to the ionizing solvent. In water  $AgClO_4 \cdot H_2O$ , and in benzene  $AgClO_4 \cdot C_6H_6$  are stable. Mol. wts. indicate that these solvations are not complete. Mol. wts. of  $AgClO_4$  in dry and moist  $C_6H_6$  are quite different. The difference between the f. ps. of dry and  $H_2O$ -satd.  $C_6H_6$  is 0.097°, corresponding to a  $H_2O$  content of 0.035% at 5.4° if the  $H_2O$  is assumed to be unimol. in the soln. The av. value for the mol. wt. of  $AgClO_4$  in moist  $C_6H_6$  is 670 (max. variation 3.5%), corresponding approx. to  $(AgClO_4 \cdot H_2O)_2$ . Simple mols. apparently do not exist in this soln. The soly. of LiI in  $PhNO_2$  was detd. at 250° to be  $5.27 \pm 0.04\%$ . The soly. of LiI in  $H_2O$  at 250° is  $61.6 \pm 0.1\%$ , dss. of soln.  $1.828 \pm 0.001$ , and g. mols. per l. =  $8.42 \pm 0.01$ . The distribution ratio of LiI between  $H_2O$  and  $PhNO_2$  varied from 3250 to >6830 as the concn. of LiI in the  $H_2O$  layer decreased from 42.2 to 10.1 g. LiI per 100 g. soln. The concn. of LiI per 100 g.  $PhNO_2$  changed little,

0.0156 to <0.0018. The system strongly supports the complete ionization theory. Detns. of the mol. wt. of LiI in  $PhNO_2$  yield reason for divergence from this theory. These mol. wts. vary from 270 to 365. The single mol. wt. = 133.86; hence the 270 value is approx. double, evidence of polymerization. In both cases (LiI and  $AgClO_4$ ) the apparent failure of the distribution law may be ascribed to the polymerization, leaving no species common to both solvents. The evidence here given, while not in direct conflict with the theory of complete ionization in the aq. phase, affords another explanation which would account for the observed phenomena. H. E. M.

Photoelectric measurement of adsorption and color change (of indicators). Rudolf Sewig and Friedrich Muller. *Chem. Fabrik* 1934, 25-7. J. H. Moore

Formation of oxide films on gold and iron. Wm. J. Shutt and Arthur Walton. *Trans. Faraday Soc.* 29, 1209-16(1933); cf. C. A. 27, 888.—Au anodes are rendered passive by alkali, while H is adsorbed. After soln. of the oxide film in dil. HCl, sufficient adsorbed H may remain to prevent further action of the alkali. If the H is removed through oxidation by alk. hypochlorite, formation of a unimol. oxide layer is indicated by the loss of wt. due to subsequent acid treatment. No film formation could be detected in oxidizing agents of low OH-ion concn., such as concd.  $HNO_3$  or acid permanganate. This is ascribed to the slowness of removal of adsorbed H and the slowness of oxide formation due to the low OH-ion concn. Presence of adsorbed H is indicated by a more neg. potential. In acid solns., the potential of electrodes contg. adsorbed H falls more rapidly, with an increase of  $pH$ , than that of electrodes freed from adsorbed H by Cl treatment. In alk. solns., where more adsorbed H is readily produced, the potential of both electrodes is the same. Fe behaves qualitatively like Au. An oxide film, readily formed by treatment with either neutral or alk. solns., causes a lowering of potential, which later rises again to its former value. In this case the dissolved O suffices for the oxidation of the adsorbed H. L. P.

What are the proportions of oxygen and carbon dioxide that extinguish a flame? P. Vinding and E. Banner-Voigt. *Ingeniøren* 42, 65-7(1933); *Chimie & Industrie* 30, 579.—Verification of the hypothesis that an atom which will sustain combustion is not toxic to man was attempted. A Davy lamp (1), bicycle lamp (2), illuminating gas (3) and  $C_2H_2$  (4) were allowed to burn in a closed vessel, and O and  $CO_2$  when the flames went out were, resp., as follows: (1) 17.5-20.1, 2.1-5.6; (2) 17.7-18.6, 2.5-7.5; (3) 10.9, 5.1; (4) 10.1, 8.7%. Intoxication takes place when the O content falls below 15% and would therefore occur in an atm. in which illuminating gas or  $C_2H_2$  does not burn. Intoxication takes place with more than 4%  $CO_2$ , i. e., in an atm. that does not support the combustion of illuminating gas or  $C_2H_2$ , and in 5 of the 12 expts. with the Davy lamp and 4 of the 9 expts. with the bicycle lamp. The values obtained are of the same order as those of Schultzig (C. A. 24, 3561), who worked under rather different conditions; but the O contents at which the flames were extinguished are appreciably higher than those given in some of the textbooks. A. Papineau-Couture

The dissociation pressure of silver carbonate. Motoo Watanabe. *Science Repts. Tôhoku Imp. Univ.*, First Ser. 22, 1229-39(1933).—Over the temp. range 120.1-201.3°, the disscn. pressure of  $Ag_2CO_3$  is  $\log P_{atm} = -(3855.9/T) + 7.9040$ . The following values were calcd. for  $2Ag + C$  (graphite) +  $3/2O_2 = Ag_2CO_3$ :  $\Delta H_{298} = -119,302$  cal.,  $\Delta F_{298} = -103,614$  cal. P. T. Newsome

Equilibrium in the reduction of cobaltous oxide by carbon monoxide. Motoo Watanabe. *Science Repts. Tôhoku Imp. Univ.*, First Ser. 22, 892-901(1933).—The equil. of the reduction of  $CoO$  by  $Co$  was studied by a dynamic method from 563° to 861°. Thermodynamic values for  $CoO$  were calcd. from exptl. results and other data. C. B. Jenni

Equilibrium in the reduction of silver sulfide by hydrogen. Motoo Watanabe. *Science Repts. Tôhoku Imp. Univ.*, First Ser. 22, 902-14(1933).—Results of previous

investigators on the equil. of the reduction of  $\text{Ag}_2\text{S}$  by  $\text{H}$  do not agree. W. used a static method. Results and other data are discussed from the thermodynamic point of view. The standard potential of  $\text{S}$  was also calcd. from these results,  $E_{298} = 0.47$  v. C. B. Jenni
